ranges as distinguished from the eastern or Rocky mountain range, the flora differs, the climate being damp instead of dry. In some of the valleys having an outlet to the south the flora is partly peculiar to the American desert, and such species as *Purshia tridentata* and *Artemisia tridentata*, and endemic species of *Gilia*, *Aster* and *Erigeron* are found. Above Yale, in the drier part of the Fraser valley, the absence of rain results in the same character of flora, while in the rainy districts of the lower Fraser the vegetation is so luxuriant that it resembles that of the tropics. So in various parts of the mountainous country of British Columbia, the flora varies according to climatic conditions. Nearer the Pacific coast the woods and open spaces are filled with flowers and shrubs. Liliaceous flowers are abundant, including various species of *Erythronium*, *Trillium*, *Allium*, *Brodiaea*, *Fritillaria*, *Lilium* and *Camassia*. (X.)

**Fauna.**—The larger animals of Canada are the musk-ox and the caribou of the barren lands, both having their habitat in the far north; the caribou of the woods, found in all the provinces except Prince Edward Island; the moose, with an equally wide range in the wooded country; the Virginia deer, in one or other of its varietal forms, common to all the southern parts; the black-tailed or mule deer and allied forms, on the western edge of the plains and in British Columbia; the pronghorn antelope on the plains, and a small remnant of the once plentiful bison in northern Alberta and Mackenzie. The wapiti or American elk at one time abounded from Quebec to the Pacific, ranging as far north as the Peace river, but is now found only in small numbers from Manitoba westward.

In the mountains of the west are the grizzly bear and the black bear. The black bear is also common to most other parts of Canada; the polar bear everywhere along the Arctic littoral. The large or timber wolf is found in the wooded districts of all the provinces, and on the plains there is also a smaller wolf called the coyote. In British Columbia the puma or cougar still frequently occurs; and generally distributed in wooded areas are the common fox and its variety, the silver fox, the lynx, beaver, otter, marten, fisher, mink, skunk and other fur-bearing animals. The wolverene is largely confined to the barren lands, which are also inhabited by the arctic fox. Mountain and plain and Arctic hares and rabbits are plentiful or scarce in localities, according to seasons or other circumstances. In the mountains of British Columbia are the bighorn or Rocky Mountain sheep and the Rocky Mountain goat, while sheep of two or three other species are also found from nearly pure white in the north to black in certain areas in the southern Canadian Rockies.

The birds of Canada are mostly migratory, and are those common to the northern and central states of the United States. The wildfowl are, particularly in the west, in great numbers; their breeding grounds extending from Manitoba and the western prairies up to Hudson Bay and the barren lands and Arctic coasts. The several kinds of geese—including the Canada goose, the Arctic goose or wavey, the laughing goose, the brant and others all breed in the northern regions, but are found in great numbers throughout the several provinces, passing north in the spring and south in the autumn. There are several species of grouse, including the ruffed grouse, ptarmigan and sharp-tailed grouse of the plains. In certain parts of Ontario the wild turkey formerly occurred, and the so-called "quail" or "bob-white" still inhabits the southern part of the province.

The golden eagle, bald eagle, osprey, and a large variety of hawks are common in Canada, as are the snowy owl, the horned owl and other owls. The raven is found only in the less populated districts, but the crow is common everywhere. Song-birds are plentiful, especially in the wooded regions, and include the American robin, oriole, thrushes, the cat-bird and various sparrows; while the introduced English sparrow has multiplied excessively and become a nuisance in the towns. More recently introduced but spreading rapidly are the European starling in the east and the Japanese starling in British Columbia. The smallest of the birds, the ruby-throated hummingbird, is found everywhere, even up to timber line in the mountains. The sea-birds include a variety of gulls, terns, guillemots, cormorants and ducks, and in

the Gulf of St. Lawrence the gannet is very abundant. Nearly all the sea-birds of Great Britain are found in Canadian waters or are represented by closely allied species.

The Migratory Birds Convention Act of 1923 involved an agreement between the United States and Canada for the protection of bird life. (E. M. W.; J. R. Dy.)

### AREA AND POPULATION

The land and water area of Canada was given by official figures for 1927 as 3,684,723 square miles, being about 3% larger than that of the Continental United States with Alaska (3,564,658 square miles) and about 2% smaller than that of the continent of Europe (3,776,700 square miles).

**Population.**—The decennial census of Canada of June 1, 1921, showed a total population of 8,787,949. This figure was increased by the census of 1931 to 10,374,196, a gain of 1,586,247 for the decade. The increase in percentage for that decade was 18.05. Table 1 below shows the land and water areas of the various provinces and territories as of 1927, and the population as enumerated in the censuses of 1901, 1911, 1921, and 1931.

TABLE 1.—Area and Population

| Area                      |           |         |           |
|---------------------------|-----------|---------|-----------|
| Provinces and Territories | Land      | Water   | Total     |
| Prince Edward Island      | 2,184     | ...     | 2,184     |
| Nova Scotia               | 21,068    | 360     | 21,428    |
| New Brunswick             | 27,911    | 74      | 27,985    |
| Quebec                    | 583,895   | 10,539  | 594,434*  |
| Ontario                   | 365,880   | 41,382  | 407,262   |
| Manitoba                  | 231,926   | 19,906  | 251,832   |
| Saskatchewan              | 243,381   | 8,319   | 251,700   |
| Alberta                   | 252,925   | 2,360   | 255,285   |
| British Columbia          | 353,416   | 2,439   | 355,855   |

\*The area assigned to Quebec was reduced from 706,834 to 594,434 square miles—nearly one-sixth—by a decision of the Judicial Committee of the Privy Council, announced on March 1, 1927, which awarded 112,400 square miles of disputed territory to Newfoundland.

\*\*Includes Royal Canadian Navy, 485 men.

With regard to natural increase, only approximate figures were available prior to 1921. For the intercensal period 1901-1911 the

surplus of births over deaths was estimated at 853,566 and for 1911-1921 at 1,150,659. The figures for the nine provinces for calendar years beginning with 1921 were as follows:<sup>1</sup>

| Year                    | Living births | Deaths  | Natural increase | Birth rate | Death rate | Rate of natural increase |
|-------------------------|---------------|---------|------------------|------------|------------|--------------------------|
| Per 1,000 of population |               |         |                  |            |            |                          |
| 1921                    | 257,728       | 101,155 | 156,573          | 29.3       | 11.6       | 17.8                     |
| 1922                    | 252,571       | 102,487 | 150,084          | 27.8       | 11.3       | 16.5                     |
| 1923                    | 240,476       | 105,330 | 135,265          | 26.1       | 11.4       | 14.7                     |
| 1924                    | 244,525       | 98,553  | 145,972          | 26.5       | 10.7       | 15.8                     |
| 1925                    | 232,205       | 107,318 | 124,887          | 24.8       | 11.4       | 13.4                     |
| *1926                   |               |         |                  |            |            |                          |

\*1926 figures are preliminary.

During 1926 the birth rates ranged from 32.1 per thousand in Quebec to 17.4 in British Columbia, while the rate of natural increase ranged from 17.6 per thousand in Quebec and Saskatchewan down to 7.8 per thousand in British Columbia. About one-third of the present natural increase is due to Quebec.

**Races.**—At the census of 1921 it was found that 83.31% of the population were of British or French origin. The French population, estimated at 80,000 in 1763, had increased in 1921 to 2,452,751 and now constitutes 27.91% of the population. 55.40% of the population are of British origin. British settlement did not begin on a large scale until the Loyalist movement which followed the American revolution. Another period of active immigration occurred during the middle third of the 19th century, but the greatest influx from all countries took place during the decade preceding the war 1914-18. From 1906 to 1915 inclusive, more than two and a half million immigrants entered the country.

**Migration.**—The movement reached its climax in 1913, when 402,432 immigrants were enumerated. During the war period, the stream of British immigration was practically cut off, and a large proportion of the non-British immigrants who had come in during the pre-war boom returned to their native countries or emigrated to the United States. Hence, of the total population in 1921, 77.75% were Canadian-born, 12.12% were born in other parts of the British Empire, and only 10.13% (890,282), were born in other countries including the United States. Of the 890,282 foreign born, 514,182, or 57.75% were naturalized, leaving only 376,100 alien residents. Of the population aged 10 years or over, in the nine provinces, 62.12% gave English, and 26.64 gave French, as their native tongue, while 84.79% could speak English. Within the same age limits, 94.26% could read and write and 5.10% could not do either.

Largely as a result of immigration, the population is strongly masculine, the proportions being 515 males to 485 females. The same cause has affected the age distribution, so that an exceptionally large proportion of the population is concentrated in the most productive years of life. The median age, which was 18.80 years in 1871, had increased to 23.94 years in 1921. The following table shows the distribution by age and sex in 1921:

|                        | Male      | Female    |
|------------------------|-----------|-----------|
| Under 1 year . . . . . | 105,953   | 103,731   |
| 1-4 years . . . . .    | 427,496   | 420,470   |
| 5-9 years . . . . .    | 528,700   | 520,061   |
| 10-19 years . . . . .  | 864,579   | 850,388   |
| 20-29 years . . . . .  | 698,629   | 699,101   |
| 30-39 years . . . . .  | 685,576   | 599,703   |
| 40-49 years . . . . .  | 523,366   | 438,799   |
| 50-59 years . . . . .  | 343,278   | 298,984   |
| 60 and over . . . . .  | 340,767   | 317,625   |
| Not given . . . . .    | 11,601    | 9,676     |
|                        | 4,529,945 | 4,258,538 |

**Religious Denominations.**—Of the total population of 1921, 97.5% were classified as belonging to some Christian denomination or sect, 1.9% as non-Christian (including Jews and adherents

<sup>1</sup>Quebec statistics are from provincial sources until 1926, when Quebec became a part of the Registration Area.

of Eastern religions). The principal denominations were Roman Catholics 38.57%; Presbyterians, 16.04%; Anglicans, 16.02%; Methodists, 13.19%; Baptists, 4.80%; Lutherans, 3.26%; Greek Church, 1.93%; Jews, 1.42%; Mennonites, .67%; all others, 4.10%. Since the date of the 1921 census, there has been organized the United Church of Canada, which includes the groups formerly classed as Presbyterians, Methodists and Congregationalists, and now constitutes the largest single Protestant body. A large number of the Presbyterians did not enter this union, and this group continues as a separate denomination.

**Rural and Urban Population.**—The Canadian census of 1931 classes 53.71% of the population as urban and 46.29% as rural. The degree of urbanization in Canada was in 1921 less than in the United States: thus, 36.55% of the population of Canada lived in places of 5,000 or over as compared with 47% in the United States. Of the total increase in population which occurred between 1921 and 1931, urban communities absorbed 1,219,936, rural 366,311. The largest cities were in 1931 Montreal (818,577), Toronto (631,207), Winnipeg (218,785), Vancouver (246,593), Hamilton (145,547), Quebec (130,594), Ottawa (126,872), Calgary (83,761), Edmonton (79,197), London (71,148), Halifax (59,275), St. John (47,514), and Victoria (39,082).

(H. R. K.)

## POLITICAL ORGANIZATION

**Government.**—Canada is one of the five self-governing Dominions of the British Empire. Though still retaining some vestiges of her former colonial status—such as the appointment of the governor-general by the British government, the privileges of appeal to the judicial committee of the Privy Council, and the necessity of applying to the British parliament for the amendment of the British North America Act, which is the fundamental law of the Canadian constitution—Canada has been declared by the Imperial Conference of 1926 to be "equal in status" with the mother country. The many unwritten conventions of the British constitution hold good in Canada; but there is an important difference between the British and Canadian constitutions, in that the Canadian is federal.

The British North America Act, which embodies the terms of the federal agreement of 1867, lays down, in sections 91-93, the subjects of legislation which are assigned respectively to the Dominion and the provinces. The former has exclusive legislative authority in all matters relating to the regulation of trade and commerce, military and naval defence, navigation and shipping, banking and currency, marriage and divorce, etc.; the latter in all matters relating to education, municipal government, property and civil rights within the province, licenses, etc.

**Executive Power.**—In the Dominion, executive power rests in the hands of the governor-general, who represents the king of Great Britain, and is appointed by the British Government. The governor-general is, however, advised by the prime minister and his colleagues in the cabinet, who at the same time are members of the King's Privy Council for Canada and sit in the Dominion parliament.

**Legislative Power.**—The Dominion legislature is bicameral: it is composed, in addition to the representative of the Crown, of a Senate numbering 96 members, who are appointed for life by the governor-general in council; and a House of Commons, numbering 245 members in 1927, who are elected by the people for the duration of parliament, which may not be longer than five years. In the provinces, the Crown is represented by a lieutenant-governor, appointed by the Dominion government. He is advised by an executive council, composed of a prime minister and a varying number of ministers, all of whom sit in the legislature. In seven out of the nine provinces, the legislature is unicameral, being composed of a Legislative Assembly, elected by the people for a term of four years. Only in Quebec and in Nova Scotia is there a second chamber, styled in both provinces a Legislative Council, and composed of nominees of the provincial government.

**Justice.**—The administration of justice is largely in the hands of the provinces, though the judges in the higher courts are appointed by the Dominion government, and the Dominion has had

since 1875 a Supreme Court. Both from the provincial courts and from the Supreme Court there may be, in certain cases, an appeal to the judicial committee of the Privy Council. (W. S. W.A.)

### DEFENCE

**Historical.**—In the earliest European settlements in Canada, the necessity of protection against Indians caused the formation of a militia, and in 1665 companies were raised in every parish. The military history of the Canadian forces under French rule is full of incident, and they served not only against Indian raiders but also against the troops of Great Britain and of her North American colonies. Six militia battalions took part in the defence of Quebec in 1759, and even the transfer of Canada from the French to the British crown did not cause the disbandment of the existing forces. The French Canadians distinguished themselves in the War of American Independence, and in particular in the defence of Quebec against Montgomery and Arnold. In 1787 an ordinance was made whereby three battalions of the militia were permanently embodied, each contingent serving for two years, at the end of which time a fresh contingent relieved it. The brunt of the fighting on the American frontier in the War of 1812 was borne by the permanent force of three battalions and the fresh units called out, all these being militia corps. The militia was again employed on active service during the disturbances of 1837, and the "Active Militia" in 1863 had grown to a strength of 25,000 men. The Fenian troubles of 1864 and 1866 caused the embodiment of the Canadian forces once more. In 1867 took place the unification of Canada, after which the whole force was completely organized on the basis of a militia act (1868). A department of Militia and Defence with a responsible minister was established, and the strength of the active militia of all arms was fixed at 40,000 rank and file. Two years later the militia furnished 6,000 men to deal with the Fenian Raid of 1870, and took part in Colonel (Lord) Wolseley's Red River expedition. In 1871 a tiny permanent force, serving the double purpose of a regular nucleus and an instructional cadre, was organized, and in 1876 the Royal Military College of Canada was founded at Kingston. In 1885 the Riel rebellion was dealt with, and the important action of Batoche won, by the militia, without assistance from regular troops. In the same year Canada contributed a force of *voyageurs* to the Nile expedition of Lord Wolseley; the experience of these men was of great assistance in navigating the Rapids. The militia sent contingents of all arms to serve in the South African War, 1899–1902, including "Strathcona's Horse," a special corps, recruited almost entirely from the Active Militia and the North-west Mounted Police. The latter, a permanent constabulary of mounted riflemen, was formed in 1873.

After the South African War an extensive scheme of reorganization was taken in hand, the command being exercised for two years (1902–1904) by Major-General Lord Dundonald, and subsequently by a militia council (Militia Act 1904), similar in constitution to the home Army Council.

### MODERN ORGANIZATION

After 1910 Canadian military organization changed very much. Its two most important features were the final war organization, and the peace organization which succeeded it. The principal military effort of Canada from 1914 to 1918 consisted in the organization and maintenance of the Canadian Corps, consisting of the 1st, 2nd, 3rd, and 4th Canadian divisions and corps troops. This force, while technically an army corps of the British Army, differed from other army corps in that it was an integral tactical unit, moving and fighting as a whole.

**War-time Organization.**—Its high tactical value resulted mainly from (a) great mobility, aided by two additional mechanical transport companies (for machine-gun battalions and engineer brigades); (b) high and consistent infantry strength, due to each division having three brigades of four battalions of 1,100 men each, one engineer brigade of three battalions in each division (eliminating the necessity of supplying working parties from infantry) and to the possession of its own system for handling reinforcements; (c) staffs almost double strength and staff officers

constantly interchanged; (d) an unique machine-gun organization, comprising two motor machine-gun brigades with the corps and one machine-gun battalion of 96 guns with each division, also a machine-gun headquarters at corps headquarters; (e) enlarged signal service; (f) high strength in permanently attached artillery (corps troops included one extra divisional artillery unit and one extra brigade of field artillery); and (g) mechanization during stationary periods by extended use of light railways, husbanding strength of men and horses. Other Canadian formations in France were the Canadian Cavalry Brigade and Canadian Railway Troops, which included headquarters, 14 battalions and four operating companies, making a total of nearly 15,000 men and several supply units.

The Canadian Army Medical Corps operated in France, England and Salonika, supplying the regular medical services with the corps and other troops and also 14 general and seven stationary hospitals, four small forestry corps hospitals, 12 convalescent hospitals and one mobile laboratory. The Canadian Forestry Corps operated in England and France with 24,000 all ranks. The Canadian Army Dental Corps had a strength of 903 all ranks. Special formations were the Accountant General's Branch, the Canadian Army Pay Corps and the Department of the General Auditor. Canadian troops in France and England were administered by the Minister of Overseas Military Forces of Canada with a headquarters in London.

**Post-War Organization.**—During the session of 1922 a National Defence Act was passed, consolidating the Naval Service, the Air Board and the Dept. of Militia and Defence into the Dept. of National Defence. The Act became effective by proclamation on Jan. 1, 1923. Under it there is a Minister of National Defence and a deputy-minister; a Defence Council was constituted to advise the minister. The senior non-civil officer is the chief of the general staff.

**Military Forces.**—The small permanent military force is used for the maintenance of organization and the instruction of the non-permanent troops, who constitute the first line fighting force. For purposes of training, discipline, mobilisation, etc., the country is divided into 11 districts, each district under permanent commanders with small staffs. Infantry is organized in brigades for training and administration, but based, for recruiting and reinforcement, on a regimental system with active and reserve battalions (122 in all), perpetuating by their names the pre-War militia regiments and units of the Canadian Corps. The organization of other arms is such as to provide for the formation of complete divisions with the necessary depots for reinforcements. The units of the permanent force and a large proportion of the non-permanent units, are allied with regiments and other units of the British army. The strength of the permanent militia was limited by the Militia Act Amending Act of 1919, to 10,000, but the authorized establishment up to 1928 was only 3,600. Royal schools of instruction are conducted at all stations of the permanent force; the Canadian Small Arms School is the only school, however, which is an independent unit of the permanent force. The total establishment of the Canadian forces is, in 1928, about 130,000 all ranks. A reserve militia has also been established.

**Air Force.**—The Royal Canadian Air Force is divided into four divisions under the following heads of divisions—Director of Civil Government Air Operations; Chief Aeronautical Engineer; Controller of Civil Aviation; Director, Royal Canadian Air Force. The first three are under the Deputy Minister, while the fourth is the military air force and is under the control of the Chief of the General Staff. Air officers are seconded from this to the other three divisions, while the Chief Aeronautical Engineer's division serves all. The headquarters are at Ottawa, and units at Vancouver, B.C.; High River, Alta.; Winnipeg, Man. (with operating bases at Victoria Beach, Norway House and the Pas); Camp Borden (the main training base); Ottawa, Ont.; and Dartmouth, N.S. The strength of the force in 1928 was 76 officers and 450 men permanently employed, of which 63 officers and 222 men are employed on Civil Government Air operations. A reserve is in process of formation. Its functions were air force training and

operations, the control of commercial flying and the conduct of flying operations for civil branches of the government service. In 1925 and 1926 the force was in process of reorganization.

(X.)

**Navy.**—Not until after the Imperial Conference of 1909 did Canada decide to bear her share in the naval defence of the Empire. In 1910, a Navy Department was formed, charged with the organization of a Naval Force, to be at the disposal of H.M. the King for the general service with the Royal Navy. The cruisers "Niobe" and "Rainbow" were purchased and stationed at Halifax and Esquimalt respectively, and these two bases were taken over from the Imperial authorities. In 1911 the formation of a Royal Canadian Navy was announced, but the number of ships and the method of providing them became an acute political issue. The Laurier Government proposed to build, in Canada if possible, four cruisers and six destroyers. The Borden Government plan was to lay down three battleships for the Royal Navy, which should be at the call of the Royal Canadian Navy, when that force came into existence. Neither plan materialized before the outbreak of the war in 1914. During the war the two old cruisers, assisted by a destroyer and two submarines were employed in patrolling, and, on both Atlantic and Pacific Coasts, large flotillas, manned chiefly by volunteers, came into being and did all patrol, minesweeping and convoy protection work in Canadian waters.

After the visit of Lord Jellicoe to Canada in 1919 the Canadian Government decided to maintain the Navy at pre-war level and the Imperial Government presented to Canada a light cruiser and two destroyers to replace the obsolete ships. The war time personnel was demobilised and re-organised and in 1922 the Navy Department was amalgamated with the Department of National Defence. In 1928 the Headquarters of the Royal Canadian Navy was at Ottawa and the force consisted of (1) a permanent personnel of 500 officers and men, (2) a Reserve of 500, recruited from the seagoing population, and (3) a Volunteer Reserve of 1,000 distributed in half companies around the coast. Two destroyers and four minesweepers are maintained in commission and there are training establishments and small dockyards at Halifax and Esquimalt. Two additional destroyers were laid down in 1928.

(S. T. H. W.)

**Banking and Finance.**—The Act of Confederation 1867 brought about the unified control of the banking system of the country, and by the Bank Act of 1871 a decennial revision of banking law was provided for. This system has worked smoothly, and changes have been in the way of natural development. The currency of the country is provided for by a note issue of the banks limited by their paid up capital and secured by a system of mutual liability by which all the banks' assets are liable for the notes of each one. Provision is made for expansion during harvest activity, and a daily clearing ensures fluidity and freedom from inflation.

No fixed ratio of reserves is imposed on the banks except that 40% of such reserves as they keep must be in notes of the Dominion Government.

In 1871 there were 23 chartered banks, with a paid up capital of \$40,000,000 and total assets \$136,000,000. In 1925 the number of banks was reduced to 11 with paid up capital and rest of \$241,636,360 and total assets of \$2,896,069,857. By July 31, 1928 total assets reached \$3,296,000,000. The maximum number of banks was 41 in 1886. Amalgamations and some failures account for the reduction. The direct loss to the public by bank failures has been slight.

While the number of banks has declined to 11 the establishment of branch offices, especially in Western Canada, has been extensive. At the beginning of the year 1929 there were in all 4,061 branch offices in existence, 3,800 of which were in Canada (one for every 2,500 inhabitants). Canadian banks also have branches in the United States, Great Britain, France, Spain, and all the principal commercial countries of Latin America.

The circulation of Dominion Government notes is mainly in large denominations, and held by the banks as cash reserve. In 1912 these notes were secured by gold to the extent of 82%.

But the exigencies of war finance induced temporary inflation and reduction of gold backing to 31% in 1921. It was 56% in 1925, and will be duly restored to a higher percentage.

The net debt of the Dominion in 1871 was about \$78,000,000, and in 1911 \$335,996,850; in 1920, \$2,248,862,624 and on March 31, 1924, \$2,417,783,275. By Mar. 31, 1928, it had been reduced to \$2,296,850,233. In 1911 the interest on the public debt was about \$13,000,000; by 1920 it had risen to \$138,824,782, reduced in 1924 to \$133,198,052. War pensions, the growth of population, increasing government activities, railway deficits and rising prices, all added to public expenditure, quite apart from the vast sums raised during the war (1914-18) for the maintenance of the army. The expenditure in 1911 on account of the consolidated fund was about \$80,000,000. In 1924 it was \$324,813,190. To this latter sum must be added various capital expenditures and railway deficits, which brought the total expenditure of 1924 to \$370,589,247. The national wealth of Canada in 1925 was estimated at \$25,673,174,000, with the provincial distribution as follows: Ontario, \$9,000,027,000; Quebec, \$6,288,284,000; Saskatchewan, \$2,870,314,000; Alberta, \$2,086,688,000; British Columbia, \$1,983,420,000; Manitoba, \$1,839,819,000; Nova Scotia, \$789,651,000; New Brunswick, \$643,528,000; Prince Edward Island, \$138,916,000; Yukon, \$31,827,000. The wealth per capita averaged \$2,772, being highest in Saskatchewan, British Columbia and Alberta. The national income of 1922 was estimated at some \$4,000,000,000. The amount of income assessed for income taxes in 1922 was \$1,463,000,000 and in 1924 it was \$1,108,000,000. This latter change reflects the fall in prices and the depression in trade that began in 1921.

The financial problem of the country was made more difficult by the burden of the vast railway system which had to be taken over by the Government soon after the War.

Customs duties were the largest source of revenue in 1928, furnishing \$156,985,818 of the \$422,717,983 receipts of the consolidated fund. Important special taxes were added to these during the war including the imposition of the income tax. In 1928 the income from these was \$150,319,088 which made them second only to the customs duties in importance.

Canada was still a considerable borrower abroad in 1925, and it is important to note that after 1914 the greater part of these borrowings were from the United States, instead of Great Britain which had supplied nearly all the foreign capital borrowed by Canada before 1914.

The following table shows the nature of the change in respect to the sale of Canadian securities:—

| Period    | In millions of dollars |               |               |       |
|-----------|------------------------|---------------|---------------|-------|
|           | Canada                 | Great Britain | United States | Total |
| 1905-09 . | 158 (21.7)             | 535 (73.5)    | 35 (4.8)      | 728   |
| 1910-14 . | 199 (15.2)             | 951 (72.7)    | 157 (12.1)    | 1,307 |
| 1915-19 . | 2,222 (71.6)           | 116 (3.7)     | 768 (24.7)    | 3,106 |
| 1920-24 . | 1,330 (57.4)           | 18 (0.8)      | 967 (41.8)    | 2,315 |

(A. J. GL.)

**Communications and Transport.**—Rapid increase in transport facilities has been accompanied by improved communications. In 1925 telegraph wire mileage totalled 284,121, of which the Canadian National Telegraph owned 110,806 and the Canadian Pacific 124,619. Canada has six transoceanic cables, five on the Atlantic and one on the Pacific. The telegraph has been rapidly extended with wireless and radio stations. In 1926 there was a total of 135,485 stations. In 1925, a total of 1,144,095 telephones was in use, or 12.2 per 100 of population with 3,020,773 m. of wire. Post office facilities have also increased rapidly. In 1925, 12,376 post offices were in operation with 3,784 rural mail routes and a total of 199,470 mail boxes. The postal revenue of the offices totalled \$32,160,904.

Canada is primarily a new country with a small population exporting such bulky raw materials as wheat, lumber, pulp and paper, and minerals to densely populated industrial countries. Cheap water transportation is fundamental. Canadian ports are seriously affected by climatic considerations. Montreal is closed

in the winter season and Halifax and St. John are too far distant from the interior to compete with United States Atlantic ports. Vancouver has benefited as an export centre for wheat by the opening of the Panama Canal. The export of wheat from the Prairie provinces intensifies the transport problem since it produces a peak load for Great Lakes shipping. The handling of great quantities of wheat during the rush season involves the use of specially constructed boats, "lakers," and of elaborate loading and unloading facilities at Port Arthur and Fort William, Port Colborne, Buffalo and the Georgian Bay ports. The Canadian Canal at Sault Ste. Marie has a depth of 19 feet and the American Canal 25 feet. The Welland canal is being deepened from 14 feet to 30 feet to permit lake vessels to continue to the foot of Lake Ontario. The deepening of the St. Lawrence waterways from 14 to 30 feet will permit ocean going boats to proceed to the head of the lakes. Since confederation in 1867 Canada has expended \$175,812,316 chiefly on canals facilitating Great Lakes traffic. Toll charges on canals were abandoned in 1903.

Railway facilities have also been improved in relation to the export of wheat from the prairie provinces. Especially since 1900 railways have been rapidly extended for the development of traffic in western Canada, and the marked increase in the export of wheat has led to the construction of new lines from Winnipeg to Fort William and Port Arthur and from Georgian Bay ports to Montreal as well as to the construction of a line from Winnipeg to Cochrane and Quebec. An additional outlet for trade of the Prairie provinces is expected in the completion of building a railway to Churchill on Hudson bay. The development of the mineral industry and of pulp and paper mills in the Precambrian territory of Canada has been followed by the construction of numerous lines in northern Ontario and in northern Quebec, including the Temiskaming and Northern Ontario Railway and the lines to the Saguenay country, and in northern Manitoba. As in the case of canals, railway construction has involved heavy expenditures on the part of the federal and of the provincial governments. Land grants up to 1925 of the federal government total 31,678,318 ac., and of provincial governments 15,508,719 ac., cash subsidies of the federal government \$176,364,480, of provincial governments \$35,850,123 and of municipalities \$15,347,628, railway bonds guaranteed by the federal government \$345,665,762, and by provincial governments \$138,899,057, and deficits of the Canadian government railways \$50,325,924. Capital expenditures on government railways to March 31, 1925, totalled \$495,956,177.

In 1927 the total capitalization of all Canadian railways was \$3,637,837,000; operating expenses amounted to \$407,646,000 and gross earnings to \$407,646,280.

Almost 90% of Canadian railway mileage (40,351 m.) is under the control of two systems, the Canadian National (20,747 m.) and the Canadian Pacific (13,667 m.). The Canadian Pacific was incorporated in 1881 and the company has built up a strong organization with low fixed charges and a large proportion of capital in the form of common stock on which it has latterly paid 10%. The Canadian National was the result of the amalgamation of several companies including the Canadian Northern, the Grand Trunk, the Grand Trunk Pacific and the National Transcontinental which found themselves in difficulties through dependence on government guaranteed bonds and the high costs of operation during the war. The post-war period has been characterized by a joining up of the various units and a rounding out of the organization as a system. Both lines have connections with American roads and in 1924 the Canadian Pacific owned 5,117 miles and the Canadian National 2,093 miles in the United States.

The financial position of these two important systems is closely dependent on railway rates. Rates are under the jurisdiction of the board of railway commissioners formed in 1903. It also regulates telephone, telegraph and express rates, and deals with problems of location, construction and operation of the railways. A general decision of the board assures the Canadian Pacific a return of 7% on its common stock, a standard which through competition seriously affects the rates and earnings of the Canadian National. In eastern Canada water competition has an important influence in lowering rates which have been increased in turn in the prairie

provinces. This discrimination is gradually diminishing with growing settlement and increasing political power of western Canada.

The transcontinental main lines with termini at the Canadian ports are supplied with traffic by numerous branch lines or feeders. In new territory further extension has been made with river steamboats, as on the Mackenzie and the Yukon and with the organization of air transport systems as in newly opened mining districts. Aircraft are used in new districts chiefly for passenger and mail service and in government work of surveying, mapping and the prevention of forest fires. In 1926, there were 44 licensed aircraft which carried a total personnel of 11,191; 724,721 lb. of freight or express and 3,960 lb. of mail. The two large railway companies have their own organization for handling of express traffic.

Transport facilities have been improved with the introduction of the automobile and the construction of roads. In 1926 Canada had 378,269 miles of road, of which 323,629 miles were earth, 47,177 miles gravel, 5,829 waterbound macadam, 574 bituminous macadam, 701 bituminous concrete, 360 cement concrete. The Canada Highways Act of 1919 provided for the expenditure of \$20,000,000. The provincial governments have also been engaged in the construction of additional roads on a large scale. Motor vehicles had increased from 2,130 in 1907 to 836,794 in 1926. Each province has its own system of regulations, and in 1925 \$17,508,351 were collected in taxes on motor vehicles. For short haul traffic in densely populated sections of Canada the motor vehicle has become a competitor of the railroads, but it has also been important in providing supplementary traffic for long distance railroad hauls.

Electric railways increased in mileage with the development of water power, growth of population and urban communities. In 1925 electric railway mileage totalled 1,737 m. and car mileage 119,684,151; passengers, 725,491,101; freight, 2,706,312 tons.

Improvement of inland transportation facilities has been responsible for a rapid growth of ocean shipping. In 1927 the total tonnage (of sea going vessels) entered and cleared at Canadian ports was 46,149,769. Of the total registered tonnage of vessels entered 8,541,124 were British, 3,914,473 Canadian and 8,014,782 foreign. Several steamship lines run between Canada and Great Britain and Europe on the Atlantic, and Canada and Asia and Australia on the Pacific. The Canadian Pacific operates an important subsidiary ocean steamship company and the Canadian National has a valuable ally in the Canadian Government Merchant Marine, which came into existence during the later years of the war. In 1925 this company had 49 vessels of a deadweight tonnage of 324,986 which made 235 voyages. Ports, lighting facilities and harbour equipment have been improved to handle the increased shipping.

(H. A. I.)

**Agriculture.**—The possible farm land in the dominion of Canada is estimated at 358 million acres, which is a quarter of the total land area. 39.3% was occupied in 1921, as compared with 17.7% in 1901. Saskatchewan and Alberta increased their farm acreage from 6½ to 73 million acres in this period. Most of the free land, suited to ordinary agriculture and within practicable distance of a railroad, has been alienated; and since 1918 the West has been engaged in settling more intensively land that has already been picked over. New settlement now usually involves the purchase of land: and estimates indicate that in 1922 there were in the prairie provinces some 20 million acres of land within 20 miles of a railway in private hands, but uncultivated. Only the southern part of the prairies is flat and treeless: and here only is lack of rainfall an urgent problem. The northern part is rolling park country, and the cultivable area runs north-west into the still undeveloped region of the Peace river and northern British Columbia. Canada, both east and west, is in the main a country of family farms and occupying ownership. In 1921 farms of 101–200 acres formed over 32% of all farms. In British Columbia, which is distinguished by the intensive cultivation of fruit and dairy products, farms of 11–50 acres predominate: in the older settled provinces of the East, dairying leads, followed by fruits and potatoes, and here the farm of 51–100 acres predominates. The larger farms, 201 acres and up, predominate in the prairies; and the expansion of the prairie provinces, 1901–21, is responsible for the increase in average

farm acreage for Canada as a whole. There is, however, no marked tendency to the very large farm, though the technical conditions in the prairies clearly favour large-scale operation—flat land being suited to tractor cultivation. Hitherto such farms have been beaten by the labour problem. In 1921, 85.4% of the farm area of Canada was occupied by its owners, as compared with 90.7% in 1901. Renting is still a *pis-aller* or a stepping-stone to ownership; and the small decrease in occupying ownership, 1901–1921, is due entirely to the prairie provinces, where some farms are rented on a share basis by tenants who hope one day to buy.

Farm property rose in value (1901–1921) 268%, and in 1921 this value was distributed thus:—land, 56; buildings, 21; implements and machinery, 10; livestock, 13;=100. With the opening of the West, the relative importance of the East has decreased. In 1901 Ontario and Quebec had 75% of all farm property; in 1921 only 43%. Ontario leads, as a province, in value of buildings (36% of the total) and of livestock (28% of the total). Canada in 1920 produced \$1½ billions of agricultural produce, excluding the product of the farm wood-lot and the hot-house. Of this total Ontario and Quebec produced \$745 millions; the three Prairie Provinces \$620 millions. The main cash product of the East is milk, and the favourite cow of Ontario is the Holstein, a heavy yielder of milk, which thrives on the rich ensilage crops fed to it in the stall. The West since 1918 has made rapid strides in dairying and other branches of mixed farming, but as a cash product wheat is still *facile princeps*. The value of the wheat crop (average 1919–23) was \$356 millions, and nearly all of it is spring wheat grown in the West. Though Canada produces only about 10% of the world's wheat crop, yet she exports ⅔ of her crop and this normally forms about 30% of the wheat and wheat flour entering the circle of international trade. The leading spring wheat is Marquis, discovered by Dr. Charles E. Saunders, the dominion cerealist, in 1904, introduced into Western Canada in 1907, and since 1909 the leading spring wheat of North America. Since 1925 a new wheat, Garnett, selected by Dr. Saunders, has been introduced. It is a cross from Marquis and has the advantage, for northern regions liable to early frost, of maturing 6 to 10 days earlier. Agricultural research in Canada is shared between the dominion, which maintains experimental farms and field stations in every province, and the provinces, each of which has in its provincial university an agricultural department devoted to the science and economics of agriculture. Manitoba's special enemy is wheat rust; and intensive research is now being devoted to the production of a rust-resistant wheat which is not defective in other qualities. The rust spores use the barberry plant as a winter host, but since they are carried by the wind from points hundreds of miles away, the local destruction of this plant is not sufficient.

Four features of outstanding economic importance, 1922–27, are:

(1) The growth of the pool method of marketing wheat by co-operatively organized farmers. Alberta led the way in 1923. Each of the prairie provinces has its own pool for organization, payment of returns, and the elevator business, but sales are operated through the Canadian Co-operative Wheat Producers, Ltd., central sales office, Winnipeg. In the crop season, 1926–27, the Central Selling Agency handled 53.6% of the inspected wheat crop of the West. Sales in the domestic market were 80 million bushels, abroad 124 million. The average pool price of No. 1 Northern was, 1923—\$1.01; 1924—\$1.66; 1925—\$1.45; 1926—\$1.42. The success of the wheat pool has reacted favourably on other forms of agricultural co-operation.

(2) The growth of grain shipment from the port of Vancouver, which has the advantage of being open the whole year round. The export of wheat from Vancouver rose from 1½ million bushels in 1920–21 to 52 million bushels in 1925–26. The movement through Vancouver depends (a) upon the total size of the Canadian crop, and (b) the relative size of the crop of Alberta, the province nearest to Vancouver. There was a phenomenal wheat crop in Alberta in 1927 (179 million bushels, compared with 113 million in 1926: and averaging 28.6 bushels per acre).

(3) The completion and stabilization of the scheme of soldier settlement, instituted towards the close of the World War and operated by the Soldier Settlement board (Ottawa), with a dominion-wide service of field-supervision. Gross loans in force, Dec. 1926, totalled \$108 millions: 31,000 returned soldiers having been assisted up to this date. For 1926, 89% of soldier settlers made payments in whole or part. Of 24,400 farms on which loans had been granted 7,600 had come back to the board through failures. The board is entrusted with the administration of the British family settlement scheme, under which by March 31, 1927, 2,630 families, numbering 14,529 persons, had come forward.

(4) The growth of the tobacco industry in Eastern Canada, and especially in Western Ontario, under the stimulus of the 25% British preferential rate. Total exports of tobacco, 1922—\$4 millions: 1927—\$2½ millions. Tobacco is more profitable than corn (maize) as a cash crop, and relieves the grower from the loss incurred by the ravages of the corn borer. Over 50% of Ontario tobacco is of the Burley variety, while in Quebec a corresponding percentage is cigar tobacco. There is need for improvement in quality and grading, in view of the competition which the Canadian export must meet from South Africa, in particular in the British market. (C. R. F.)

**Minerals and Mining.**—Most of the economic minerals occur in Canada, as might be expected from its great area and varied geology, and more than 40 products were reported in 1926 by the Dominion Bureau of Statistics; but only the more important need be referred to. Coal comes first in value, but is confined to the eastern and western provinces, Quebec, Ontario and Manitoba lacking fossil fuels. Nova Scotia produces bituminous coal of Carboniferous age, more than half of which is mined beneath the sea. Coke made from it and hematite, also mined beneath the sea in Newfoundland, make the basis of the important steel industry of Sydney. Alberta produces nearly as much coal, but of Cretaceous age and largely lignitic, though the quality improves towards the mountains. British Columbia mines less than half as much as Alberta, most of it Cretaceous, but some of it making excellent coke for the smelters.

Gold comes first in value among metals and has been obtained in part from placer mines in British Columbia and Yukon Territory (\$22,275,000 in 1900); but at present comes mainly from lode mines. The Porcupine and Kirkland Lake districts in northern Ontario are the greatest producers, the Hollinger mine in the former region being one of the foremost gold mines of the world. Northern Ontario produced gold to the value of \$30,950,180, in 1926. The silver mines of Cobalt, at one time the richest in the world, are becoming exhausted, so that British Columbia now leads in silver, which is obtained from ores containing other metals. Copper is mined in large amounts in British Columbia, usually associated with some gold and silver, and occasionally with lead and zinc in complex ores requiring elaborate plants for separating and smelting them. 90% of the nickel of the world comes from the Sudbury district in Ontario, where it is associated with copper ore.

**Metalliferous Regions.**—The metals mined in Canada come mainly from two widely separated regions, the first being the Coast and Gold ranges of the Pacific coast, where batholithic intrusions have acted upon sedimentary rocks during mountain building in Jurassic times; and the second the Pre-cambrian area of Ontario, where Algonian granite has invaded very ancient volcanic and sedimentary rocks. Similar rocks are widely distributed through the Canadian Shield and extend into Quebec on the east and Manitoba and Saskatchewan to the north-west. Great deposits of copper ores are being opened up on the Rouyn region of Quebec and the Flinflon region of Manitoba; and gold, as well as lead and zinc ores, occur also on a large scale. The Cordilleran and Archaean regions of Canada have been comparatively little explored and there is reason to believe that many other ore deposits will be found in the future. Asbestos is obtained from Serpentine areas in the Eastern Townships of Quebec, which provide most of the world's supply. (A. P. Co.)

**Mineral Production.**—The following statistics include min-

eral products having a value of over \$10,000,000, the smaller items being lumped together:

|                          |            |               |
|--------------------------|------------|---------------|
| Coal—tons . . . . .      | 16,457,484 | \$ 59,797,181 |
| Gold—oz. . . . .         | 1,748,364  | 36,141,891    |
| Silver—oz. . . . .       | 22,435,531 | 13,934,935    |
| Nickel—tons . . . . .    | 31,357     | 14,374,163    |
| Copper—tons . . . . .    | 66,172     | 17,386,867    |
| Lead—tons . . . . .      | 142,060    | 19,262,242    |
| Zinc—tons . . . . .      | 80,948     | 11,996,601    |
| Asbestos—tons . . . . .  | 279,389    | 10,095,487    |
| Other products . . . . . | ..         | 59,157,431    |
| Total . . . . .          | ..         | \$241,245,898 |

Details in regard to the mining area will be found in the accounts of the different provinces. Of recent years there has been a rapid growth in the mining industry and there is reason to believe that there will be great expansion in the future.

The literature on the geography of Canada is very scattered, but general accounts may be found in *The Oxford Survey of the British Empire*, vol. iv., and the *Handbook of Canada*, University of Toronto Press, 1924. The reports and other publications of the Geological Survey, Mines Branch, Topographic Survey, and Dominion Bureau of Statistics, etc., Ottawa, may be consulted for details.

**Forest Industries.**—The total forested area of Canada is approximately 1.2 million square miles. Only 40% of this vast area at the present time, however, contains merchantable timber, a condition chiefly due to widespread and recurring forest fires. The ownership of more than 90% of the forests lies with the Crown and they are administered for the people by the dominion and provincial Governments. Only the right to cut the timber is sold and it is sold by sealed tender to the highest bidder at so much per cord, in the case of pulpwood, or per 1,000 board feet of saw logs, or sometimes a lump sum is paid. In addition to the original purchase price, the operator is usually required to pay a tax when the timber is cut varying in amount according to the kind, the quality and the distance from markets. To this may be added a small annual tax for the use of the land and a fire protection tax.

The average annual cut of wood material for all purposes for the past five years period was 2.5 billion cubic feet. The proportions put to various uses were approximately as follows:

|  | Per cent. |
|--|-----------|
| Fuel-wood . . . . .  | 35        |
| Lumber, lath and shingles . . . . .                          | 32        |
| Pulpwood . . . . .   | 21        |
| Railway ties . . . . .                                       | 7         |
| Posts, poles, mining props; logs and square timber . . . . . | 5         |

Although it does not attract much attention, the humble woodlot leads in volume of wood produced. Pulpwood stands third in rank of production but in value of its products, it far surpasses all others. The total value of all forest products in 1925 was 470 million dollars. The forest products are surpassed only by the agricultural products as creators of wealth and the ratio of values is 1 to 4. Much the greater portion of both the sawn lumber and the pulp and paper products is exported, chiefly to the United States. The export of the forest products on a valuation basis constitutes one-quarter of the total export trade.

In 1925, the date of the latest official figures from the Bureau of Statistics, the capital invested in the forest industries was 660 million dollars—around 200 millions in the saw milling and 460 million dollars in the pulp and paper industry. The two industries distributed 100 million dollars in wages to 100,000 employees in the forest and in the mills. The forest industries supply close to one-fifth the total tonnage hauled by the railways.

Pulpwood is manufactured into wood pulp and paper. Wood pulp is only a stage in paper manufacture, but a mill may not carry the process to completion and a mill may not manufacture the pulp from which its paper is made. In 1926 there were 44 mills manufacturing pulp only, 35 mills making paper only and 36 mills producing both pulp and paper; 114 in all. Quebec had the largest number of mills, 50; Ontario 45, Nova Scotia 8, British Columbia 6 and New Brunswick 5. Quebec led Ontario

in capital invested and the value of both pulp and paper products, but Ontario manufactured a larger percentage of its pulp into paper. Of the paper manufactured in Canada over 80% is newsprint and over 91% of the newsprint is exported, chiefly to the United States.

At least two very important trends have manifested themselves in the forest industries in the past decade or two, the one, the shifting of the centre of the sawmilling production to British Columbia and the other the phenomenal development of the pulp and paper industry in eastern Canada. Close to one-half of the sawn lumber comes from British Columbia and will doubtless continue to do so for some time as that province contains 70% of all the standing saw-log material in the dominion. Twenty years ago there were 50 mills in Canada manufacturing pulp and paper; in 1925 the number was 114. The value of the pulp and paper products has risen in the past decade from 85 million dollars to 193 million dollars, an increase of 227%. In 1926 and 1927 Canada surpassed the United States in the amount of newsprint manufactured which means that she now manufactures more newsprint than any other country in the world. (C. D. H.)

**Fur Farms.**—Since the beginning of the century prices of the more valuable furs have increased with great rapidity as a result of a decrease in supply and an increase in demand. This has been the cause of numerous regulations on the part of the provinces and the Dominion, leading to the conservation of fur-bearing animals. Fur-farming, especially with silver and black fox in Prince Edward island, has become an important industry since 1910. During the World War the European market was shut off and North America developed its own marketing system. In Canada auction sales are held at Montreal, Winnipeg, Edmonton and Vancouver. Manufacturing of fur goods also received an impetus from the war. The conservation of fur-bearing animals has been accompanied by increased interest in the conservation of wild life in general.

**Fishing** is Canada's oldest industry, but its importance on the Atlantic coast, in the inland lakes and on the Pacific coast has increased materially in the past half century. On the Atlantic the cod fishery has always been the most important although it has been exceeded in value by the lobster fishery in recent years. Salmon on the Pacific coast has been responsible for the leadership of British Columbia in Canadian fishing. Halibut is important on both the Atlantic and the Pacific. On the Atlantic the deep sea fishery and the inshore fishery have expanded rapidly through the growing use of steam trawlers and motor-boats. The improvement in fishing technique has led to the depletion of the fishery especially of fish which spawn in the rivers as in the salmon of British Columbia. Depletion of the inland fisheries has also been pronounced, as in the white fish. Measures to offset the decline include closed seasons, regulation of fishing operations, prohibition of obstructions in streams and the establishment of hatcheries and stations for biological research. The effectiveness of these measures depends to a large extent on the co-operation of the government of the United States, as in the treaty of March 2, 1923, "For the Protection of the Pacific Halibut." The fishing rights of the United States in Canadian waters have involved a long series of disputes and treaties. The Canadian government pays a direct bounty to fishermen, the amount paid in 1925 being \$159,992. In 1925 the total value of the Canadian fisheries was \$47,942,131; the capital employed (a) primary operations \$25,732,645, (b) canning and curing \$21,139,985; number of employees (a) primary operations 58,169, (b) canning and curing 16,272; the total wages \$4,971,167; value of exports \$33,967,009, of which \$6,709,951 was sent to Great Britain and \$13,912,139 to the United States.

**Manufactures and Water Power.**—As a manufacturing nation Canada is steadily coming into more prominence. Among the states of the British empire her output of manufactured goods is second only to that of Britain and the major portion of her exports to other dominions consists of such commodities. Canadian manufactures have largely grown out of and are complementary to the agricultural and extractive industries of the country. They depend mainly upon domestic farm materials or

upon the products of the forest and the mine. Judged by the net value of products those which finish materials of farm origin lead with nearly 31% of the total manufactures of Canada, followed closely by the mineral origin group with 28% and forest origin with 24%. In the number of employees engaged the groups follow the same order, but in the total salaries and wages paid and the amount of capital invested the mineral origin group stands highest.

According to the last available census, that of 1925, the ten leading manufactures judged by value of products were:

|                                 | Value of Products |
|---------------------------------|-------------------|
| Pulp and paper                  | \$193,092,937     |
| Flour and Grist-mill Products   | 187,944,731       |
| Slaughtering and meat-packing   | 163,816,870       |
| Saw-mills                       | 134,413,845       |
| Butter and cheese               | 124,828,754       |
| Automobiles                     | 110,835,380       |
| Electric light and power        | 102,587,882       |
| Rubber goods including footwear | 78,229,574        |
| Cotton yarn and cloth           | 72,781,517        |
| Sugar refineries                | 68,445,879        |

While the chief industries are directly dependent upon native resources, four virile industries, manufacture of automobiles, cotton goods, sugar and rubber goods, utilize materials largely imported in a raw or semi-finished state.

Since 1879 the state has sought to promote manufacturing by protective tariffs and in some cases by bounties and subsidies. At intervals the municipalities have also assisted manufacturers by exempting them from taxation or by granting loans and bonuses, a practice at one time very common in Ontario. The Canadian protective tariff has never been high. The average *ad valorem* rate of duty reached its peak in 1889, when the rate was 31.9%. In 1926 it was 24.7%. Its precise stimulus is difficult to determine, because of the mass of influences on the growth of industry and the impossibility of isolating the effect of each. In the 20th century, tariff or no tariff, Canada's manufactures grew rapidly due to the opening of the West, the extension of railways, the growth of population, the development of mineral and forest resources, and the discovery of vast power in the country's extensive waters. Utilization of water power has become a vital fact in her industrial life.

The dominion has about 18½ million horse-power at ordinary minimum stream flow, rising to over 32 millions for at least six months of the year. The central provinces without indigenous coal supplies have steadily endeavoured to utilize this power for manufacturing, although up to the present less than 11% of the recorded water power resources have been harnessed. Compared with other countries, Canada stands second to the United States in turbine horse-power installation, and second to Norway in horse-power installation per 1,000 of population. On a *per capita* basis it has nearly five times the installation of the United States. It is estimated that the energy and heat produced by the developed water-powers is about equal to that of the coal consumed in Canada for all purposes. The industry which has benefited most is woodpulp and paper. Since the beginning of the 20th century, it has grown phenomenally due to the country's great timber resources, an ever widening market for newsprint, and the cheap power obtained from Canada's many waterfalls.

Manufactures are not evenly distributed throughout the dominion. About 80% are concentrated in the provinces of Ontario and Quebec. Ontario alone contributes over 50% of the net manufacturing output of the country. Such concentration is due to the nearness of the older provinces to water and mineral resources, proximity to the coal fields and the industrial belt of the United States, and the possession from early times of large populations. An important effect of the regional massing of manufactures is an acute conflict of political interests between the eastern and western provinces.

**Trade and Commerce.**—Canada is one of the great trading nations of the world. At the end of the first quarter of the 20th century, she held sixth place in the aggregate volume of trade, being excelled by Great Britain, the United States, Germany, France and British India. Since 1925 her trade statistics have

vigorously grown and show every prospect of continuing to do so. In export trade *per capita*, she stood second in 1925 among the principal exporting countries, as compared with seventh in 1913. With reference to imports *per capita*, Canada occupied fifth place in 1913 and eighth place in 1925. The continent which receives the largest portion of her exports, nearly 50%, is Europe, while over 65% of her imports are obtained from the United States and other North American countries. The dominant fact of Canada's trade is her transactions with the United States and Great Britain. Something over 80% of her imports are obtained from these two nations and to them she sends 70% of her exports. Other countries with whom she has considerable dealings are Japan, France, Germany, Australia and China. Her principal exports are wheat, paper, wheat flour, planks and boards, wood pulp, meats, fish, automobiles, cheese, raw gold, oats, refined sugar, cattle, copper ore, nickel and silver. Wheat has long been the leading exported commodity, and will likely remain so for a lengthy period in the future. In 1926 it represented 27.7% of the value of the total exports, and wheat flour represented 5.3%.

While Canada continues to export large quantities of raw products, there is an increasing proportion of native products exported in manufactured or semi-manufactured form, an expressive result of the country's industrial progress. Another indication of such progress is that the percentage of raw materials imported has steadily risen since 1900. In the latter year raw materials represented 24.9% of total imports. In 1925 they had climbed to 27.7%, while manufactured articles dropped from 40.2% in 1900 to 32.5% in 1925. Twelve of the principal imports, arranged according to their value in 1926, are: coal, sugar, woollen goods, machinery, raw rubber, cotton goods, crude petroleum, raw cotton, fruits, alcoholic beverages, automobile parts and iron and steel plates and sheets. Machinery and iron and steel products hold a prominent position in the list of imports due to the constant demand in the extractive industries and the inability of domestic plants to meet it. The dominion has large deposits of iron ore, but with few exceptions they have not been developed commercially, and ore is imported from the Wabana mines in Newfoundland and from the United States.

In the years from confederation to 1926, exports have exceeded imports on 15 occasions, while imports have exceeded exports on 44 occasions, but throughout the period as a whole there has been an excess of exports over imports. The "unfavourable" balances occurred in years of heavy capital imports, as notably in 1903-13. The "favourable" balances represented Canada's successful meeting of foreign obligations.

The federal government has done much to promote foreign trade, and particularly to assist the Canadian exporter to procure markets abroad. The Department of Trade and Commerce established the Commercial Intelligence Service, and a leading part of its programme is the appointment of commercial agents and commissioners to report upon the demand in foreign countries for such commodities as Canada is in a position to supply. A *Commercial Intelligence Journal* is published weekly, and distributed among firms engaged in export trade. The government also endeavours to encourage trade by the negotiation of commercial treaties with foreign states. Boards of trade and chambers of commerce in cities and towns play an important rôle in investigating the possibilities of distant markets, and the nation-wide Canadian Manufacturers' Association interests itself in the same end. The leading Canadian banks by establishing branches abroad have similarly done much to promote external trade. (A. Br.)

**Education.**—For details of Education in Canada see the section on this subject in the article *British Empire*.

## ANTHROPOLOGY

Anthropologically as geographically, Canada must be considered as an integral part of the North American continent. The boundaries between the Dominion and the United States, Alaska and Newfoundland do not conform to ethnic divisions among the aborigines. The culture of the Canadian natives does not differ markedly from that of their neighbours.

The first explorers found the country inhabited by people of

brown complexions, lank hair and primitive mode of life to whom the term "Indian" was applied. In later years the same designation was given to the various tribes encountered by adventurers, French and English, as they penetrated westward across the continent. In the north, however, the hunters dwelling on the shores of the Arctic were so different both in appearance and culture that the term "Indian" was inapplicable, and "Eskimo" was used instead.

Certain important physical characteristics are common to all Canadian Indians. The colour of the skin is dark brown—"red" is a misnomer and "yellow" an exaggeration; the black hair is leiotrichous (smooth); the zygomae (cheekbones) are prominent; the face is broad in comparison with the breadth of the head; the nose is usually well developed, though not flattened; the incisors are often concave, and the frontal portion of the skull is somewhat ill-filled. But it must be emphasized that there is no absolute uniformity of type. On the coast of British Columbia the natives are characterized by relatively short stature, heavy build, with round heads, broad faces and a certain amount of facial hair. On the Plains the stature is greater, the body more lithe and graceful, facial hair limited to an occasional sparse moustache, and the head form ranges from medium to low broad types. The Eastern type generally resembles that of the Plains, although several tribes have longer heads, and a few prehistoric dolichocephalic skulls have been found.

The Indians of Canada belong to one racial stock, related to the Mongoloid branch of mankind. An unmixed race does not exist in North America, and the physical differences in America suggest that the migrations from Asia came in successive waves, comprising non-homogeneous Mongoloid groups. Furthermore, environmental factors have probably produced considerable variation within America itself.

It is difficult to estimate the antiquity of man's settlement in America. Goddard (*American Anthropologist*, vol. xxix., 1927, p. 262) has recently summarized the evidence for human existence during interglacial periods, but Hrdlička and other students hold that the continent was uninhabited until post-glacial times. It is probable that the ancestors of the Indians came by the north-western route across Bering strait. Even at the present time the passage occasionally freezes so solidly that it is possible to walk from Asia to America, while the Diomedé islands offer convenient stepping-stones for sea voyagers. The earliest immigrants were probably long-headed or dolichocephalic (possibly akin to the Palaeo-Amerinds of Haddon); the length of the skull among some of the Iroquoian and Algonquian peoples of Ontario may be either a survival of this characteristic or a mere deviation from the later and now predominant round-headed type. Norsemen undoubtedly reached the eastern coast, but have left no impress on the physique of the people. Other maritime adventurers had little effect upon Canada.

The Eskimo (*q.v.*), who inhabit the shore of the Arctic from north-west Siberia to Greenland, present an appearance very different from that of the Indians. Their hair is equally straight, but the skin colour lacks the warm brown of their southern neighbours. The large, long head is high, somewhat keel-shaped in general form; the nose is narrow and inconspicuous, which, combined with prominent cheek-bones and unusually broad face, gives a frontal appearance of flatness; the eyes are black with the epicanthic fold frequent; the hands and feet are even smaller than those of the Indians, and the stature usually less. These characteristics are most obvious in the Hudson Bay region; towards Alaska mixture appears to have taken place and the head is broader. The smooth hair and broad cheek-bones, however, indicate membership in the same general Mongoloid race, of which they may be regarded as a highly specialized offshoot. Sollas (*Journal of the Royal Anthropological Institute*, vol. lvii., 1927, p. 89) contends that they resemble the Chancelade type of Magdalenian Europe. At that period conditions in France resembled those under which the Eskimo now live, and it has been suggested that their ancestors slowly followed the retreat of the ice, later spreading along the shores of the Arctic, either by way of Asia or Greenland.

The presence of a large number of closely related and intermediate types prevents a rigid and satisfactory classification of the Indians by physical means alone, so other criteria must be employed. Linguistically, the tribes of Canada and Newfoundland can be divided into the following stocks:—

(1) **Beothukan**.—Little is known concerning the speech of the extinct Beothuk of Newfoundland, but limited vocabularies indicate that it was unrelated to any other known language.

(2) **Algonquian** (Algonkin, *q.v.*).—Tribes speaking Algonquian languages formerly roved over vast areas in eastern and central Canada. Early explorers encountered the Micmac in Nova Scotia and Prince Edward island, and the Malecite and Abnaki<sup>1</sup> in New Brunswick, whose descendants are still to be found in those provinces. North of the St. Lawrence, in the wilderness of northern Quebec and Labrador live the Montagnais and the Nascapée, hunters who still roam in small bands. Across the northern woodlands between James bay and the prairies are various Cree tribes, some of which have spread even to the slopes of the Rocky mountains. The Blackfoot of southern Alberta, Algonquian in speech, are a typical Plains tribe. Western Ontario, especially the region north of Lake Superior, is the home of the Chippewa or Ojibway, one of the most populous Canadian tribes, split into many sub-divisions dependent upon dialectical differences and geographical considerations. Eastward in central Ontario and Quebec, live, or lived, the Nipissing, the Temiskaming, the Ottawa, the Algonquin proper, the Mississauga, the Têtes de Boule and a host of minor groups. The fluidity of tribal organization, with consequent splitting-off of smaller bands, makes an enumeration of any but the more important groups impossible.

(3) **Iroquoian**.—When first encountered, the Five Nations of the Iroquois were resident south of the international boundary, but several tribes speaking languages belonging to the same stock were resident in southern Ontario. The Neutrals occupied much of the Niagara peninsula and the north shore of Lake Erie; the Hurons dwelt near Lake Simcoe; the Tobacco Nation were their western neighbours nearer Lake Huron. A vocabulary collected by Cartier in 1535 shows that Iroquoian peoples were then living in the St. Lawrence valley; these may later have amalgamated with the Hurons.

(4) **Siouan**.—This important linguistic stock is represented in Canada by the Assiniboin of Saskatchewan and Alberta, an offshoot of the Yankton Sioux who have moved north of the international boundary within recent years.

(5) **Kutenai**.—The Upper and Lower Kutenai inhabit the mountain valleys of south-eastern British Columbia and northern Idaho. Their two dialects comprise a distinct stock.

(6) **Salishan**.—The Salish-speaking peoples comprise two main divisions, distinctive on both dialectical and geographical grounds. The interior group consists of the Shuswap, Okanagan, Thompson and Lillooet, resident in the valleys of the Fraser and the Thompson rivers in southern British Columbia. On the coast, the Salish extend from the international boundary to Cape Mudge, with an isolated enclave, the Bella Coola, on South Bentinck Arm; several tribes of the same stock inhabit south-eastern Vancouver island.

(7) **Wakashan**.—The Nootka, whose villages formerly extended along the western shore of Vancouver island, and the Kwakiutl of the north end of the island belong to this stock. Similar languages are spoken on the mainland north to Douglas channel.

(8) **Tsimshian**.—The Tsimshian tribes, formerly of considerable importance, live on the Nass and Skeena rivers in northern British Columbia. Their dialects differ fundamentally from those of the stocks already cited.

(9) **Haida**.—This language is limited to the people of the Queen Charlotte islands and part of the Alaskan mainland.

(10) **Athabaskan** (*q.v.*).—Athabaskan-speaking bands—their political organization is too intangible to warrant the name of tribe—roved over the vast regions of the Yukon and Mackenzie

<sup>1</sup>In this article the spelling follows that adopted in *Handbook of American Indians* (Bulletin 30, Bureau of American Ethnology, Washington, 1906).

basin, eastward towards Hudson bay, generally north of the Algonquians. Southward they extend into the interior of British Columbia, coming in contact with the coastal tribes on the west and the interior Salish on the south. Other Athabaskan groups, widely separated from their northern kinsmen, are found in Arizona, New Mexico and Mexico, while on the Canadian Plains the Sarsi are confined to a reserve near Calgary.

(11) **Eskimo.**—The Eskimo language, comprising several dialects, is spoken along the Arctic coast from Siberia to Greenland. Scattered settlements dot the whole shore of the Canadian Arctic, with the exception of the southern part of Hudson bay, and extend down the Labrador coast almost to Belle Isle.

**Religion.**—The Indians of Canada differ markedly in culture, in physical characteristics and in language, but certain elements prevail throughout, such as the importance of religious beliefs and practices. The forms in which non-human powers are conceived differ enormously, but the thoughts and actions of the natives are universally influenced by the conviction that supernatural beings are close at hand, ready to assist or to harm the individual, and that their help must be obtained for success in any venture. Throughout wide areas in the east and on the Plains, religious beliefs centre around the concept of a personal guardian spirit, usually obtained at adolescence by prayer and fasting. Among almost all tribes, respect is shown to shamans, "medicine-men" or "witch-doctors," individuals who have achieved miraculous powers which can be used either benevolently or malevolently. The rich mythology of the Indians abounds in references to superhuman incidents of all kinds. Although some tales are regarded as fiction, many are believed to be chronicles of events that took place in the distant past, and serve as constant reminders of the reputed existence of strange creatures endowed with tremendous power.

The Indians are undoubtedly proud, and their reaction to the attitude of superiority assumed by the white man is to withdraw into a shell of grave and dignified reserve which has been misinterpreted as taciturnity. Among themselves, the natives are as fond of laughter and joking as any other people. Their behaviour in times of joy, sorrow, fear, excitement or periods of stress is far from one of indifference, although pride leads them to conceal their emotions. The Iroquoian peoples and the Plains tribes respect martial achievement and fortitude in pain, but oratorical ability, skill in hunting, athletic prowess, wealth (on the Pacific coast), wisdom, religious power and other characteristics are also esteemed. Individuals vary, but their fundamental psychology is not radically different from that of white people, although the medium in which it is expressed—their culture—appears so strange to the European that the underlying qualities are usually misunderstood.

In material culture the wheel was unknown; the use of metals was limited to the beating out of unrefined copper; the dog was the only domesticated animal; and, north of Mexico, there was no system of writing. Stone was universally used for tools, frequently ground or polished to a smooth surface. Work in wood, bone, shell and ivory varied from area to area, dependent largely on local conditions.

#### ZONAL INFLUENCES

Climate, flora, fauna and geographical considerations have profoundly affected the life of the aboriginal Canadians. The culture of tribes living within given zones tends to conform to a type, irrespective of linguistic or physical classifications. On this basis the following areas can be distinguished:—

(1) **The Arctic Belt.**—The Eskimo (*q.v.*) of the Arctic islands and littoral differ from the Indians as markedly in culture as in physical characteristics or language. The keynote of their existence is dependence upon sea animals. Wild-fowl, rabbits, bear and caribou are hunted during the brief summers, but seals and whales are more important than any of these. The flesh is eaten, and the grease serves as fuel for the indispensable stone lamp used for heating and cooking during the winter. Wood is extremely scarce, but the Eskimo are skilful workers in bone, ivory and, to a lesser extent, stone. Their chief weapons are lances and

harpoons, the latter fitted with detachable head and fore-shaft. The bow is composite, made of bone and drift-wood, elasticity being obtained by thong lashings. Similar ingenuity is shown in other Eskimo manufactures. Stone and, in the Coronation Gulf area, copper tools are set in bone handles; the bow-drill is used for perforating hard objects; well-tailored fur clothing is made; toys and toggles are carved of walrus ivory, and the vaulted snow house is a unique architectural achievement. The hunter's canoe is also distinctive, consisting, as it does, of a bone or a wooden framework over which a waterproof skin cover is stretched.

Eskimo political organization is limited to the simple band, comprising a number of related families. Such a group wanders over a vaguely defined area, returning year after year to the same camping-grounds following the movements of game. The leader is the most skilful hunter, but he is entirely without authority, and hereditary chiefs with executive or judicial power are unknown. Shamans have much influence, especially with regard to the enforcement of multitudinous hunting taboos, but there are few communal religious rites.

(2) **The Eastern Forest Area.**—Under this general heading may be considered Newfoundland (politically not included in the Dominion), the maritime provinces, most of Quebec and the interior of the Labrador peninsula. The present inhabitants are Algonquians, although Newfoundland was formerly the home of the extinct Beothuk (*q.v.*).

The north-eastern Algonquians in Quebec and Labrador, are the Montagnais (*q.v.*) and the Nascapies.

(3) **The Central Forest Area.**—This vast region, comprising all of Ontario with western Quebec and eastern Manitoba, can be divided into a northern and a southern sub-area, the latter being limited to the southern part of Ontario. The northern forests were inhabited, during the period of European exploration, by loosely organized Algonquians, subsisting upon deer and smaller animals, eked out with berries and nuts. Bark is still extensively used for utensils and shelters, and it was in the bark canoes of these woodland hunters that French-Canadian *voyageurs* penetrated to the Plains. The most important Algonquian "tribe," the Chippewa (*q.v.*), live north and west of Lake Superior. Lacking central authority, they are divided into a number of local groups, each with a vague council, electing a "chief" with nebulous authority. Socially, they are divided into exogamic, patrilineal clans. Socio-religious rites are unimportant, except ceremonies connected with the Midéwiwin, a secret society, the members of which claim tremendous religious powers.

The culture of the Iroquoian-speaking (*see* IROQUOIS) tribes of southern Ontario, the Hurons (*q.v.*), the Neutrals and the Tobacco Nation differed fundamentally from that of the Algonquians. Large crops of corn, beans, squashes and sun-flowers provided reliable food stocks and made possible the erection of villages which were moved only when the fields became exhausted. Communal houses were built; wood and bark were used for utensils, as was also rough pottery to some extent.

(4) **The Plains Area.**—Although the prairies of Manitoba, Saskatchewan and Alberta are inhabited by tribes of three distinct linguistic stocks, there is a general cultural uniformity. In the east the Plains Cree and the Plains Chippewa have many characteristics which are more highly developed among the Athabaskan Sarsi, the Siouan Assiniboin and the Algonquian Blackfoot and Atsina. The centre of life was the bison. The flesh was eaten in tremendous quantities, either fresh or dried and pounded as pemmican; the skins provided clothing and covering for the movable tent; the bones were used for arrow-points and scrapers, and the dung served as fuel. The dressing of bison, elk and deer skins reached a high development, and raw-hide receptacles were used for storage vessels, basketry and pottery being unknown on the central Plains. The bow and arrow, lance, club and shield were more important than household utensils.

Chiefs, elective or hereditary, formerly exercised great authority, but martial achievement often enabled a man to attain a superior position. Male societies still flourish, their members exercising functions of a war-like, political, economic and social nature.

Success in life was usually attributed to the aid of a guardian-spirit, acquired at adolescence. The collection of certain symbolic objects was sometimes recommended in a dream or vision, and these, carefully preserved, often for generations, served as tangible articles of religious veneration. Intangible prerogatives are frequently closely associated with them. Socio-religious rites are extremely important on the Plains, the scattered divisions of a tribe assembling annually for the performance of elaborate symbolic celebrations, of which the Sun Dance is the best known.

(5) **The Mackenzie Area.**—Those parts of Canada inhabited by Athapaskan-speaking peoples, the Déné so-called, form a single culture area, with two sections, (1) the Mackenzie valley and the barren country inland from the shores of the Arctic and Hudson bay, stretching south to the Plains and west almost to the Pacific; the home of the Hares, the Dog-Ribs, the Caribou-Eaters, the Yellow-Knives—so-called owing to their copper tools—the Slaves, the Chipewyan and the Beaver; and (2) the upland plateau of British Columbia, west of the Rocky mountains, inhabited by the Nahane, the Sekani, the Carrier and the Tsilkotin (Chilcotin). The Athapaskan (*q.v.*) peoples extend even beyond this range.

The staple food supply of this area is the caribou; deer, rabbits, wild-fowl, fish and berries are eaten when obtainable, but, especially in the north, the roving hunting bands depend on the caribou. The toboggan simplifies transportation in winter, the canoe and the dog-drawn travois in summer; but life is hard at the best of times. Material culture is scanty; pottery is unknown; bark vessels are used for cooking; baskets are plaited of spruce-roots; clothing was formerly of skins; and one of the few distinctive traits of culture is the double lean-to. The Athapascans are unusually receptive to foreign influence, and have assimilated many elements from south and west.

The political organization of the eastern Athapascans comprises only the simple band, a loose-knit, patrilineal unit without definite leadership. The men have the reputation of cowardice, the women of immorality; exchange of wives takes place, and wrestling duels for women are reported. The settlements of the western Athapascans are semi-permanent, matrilineal clans are found among several of the tribes and chiefs have greater authority. The western shamans are said to have added the function of confessing to the powers claimed by their eastern prototypes.

(6) **The Interior Area of Southern British Columbia.**—The wooded valleys of southern British Columbia are inhabited by the Kutenai and the Salish-speaking Thompson, Shuswap and Lillooet. The rivers flowing westward are filled every year with salmon, which the natives formerly caught in large numbers and smoked or pulverized for winter use. Deer and mountain goats were hunted and berries collected in large quantities. Clothing was of deer-skin, while rabbit-skin blankets were woven prior to the introduction of European goods. Wood was used more extensively than on the Plains, including a kind of slat armour. Pottery was lacking, but excellent basketry is still produced, including water-tight vessels; twine weaving was employed for bags. Rush-covered lean-tos served for shelter, replaced in winter by permanent, semi-subterranean houses with combined door and flue.

Semi-hereditary chiefs, exercising considerable influence over local groups, formerly prevailed, but they lacked the martial prowess of their compeers on the Plains, or the respect based upon wealth as among the coastal groups. Ceremonial rites were also weakly developed, although puberty ceremonies were performed, and the Kutenai held an elaborate ritual before departing to the Plains on their annual bison hunt. In addition to guardian-spirits, there was a belief, among the Kutenai at least, in the sun as a vague supreme being. The culture of this area is, in many respects, intermediate between that of the Plains and the Pacific littoral.

(7) **The Coastal Area of British Columbia.**—This region, the most distinctive culture area in Canada, can be divided into three parts. The northern is occupied by the Haida, the Tsimshian of the Skeena river, the Niska of the Nass valley and the Tlingit of Alaska; the central, by the Kwakiutl and the Bella Coola; and the southern, by the Nootka and the Coast Salish, with many tribes resident in the United States.

In contrast to linguistic diversity on the coast, there is relative

cultural uniformity. The chief food is salmon, which are smoked for storage. In addition, deep-sea fishing is practised by several tribes, olachen are boiled for their highly prized grease, berries and shell-fish are collected, deer and mountain goats are hunted, and the Nootka formerly captured whales at sea. These abundant sources of food supported a relatively dense population, living in permanent villages. The even-grained cedar was split into planks with which large, communal, rectangular houses were built; smaller boards were bent into serviceable water-tight boxes; enormous canoes were hollowed from the trunks; and totem-poles were carved and erected as heraldic posts. Pottery is unknown, but baskets and mats of bark and roots are still manufactured. Clothing was either made of skins or bark, or woven from mountain goat- or dog-hair. Nephrite was extensively used, and copper was beaten out into plaques having a ceremonial value.

Political organization is marked by the importance of hereditary rank. The Haida and the Vancouver Island Salish have four classes, chiefs, nobles, commoners and (formerly) slaves, each stratum being, in theory at least, endogamous. These distinctions are less rigid in the central sub-area, where, however, great deference is shown to the man who is able to display his wealth by a lavish bestowal of goods to validate the assumption of prerogatives. The strongly organized northern tribes are matrilineal, the southern are patrilineal; in the central region the influence of the former has led to the introduction of certain matrilineal institutions. Secret societies, employing masks and ingenious mechanical devices, further complicate social life. There is a firm belief in supernatural beings, whom the Bella Coola have organized into a pantheon, dominated by a supreme deity.

**BIBLIOGRAPHY.**—*Handbook of the American Indian* (Bulletin 30, Bureau of American Ethnology, Washington, 1906), gives brief, authoritative notes on the principal tribes and chief elements of culture, with excellent bibliography. Clark Wissler's *The American Indian* is the most comprehensive recent work on North American anthropology. See also the publications of the Anthropological Division, National Museum of Canada, and articles in *The American Anthropologist*, *The Journal of American Folk-Lore*, *Le Journal de la Société des Américanistes de Paris*, and *Annual Archaeological Reports for Ontario*. (T. F. McI.)

## HISTORY

**Early Discovery.**—About A.D. 1000 Leif Ericsson, a Norseman led an expedition from Greenland to the shores probably of what is now Canada, but the first effective contact with Europeans was not until the end of the 15th century. John Cabot (*q.v.*), sailing from Bristol, reached the shores of Canada in 1497. Soon after, fishermen from Europe began to go in considerable numbers to the Newfoundland banks and to the coasts of the mainland of America. In 1534 a French expedition under Jacques Cartier, a seaman of St. Malo, sent out by Francis I., entered the Gulf of St. Lawrence. In the following year Cartier sailed up the river as far as the Lachine rapids, to the spot where Montreal now stands. During the next 60 years the fisheries and the fur trade received some attention, but no colonization was effected.

## CANADA AS A FRENCH COLONY

At the beginning of the 17th century we find the first great name in Canadian history. Samuel de Champlain (*q.v.*), who had seen service under Henry IV. of France, was employed in the interests of successive fur-trading monopolies and sailed up the St. Lawrence in 1603. In the next year he was on the Bay of Fundy and had a share in founding the first permanent French colony in North America—that of Port Royal, now Annapolis, Nova Scotia. In 1608 he began the settlement which was named Quebec. From 1608 to his death in 1635 Champlain worked unceasingly to develop Canada as a Colony, to promote the fur trade, and to explore the interior. He passed southward from the St. Lawrence to the beautiful lake which still bears his name and also westward, up the St. Lawrence and the Ottawa, in the dim hope of reaching the shores of China. He reached Lake Huron and Lake Ontario, but not the great lakes stretching still farther west.

**The Chartered Companies.**—The era was that of the Thirty Years' War (1618-48), and during that great upheaval England

was sometimes fighting France. Already, in 1613, in time of peace, the English from Virginia had almost completely wiped out the French settlement at Port Royal, and when, in 1629, a small English fleet appeared at Quebec, Champlain was forced to surrender. But in 1632 Canada was restored to France by the treaty of St. Germain-en-Laye. Just at this time was formed under the aegis of Cardinal Richelieu the "Company of New France" known popularly as "The Company of One Hundred Associates." With 120 members it was granted the whole St. Lawrence valley and for 15 years from 1629 it was to have a complete monopoly of trade, while products from its territory were to enter France free of duty. In return, the company was to take to New France 300 colonists a year; only French Catholics might go; and for each settlement the company was to provide three priests. Until 1663 this company controlled New France.

It was an era of missionary zeal in the Roman Catholic Church, and Canada became the favourite mission. The Society of Jesus was only one of several orders—Franciscans (Récollets), Sulpicians, Ursulines, etc.—who worked in New France. The Jesuits have attracted chief attention, not merely on account of their zeal and numbers, but also because of the tragic fate of some of their missionaries in Canada. Among the Huron Indians, whose settlements bordered on the lake of that name, they secured a great influence. But there was relentless war between the Hurons and the Iroquois, occupying the southern shore of Lake Ontario, and when in 1649 the Iroquois almost completely destroyed the Hurons, the Jesuit missionaries fell victims to the conquerors' rage. Some missionaries to the Iroquois themselves met with a similar fate. Commercial life also languished. The company planned by Richelieu was not a success. It did little to colonize New France, and in 1660, after more than 30 years of its monopoly, there were not more than 2,000 French in the whole country. In 1663 the charter of the company was revoked. No longer was a trading company to discharge the duties of a sovereign. New France now became a royal province, with governor, intendant, etc., on the model of the provinces of France.

In 1664 a new "company of the West Indies" (*Compagnie des Indes Occidentales*) was organized to control French trade and colonization not only in Canada but also in West Africa, South America, and the West Indies. At first it promised well. In 1665 some 2,000 emigrants were sent to Canada; the European population was soon doubled; and Louis XIV. began to take a personal interest in the colony. But once more, in contrast with English experience, the great trading company proved a failure in French hands as a colonizing agent, and in 1674 its charter was summarily revoked by Louis XIV.

**Exploration.**—By 1659 two Frenchmen, Radisson and Groseillers, had penetrated beyond the great lakes to the prairies of the far West, and were probably the first Europeans to see the upper Mississippi. By 1666 a French mission was established on the shores of Lake Superior, and in 1673 Joliet and Marquette, explorers from Canada, reached and for some distance descended the Mississippi. Five years later Cavelier de la Salle was making his way westward from Quebec to discover the true character of the great river and to perform the feat, perilous in view of the probable hostility of the natives, of descending it to the sea. In 1682 he accomplished his task, took possession of the valley of the Mississippi to the Gulf of Mexico in the name of Louis XIV., and called it Louisiana.

There was keen rivalry between Church and State for dominance in this new empire. In 1659 there arrived at Quebec a young prelate of noble birth, François Xavier de Laval-Montmorency, who had come to rule the Church in Canada. An ascetic, who practised the whole cycle of mediaeval austerities, he was determined that Canada should be ruled by the Church, and he desired for New France a Puritanism as strict as that of New England. His special zeal was directed towards the welfare of the Indians. He insisted that the traders should not supply them with brandy, declared he would excommunicate any one who did so and, for a time, triumphed. In 1663 he was actually invited to choose a governor after his own mind and did so, but

with no cessation of the old disputes. In 1672 Louis de Buade, Comte de Frontenac (q.v.), was named governor of New France, and in him the Church found her match. After a bitter struggle, he was recalled in 1682; but Canada needed him. He knew how to control the ferocious Iroquois, who had cut off France from access to Lake Ontario; to check them he had built a fort where now stands the city of Kingston. With Frontenac gone, these savages almost strangled the colony. On a stormy August night of 1689 Iroquois burst in on the village of Lachine near Montreal, killed four or five score of its people, and carried off more than 100 to be tortured to death at their leisure. Then the strong man Frontenac was sent back to face the crisis.

**War with England.**—It was a critical era. James II. had fallen in England, and William III. was organizing Europe against French aggression. France's plan for a great empire in America was now taking shape, and there, as in Europe, a deadly struggle with England was inevitable. Frontenac planned attacks upon New England and encouraged a ruthless border warfare. The English retaliated. Sir William Phips sailed from Boston in 1690, conquered Acadia, now Nova Scotia, and then hazarded the greater task of leading a fleet up the St. Lawrence against Quebec. On Oct. 16, 1690, 34 English ships, some of them only fishing craft, demanded the surrender of the town. When Frontenac answered defiantly, Phips attacked the place; but he was repulsed and in the end sailed away unsuccessful.

Each side had now begun to see that the vital point was control of the interior, which time was to prove the most extensive fertile area in the world. La Salle's expedition had aroused the French to the importance of the Mississippi, and they boldly determined to occupy it, to close in from the rear on the English on the Atlantic coast, seize their colonies, and even deport the colonists. The plan was audacious, for the English in America outnumbered the French by 20 to one. But their colonies were democracies, disunited because each was pursuing its own special interests, while the French were united under despotic leadership. Frontenac attacked the Iroquois mercilessly in 1696. In the next year the treaty of Ryswick was signed, and conquests were restored. In 1698 Frontenac died.

The peace of Ryswick proved but a truce. In Europe, renewed war in 1702 saw the brilliant victories of Marlborough, and in America France lost heavily. Though the English, led by Sir Hovenden Walker, failed in 1711 to take Quebec, they again seized Nova Scotia; and when the treaty of Utrecht was made in 1713, France admitted defeat in America by yielding to Britain her claims to Hudson Bay, Newfoundland, and Nova Scotia.

**The British Conquest of Canada.**—France still held the shores of the St. Lawrence, and she retained, too, the island of Cape Breton to command its mouth. There she built speedily the fortress of Louisburg and prepared once more to challenge British supremacy in America. With a sound instinct that looked to future greatness, France still aimed, more and more, at the control of the interior of the continent. The danger from the Iroquois on Lake Ontario had long cut her off from the most direct access to the West, and from the occupation of the Ohio valley leading to the Mississippi, but now, free from this savage scourge, she could go where she would. In 1701 she founded Detroit, commanding the route from Lake Erie to Lake Huron. Her missionaries and leaders were already at Sault Ste. Marie commanding the approach to Lake Superior, and at Michilimackinac commanding that to Lake Michigan. They penetrated to what is now the Canadian West, and it was a French Canadian, La Vérendrye, who pressed on into the far West until, in 1743, first recorded of white men, he came in sight of mountains which barred the way to the Pacific coast. France also crowned La Salle's work by founding, early in the 18th century, New Orleans at the mouth of the Mississippi. It was a far cry from New Orleans to Quebec. If France could link them by a chain of settlements and shut in the English to their narrow strip of Atlantic seaboard there was good promise that North America would be hers.

The project was far-reaching, but France could do little to make it effective. Louis XV. allowed her navy to decline and

her people showed little inclination for emigration to the colonies. In 1744, when the war of the Austrian Succession broke out, the New England colonies planned and in 1745 effected the capture of Louisbourg (*q.v.*), the stronghold of France in Cape Breton Island, which menaced their commerce. But, to their disgust, when the peace of Aix-la-Chapelle was made in 1748, this conquest was handed back to France. She continued her work of building a line of forts on the great lakes—on the river Niagara, on the Ohio, on the Mississippi; and the English colonies, with the enemy thus in their rear, grew ever more restive. In 1753 Virginia warned the French on the Ohio that they were encroaching on British territory. The next year, George Washington, a young Virginian officer, was sent to drive the French from their Fort Duquesne on the Ohio river, where now stands Pittsburgh, but was defeated, as was also the British general Braddock in 1755. In that year the British took the stern step of deporting the Acadian French from Nova Scotia (*see NOVA SCOTIA: History*). In 1756 the Seven Years War began. France had no resources to cope with those of Britain in America, and the British command of the sea proved decisive. On Sept. 13, 1759, Wolfe won his great victory before Quebec, and a year later at Montreal the French army in Canada surrendered. By the peace of Paris, 1763, Canada was finally ceded to Great Britain.

#### CANADA AS A BRITISH COLONY

**The American Revolution.**—After the peace, Canada was governed under the authority of a royal proclamation until, in 1774, the Quebec Act was passed by the Imperial Parliament. The western territory which France had claimed, extending as far as the Mississippi and south to the Ohio, was included with Canada in what was called the province of Quebec. This vast territory was to be governed despotically from Quebec; the Roman Catholic Church was given its old privileges in Canada; and the French civil law was established side by side with the English criminal law. The act linked the land-owning class in Canada and the Church by ties of self-interest to the British cause. The *habitant*, placed again under their authority, had less reason to be content.

In 1775 began the American revolution. Its leaders tried to make the revolt continental, and invaded Canada, hoping that the French would join them. They took Montreal and besieged Quebec during the winter of 1775–76; but the prudent leadership of Sir Guy Carleton, afterwards Lord Dorchester, saved Quebec and in 1776 the revolutionary army withdrew unsuccessful from Canada. Since that time any prospect of Canada's union to the United States has been very remote.

The American revolution profoundly influenced the life of Canada. The country became the refuge of thousands of American loyalists who would not desert Great Britain. To Nova Scotia, to what are now New Brunswick and Ontario (*qq.v.*) they fled in numbers not easily estimated, but probably reaching about 40,000. This meant bitter hostility on the part of these colonists to the United States, which refused in any way to compensate the loyalists for their confiscated property. Great Britain did something; the loyalists received liberal grants of land and cash compensation amounting to nearly £4,000,000.

**Rebellion in Canada.**—A prevailingly French type of government was now no longer adequate in Canada, and in 1791 the Constitutional Act was passed by the British parliament, separating Canada at the Ottawa river into two parts, each with its own government; Lower Canada, chiefly French, retaining the old system of laws, with representative institutions now added, and Upper Canada, on the purely British model. (For Lower and Upper Canada, *see also QUEBEC and ONTARIO*.) Each province had special problems; the French in Lower Canada aimed at securing political power for their own race, while in Upper Canada there was no race problem, and the great struggle was for independence of official control and in all essential matters for government by the people. Before this issue matured war broke out between Great Britain and the United States in 1812 from causes due chiefly to Napoleon's continental policy. The war seemed to furnish a renewed opportunity to annex Canada to

the American union, and Canada became the chief theatre of conflict. The struggle was most vigorous on the Niagara frontier. But, in the end, the American invasion failed and the treaty made at Ghent in 1814 left the previous position unaltered.

In 1837 a few French Canadians in Lower Canada, led by Louis Joseph Papineau (*q.v.*) took up arms with the wild idea of establishing a French republic on the St. Lawrence. In the same year William Lyon Mackenzie (*q.v.*) led a similar armed revolt in Upper Canada against the domination of the ruling officialdom, which was known locally as the "Family Compact." In 1838 the Earl of Durham (*q.v.*) was sent to govern Canada and report on the affairs of British North America. Clothed as he was with large powers, he undertook in the interests of leniency and reconciliation to banish, without trial, and so save from possible execution, some leaders of the rebellion in Lower Canada. For this reason he was censured at home and he promptly resigned, after spending only five months in the country. But his *Report*, published in the following year, is a masterly survey of the situation and included proposals that profoundly influenced the later history of Canada. He recommended the union of the two Canadian provinces at once, the ultimate union of all British North America, and the granting to this large state of full self-government. The French element he thought a menace to Canada's future, and he desired all the provinces to unite so that the British element should be dominant.

**The Union of Upper and Lower Canada.**—To carry out Lord Durham's policy the British Government passed in 1840 an Act of Union joining Upper and Lower Canada, and sent as governor Charles Poulett-Thompson, who was made Baron Sydenham of Kent and Toronto. In the single Parliament each province was equally represented. By this time there were over a million people in Canada, and the country was becoming important. Lord Sydenham died in 1841, before his work was completed, and he left Canada still in a troubled condition. The French were suspicious of the union, aimed avowedly at checking their influence, and the complete self-government for which the "reformers" in English-speaking Canada had clamoured was not yet conceded by the colonial office. But rapidly it became obvious that the provinces united had become too important to be held in leading strings. The issue was finally settled in 1849 and Canada's right to control her own affairs was fully recognized when the earl of Elgin was governor. The Canadian legislature, sitting at Montreal, passed by a large majority the Rebellion Losses Bill, compensating citizens, some of them French, in Lower Canada, for losses incurred at the hands of the loyal party during the rebellion a decade earlier, and the cry was easily raised by the Conservative minority that this was to vote reward for rebellion. They appealed to London for intervention. The mob in Montreal burned the parliament buildings and stoned Lord Elgin himself because he gave the royal assent to the bill. He did so in the face of this fierce opposition, on the ground that, in Canadian domestic affairs, the Canadian parliament must be supreme.

The union of the two provinces did not work well. Each was jealous of the other and deadlocks frequently occurred. Commercially, after 1849, Canada was prosperous. In 1854 Lord Elgin negotiated a reciprocity treaty with the United States which gave Canadian natural products free entrance to the American market. The outbreak of the Civil War in the United States in 1861 increased the demand for such products, and Canada enjoyed an extensive trade with her neighbour. But, owing largely to the unfriendly attitude of Great Britain to the northern side during the war, the United States cancelled the treaty, when its first term of ten years ended in 1865, and it has never been renewed.

The union of the two provinces, however, did not give political stability. The French and English were sufficiently equal in strength to make the task of government well nigh impossible. In 1864 came the opportunity for change, when New Brunswick, Nova Scotia, and Prince Edward Island were considering a federal union. Canada suggested a wider plan to include herself, and in Oct. 1864 a conference was held at Quebec. The conference

outlined a plan of federation which subsequently, with slight modifications, passed the imperial parliament as "The British North America Act."

#### CANADA AS A FEDERAL STATE

Canada was the first federal union in the British Empire and it came into being on July 1, 1867, a date ever since observed as a public holiday. The union sprang from necessity: Upper and Lower Canada, united in one legislature but divided on racial lines, English and French, had reached deadlock in government. Nova Scotia and New Brunswick, far away by the sea, had no connection by rail with the rest of British North America. Prince Edward Island and Newfoundland were stagnant in isolation. Stretching across the prairie and across the mountains to the Pacific were other vast areas under the British crown. Side by side with them and reaching from ocean to ocean was the United States, the North flushed with recent victory in the civil war, and irritated with Great Britain because of incidents in the war. A new era was opening with the building of railways and the flow of population into the American West. With such a nation at their doors, union among the British provinces offered the sole hope of successful growth. Yet only four provinces entered the union at first; Upper Canada, as Ontario, Lower Canada, as Quebec, and Nova Scotia and New Brunswick. Newfoundland still remains outside; and Prince Edward Island did not join until 1873.

The West had no part in the original negotiations, but such was the pressure of conditions that, by 1869, terms had been made with the Hudson's Bay Company (*q.v.*) to bring in its great territory of Rupert's Land, stretching westward to the Rocky mountains, and in 1871 British Columbia, the vast province on the Pacific, joined Canada. To complete Canada's ownership of the whole north of the continent, the British Government in 1878 conveyed to Canada all of British North America, except Newfoundland. The Yukon and other regions of the far north still, as territories, lie outside of the organized provinces.

The leader in these great movements was Mr. (Sir) John Alexander Macdonald (*q.v.*), who had remarkable political genius and was an astute manager of men. Born in Scotland, he had gone when still a boy to Canada with his family and, almost entirely self-educated, had practised law in the city of Kingston, Ontario. He had taken an active part in the politics of United Canada on the Conservative side and become leader. Canada East and Canada West were, however, still so divided that there was a separate leader for each division, and Macdonald had had as his French colleague a man of great energy, Mr. (Sir) Georges Etienne Cartier (*q.v.*). With the formation of the Dominion, this dualism ended and Macdonald was the single leader of his party. The union had been supported by the Liberals under George Brown and the first federal cabinet was a coalition, with Macdonald as Prime Minister. But party divisions were acute in Canada, Brown and other Liberals soon withdrew, and an election in 1868 confirmed the Conservatives in office. The election showed that while the two provinces of the older Canada had not been asked to pronounce upon the union, they approved of it. Strong dissent came, however, from Nova Scotia. Assent to the union had been carried in its legislature by the strong leadership of the Prime Minister, Dr. (Sir) Charles Tupper (*q.v.*). He had been opposed by his rival Joseph Howe (*q.v.*), and when, in 1868, the electors of Nova Scotia had their first opportunity to pronounce upon the project, Tupper alone was elected as a supporter and the other 18 members were pledged to its repeal. The legislature passed an almost unanimous appeal to the Queen to aid withdrawal, and sent Howe to England to press it. There he could not secure official support and, in the end, after securing for the Province some financial concessions, he accepted the inevitable and took office under Macdonald. The sequel was that, in the election of 1872, only one member from Nova Scotia was elected to support repeal.

**Relations with Great Britain.**—A cardinal feature of Sir John Macdonald's opinions was devotion to the political tie with Great Britain. At the conference at Quebec, in 1864, when the

terms of union had been formulated, the leaders agreed that the federation should be called "The Kingdom of Canada." This was an anticipation of the day when Canada should claim political equality with Great Britain. At the time there was friction with the United States and the foreign office had the rather fanciful fear that to set up a kingdom on the borders of the republic would cause offence. Under this pressure, Macdonald and his colleagues had to agree that Canada should be called not a kingdom, but a dominion. A little later Macdonald's ardent imperialism had to endure another rebuff. The American government claimed from Great Britain compensation for the losses caused to American shipping by the southern privateer *Alabama*, which had been fitted out in a British port. On the other hand, Canada claimed compensation from the United States for raids across the Canadian frontier by Fenians who, after the close of the war, had caused great expense and some loss of life in Canada. There was also a dispute about the boundary of British Columbia and the ownership of the island of San Juan. Canada also claimed compensation from the United States for fishing rights conceded to Americans. Macdonald was appointed a member of the British commission which met an American commission at Washington in Feb. 1871, and resulted in the treaty of Washington. He found that the *Alabama* question dwarfed all others in the minds of his fellow commissioners from England and that the claims of Canada secured slight consideration. The San Juan question was referred for arbitration to the German emperor, who decided in favour of the United States, and Canada secured no compensation for the Fenian raids. A fishery commission created by the treaty sat, however, at Halifax and awarded to Canada \$5,500,000 for the excess value of its fisheries, over the value to Canada, of American fisheries for a period of 12 years. The Commission marked a new stage in imperial relations, since for the first time it included a Canadian leader in negotiations with a foreign government. Macdonald's prestige secured the support of the Canadian parliament, which ratified the treaty as it affected Canada, but an election was near and he feared the cry that he had sacrificed the interests of Canada.

**The First Riel Rebellion.**—The remarkable achievement of the rapid extension of Canada across the continent to the Pacific led to problems which dominated politics for the next 20 years. Rupert's Land had been owned and ruled by the Hudson's Bay company ever since the grant made by Charles II.; but in 1869 the company was willing that Canada should take over the country on condition of paying a nominal price of £300,000, of securing to the company  $\frac{1}{20}$  of the fertile lands as they were surveyed, and of the full ownership of about 45,000 ac. about its posts. The problem of government remained. The great western section, which now forms the provinces of Saskatchewan and Alberta, had very few inhabitants except the native tribes and was destined to remain under federal tutelage for some 35 years still; but in the eastern section, the present Manitoba (*q.v.*), were some 10,000 settlers who desired local self-government on the lines of the older provinces. There were two elements in the population. Fort Garry, the present Winnipeg, on the left bank of the Red river, was the centre of the English-speaking population, chiefly Protestant and of Scottish descent, while St. Boniface on the right bank was the centre for the French-speaking and Roman Catholic element. During more than a century French fur traders had been in the country, they had intermarried with native women, and a race, known as Métis or half-breeds, had grown up which far outnumbered the English in the country.

The Government at Ottawa had not yet learned how to rule a new empire and took few precautions to soothe inevitable suspicion. The Métis wanted guarantees as to their French language and their religion; and above all secure titles to their farms. Few of the Métis had deeds, and when in the summer of 1869 agents from the East were entering the country and making surveys, suspicion entered the minds of these remote and ignorant people that their rights would not be respected. A wise leader might have secured needed guarantees, but unfortunately there now came to the front one Louis Riel (*q.v.*), a little better

educated than his fellows, but a man of violent passions and unbalanced judgment. While the English-speaking settlers held aloof, Riel seized Fort Garry and set up a provisional government with himself as president. Canada was to take over the region on Dec. 1, 1869, but when the new governor, Mr. William Macdougall, arrived at the frontier by way of the United States, he was not allowed to enter the country. The government at Ottawa then sent to Fort Garry Donald Alexander Smith (Lord Strathcona *q.v.*). He was not familiar with the West, but he was prominent in the affairs of the Hudson's Bay company, and much was hoped from his Scottish prudence and tact. Riel, however, imprisoned him and other English-speaking leaders and seized the property of the company. His worst act was the summary trial and brutal execution of Thomas Scott, a young man from Ontario, who had used defiant words. Riel was undoubtedly partly insane, but he was in possession, and the only way to dislodge him was to send from the East a military expedition. It was placed under Col. Garnet (afterwards Lord) Wolseley. There was no railway from Canada to the West, a military force could not pass through the United States, and Wolseley had to take his men across hundreds of miles of wilderness from Lake Superior to Fort Garry. He reached the fort in Aug. 1870, to find that Riel had fled. In such stormy conditions it was that Manitoba came into being as a self-governing province.

**The Transcontinental Railway.**—In Canada, as in the United States, a vast territory makes railways and tariffs the leading interest in politics. In 1872 Macdonald had to confront the realities of building a railway to the Pacific Ocean. Between Ottawa and Winnipeg were 600 miles of wilderness, with rivers and swamps to cross. Then came 1,000 miles of prairie and after that 500 miles of rugged mountains, across which as yet no suitable pass was known. How best to build it—by government or by a private company? Canada decided for a private company. When the second federal election came in 1872, two groups of financial interests, one in Montreal and one in Toronto, were bidding for the contract which would carry with it heavy subsidies from the government. Sir George Etienne Cartier had lost support in Quebec because of the racial issue in Manitoba. French Canada is always peculiarly sensitive to any unfairness to the French. In Ontario there had been great outcry at Riel's execution of Scott, an Orangeman, and the legislature had offered a large reward for Riel's apprehension, while in Quebec it was held that the French settlers in Manitoba had had genuine grievances, voiced by Riel, and that a general amnesty should be granted to those who took up arms. Macdonald feared this agitation and Cartier was in fact defeated in Quebec because he was a member of the government which refused amnesty. Moreover, elections in the new vast Canada were costly and Macdonald needed money for election expenses. He won the election but he had to face an acute crisis when he met the new Parliament.

The charge was then made and proved that during the election Macdonald had received from Sir Hugh Allan (*q.v.*), the head of the Montreal company which wished to build the Pacific railway, some \$300,000 for election expenses, and the inference was that a corrupt bargain had been made with Allan to build the railway. The charge created a sensation. Parliament appointed a commission to investigate and the Governor-General, Lord Dufferin (*q.v.*), took up so stern a position that he was prepared to adopt the dangerous course of dismissing the ministry. In Oct. 1873, when the commission's report acquitted Macdonald of personal corruption but established the receipt of the large sum for election expenses, he resigned, and a Liberal ministry came into office with Mr. Alexander Mackenzie at its head. In the election which followed the new government was sustained by a large majority.

**The Protectionist "National Policy."**—The defeat of Macdonald left in the air the building of the line to the Pacific; yet it was chiefly on this condition that British Columbia had entered the union. Mr. Mackenzie's government held that to complete the line within the agreed ten years was impossible. This caused in British Columbia angry charges of breach of faith and an agitation for withdrawal from the federation. Mr. Mackenzie pleaded for patience, Lord Dufferin himself went to British Co-

lumbia, but even his buoyant tact, which had a tint of blarney, did not soothe the discontent. Meanwhile, the Liberal government was proceeding with the railway as a government line.

It was the problem of tariffs which in the end solved the railway issue and brought Macdonald back to power. Canada's position is made difficult by her having only one neighbour, the United States, with a population about 12 times as great and with highly developed industries. The Liberal government had to face a period of acute depression and annual deficits. There was an alarming exodus of population to the United States and, to give opportunity at home, Macdonald now became the spokesman of a policy of protection for Canadian industries—a National Policy as he named it. Mr. Mackenzie's government adhered to a tariff for revenue only. He tried, but failed, to make a bargain with the United States to open the American market to Canada's natural products, a revival of the reciprocity treaty which the United States had ended at the close of the civil war. The result was that, when an election came in 1878, Canada accepted by a large majority the national policy, Macdonald again became prime minister, and remained in office until his death in 1891.

**The Canadian Pacific Railway.**—In 1879, the new minister of finance, Sir Leonard Tilley, introduced and carried a bill to protect Canadian industries which has been only slightly modified since that time. The immediate result was disappointing. New industries sprang up but Canada had a small home market and almost no export market. Yet with unbounded courage the government faced the great task of linking the Pacific and the Atlantic by a railway. The Canadian Pacific railway company was formed with headquarters at Montreal. At its head was Mr. George Stephen (Lord Mountstephen *q.v.*), and its active manager was a man of boundless energy and resource, Sir William van Horne. The building of the line was pressed on, and on Nov. 7, 1886, at a little mountain station in British Columbia, Mr. D. A. Smith (Lord Strathcona) drove the last spike needed to link the East and the West by a railway. Twenty-five million ac. of land in the west and \$25,000,000 formed the subsidy of Canada to the project, but, even with this support, there were times when it barely escaped bankruptcy. Its affairs were managed with fine insight and integrity and it has become one of the world's greatest organizations and much more than a railway. With its millions of acres of land, it has played a great part in colonizing the West and it has become, besides, a great shipping organization with a fleet of steamships on the great lakes, the Pacific, and the Atlantic, girdling the world.

**The Second Riel Rebellion.**—Experience quickly showed that the pushing of a railway into a region inhabited by native tribes and a few scattered settlers aroused suspicion. For the natives, the railway meant the ultimate disappearance of the herds of buffaloes on which they relied for food. In the valley of the Saskatchewan were many half-breed settlers, some of them refugees from Manitoba after the rebellion of 1869, and they now had fears for the security of the titles to their lands. Louis Riel was still alive, and these ignorant people begged him to come from his refuge in the United States to lead them in their difficulties. As in 1869, the government at Ottawa failed to realize the gravity of the situation. There was danger of a rising of the Indian tribes. Blackfeet and Crees still waged war on each other and measured victory by the number of scalps taken, and they were demoralized and made reckless by the illicit sale of whisky, which caused brutal outrages. Speculators in land were flocking into the country and caused dismay to its people. The West was, in truth, a wild region, like that across the border in the United States. To preserve order, the federal government had created in 1873 a mobile force known as the North-west Mounted Police, which saved Canada from the lawlessness of the mining camps in the United States. But, none the less, a crisis came in 1885.

By this time, Riel's mind had become so unbalanced that he proclaimed himself the prophet of a new religion and, in the spring of 1885, he set up a provisional government on the Saskatchewan which denied the authority of Canada, and announced separation from the Roman Catholic Church. On March 24 half-breeds attacked, near Prince Albert, a party of mounted police

under Major Crozier and killed 14 of his men and wounded 25. Riel appealed to the Indian tribes to join him and drive out the whites, and there was danger of extensive massacres of scattered loyal settlers in the region.

Thus it happened that Canada had the task of suppressing a second rebellion. It was difficult, for the railway from Lake Superior to Winnipeg was not yet completed, and the troops had to march in bitter winter weather over the uncompleted sections of the line. The rebel force was led with skill by Gabriel Dumont, but when the Canadians, under an Imperial officer, General Middleton, reached the Saskatchewan, they carried the rebel entrenchments at Batoche. By May, Riel was a prisoner and, soon after, Dumont was a refugee in the United States. The rising had cost Canada about 200 lives. Riel was put on trial at Regina, the capital of the north-west territories, and there, late in 1885, he was hanged. Eight Indians were also hanged in the presence of many natives, and this ended their fantastic ambition to drive the whites from the West. The execution of Riel had far-reaching consequences. In Quebec, the plea urged in 1870 was repeated that the rebels had real grievances and that, moreover, since Riel was really insane his execution was unwarranted and due to the animosity of the English towards the French. The Quebec Conservatives were divided by rivalries, and in a few years the Liberal Party became and remained dominant in Quebec.

**Sir Wilfrid Laurier.**—After the retirement of Mr. Mackenzie from the leadership, Mr. Edward Blake (*q.v.*) had been chief of the Liberal party. His defeat in the two elections of 1882 and 1887 led to his retirement and he was succeeded by Mr. (Sir) Wilfrid Laurier, who remained the Liberal chief for 32 years until his death in 1919. Like Macdonald, Laurier was a man of striking personality. His ancestors had lived for many generations in French Canada; his family was poor; and he had been reared in a French Canadian village with only the advantages of a small college conducted by priests and a course in law at McGill university. Yet he had the courtly bearing of a *grand seigneur*, and his stately dignity never failed. He was called to a difficult position, for it seemed doubtful whether a French leader could unite both the English and the French elements in the Liberal party. It was not long, however, before it was clear that he had political tact and skill to rival that of Macdonald.

Laurier's first election came in 1891. The times were bad and the Liberals hoped for improvement in closer trade relations with the United States. Their policy called for unrestricted reciprocity in trade and this gave Macdonald the chance to urge that such a step would lead to political union. He was old, he realized that this was likely to be his last election, and he won it largely by the rallying cry for the link with Britain: "a British subject I was born; a British subject I will die." The effort wore him out and he died early in the summer of 1891. Sir John Abbott, a Montreal lawyer, succeeded him, and in 1892, Sir John Thompson, a Nova Scotian, showed skill and capacity as prime minister. He died suddenly in 1894 and was followed, wholly on grounds of seniority, by an Ontario Orangeman, Sir Mackenzie Bowell. The party, floundering with divided counsels and no strong head, at last turned, in 1896, to Sir Charles Tupper. He had been absent from Canada as High Commissioner in London and he returned to lead a disorganized party corrupted, as all parties tend to be corrupted, by a long tenure of office.

Again the West brought a storm in Canadian politics. Manitoba had had sectarian schools but the Liberal government of 1890 held that this division weakened education, and it unified the schools in a non-sectarian system. From the first, the Roman Catholic element had feared a policy which should remove the teaching of their beliefs in schools supported by the state, and to protect them a provision had been included in the constitution of Manitoba that the federal government might override provincial action which should abolish such a right. Education in Canada was administered by the provinces. Laurier thought that an injustice had been done. No word of his, he said, should embitter the struggle, but he pointed out that, while the federal government might by legislation direct the correction of the grievance, it had no power to intervene in the administration of

education in Manitoba. To give orders which it had no means of enforcing would prove futile. Conciliation would do more than a merely legal demand. This he promised if placed in office, and meanwhile "Hands off Manitoba."

Tupper was in a difficult position. Many of his supporters were Orangemen and he was yielding to insistent demands of Roman Catholic bishops to coerce an unwilling province. He introduced what was called a Remedial Bill but the term of parliament expired before he could force it through, and in the election which followed he was defeated.

Thus it was that in 1896, after 18 years of Conservative rule, the Liberals came into power. Governments endure in Canada and Laurier remained prime minister for 15 years until 1911. It was one of the ironies of politics that Manitoba had voted for its own coercion, while Quebec, in which the people were supposed to be amenable to episcopal direction, supported Laurier by a large majority. Some episcopal extremists sent an appeal to Rome urging the excommunication of the Catholic leader who had defied the bishops, and this policy was reported to be under serious consideration by the entourage of Pope Leo XIII. A personal envoy went unofficially from Laurier to put the case before the Pope, with the result that Cardinal Merry Del Val was sent to Canada and made a report which amounted to a rebuke to the bishops for undue interference in politics. The Liberal government of Manitoba made some concessions to a Liberal government in Ottawa, but the separate schools were not restored.

**Imperial Preference.**—The new government faced its tasks with energy. The problem of the tariff was urgent, for the Liberals had preached the doctrines of Free Trade. They had, however, to face the condition that many industries had grown up under Protection and that to open the door to the more highly developed manufactures of the United States would involve disaster. The year 1897 was the 60th of the reign of Queen Victoria, and Laurier met his difficulties with a brilliant stroke. Though he made but slight changes in the tariff, he used the occasion of the jubilee to give to Great Britain a reduction of 25%, later increased to 33½% of the tariff. He visited England for the first time in that year and was a conspicuous figure in the celebrations. His policy of Preference proved enduring and remains in force.

The great need of Canada was to people the empty spaces of the West. In the cabinet was the very capable minister of the interior, Mr. Clifford Sifton, a former prime minister of Manitoba, who understood the problems of the West. Sifton set on foot a movement which carried settlers to Canada on a scale so great, in relation to the total population of the country, that it had not been equalled even by the United States. He drew them from Great Britain, from continental Europe, and, to general surprise, in large numbers from the United States where free grants of land were no longer available.

The result was that, within ten years after the Liberal government took office, the population of the prairie country had so increased that it was necessary to set up two new provinces, Saskatchewan and Alberta, with self-government on the lines of the other seven provinces. This was done in 1905, not without friction, for again the demand was made for the right to separate schools, supported by the state, in which should be taught the Roman Catholic faith. Minor compromise eased the friction and Regina and Edmonton, so recently little more than trading posts, soon had impressive parliament buildings as capitals respectively of Saskatchewan and Alberta. The political framework of Canada from the Atlantic to the Pacific was thus completed.

**French Canadian Nationalism.**—The politics of Canada are always haunted by racial issues. When Canada was still a French colony a cleavage grew between the old and the new France which bred in the Canadians a sense of separation from Europe and endured under British rule. One result was an unwillingness to share in any conflicts not directly affecting Canada. Though politically British, they did not share in the unity of sentiment which leads Britons in all parts of the world to stand by each other in time of danger. When the South African War broke out in 1899, outside of Quebec, public sentiment was so strong

for aiding Great Britain that Canadian contingents were recruited and sent to South Africa, where they made a creditable record. They were paid, however, by Great Britain, not by Canada. Laurier's chief political strength was in Quebec and he realized the danger there to his prestige of this share in imperial wars. Following on this war came the rapid approach of conditions in Europe which were to result in the World War. Canada was not equipped for war. She had no fleet, and a considerable section of public opinion was demanding that she should take some share in the naval defence of the Empire. Laurier knew that in Quebec any move in this direction would arouse antagonism. Henri Bourassa (*q.v.*), grandson of Papineau, the rebel of 1837, became the able and eloquent exponent of opposition to taking any share in imperial wars. Yet the pressure of other opinion was such that, in 1910, Laurier was forced to acquire two men-of-war as training ships, and in the next year to found a small naval college at Halifax and thus make the beginnings of a Canadian navy.

In 1911 came an election which resulted in Laurier's defeat. In Quebec, his support had cooled, owing to Bourassa's attacks on his imperialism. What broke his power was, however, quite another question. Canada had long sought reciprocity in trade with the United States and, early in 1911, an agreement was reached at Washington for a wide measure of free trade between the two countries. The farmers of the West welcomed the proposal joyously; it would give them wide markets and cheaper agricultural implements. But the industries were naturally alarmed at any intrusion on a protected field; the railways feared diversion of traffic from the long lines running east and west to shorter routes by way of the United States; and banking interests were alarmed lest closer relations should lead to the financial dominance of New York. These considerations were reinforced by the strong British sentiment in Canada, which resented the giving to the United States of advantages in trade superior to those of Great Britain. Laurier dissolved parliament with confidence, but he was defeated and the Conservative leader Mr. (Sir) Robert Borden (*q.v.*) became in 1911 prime minister of Canada.

**Relations with the United States.**—During Laurier's term of office, relations with both Great Britain and the United States had become more clearly defined. In successive imperial conferences he refused to accept for Canada any direct responsibility for other than Canadian affairs, a policy in which his opinions ran counter to those of the British colonial secretary, Mr. Chamberlain. Canada, Laurier always said, would do her duty in any emergency but he would not give pledges in advance. Canada was moving towards control of her own foreign affairs and there was a certain uneasiness at Britain's conduct of Canada's relations with the United States. The Conservative government of Sir John Thompson had secured by arbitration the rejection of a claim by the United States to jurisdiction over Bering Sea in order to protect American interests in the seal fisheries of the Pribyloff Islands. A more difficult case arose, however, in 1903 in connection with the boundary between Canada and Alaska. A decision favourable to the United States was reached by the vote of Lord Alverstone with three American commissioners against his two Canadian colleagues, though he had previously reached an agreement with them and signed a common verdict. Later revelations showed that his change of view had been determined by a sharp menace from the American president, Mr. Roosevelt, that he would dictate a settlement if the commission should fail to agree.

A happier phase of relations with the United States came in 1911 in the establishment of an international joint commission with three commissioners named by the United States and three by Canada to continue in permanence and to which should be referred questions relating to the use of boundary waters. These include such difficult questions as the building of dams and the generation of electrical power on boundary rivers; and it was further provided that, by agreement of the two governments, the commission might exercise comprehensive powers in determining rights, obligations and interests in the relations of one country to the other or of their respective inhabitants. In its task of

settling difficulties peaceably the treaty ranks with the important Rush-Bagot convention of 1818 which brought about disarmament on the Great Lakes and, indeed, on the whole boundary line.

**The Naval Question.**—The new Conservative government was confronted at once by the danger of war in Europe. In 1912 Sir Robert Borden visited England for a conference with the British authorities, who convinced him that, in view of Germany's preparations, there was an emergency in naval affairs. In consequence, in Dec. 1912, the prime minister submitted to Parliament a proposal to build three warships at a cost not exceeding £7,000,000, to be placed at the disposal of the King for naval defence. The plan of a Canadian navy was not abandoned, but was postponed in view of urgency. The proposal was hotly debated. Even the mild naval policy of Sir Wilfrid Laurier had aroused the nationalist group in Quebec which scented imperialism. The session of 1913 saw determined obstruction which led to the adoption of the closure in debate, already found necessary in England. The House of Commons, by 101 votes to 68, supported the naval bill which, however, failed to pass in the Liberal Senate. Thus on the eve of the World War Canada was giving almost no aid in naval defence.

#### THE WORLD WAR AND AFTER

On the outbreak of the World War Canadian opinion was at once clear. To the measure of her strength Canada was ready, in an hour of deadly peril, to fight side by side with Britain. Before Parliament met, on Aug. 18, mobilization had begun. One of the first acts of Parliament was to make a gift of 1,000,000 bags of flour to Great Britain, a gift which required 200 trains, each of 30 cars, to take to the ports. By October, a volunteer Canadian army of 30,000 men had reached England and a second contingent of more than 20,000 was drilling. The war minister, Sir Sam Hughes (*q.v.*), said that 150,000 were then eager to go. In all, Canada enlisted during the War 595,441 men; of these about 52,000 were killed in action and about 10,000 died from other causes.

The events of the War are too complex to find here more than mention. In the end the four divisions of the Canadian army corps were placed under the command of Lieut.-Gen. Sir Arthur Currie (*q.v.*). The Canadians fought in some of the hardest battles on the western front; in April 1915, at the second battle of Ypres, and later in the further severe fighting in that region; in 1916, at St. Eloi, Sanctuary Wood and other points, and in the prolonged battle of the Somme; in 1917, at the taking of Vimy Ridge and in the desperate struggle in mud and slime which ended in the taking by the Canadians of Passchendaele, on the Ypres salient; in 1918, in driving back the Germans after their success near Amiens in March, cutting through a part of the supposedly impregnable Hindenburg line in September, and finally, after the great battle of Arras, taking Cambrai on Oct. 9. When the Armistice came on Nov. 11 the Canadians were at Mons, whence the British had begun their great retreat in 1914.

**The Issue of Conscription.**—By the end of 1916 a lull had come in voluntary enlistment and Sir Robert Borden urged that the pledge of support to the men facing death at the front required the drastic method of raising 100,000 new troops by compulsion. This developed an issue which has since played a large part in Canadian politics. The expectation that, with France and Britain allied, the French Canadian would feel doubly called to share in the War was not realized. Many French Canadians, led by Mr. Bourassa, felt that Europe must be left to settle its own disputes and they fought conscription with intense resentment. None the less, French Canadian volunteer regiments served in the War with the spirit of that military France from which their ancestors came.

By May 1917, the government of Sir Robert Borden had adopted conscription. Laurier's position was difficult. He was in ardent sympathy with the aims of the Allies. If, however, he should support conscription he would endanger his position among his own people of the Province of Quebec. In Jan. 1917 he issued an appeal to all Canadians to forget party differences in pursuit of victory in the War. He urged that, on so vital an issue

as conscription, the example of Australia should be followed and a plebiscite taken. This attitude lost him many Liberal supporters outside of Quebec, and his resolution in favour of a plebiscite was defeated in the House of Commons by 118 to 55, with the minority almost wholly from Quebec. When, finally, after announcing conscription, Sir Robert Borden asked Laurier to join in a coalition, with half the Cabinet Liberals, he declined. He could not face Quebec as a supporter of compulsory service.

**The Coalition Government of 1917.**—In Oct. 1917, a coalition government was formed under Sir Robert Borden, with seven Liberal members. Dissolution followed and Laurier fought his last campaign with but few of his former followers supporting him, except in Quebec. The coalition won by 137 to 93, and 62 of the minority were from Quebec. The election of 1917 was noteworthy, in that for the first time women voted in a Federal election. A War Franchise Bill passed in 1916 gave votes to women who had relatives serving in the War, the qualifying clause being removed in 1918, when women who had reached the age of 21 received the franchise. The provinces, which control their own franchise, also, Quebec excepted, gave votes to women. During the War knighthoods and other honours were freely distributed by British ministers in the name of the King, especially in connection with services relating to the War. In England, the principle is deeply rooted in social life, but to many it seemed alien to the life of Canada, and, in the end, sharp protest culminated in an undertaking by the Canadian prime minister to request the King not only to cease conferring hereditary titles on citizens of Canada, but to ask also that other honours should only be given on the advice of his Canadian ministers. Since that time, the giving of such titles has ceased in Canada.

**Prohibition.**—The period of the War brought with it great social changes. The agitation of many years in the cause of prohibition was reinforced by the sense of waste which the liquor traffic caused during the War. A wave of opinion in favour of prohibition swept over both the United States and Canada. In Canada, jurisdiction over the liquor traffic is divided, under the British North America Act, between the federal and the provincial authorities. The federal authority has control over manufacture and export, the provincial authority over sale. The federal government would not prohibit manufacture and export, but left to the provinces the right to control importation, and their right to regulate sale was never challenged. Each province has its own type of restriction. In Ontario liquor could at first be secured only at government stores on a physician's certificate of illness. The law proved too severe; a sharp reaction followed, and in 1927 the system was changed to one of strict control by government and sale to persons holding a permit to be renewed annually, but with no sale in hotels or clubs or by the glass in drinking places. In parts of Ontario the grape is easily grown and the law provides that the wine of the province may be sold by the manufacturer in bulk direct to the consumer for his own use. Quebec, in contrast with Ontario, while closing the bars and restricting the traffic, did not adopt prohibition. The laws in the other provinces vary and there is a strong tendency to ease restrictions. Monopoly of sale by government is making the traffic a source of revenue in all the provinces. A province may at any time remove or increase restrictions by an act of its legislature. In contrast, therefore, with what is possible in the United States, where prohibition is embodied in an amendment to the federal constitution, prohibition might disappear in Canada within a few months. The issue is still acute in political life.

**Radical Movements.**—During the War, railway affairs reached a crisis. The boundless optimism related to the peopling of the West had led to the construction at heavy cost of two railways, the Canadian Northern and the Grand Trunk Pacific, to make, with the Canadian Pacific, three lines across the continent. The war closed resources for capital and checked development, and, in the end, both lines were taken over by the government. The War unsettled the two old political parties and led to the organization of dissatisfied elements into new groups. Of these the most powerful was that of the farmers, who took the name of Progressives and were especially strong in the West. They

favoured freer, if not free, trade and, indeed, proposed free trade with Great Britain. The Labour party and the Socialist party have never been strong in Canada, but in the spring of 1919 Labour agitation brought on a general strike in Winnipeg. All public services were put out of commission, and during five weeks Winnipeg was the scene of a struggle unprecedented in Canada. The scenes of violence and intimidation which accompanied the closing down of the street car system and the blocking of the means of distributing supplies aroused sharp antagonism and caused the strikers to lose public sympathy. Citizens volunteered to carry on these services with so firm a resolution that the movement was defeated and Winnipeg returned to its normal activities.

A provincial election in Ontario in 1919 showed the strength of the farmers and brought a surprising defeat of what seemed a strongly entrenched Conservative government. Of 110 seats it held only 24; the Liberals had 30; and the Farmers' party and Labour combined secured 56, thus giving them a small majority. With the Hon. E. C. Drury as prime minister, a new administration was formed, dominated by the Farmers' party. In two other provinces, Alberta and Manitoba, the unsettlement of the other parties led to the coming into office of Farmers' governments which, at the end of 1927, still endured and seemed to command confidence.

**1919-25.**—Sir Wilfrid Laurier died in Feb. 1919. The cleavage in the Liberal party on the issues of the War left him a rather lonely figure during his last two years, and the problem of a successor was not easy. Quebec was the chief Liberal stronghold and it resented the action of those Liberals who had broken with Sir Wilfrid Laurier. The choice went to Mr. William Lyon Mackenzie King (*q.v.*), minister of Labour under Sir Wilfrid Laurier, and a sharer of his attitude on conscription.

Membership of the imperial war cabinet and of the peace-conference at Versailles, added to duties as prime minister, had worn down the strength of Sir Robert Borden. In 1920 he resigned and was succeeded as prime minister by Mr. Arthur Meighen (*q.v.*), a member of his cabinet. Mr. Meighen had a difficult task. The coalition was in process of disintegration, chiefly on the issue of the tariff, and one by one the Liberal members were retiring. The Liberals were returning to their former allegiance or joining with some Conservatives in the farmers' movement. In the election of Dec. 1921 Mr. Meighen stood stiffly for protection and suffered overwhelming defeat. The Conservatives carried 51 seats and the Liberals 117, among them the entire representation of Quebec, and there was the new and advanced group of 65 Progressives. Labour remained weak, returning only two members. Over the two other parties Mr. King had a majority of one. He took office but his path was difficult. Though he reached a working arrangement with the Progressive party, this support was always conditional.

The census of 1921 showed what is always desired in scantily peopled countries, a satisfactory increase of population. The principle of representation in proportion to numbers is applied to the Canadian House of Commons. Quebec has always 65 members, and those from the other provinces are in proportion to the number from Quebec. A redistribution follows each census and that of 1921 showed marked increase in population in the west. The members from Nova Scotia and Ontario were reduced by two and one respectively. New Brunswick, Prince Edward Island, and Yukon remained unchanged, while the increases in the West were Manitoba two, Saskatchewan five, Alberta four, and British Columbia one. Such changes indicate that policy must be adjusted to the needs of the relatively larger agricultural population of the West.

The Liberal government, which carried its budget in 1923 by a majority of only one, had to confront an adverse majority in the Senate, to which only Conservatives had been appointed during the Conservative régime. This situation is always a feature of Canadian political life when a government long in power quits office. In 1923 the Senate showed great activity upon railway policy. Sir Henry Thornton, the head of the vast government railway system, with more than 20,000 m. of lines, proposed to

build 26 small branch lines, chiefly in the west, as feeders of the trunk lines. The House of Commons endorsed the building of the lines at an estimated cost of \$29,000,000, but the Senate objected that, while a few of the lines might be needed, it was unwise to increase an already crushing burden of debt at a time when trade was depressed. The cost, it was also urged, would go far beyond the estimate. When the Senate rejected the proposal, its action caused sharp criticism of a body not directly responsible to the people. Since that time, the Liberal party has been committed to the reform of the Senate, a familiar cry of the party in a minority in that body. There is, however, no serious prospect of a change in the constitution.

The loss of purchasing power in Europe after the War so lowered the price of wheat as to make the market price cover little more, and often less, than the cost of production. This brought severe depression in western Canada. The cattle industry found some relief when, in 1922, after a prolonged discussion, the British government removed the embargo on the importation of live cattle from Canada. It had endured for 30 years, though the cause—disease in Canadian cattle—had long since disappeared. Canadian cattle can now be sent across the ocean to be fattened in England for slaughter. The relief in this direction was timely, for the farmers of the United States were complaining of Canadian competition. In 1922, on the plea that both land and labour were cheaper in Canada, Congress empowered the President to proclaim a tariff against Canadian grain and cattle which should represent this difference. At first the duty on wheat was 30 cents a bushel, and on oats 15 cents, but in 1924 the President increased the duty on wheat to 42 cents, with proportionate duties on other produce and on sheep and cattle. The duty on wheat affected but slightly the Canadian producer, since the price is determined in the world market.

**The Election of 1925.**—The Progressive or Farmers' movement, which meant a three-party system like that in England, was essentially a class movement, and soon showed signs of disintegration. One element, persistently friendly to the Liberal party, was opposed by a so-called "ginger group," which decried party government and favoured the making of specific changes and reforms by using their members to support Liberals or Conservatives as occasion might offer. The discontent with the old parties, so urgent during and after the War, spent itself rapidly, as experience showed that conditions did not favour class government. In 1923, the Farmers' government in Ontario was badly beaten at the polls and a stable conservative government took office with Mr. G. Howard Ferguson as prime minister. In the agricultural West the Farmers' party has proved more enduring, but there, too, the drift back to the two-party system has been marked. In 1925, Mr. Mackenzie King, weary of the uncertain support from the Progressives, dissolved parliament a year before the end of its term, and appealed to the country for a decisive Liberal majority. The long strain of war and of unsettlement after war had increased the public debt to an amount which represented about \$300 for each inhabitant of Canada. The cost of government had risen to about \$1,000,000,000 yearly, when federal, provincial, and municipal taxes were included, and there was a large deficit on the two great railway lines united to form the Canadian national railways. Burdens so heavy necessarily hampered commerce. While the farmer, competing in an unprotected world market, complained of the high prices paid to the protected manufacturer, he, in turn, complained that the tariff was so low as to enable the mass production of the United States to close Canadian factories, and that Canadians, unable to secure employment at home, were going in considerable numbers across the frontier. The reduction of one-third of the tariff in favour of British imports, it was claimed, was ruining especially the textile industry.

This cleavage on the tariff fortified sectional cleavage. The maritime provinces resented the more rapid development of the provinces farther West. In the previous election Quebec had sent only Liberals to Parliament, and this unanimity was rather on racial than on political grounds, in antagonism to English-speaking Ontario. The agricultural West thought it was being

exploited by the industrial East. During the election in October all these grievances found expression. The result showed a weakening of the hold of both the Liberals and the Progressives. The Conservatives, with 117, were the strongest party. The Liberals had 102 and the Progressives 23, and there were two or three Independents. No party had a majority. Union between the protectionist Conservatives with low-tariff Progressives to turn out Liberals who denounce protection would involve a paradox. Mr. King consequently did not resign, but faced the new parliament, hoping that on any question of confidence he would have the support of Progressives. On June 28, 1926, this support again proved unstable and, following the refusal of the governor-general to dissolve parliament, Mr. King resigned, and his place was taken by the Conservative leader, Mr. Arthur Meighen.

**Constitutional Crisis.**—The Governor-General, Lord Byng, had refused Mr. King a dissolution on the ground that it would be disturbing to have a second election within a year and that, as Mr. Meighen was the leader of the most numerous party in the House of Commons and thought that he could command a majority, it was fair to call him to office. Mr. King challenged the constitutional right of the Governor-General to refuse the advice of the prime minister to dissolve, and a complex situation arose when, within a few days after taking office, Mr. Meighen was defeated in the House and an instant dissolution followed with, of course, Lord Byng's consent. His course became a leading issue in the election and, since Mr. King was returned to office, the constitutional principle seemed to be established that the Crown cannot refuse a dissolution asked for by a prime minister. The tariff was another issue, and the Conservatives laid stress on charges against Mr. King's government of lax administration of the customs service. With a frontier running for some 3,000 m. with that of the United States, to prevent smuggling is difficult. At some points, the customs officials had been corrupted and the revenues of Canada were being robbed to the extent of many millions of dollars a year. The election showed the further disintegration of the Progressives and the result was that in the autumn of 1926 Mr. King had a small majority, made up by Liberal gains from both Progressives and Conservatives and by the union with the Liberals of a section of Progressives, elected as such, with Mr. Forke, the Progressive leader, joining the Liberal cabinet.

In 1927, on Mr. Meighen's resignation, the Conservative Party, with general approval, chose as leader Mr. R. B. Bennett, from Calgary in the far West, in itself evidence of the shifting of political power westward. By 1928 a buoyant sense of prosperity was general and this eased the position of the Liberal Government, for the feeling of better security produced by this prosperity, coupled with the fact that there was no apparent outstanding issue likely to disturb the then existing political situation, made it improbable that any political event would occur which would be likely to precipitate a general election before the allotted date in 1930.

**BIBLIOGRAPHY.**—Shortt and Doughty, ed. *Canada and its Provinces* (Toronto, 1910, bibl.) covers history and resources. The general history of Canada is told in a popular series: *The Chronicles of Canada* (Toronto, 1912, bibl.). The series, *The Makers of Canada* (new ed. 1926) covers the chief figures in Canadian history. On the French period, Francis Parkman, *Works* (many editions) is valuable. G. M. Wrong, *The Rise and Fall of New France* (1928, bibl.) covers the whole French period. There is no recent general work on the English period except the several series mentioned above; O. D. Skelton, *Life and Letters of Sir Wilfrid Laurier* (1921) touches the chief problems of Canadian history since 1870. *The Canadian Annual Review of Public Affairs* (Toronto, annually) gives full accounts of politics and finance, and *The Canada Year Book* (Ottawa, annually, statistical) is useful. *The Canadian Historical Review* (Toronto, quarterly) is a guide to literature relating to Canada. See also the bibliography contained in the last volume of the *Cambridge Modern History*. (G. M. W.)

#### CONSTITUTIONAL DEVELOPMENT

During the Imperial Conference of 1911, dominion delegates for the first time received important confidential information upon foreign relations. It was resolved, on the motion of Sir Wilfrid Laurier, that the British Government should secure the consent of foreign powers that any dominion might withdraw from the opera-

tion of a treaty affecting that dominion, without impairing the effectiveness of the treaty for the rest of the Empire. A rather ineffective resolution was passed as to consultation with the dominions respecting the negotiation of international agreements affecting them.

In 1912 Sir Robert Borden, the prime minister, and three of his colleagues, attended a meeting of the imperial defence committee at which the foreign relations of the British Commonwealth and the necessary safeguards against aggression were usefully discussed. In the same year the British Government gave assurances to the Government of Canada that, pending a final solution of the question of voice and influence in foreign relations, a dominion minister resident in London should be regularly summoned to the committee of imperial defence and regarded as one of its permanent members, and that no important step in foreign policy would be undertaken without consultation with such representative.

In Oct. 1916 the Canadian Government established in London a ministry of overseas military forces with a resident minister. This department was charged with the administration of military affairs overseas, and with the expenditure connected therewith. Eventually it became an overseas Canadian war office. Military operations in the field were under the final direction of British general headquarters, but otherwise the Canadian forces serving in the war were administered as a thoroughly autonomous body, under the primary direction of the overseas ministry, with ultimate responsibility to the Canadian Government and Parliament.

**The Imperial War Cabinet and War Conference.**—The prime minister of Canada was summoned to and attended a meeting of the British cabinet in 1915. This was regarded as an event of constitutional significance. In 1917, however, a more important step was taken. The British prime minister called into operation the imperial war cabinet. It included the five ministers of the British war cabinet, the prime ministers of the dominions, and a representative from India. Thus ministers for all the self-governing nations of the Empire sat on terms of equality at a common council board, acting in co-operation and responsible to their respective Parliaments. Each minister, or group of ministers, represented a government, and the conference might fairly be termed a Cabinet of governments. In 1917 the British Government advanced the view that it had authority to requisition ships owned and registered in Canada. This view was effectively controverted by the Canadian government, which held firmly to the principle that, in such cases, the executive power was properly vested in the government of the dominion. The legal power which undoubtedly existed was effectively limited by the controlling force of constitutional right.

The Imperial Conference sat as the Imperial War Conference in 1917 and 1918, and was occupied with questions not directly concerned with war measures and operations. In 1917 the question of immigration from India to the dominions was considered, and the principle of reciprocity of treatment between India and the dominions was adopted by resolution as a working basis. The most important contribution of the conference in that year was a resolution to which the British Government was a party, recognizing the dominions as autonomous nations of an imperial commonwealth, with the right of Canada, the other dominions, and India to an adequate voice in foreign policy and in foreign relations. This resolution, which formed the basis of future co-operation, gives distinct recognition to equality of nationhood between the dominions and the mother country.

**The Dominions and the League of Nations.**—The principle thus established was carried to its logical conclusion at the Peace Conference of 1919, at which Canada, the other dominions, and India were distinctively represented by their delegates. There was serious opposition at Paris to such distinctive representation; but the insistence of the dominions, with the strong support of the British Government, eventually prevailed. The imperial war cabinet functioned at Paris under the designation of the British Empire delegation.

It was determined that Canada, the other dominions, and India should be parties to the peace treaty and members of the League of Nations, and that the treaty should be signed by dominion and

Indian plenipotentiaries and submitted for approval to dominion parliaments. This decision involved the recognition by foreign powers of the dominions as nations on an equality with Great Britain.

In 1918 a resolution of the Imperial Conference acknowledged the inherent function of each dominion government and of India to enjoy complete control of the composition of its population by restricting immigration from any other communities. In the same year the conference by resolution declared that the prime ministers of Great Britain and of the dominions should have the right to direct communication with each other. This principle was reaffirmed at the conference of 1921. A Canadian war mission had been established at Washington at the beginning of 1918. It was, in effect, although not in form, a diplomatic mission, and during the last year of the war and the first year of reconstruction it proved of great service. In view of this, the Canadian prime minister discussed with British ministers in 1919 the right of legation, which was acknowledged by an arrangement announced to the Canadian parliament in 1920. The proposed appointment of a Canadian minister at Washington was not to denote any departure from the principle of the diplomatic unity of the British Empire.

In 1921 the Canadian parliament passed an important measure to define Canadian nationals, which was rendered necessary by the status of Canada under the Versailles treaty and especially as a member of the League of Nations. In the same year the voice of Canada and of other dominions with regard to the proposed renewal of the Anglo-Japanese treaty exercised an important influence upon the subsequent course of events.

**Washington Conference.**—The President of the United States did not extend to Canada and the other dominions invitations to the disarmament conference (1921) at Washington. Precedent existed for separate invitations, and there was a question whether certain dominions would not stand aloof. It was wisely decided that the absence of special invitations should be overlooked and that the dominions should be represented at Washington by their special plenipotentiaries, to whom full powers should be issued under the practice established at Paris in 1919. In the result the status and distinctive consideration that the dominions had received at Paris were accepted at Washington, and each dominion plenipotentiary signed on behalf of his government.

**The Canadian Model for the Irish Free State.**—The agreement (Dec. 6, 1921) between Great Britain and Ireland, which was subsequently ratified by imperial statute, provides that the Irish Free State shall have the same constitutional status as the dominions and that its position in relation to the imperial parliament and government shall be that of the Dominion of Canada. By Article 1 of its constitution it is declared to be "a co-equal member of the Community of Nations forming the British Commonwealth of Nations."

**The Treaty Power.**—A question having arisen about the signing and ratification of treaties which concern only the interests of one dominion, the whole subject was under consideration at the Imperial Conference of 1923, when principles were formulated and procedure laid down which should govern such cases and which fully recognize the right of each dominion to negotiate and enter into a treaty affecting only its own interests, but not without due consideration of its possible effect on other parts of the commonwealth or on the commonwealth as a whole. Such a treaty, imposing obligations on one part only, should be signed by a representative of the government of that part. The ratification of such a treaty is effected at the instance of the government concerned.

The Anglo-French treaty of 1919 (defence of France) which was ratified by the British Parliament, but which never came into force as the corresponding treaty between the French republic and the United States was not ratified, provided that it should impose no obligation upon any of the dominions unless and until it should be approved by the parliament of the dominion concerned. The security pact (Locarno, Oct. 16, 1925) between Germany, Belgium, France, and Great Britain provides (article 9) that it shall impose no obligation upon any of the British dominions or upon India unless the government of such dominion or of India signifies its acceptance. In the one case Parliament, in the

other case the Government, must approve. At Locarno the dominions did not take part in the negotiations, and it does not appear that they were invited to do so. Thus, at Locarno there was a distinct departure from the spirit of the 1917 resolution and from the precedent established at Paris. The reasons for such departure have not been made public. (R. L. B.)

**Definition of Equality with Great Britain.**—Following this development, the movement towards full recognition as nations of the dominions reached the climax in the Imperial Conference in Oct. 1926. The agreement was then made and confirmed by subsequent legislation that the King's title should be changed to read "By the Grace of God, of Great Britain, Ireland, and the British Dominions beyond the Seas, King, Defender of the Faith, Emperor of India." The changed title places Canada and Great Britain in the same relation to the King and it involved that the Governor-General should not be regarded as the representative of the Government of Great Britain but as that of the Crown, with functions analogous to those of the King in Great Britain. The decisions of the conference of 1923 were extended to embody the principle that while all treaties with foreign countries should be made in the name of the King and with regard to all interests affected by them, "the various British units should have full powers issued in each case by the King on the advice of the Government concerned." Thus a treaty made by Canada would be made in the name of His Majesty the King "for the Dominion of Canada," just as that for Great Britain would be made "for Great Britain and Northern Ireland and all parts of the British Empire which are not members of the League of Nations." The right of each dominion to negotiate directly with foreign governments was fully recognized and the principle was laid down that a dominion is bound only by a treaty signed by its representative. Membership of the League of Nations was taken as the guarantee of international status, so that for this status the Treaty of Versailles was recognized as the Magna Charta of the dominions. The conference could only express opinions which had in themselves no legal validity and involved many anomalies such as that Canada, though a nation, would change its constitution only by an Act of the British Parliament and that, should Great Britain declare war, Canada was also legally at war. The British mind does not attempt to apply logic in politics, and British constitutional practice is not based on formal law. Immediately after the conference, Canada, following what the Irish Free State had already done, appointed a minister plenipotentiary to the United States, and the changed status of the Governor-General was made clear when, in 1927, he visited Washington and was received with the formalities accorded to a reigning sovereign.

In effect, the British Commonwealth may now be regarded as a league of nations, owning a single allegiance. In all essentials touching its continued existence and development there must be a real unity among its members, based upon common ideals of liberty and autonomy and upon close and sympathetic co-operation between the Commonwealth governments. Each, with due regard to its own point of view and special interests, must survey the aspects of external relations from the higher standpoint of Commonwealth unity and welfare.

(G. M. W.)

In addition, the Canadian Geological Survey has published (Ottawa, 1845) a series of reports covering a great number of subjects. Several provinces have bureaux or departments of mines, also issuing reports. The various departments of the federal and the provincial governments publish annual reports and frequent special reports, such as the decennial report on the census, from which a vast quantity of information may be obtained. Most of this is summed up in the *Canada Year Book*, published annually by the Bureau of Statistics of the Department of the Interior (Ottawa). See also *Atlas of Canada*, published by the Department of the Interior (Ottawa, 1915); the *Canadian Annual Review* (Toronto, 1901); A. P. Coleman and W. A. Parks, *Elementary geology, with special reference to Canada* (London, 1922); W. P. M. Kennedy, *The Constitution of Canada* (Toronto, 1923); Sir E. Walker, *A History of Canadian Banking* (Toronto, 1909); W. T. Jackman, *Economics of transportation* (Toronto, 1926); H. A. Innis, *A History*

*of the Canadian Pacific Railway* (London, 1923); A. H. R. Buller, *Essays on wheat* (Toronto, 1919); W. P. Davisson, *Pooling wheat in Canada* (Ottawa, 1927); H. A. Innis, *The fur trade of Canada* (Toronto, 1927); J. Mavor, *Niagara in politics* (New York, 1925); *National problems of Canada*, McGill University Economic Studies (Montreal, 1925); P. Sandiford, "Canada" in *Comparative Education* (London, 1918). A good general account of Canada is to be found in the *Handbook of Canada* (Toronto, 1924), published on the occasion of the visit of the British Association to Canada in 1924.

(W. S. WA.)

CANADA-KANSAS CITY-GULF ROAD

region west of the Mississippi river for a distance of about 1,600 m. and includes Minneapolis, St. Paul, Fort Dodge, Kansas City, Joplin, Shreveport and Lake Charles in its course.

**CANADA THISTLE**, the creeping thistle (*Cirsium arvense*) of Europe, now extensively naturalized in North America, where

BY COURTESY OF THE IOWA GEOL. SURVEY  
CANADA THISTLE, A PESTIFEROUS WEED, 1 TO 3 FT. HIGH, OFTEN INJURIOUS TO GROWING CROPS and in waste grounds before the seeds mature are the most effective means of control. (See THISTLE.)

it is found in fields and waste grounds from Newfoundland to British Columbia and southward to Virginia and California. In many places it is an exceedingly pernicious weed. It is a low perennial, 1 ft. to 3 ft. high, creeping extensively by horizontal rootstocks and forming patches. The smooth, grooved stems, somewhat branched above, bear deeply cut, exceedingly prickly leaves and numerous clustered, purple or white flower-heads about 1 in. broad. As the plant spreads by long, underground rootstocks as well as by innumerable wind-borne seeds, it is very difficult to eradicate. Intensive cultivation of field crops and rigorous cutting of the plant along roadsides are the most effective means of control. (See THISTLE.)

**CANADIAN ARCTIC ISLANDS** comprise the archipelago which lies north of Canada with Davis strait, Baffin bay, Smith sound and its northward continuation on the east and the Beaufort sea on the west. As far as is known the most northern land, Cape Columbia 83° 7' N., is about half a degree south of the northern

cape of Greenland. The largest islands are Baffin, Ellesmere and Victoria, which are about 211,000, 76,600, and 74,000sq.m. respectively. The total land area of the archipelago is about 550,000 square miles. Baffin island contains several large, little known lakes. The loftiest land is in the east where Baffin and Ellesmere islands rise to 5-6,000ft. In the middle the islands are low but in the west of the archipelago there are elevations of 3,000ft. The islands are built mainly of Palaeozoic strata laid down on the submerged border of the Archaean shield of Canada. In central Victoria island, Melville and Boothia peninsulas, parts of Baffin, Devon and Ellesmere islands, there are large areas of Archaean rock. To the north of this old shield heavy folding occurs in the Palaeozoic rocks of Ellesmere island and has been traced eastward into Northern Greenland. In parts there are gently folded Triassic and Tertiary beds overlying the Palaeozoic strata. Permanent ice occurs only in parts of Baffin, Devon, Ellesmere and Heiberg islands and nowhere does it mask completely the underlying relief. Islands further west are too low and have too little precipitation for glaciers to form. The channels between the islands due to erosion and faulting in the depressed plateau, are mostly shallow and, being landlocked, are liable to be blocked with pack ice. It was this ice which made the chief difficulties in the long search for a north-west passage and makes that passage useless for commerce. Winter snowfall being slight, there are two to three months in summer during which the low ground is free from snow. This allows mean temperatures to rise to over 40° and absolute maxima to reach 60° or more at that season. Vegetation is a form of open tundra which is luxuriant and bright in summer. Animals include the caribou, musk-ox, polar bear, wolf, fox, hare, lemming, ermine and glutton as well as seals, walrus and narwhal. Eskimo inhabit the southern and eastern islands and apparently had once a wider range towards the north-west. As far as is known the only minerals of economic value are native copper in Victoria and Prince of Wales islands and a few scattered deposits of coal and lignite. The islands were explored in the course of the search for a north-west passage and especially during the Franklin search expeditions (see ARCTIC REGIONS). Later work has been done in the north by A. W. Greely, R. E. Peary, D. B. Macmillan and others; in the south by R. Amundsen; in the west and north-west by O. Sverdrup and V. Stefansson, and in the east and south by the patrols of the Royal Canadian mountain police who have posts at Pangnirtung fjords, Ponds inlet and Lake Harbour on Baffin island, Dundas Harbour on Devon island and at Craig Harbour and on Bache Peninsula in Ellesmere island. Some of the coast lines are still imperfectly charted and the interiors of many of the islands are unknown. The cession of territorial rights in 1869 by the Hudson's Bay Company brought its territories, including many of the islands, under the new Dominion of Canada, and in 1880 the Imperial Government granted to Canada all British territory in the northern waters of America between 60° and 141° W. The islands now form the greater part of the Franklin district of the North-West territories. The whole of the area except the eastern part of Baffin island is now administered as a preserve for the Eskimo. Ottawa is the centre of administration. The construction of a wheat port at Nelson in Hudson bay will bring a certain amount of summer traffic to Hudson strait. The Canadian Government sends a vessel annually to visit the police posts.

**BIBLIOGRAPHY.**—In addition to books on Arctic Regions (*q.v.*) especially those in the Franklin search expeditions, see O. Sverdrup, *New Land* (1904); J. E. Bernier, *The Cruise of the Arctic* (Ottawa, 1909); V. Stefansson, *My Life with the Eskimo* (1913), *The Friendly Arctic* (1921), *The Northward Course of Empire* (1922); K. Rasmussen, *Across Arctic America* (1927); *Report of the Canadian Arctic Expedition 1913-18* (Ottawa, 1919-25); and *Canada's Arctic Islands* (Ottawa, 1927); *The Arctic Pilot III*. (1915) gives full details of the topography.

**CANADIAN LITERATURE (IN ENGLISH).** Perhaps the most notable examples of Canadian literature in English are to be found in the field of history, where the outstanding achievement is *Canada and its Provinces* (1913 *seq.*), a comprehensive history of the country in 23 volumes, edited by Dr. A. G. Doughty and Dr. Adam Shortt, and counting among its contributors most of the recognized authorities on Canadian history,

biography and economics. Another notable essay in Canadian history is the series known as the *Chronicles of Canada* (1920 *seq.*) in 32 volumes, edited by G. M. Wrong and H. H. Langton, each volume by a competent Canadian writer.

Of individual works, William Kingsford's (1819-98) *History of Canada* (1887-98), in 10 volumes, is still the most ambitious, carrying the story of the country from its earliest beginnings down to the Union of 1841. In the main it is accurate, but the style is heavy and unattractive. J. C. Dent's (1841-88) *Last Forty Years* (1880) is practically a continuation of Kingsford. Dent also wrote an interesting but one-sided account of the Rebellion of 1837-38. A useful but somewhat perfunctory general history is F. B. Tracy's *Tercentenary History of Canada* (1908). This comes down to the first decade of the 20th century. Robert Christie's (1788-1856) *History of Lower Canada* (1848-55), was the first serious attempt to deal with the period of British rule, and is still useful. Histories of the Maritime Provinces have been written by Thomas Chandler Haliburton (1796-1865), Beamish Murdoch (1800?-1876), and James Hannay (1842-1910). Haliburton's is much the best of the three, but none covers the later history of these provinces. The brief but stirring history of western Canada has been told by Alexander Begg (1840-98) and his namesake (1825-1904), by George Bryce (b. 1844), and in such special studies as Agnes Laut's (b. 1871) *Conquest of the Great Northwest* (1908) and L. J. Burpee's (b. 1873) *Search for the Western Sea* (1908). F. O. S. Scholfield's (1875-1919) and F. W. Howay's *British Columbia* deals comprehensively with the history of that province. Brief and popular histories of Canada have been written by J. M. McMullen (1820-1907), Charles G. D. Roberts (b. 1860), Sir John Bourinot (1837-1902), W. L. Grant (b. 1872), and George Bryce. But perhaps Canadian scholarship and research are shown at their best in such special works as A. G. Doughty's (b. 1860) *Siege of Quebec* (1901-2), William Wood's (b. 1864) *Fight for Canada* (1905), Sir C. P. Lucas' (1926) *Canadian War of 1812* (1906) and *History of Canada 1763-1812* (1909), and D. C. Harvey's *French Régime in Prince Edward Island*. Such books as Sir Robert Borden's (b. 1854) *Canada and the Commonwealth* (1928) and Mackenzie King's (b. 1874) *Message of the Carillon* (1927) serve to prove that Canadian statesmen sometimes put their thoughts into print. Standard works in their several fields are Alpheus Todd's (1821-84) *Parliamentary Government in the British Colonies* (1880), Sir John Bourinot's *Parliamentary Procedure and Practice* (1884), W. P. M. Kennedy's *Constitution of Canada* (1922), and the series of *Canadian Constitutional Documents* (1914-18) edited by Doughty, Shortt and McArthur.

Canadian biography has been devoted mainly to political subjects. The most important work in this field is *The Makers of Canada*, published in a new and revised edition in 1926, in 12 volumes, including an *Encyclopaedia of Canadian History*. Each of the 31 biographies is by a competent Canadian writer, and the series is edited by W. L. Grant. An indispensable work is W. S. Wallace's *Dictionary of Canadian Biography* (1926). Other important biographies are Sir Joseph Pope's (1854-1926) *Sir John Macdonald* (1894), O. D. Skelton's (b. 1878) *Sir Alexander Galt* (1920) and *Sir Wilfrid Laurier* (1921), E. M. Saunders' (1829-1916) *Sir Charles Tupper* (1916), Isabel Skelton's (b. 1879) *Thomas D'Arcy McGee* (1925), C. R. W. Biggar's *Sir Oliver Mowat* (1905), Beckles Willson's *Lord Strathcona* (1915), L. J. Burpee's *Sir Sandford Fleming* (1915), Sir John Willison's (1856-1927) *Reminiscences* (1919), John Boyd's *Sir Georges Etienne Cartier* (1914), Harvey Cushing's *Sir William Osler* (1925), Sir Richard Cartwright's (1835-1912) *Reminiscences* (1912), Arnold Haultain's *Goldwin Smith* (1913), and James Mavor's (1854-1925) *My Windows on the Street of the World* (1924).

In the literature of such a country as Canada books of exploration and travel fill relatively a much larger place than in the literature of older countries. The original narratives of such discoverers as Jacques Cartier, Champlain, La Salle, Radisson, La Vérendrye, in the French period; of Mackenzie, Thompson, Fraser, Cook and Vancouver in the west; and of Hudson, Foxe, James, Franklin, Hearne, Back, and many others, in the far north, are to-day very

rare in their early printed form, or have remained until recently in manuscript. Thanks largely to such agencies as the Champlain Society, many of these journals have been in recent years either printed for the first time or reprinted, with scholarly notes and introductions. It is appropriate to note here the important contributions made to Canadian history, literature and science, through such agencies as the Public Archives, the National Museum, the Royal Society of Canada, and the Canadian reviews.

In literary essays very little has as yet been accomplished, unless we may count Goldwin Smith (*q.v.*) as in some sense a Canadian. As a scholar, a thinker, and a master of pure English he exerted a marked influence upon Canadian literature and life, though some of his political views made very little appeal to Canadian sentiment. Some of the books of Stephen Leacock (b. 1869), Archibald MacMechan (b. 1862), Peter McArthur (1866-1924), and W. H. Blake (1861-1924) deserve to be mentioned here.

**Poetry.**—Imaginative literature has not yet reached very high levels. Mediocrity is the prevailing characteristic of much that passes for poetry in Canada, though a few writers have produced meritorious work. The conditions of Canadian life, as already suggested, have not been altogether favourable to the birth of great poets, but within the limits of their song such men as Archibald Lampman (1861-91), William Wilfred Campbell (1861-1918), Charles G. D. Roberts, Bliss Carman (b. 1861), Duncan Campbell Scott (b. 1862), George Frederick Cameron (1854-85) and Frederick George Scott (b. 1861) have written verses that are well worth remembering. Lampman's poetry is perhaps the most finished and musical. Campbell's poetry, in spite of a certain lack of compression, is full of dramatic vigour; Roberts has put some of his best work into sonnets and short lyrics, while Carman has been very successful with the ballad; the simplicity and severity of Cameron's style won the commendation of even so exacting a critic as Matthew Arnold. Charles Mair (1840-1927) was a survival from the pioneer period. His long narrative poem *Tecumseh* (1886) is on the whole a fine piece of work. One remarkable drama, *Soul* (1857), by Charles Heavyside (1816-1876), belongs to Canadian literature. Though unequal in execution, it contains passages of exceptional beauty and power. The sweetness and maturity of the verses of Isabella Valency Crawford (1851-87) are also worthy of remembrance. The *habitant* poems of W. H. Drummond (1854-1907) stand in a class by themselves, between English and French Canadian literature, presenting the simple life of the farmer of Quebec with sympathy, humour, and picturesqueness. Marjorie Pickthall (1883-1922) produced three little volumes containing verse of unusual charm. John McCrae (1872-1918) will be remembered because of his one heart-stirring poem "In Flanders Fields." Of the more recent writers Wilson Macdonald stands easily first. His *Out of the Wilderness* (1926), marks him as a poet who may be expected to do even more notable work in the future. Other new Canadian poets whose work rises above mediocrity are Norah Holland, Beatrice Taylor, E. J. Pratt, and Louise Morey Bowman. Collected editions are now available of the works of Lampman, Roberts, Carman, Campbell, Mair, D. C. Scott, F. G. Scott, Drummond and Pickthall. Selections from the poems of these and other Canadian writers are found in the following anthologies:—W. D. Lighthall's *Songs of the Great Dominion* (1889), Wilfred Campbell's *Oxford Book of Canadian Verse*, John W. Garvin's *Canadian Poets* (1925), Theodore Rand's *Treasury of Canadian Verse* (1900), L. J. Burpee's *Flowers from a Canadian Garden* (1909) and *Century of Canadian Sonnets* (1910). Two books that may be noted here are C. M. Barbeau's *Folk Songs of French Canada* (1925) and J. M. Gibbon's *Canadian Folk Songs* (1927).

**Fiction.**—The first distinctively Canadian novel was John Richardson's (1796-1852) *Wacousta* (1832), a stirring and readable tale of the war of 1812. Richardson afterwards wrote half a dozen other romances, dealing chiefly with incidents in Canadian history. Susanna Moodie (1803-85) and Katharine Parr Traill (1802-99), sisters of Agnes Strickland, contributed novels and tales to one of the earliest and best of Canadian magazines, the *Literary Garland* (1838-47). *The Golden Dog*, William Kirby's

(1817-1906) fascinating romance of old Quebec, first appeared in 1877 in a pirated edition. Twenty years later the first authorized edition was published, and it has often been reprinted. James de Mille (1833-80) was the author of some 30 novels, the best of which is *Helena's Household* (1868), a story of Rome in the 1st century. *The Dodge Club* (1869), a humorous book of imaginary travel, appeared, curiously enough, a few months before *Immocents Abroad*. De Mille's posthumous novel, *A Strange Manuscript found in a Copper Cylinder* (1888), is a penetrating satire upon the modern worship of wealth. In form it anticipated the romances of Rider Haggard. Sir Gilbert Parker (b. 1862) has made good use in many of his novels of the inexhaustible stores of romantic and dramatic material that lie buried in forgotten pages of Canadian history. Charles W. Gordon, "Ralph Connor" (b. 1866) is probably the most popular of Canadian novelists. His stories deal largely with pioneer life in the West, as those of Robert Stead (b. 1880) are devoted to western farm life of the present day. Sara Jeannette Duncan (Mrs. Everard Cotes, 1862-1922) published a very entertaining book of travel fiction, *A Social Departure*, in 1890. Between that year and 1914 she wrote nearly a score of light and readable novels. Lucy M. Montgomery (Mrs. McDonald, b. 1877) and Frederick William Wallace (b. 1886) stand easily first among present-day novelists of the Maritime Provinces. In *Anne of Green Gables* (1908) and its successors Mrs. McDonald has written a series of very delightful books for girls. Mark Twain wrote to a friend, according to Dr. MacMechan, "In Anne Shirley you will find the dearest and most moving and delightful child of fiction since the immortal Alice." F. W. Wallace is the author of a number of stories of the deep sea fishermen of Nova Scotia and the glorious days of the "Blue-nose" clipper ships. He has also produced two more serious books, *Wooden Ships and Iron Men* (n.d.) and a sequel *In the Wake of the Wind Ships* (1927). While these two are not fiction, C. H. J. Snider has combined history with fiction in his tales of the Great Lakes and the war of 1812, *In the Wake of the Eighteen Twelves* (1913) and other books of the same character. Mrs. L. Adams Beck, of Victoria, B. C., writes fascinating tales of the Orient under her own name, and equally readable historical novels under the pen-name of "E. Barrington." In the Prairie Provinces a rather remarkable group of Scandinavian-Canadian novelists has been doing good work in the interpretation of the life of their people in the new environment of the Canadian west. The outstanding names in this group are Martha Ostenso, Philip Grove, and Laura Salverson. Both the first-named and Mazo de la Roche, of Toronto, have won very large money prizes against hundreds of competitors in fiction contests in the United States. An exceptionally effective group of short stories is Marjorie Pickthall's *Angels' Shoes* (1923), and a remarkable autobiography in the form of fiction is Philip Grove's *A Search for America* (1927).

Children's books of distinct merit are Cyrus MacMillan's *Canadian Wonder Tales* (1918) and *Canadian Fairy Tales* (1922), H. A. Kennedy's *New World Fairy Book* (1904), Isabel Eccleston Mackay's *The Shining Ship* (1918), Marjory MacMurchy's *The Child's House* (1923), T. G. Marquis' *The King's Wish* (1924), which has been put into Braille type for the blind, Marshall Saunders' *Jimmy Goldcoast* (1924), Helen B. Sandwell's *Valley of Colour Days* (1924) and the animal stories of Charles G. D. Roberts and Ernest Thompson Seton.

Thomas Chandler Haliburton (*q.v.*) stands in a class by himself. In many respects he is the most striking figure in Canadian literature. He is best known as a humorist, and he has been compared with the creators of "My Uncle Toby" and Pickwick. But there is more than humour in Haliburton's books. He lacked, in fact, but one quality to make him a great novelist: he had no conception of how to construct a plot. But he knew human nature, and knew it intimately in many of its phases; he could construct a character and endow it with life; his people talk naturally and to the point; and many of his descriptive passages are admirable. Those who read Haliburton's books only for the sake of their humour will miss much of their value. His inimitable *Clockmaker* (1837) as well as such of his later books as *The Old Judge* (1849), *The Attaché* (1843), *Wise Saws and Modern Instances*

(1853) and *Nature and Human Nature* (1855), are mirrors of colonial life and character.

Lee, *Bliss Carman* (1912); Pelham Edgar, "English Canadian Literature," *Camb. Hist. Eng. Lit.* vol. xiv. (1916). (L. J. B.)

**CANADIAN LITERATURE (IN FRENCH).** Early in the 20th century, French Canadian literature entered upon a period of revival and rapid progress. This should not, however, be allowed to obscure the fact that important works were produced earlier, and laid the foundation for the intellectual movement of the 20th century.

The French language was introduced by the colonists of the 17th and 18th centuries, and has been preserved down to the present day in great purity by all groups of French Canadians, particularly those of the French province of Quebec. Some of the older forms of the language have been preserved more accurately than in France itself; for linguistic development has been less rapid in Canada owing to the smaller number of persons who speak French and their distance from the mother country. Canadian French has, moreover, been enriched by new words of Canadian origin. About 1860 several writers, living in the province of Quebec, combined to form an intellectual movement which led to an improvement in the quantity and quality of French Canadian literature. The leaders were the Abbé Raymond Casgrain, Antoine Gérin-Lajoie, Hubert Larue and Joseph-Charles Taché.

Even before this time, however, there were writers whose works deserve to be remembered, and whose influence made itself felt on those who followed them. One of the most important names in the early history of French Canadian literature is that of Etienne Parent (1802-74), who was for many years editor of the first French Canadian journal *Le Canadien*, and who was also the author of a number of articles on political and social questions.

**History.**—The eloquent *Histoire du Canada* of François-Xavier Garneau (1809-66) (q.v.), which began to appear in 1845, is, in spite of its defects, a standard work which still retains its value. Garneau did not have access to all the sources of information which modern research has made available, and his style is sometimes over-enthusiastic, but his history formed the basis of all the historical studies written after it. Somewhat later than Garneau, the Abbé J.-B. A. Ferland (1805-65) published a *Cours d'Histoire du Canada* which gives an excellent account of French rule in the country.

One of the principal historians of the early period of French Canadian literature is Antoine Gérin-Lajoie (1824-82) who published a well-documented political study entitled *Dix ans d'Histoire du Canada, 1840-1850*, describing the struggles which preceded the setting up of responsible government after the Act of Union between Upper and Lower Canada in 1840.

The Abbé Raymond Casgrain (1831-1904) was a historian who combined learning with imagination. His works include skilfully composed descriptions of episodes in national history, such as *Pèlerinage au Pays d'Évangéline* (1885), *Montcalm et Lévis* (1891) and *Une Seconde Arcadie* (1894).

Benjamin Sulte (1841-1923) belonged to the generation of Canadian historians who explored both the wider and the more detailed aspects of history. After publishing *L'Histoire des Canadiens-Français* (1882-84) he wrote a number of studies and monographs on special problems of Canadian history. Joseph-

Edmond Roy (1858-1913) was undoubtedly one of the most painstaking historians of the end of the last century. His *Histoire de la Seigneurie de Lauzon*, in five volumes, contains most valuable information on the history of popular manners and customs.

In the 20th century history continued to be the most important branch of French Canadian literature. More rigorous scientific methods were, however, adopted. The Abbé Auguste Gosselin wrote the history of the Catholic Church in Canada in the form of episcopal monographs. Mgr. Amédée Gosselin, archivist of the Laval University of Quebec, published an abundantly documented study, *L'Instruction au Canada sous le régime français* (1911).

Thomas Chapais, professor at the Laval University of Quebec, has won a high place among French Canadian historians by his numerous works, which are notable for their objective character. He published monographs on *Jean Talon*, commissioner of the king of France in Canada (1904) and on the *Marquis de Montcalm* (1911). He then published his *Cours d'Histoire du Canada* in four volumes, dealing with the English rule from 1760-1850, which is dedicated to the Laval University. His great authority as a historian is largely due to his careful research work combined with the vitalizing influence of strong feeling and a lofty style.

The Abbé Lionel Groulx, professor at the University of Montreal, has published historical works which a strong nationalist tendency sometimes prevents from being altogether reliable. Among them are *La Confédération Canadienne* (1918); *La Naissance d'une Race* (1919), *Lendemain de Conquête* (1920) and *Vers l'Émancipation* (1921).

**Poetry.**—Canadian poetry found its first inspiration in national history. The earliest poetic school which arose at Quebec was a school of patriotic poetry. This was one of the manifestations of the literary movement of 1860.

Octave Crémazie (1827-79) (q.v.), the first French Canadian poet, wrote patriotic verse inspired by memories of the French régime. *Le Chant du vieux Soldat Canadien* was one of his most popular poems with his fellow-countrymen, who shared his attachment to France and to their own French origin. His *Drapeau de Carillon* celebrates a victory of Montcalm. He also wrote poems dealing with European events, such as *La Guerre de Crimée* and *Castelfidardo*. He wrote a certain number of philosophical poems, including *Les Morts* and *La Promenade des Trois Morts*. Louis Fréchette (1839-1908) (q.v.) surpassed the older poet in the variety and in the quality of his work. The French Academy crowned his *Fleurs boréales* (1879) and *La Légende d'un Peuple* (1887). Fréchette also published other volumes of lyric poetry, including *Les Oiseaux de Neige* (1879) and *Feuilles volantes* (1891). Influenced by Victor Hugo, he attempted the epic style in *La Légende d'un Peuple*. He took those events and those personalities which best represented the glories of French Canadian history, and wove them into an epic of his country. *La Légende d'un Peuple*, although it is sometimes too rhetorical in style, won an immense success.

Pamphile Lemay (1837-1918) was another of the followers of Crémazie. Although he had genuine lyrical feeling, he wrote with too much facility and without sufficient care. His early volumes, *Essais poétiques* (1865), *Les Vengeances* (1875), *Une Gerbe* (1879) and *Petits Poèmes* (1883) bear traces of artistic negligence. His talent is best illustrated by his volume of sonnets *Les Gouttelettes* (1904). Lemay's principal theme is Canadian life with its traditions, its picturesque customs and its religious faith. He was undoubtedly a precursor of the *Terroir* school of recent years, which records with loving care the humble but picturesque aspects of French Canadian popular life.

William Chapman (1850-1917), a contemporary of the two last-mentioned poets and a member of the Quebec school, celebrated the glorious past of the French Canadians in his volume *Les Aspirations* (1904). His style is sometimes rather strained; there is more sincerity and feeling in his *Rayons du Nord* (1910) and *Fleurs de Givre* (1912).

Other members of the patriotic school inaugurated by Crémazie are Alfred Garneau (1836-1904), who published his *Poésies*, Adolphe Poisson (1849-1922), author of *Heures Perdues* (1894), *Sous les Pins* (1902), and *Chants du Soir* (1917), and M. Nérée

Beauchemin, author of *Floraisons matutinales* (1897) and *Patrie intime* (1928). Alfred Garneau tends toward a more intimate style of lyric poetry, characterized by greater delicacy of form, thus preparing the way for a new school, consisting mainly of Montreal poets, which now came into existence.

Emile Nelligan, whose poetic career was unfortunately cut short by illness, published a number of psychological poems in 1903 which showed a certain morbidity of temperament, but a high degree of poetic talent. Albert Lozeau (1878-1924) is the most important and at the same time the most prolific of the Montreal psychological school. His volumes of verse, *L'Ame Solitaire* (1907), *Le Miroir des Jours* (1912) and *Les Images du Pays* (1926), contain meditations on love, suffering, nature and Canadian life. Paul Morin, in *Le Paon d'Email* and *Poèmes de Cendre et d'Or*, writes in a descriptive style; his main interest is in line and colour. His verse is impersonal, objective and largely exotic. His versification is of high quality; in this respect some of his poems surpass anything which French Canadian literature has produced. Jean Charbonneau, author of *Les Blessures*, *L'Âge de Sang* and *Les Prédestinés*, and Albert Dreux, author of *Les Soirs* and *Le Mauvais Passant*, derive their inspiration from psychological study and from the love of nature.

Soon, however, there arose another poetical school which has greater affinity with the Quebec school. Its inspiration is patriotic, and it finds its subjects in the picturesque features of popular life, customs and traditions. Madame Blanche Lamontagne is the best poet of this group, which has been called the *Terroir* school. Her best-known volumes are *Par nos Champs et nos Rives* (1917), and *La Vieille Maison* (1920). Her poetry is full of sincere feeling, and shows great variety. Other poets of this school are Albert Ferland, author of *Canada chanté*, Englebert Gallez, who wrote *Chemins de l'Ame* (1910), and Alphonse Desilets, author of *Mon Pays, mes Amours* (1913) and *Dans la Brise du Terroir* (1922). The Abbé Arthur Lacasse, who published *Heures Solitaires* (1916), *L'Envol des Heures* (1919) and *Heures Sereines* (1927) belongs both to the religious and to the *Terroir* schools.

**Novels and Essays.**—The Canadian novel made its appearance at the same period as history and poetry. Philippe Aubert de Gaspé (1786-1871) published *Les Anciens Canadiens* in 1863; this is a novel of manners, in which the author gives an account of the old customs and traditions of the country. Another novel of manners, *Jean Rivard* (1864) by Antoine Gérin-Lajoie (1824-82) (q.v.), not only depicts the life of a settler, but is also intended to show that it is the duty of young Canadians to remain on the land, and not to emigrate to the industrial towns of the United States.

There are not many French Canadian novels of great importance. Among the most successful novelists may be mentioned Joseph Marmette (1844-95), who wrote a number of historical novels, and Laure Conan (1845-1924), whose psychological novels include *Angeline de Montbrun* (1884), *L'Oublié* (1902) and *La Sève Immortelle* (1924). Among the more recent writers, M. Ernest Choquette with his *Les Ribaud* (1898) and *Claude Paysan* (1899), R. de Roquebrune with *Les Habits Rouges* (1923), *Les Dames Le Marchand* (1927) and Harry Bernard with *La Terre Vivante* (1925) and *La Maison vide* (1926) have all produced works in which history and descriptions of manners are combined with psychological analysis.

French Canadian literature includes a large number of essays and travel sketches which have achieved considerable success. Faucher de Saint-Maurice (1844-97), a writer of great imagination and sensitiveness, wrote mainly travel impressions: *De Québec à Mexico* (1866), *A la Brunante*, *Contes et Récits* (1874), *De tribord à babord* (1877) and *Loin du Pays* (1889).

Arthur Buies (1840-1901) is undoubtedly the greatest master of the essay; he is notable for his witty and lively style. His principal works include *Chroniques*, *Humeurs et Caprices* (1873), *Chroniques*, *Voyages* (1875) and picturesque studies in descriptive geography such as *L'Outaouais supérieur* (1889), *Au Portique des Laurentides* (1891) and *La Vallée de la Matapédia* (1895).

Napoléon Legendre (1841-1907) and Ernest Gagnon (1834-1915) wrote interesting studies of manners and history. Adolphe Routhier (1839-1920) left a considerable body of critical and other writings. *A travers l'Europe* (1881 and 1883), *A travers l'Espagne* (1889), *De Québec à Victoria* (1893) and *Québec et Lévis* (1900) may be specially mentioned. He also wrote a novel on a Biblical subject, *Le Centurion* (1909). Adolphe Routhier is notable for the taste and artistry of his prose style. One of the most polished prose writers of the present day is Adjutor Rivard, the author of popular artistic sketches, *Chez nos Gens* (1918).

**Philosophy and Criticism.**—One of the characteristics of the revival of French Canadian literature in the 20th century is the development of philosophical and critical literature. There were few important philosophical works until quite recently, when Mgr. Louis-Adolphe Paquet, professor at the Laval University of Quebec, published a series of social and religious studies written in a classical style: *Principes généraux du droit public de l'Eglise* (1908), *L'Eglise et l'Education* (1909), *L'Organisation religieuse et le pouvoir civil* (1912), *L'Action religieuse et la loi civile* (1915) and five series of *Etudes et appréciations*. M. Henri Bourassa, leader of the nationalist school, has published a number of political studies written in a style of great vigour, including *Que devons-nous à l'Angleterre?* (1915) and *Hier. Aujourd'hui, Demain* (1916). Somewhat earlier, Edmond de Nevers (1862-1906) made valuable contributions to sociology and history: *L'Avenir du peuple canadien-français* (1896) and *L'Ame Américaine* (1900).

Not much of importance has been produced in the sphere of political oratory except the speeches of Sir Wilfrid Laurier, who excelled as a parliamentary speaker. The chief representatives of academic eloquence are Adolphe Routhier and Thomas Chapais. A religious speaker of remarkable power was Mgr. Paul-Eugène Roy (1859-1926), archbishop of Quebec. His published speeches, *Discours patriotiques et religieuses* (1926), *Action Sociale catholique et Tempérance* (1927) and *Apôtres et Apostolat* (1927) show great dialectical power combined with imagination and a graceful style.

Practically the first exponent of literary criticism was Mgr. Camille Roy, who began his work in this direction some 20 years ago. He was the first to make a systematic study of French Canadian literature and its history. Henri d'Arles has also made valuable contributions to criticism with his *Essais et Conférences* (1910), *Nos Historiens* (1921) and *Louis Fréchette* (1925).

The branch of French Canadian literature which has made least progress is the drama. No important theatrical works have as yet been produced. French Canadian literature is nevertheless in a flourishing condition at the present time. During the last 20 years there has been great progress in almost all branches of literary activity.

**CANADIAN NATIONAL RAILWAY COMPANY** was organized under laws of Canada, Oct. 4, 1922, and on Jan. 30, 1923 became amalgamated with the Grand Trunk Railway Company of Canada. The amalgamation retained the name Canadian National Railway Company, but is more commonly known as the "Canadian National Railways." It owns and operates the lines of the old Grand Trunk Railway Company, and controls the subsidiary companies in the old Grand Trunk Railway system. It is charged with the operation of the railway lines owned by the Dominion Government, such as the Intercolonial Railway, the National Transcontinental Railway and the Prince

Edward Island Railway. The descriptive name, Canadian National Railways, also includes the Canadian Northern Railway system.

The Canadian National Railways comprise about 22,700 m. of main track and extends from Halifax, N.S., and Portland, Me., in the east, to Vancouver and Prince Rupert, B.C., its two terminals on the Pacific coast. The general offices are at Montreal. The equipment, Dec. 31, 1926, consisted of 3,145 locomotives; 126,029 freight cars; 3,668 passenger, mail and express cars and 7,458 service cars. The total revenue freight tonnage for the year 1926 was 63,568,779 and the number of revenue passengers transported 22,240,390. Of the freight tonnage, approximately 34% was mineral products, 20% agricultural, 16.5% forest and the remainder, manufactures, live stock and miscellaneous. The company's operating revenue for the year ending Dec. 31, 1926, was \$275,570,310, and the net operating revenue \$48,225,029.

"Canadian National Steamships," as a descriptive title for the Canadian Government Merchant Marine Ltd., the Canadian National (West Indies) Steamships Ltd. and any other steamship company allied with the Canadian National Railways, was authorized in 1927. Coastal services on the Pacific coast and ocean services to the West Indies, Europe and other parts of the world are operated under this name. (H. W. T.)

**CANADIAN PACIFIC RAILWAY COMPANY** operates a railway extending across Canada from Halifax on the Atlantic coast to Vancouver and Victoria on the Pacific, and by a network of branch lines reaches practically every town and city in the Dominion. By its own Atlantic and Pacific fleets it provides under one management a direct artery of communication between Europe and Asia.

Built to unite the scattered provinces of Canada into an economic, as well as a political confederation, it also established British dominion over the Canadian North-west when the future of that country was in some doubt. A Government attempt to build the road failed ignominiously. A private syndicate headed by Lord Mount Stephen, first president, Sir William Van Horne, Lord Strathcona and others were given ten years in which to build it. In the face of tremendous physical and financial difficulty, and great opposition, the main line from Montreal to the Pacific was finished in five years, the last spike being driven on Nov. 7, 1885. Settlement of Canada's west by the company followed. Mileage of lines now owned, operated and building in Canada is 15,500; lines controlled in the United States, 5,070 m.; passenger and freight liners on the Atlantic, 26; on the Pacific three and one building; coastal, lake and river steamships, 48, hotels owned and operated, 15, bungalow camps, 11. It also operates a telegraph and cable company and an express company covering every important point in the world. The company builds most of its own rolling stock and engines. Total investment in property, Aug. 1928, \$1,037,744,869. Capitalization as of Dec. 31, 1927; ordinary capital stock authorized \$335,000,000; issued \$300,000,000; 4% preference \$100,148,587; 4% debenture stock \$264,244,882; funded debt \$77,455,079. The head office is in Montreal.

(E. W. B.)

**CANADIAN PRESS.** Approximately 100 daily newspapers in the Dominion of Canada form the Canadian Press, which co-operatively collects and distributes news over a net-work of 12,000 m. of leased wires. The members appropriate about \$500,000 annually to cover the cost of this mutual news service. The Canadian Press operates in close relation to the Associated Press. Both are mutual and non-profit making. Between them there is an exchange of news. In addition to the Associated Press foreign service the Canadian Press maintains supplementary cable service from London.

**CANADIAN ROCKIES CIRCLE TOUR,** as its name implies, extends loop-fashion from Calgary, Alberta, Canada, through eastern British Columbia as far east as Macleod and back to Calgary. It covers 567 m. in its course and twice crosses the continental divide of the Rocky mountain system, following the Trans-Canada highway throughout most of its length. Lakes, rivers, mountains and valleys of unusual beauty are viewed repeatedly along the way. The camp of the Prince of Wales, Banff, Vermilion pass, Radium hot springs, Windermere, Cranbrook,

Crow's Nest pass, Claresholm and High river are points of especial interest along this route.

**CANAL CRAFT:** see BARGES AND CANAL CRAFT.

**CANALE or CANALETTO, ANTONIO** (1697-1768), Venetian painter, born on Oct. 18, 1697, was educated under his father, Bernard, a scene-painter of Venice, and for some time followed his father's profession. In 1719 he went to Rome, to study architecture. On his return home he devoted his powers to painting, finding subjects in the architecture of his native city, which he painted with a clear and firm touch, with magnificent perspective and mastery of colour. He resided some time in England, in 1746 and in 1753. The National Gallery, London, has five pictures by him, notably the "View on the Grand Canal, Venice," and the "Regatta on the Grand Canal." He died on April 20, 1768. Among his pupils, whose work passed at an early date under the misleading title of "Canaletto," were Francesco Guardi, Michele Marieschi, Antonio Visentini, Zattaglionni and Columbini. Bellotto (commonly named Barnardo), who is also sometimes called CANALETTO (1724-1780), was his nephew and pupil, and painted with deceptive resemblance to the style of the more celebrated master.

**CANALEJAS Y MENDEZ, JOSÉ** (1854-1912), Spanish politician, was born in Ferrol on July 31, 1854. He graduated (1871) at the university of Madrid, took his doctor's degree (1872), and became a lecturer on literature (1873). He entered his father's engineering works and studied railway problems, but continued his literary work, publishing a history of Latin literature in two volumes. He was elected deputy for Soria in 1881, became under-secretary for the prime minister's department under Posada Herrera (1883), minister of justice (1888), and of finance (1894-95). He was president of the chamber in the Moret administration, and became prime minister and chief of the Liberal party in 1910. He was murdered in Madrid on November 12, 1912, while in office. Canalejas believed in the possibility of a monarchy open to a thoroughgoing democratic policy both in economic and in civil and political matters. A sincere Catholic, he was nevertheless a strong anti-clerical, and a champion of the rights of the State against the encroachments of the Church. By his death the Spanish Liberal party lost the only statesman capable of uniting it under one definite programme.

**CANALIS** (sometimes CANAL), in architecture, the depressed portion of the band whose spiral curvature forms the volute of the Ionic capital (see ORDER).

**CANALS AND CANALIZED RIVERS.** A canal is an artificial watercourse used for the drainage of low lands (see DRAINAGE OF LAND), for irrigation (q.v.), or more especially for the purpose of navigation by boats, barges or ships. For canalized rivers see below. Traffic on inland waterways and international agreements affecting them are dealt with in the article INLAND WATER TRANSPORT. See also the articles on particular rivers, canals and places; e.g., THAMES; MEUSE; KIEL, etc.

**Early History of Canals.**—Probably the first canals were made for irrigation, but in very early times they came also to be used for navigation, as in Assyria and Egypt. The Romans constructed various works of the kind; Charlemagne projected a system of waterways connecting the Main and the Rhine with the Danube; while in China the Grand Canal, joining the Pei-ho and Yang-tse-Kiang and constructed in the 13th century, formed an important artery of commerce, serving also for irrigation. But although it appears from Marco Polo that inclines were used on the Grand Canal, these early waterways were for the most part only practicable between points that lay on nearly the same level, no method being known

CANADIAN ROCKIES CIRCLE TOUR

of conveniently transferring boats from one level to another; and inland navigation could not become generally useful until this defect had been remedied by the employment of locks.

Doubts exist as to the person, and even the nation, that first introduced locks. Some writers attribute their invention to the Dutch, holding that nearly a century earlier than in Italy locks were used in Holland, where canals are very numerous owing to the favourable physical conditions. On the other hand, the contrivance has been claimed for engineers of the Italian school, and it is said that two brothers Domenico of Viterbo constructed a lock chamber enclosed by a pair of gates in 1481, and that in 1487 Leonardo da Vinci completed six locks uniting the canals of Milan. In any case the introduction of locks in the 14th or 15th century gave a new character to inland navigation.

The Languedoc canal (canal du Midi), which connects the Bay of Biscay with the Mediterranean, may be regarded as the pioneer of the canals of modern Europe. It has 119 locks in a length of 148 miles and rises to an elevation of 620ft. above sea-level, its depth being about 6½ feet. It was designed by Baron Paul Riquet de Bonrepos (1604–80) and was finished in 1681. With it, and the still earlier Briare canal (1604–42), France began that policy of canal construction which has provided her with over 3,000 miles of canals, in addition to over 4,600 miles of navigable rivers. In Russia Peter the Great undertook the construction of a system of canals about the beginning of the 18th century, and in Sweden a canal with locks, connecting Eskilstuna with Lake Mälaren, was finished in 1606. In England the oldest artificial canal is the Foss Dyke, a relic of the Roman occupation. It extends from Lincoln to the river Trent near Torksey (111m.), and formed a continuation of the Caer Dyke, also of Roman origin but now filled up, which ran from Lincoln to Peterborough (40m.). Camden in his *Britannia* says that the Foss Dyke was deepened and to some extent rendered navigable in 1121. Little, however, was done in making canals in Great Britain until the middle of the 18th century, though before that date some progress had been made in rendering some of the larger rivers navigable. In 1759 the duke of Bridgewater obtained powers to construct a canal between Manchester and his collieries at Worsley. This work, of which James Brindley was the engineer, was opened for traffic in 1761, and there followed a period of great activity in canal construction, which, however, came to an end with the introduction of railways. In the United States the first canal was made in 1792–96 at South Hadley, Mass., and canal building was carried on with great activity from the beginning of the 19th century until about 1837, when the advent of railways checked their development. Out of a total of over 4,500 miles of canals built, mostly in New York, Pennsylvania and Ohio, 2,444 miles were out of use or abandoned in 1911.

The canals made in the early days of canal-construction were mostly of the class known as *barge* or *boat canals* and, owing to their limited depth and breadth, were only available for vessels of small size. But with the growth of commerce the advantage was seen of cutting canals of such dimensions as would enable them to accommodate sea-going ships. Such *ship canals* are referred to in the last section of this article.

#### BARGE CANALS

**Choice of Line.**—In laying out a line of canal the engineer is more restricted than in forming the route of a road or a railway. Gradients being inadmissible, the canal must either be made on one uniform level or must be adapted to the general rise or fall of the country through which it passes by being constructed in a series of level reaches at varying heights above a datum line, each closed by a lock, or some equivalent device, to enable vessels to be transferred from one to another. To avoid unduly heavy earthwork, the reaches must follow the bases of hills and the windings of valleys, but from time to time it will become necessary to cross a depression by the aid of an embankment or aqueduct, while a piece of rising ground or a hill may involve a cutting or a tunnel. Sharp bends must be avoided, the permissible radius of curves depending on the dimensions of the vessels for which the canal is designed and the width of the waterway.

**Aqueducts.**—Brindley took the Bridgewater canal over the Irwell at Barton by means of an aqueduct of three stone arches, the centre one having a span of 63ft., and Thomas Telford arranged that the Ellesmere canal should cross the Dee valley at Pont-y-Cysyllte partly by embankment and partly by an aqueduct 1,000ft. long and 127ft. above the river, consisting of a cast-iron trough supported on iron arches with stone piers. In the building of the Manchester Ship Canal it became necessary to replace Brindley's aqueduct at Barton, which was only high enough to give room for barges, by a swing aqueduct, the first of its kind, to allow shipping to pass in the canal under it. (See MANCHESTER SHIP CANAL.)

**Tunnels.**—One of the earliest canal tunnels was made in 1766–77 by Brindley at Harecastle on the Trent and Mersey canal. It is 2,880yd. long, 12ft. high and 9ft. wide, and has no tow-path, the boats being propelled by men ("leggers") lying on their backs and pushing with their feet against the tunnel walls. This tunnel was in 1928 out of use owing to subsidence due to coal workings. Traffic is now worked through a second tunnel, parallel to this but 16ft. high and 14ft. wide, including a tow-path, which was finished by Telford in 1827. Standedge tunnel, on the Huddersfield canal, is over three miles long, and is still (1928) worked by "leggers." Tunnels on Continental canals, especially in France, are numerous and of much larger dimensions than those on English canals. One, on the St. Quentin canal, 6,200yd. long, is 26½ft. wide and 22½ft. high. The Royaulcourt tunnel on the Nord canal (completed 1923) is 4,757yd. long, 33ft. wide and 28½ft. high, with an enlarged passing place in the middle. The largest canal tunnel in the world is that at Rove (fig. 8) near Marseille. (See SHIP CANALS below.)

**Dimensions.**—The dimensions of a canal, apart from considerations of water-supply, are regulated by the size of the vessels which are to be used on it and, to some extent, by their speed. According to J. M. Rankine (*Manual of Civil Engineering*), the depth of water and sectional area of waterway should be such as not to cause any material increase of the resistance to the motion of the boats beyond what would be encountered in open water, and he laid down the following rules as fulfilling these conditions:—

|                                  |   |
|----------------------------------|---|
| Least breadth of bottom          | = 2 × greatest breadth of boat.                   |
| Least depth of water             | = 1½ ft. + greatest draught of boat.              |
| Least sectional area of waterway | = 6 × greatest immersed mid-ship section of boat. |

Rankine was considering the small barges in use in his day, but his proportions are still very generally accepted. In large modern canals it is, however, usual to allow a greater clearance than 18in. under the boat, the amount increasing with the size and the speed of the vessels (see HYDRAULICS and WAVE). The ratio of wetted cross-section of the canal to the immersed cross-section of boat varies in modern canals from 4:1 to 6.5:1. The larger the ratio, the less will be the erosion of the banks, which increases with the speed of vessels. The ordinary inland canal in England is commonly from 18 to 30ft. wide at the bottom, 30 to 45ft. at the water level, with a depth of 3½ to 5 feet. The early continental canals were a little larger, being usually designed for boats of 100 tons or more. In some recent French canals a depth of 8½ft. and a width of 39½ft. at a depth of 6½ft. have been adopted for the waterway; and the locks, designed for two barges in line, are 280ft. long and 19.7ft. wide. The tendency on all continental waterway systems has been, since the last decade of the 19th century, to increase the ruling dimensions of both canals and canalized rivers in order to allow a larger proportion of the craft using the great free rivers, such as the Rhine, to navigate the locked waterways. In Germany, for instance, canals have been constructed with a width of 69ft. and upwards.

**Canal Banks, etc.**—To retain the water in porous ground, and especially on embankments, a watertight lining of puddle clay must be provided on the bed and sides of the channel, or some other means, such as a lining of concrete, adopted to prevent leakage (fig. 1). The difficulty of maintaining canals on embankments is always a serious one even on banks of quite moderate height.

## CANAL SHIPPING IN INDUSTRIAL CENTRES

1. A train of compartment boats on the way to Goole in Yorkshire, England, by way of the Aire and Calder Navigation. The compartment boats, which are loaded with coal, are shown towed by a tugboat. Each compartment holds 40 tons; the tow represents 700-800 tons of coal
2. The junction of the Neckar and Rhine rivers outside of Mannheim. The factories of Mannheim, an important industrial city of Germany, are benefited by the cheap canal and river transport on these waterways
3. Belgium lock at Cappelle au Bois, situated along the canal which originates at Brussels and flows into Le Rupel river
4. Lock at Hazleford on the Canalized River Trent with three barges and internal combustion tug
5. The Trollhätte Ship canal, Sweden. One of the three locks of the Trollhätte canal is shown under construction before the admission of water. The internal dimensions of all three locks are 321x45 feet. Each is over 50 ft. deep from coping to floor. In filling and emptying the lock, the water passes through the floor openings which connect with the culverts
6. Barges in lock 9 of the New York State barge canal. This canal, which is a reconstruction of the old Erie canal, connects the Hudson river at Troy with Lake Erie at Buffalo

The sides of canals are usually sloped, the angle varying with the nature of the soil from 1 in 1½ to 1 in 3 or even flatter. In rock cuttings the sides are often nearly vertical. To prevent the erosion of the sides by the wash from boats it is usual to protect the banks at and near the water line by stone rubble or pitching, concrete or brick paving or fascine work, in some cases combined with continuous piling (figs. 1 and 2). A berm—a narrow

FIG. 1.—HALF CROSS-SECTION OF A PORTION OF THE DORTMUND-EMŚ CANAL, BUILT ON EMBANKMENT OF PERVIOUS MATERIAL

level strip along the bank at or just under the water level—is sometimes formed in the bank to minimize the effect of wash (fig. 2).

**Water Supply.**—If there be no natural lake in the district for storage and supply, or if the engineer cannot draw upon some stream of sufficient size, he must form artificial reservoirs in suitable situations. They must be situated at such an elevation that the water from them may flow, through feeders, to the summit-level of the canal; and, if the expense of pumping is to be avoided, they must command a sufficient catchment area to supply the loss of water from the canal by evaporation from the surface, percolation through the bed, leakage at gates and lockage. Since the consumption of water in lockage increases both with the size of the locks and the frequency with which they are used, the difficulty of finding a sufficient water supply may put a limit to the density of traffic possible on a canal or may prohibit its locks from being enlarged so as to accommodate boats of the size necessary for the economical handling of the traffic under modern conditions. It may be pointed out that the up consumes more water than the down traffic. An ascending boat on entering a lock displaces a volume of water equal to its submerged capacity. The water so displaced flows into the lower reach of the canal and, as the boat passes through the lock, is replaced by water flowing from the upper reach. A descending boat in the same way displaces a volume of water equal to its submerged capacity, but in this case the displaced water flows back into the higher reach where it is retained when the gates are closed.

Some economy of water in locking may be effected by using side ponds (*see below*); but, nevertheless, it is necessary in the case of some canals to resort to pumping in order to supply deficiencies, particularly in dry seasons and on summit levels. There are many canal pumping installations in France, Germany and England. Electric power has been utilized for pumping in some plants.

**Waste-weirs and Stop-gates.**—An essential adjunct to a canal is a sufficient number of waste-weirs to discharge surplus water accumulating during floods. The waste-weirs are placed at the top water-level of the canal, so that when a flood occurs the water flows over them and thus relieves the banks. Culverts, when constructed under a canal embankment to pass streams and flood water, must be of ample dimensions (*see Weir*).

Safety or stop-gates are necessary at intervals for the purpose of dividing the canal into isolated reaches so that, in the event of a breach, the gates may be shut, and the discharge of water confined to the reach intercepted between two of them. In broad canals these stop-gates may be formed like lock gates; or in small works they sometimes consist of thick planks slipped into grooves. Self-acting gates have been tried but have not proved trustworthy. Stop-gates consisting of a horizontally framed steel

shutter of the width of the canal, suspended from an overhead bridge and counterbalanced, are used on some modern canals: these can be lowered by means of gearing into grooves built in the canal sides.

**Locks.**—In large locks, as well as in most of the small locks of modern construction, the sluices by which the lock is filled or emptied are carried through the walls, but in many old locks the sluices consist of small openings in the gates.

The gates, generally of oak in old canals, but more usually of steel in large canals and those of later date, fit into recesses of the walls when open, and close against sills in the lock bottom when shut. In small narrow locks single gates only are necessary; in large locks pairs of gates are required, fitting together at the head or "mitre-post" when closed. The vertical timber at the end of the gate is known as the "heel-post," and at its foot is a casting that admits an iron or steel pivot which is fixed in the lock bottom, and on which the gate turns. Iron straps round the head of the heel-post are let into the lock-coping to support the gate. The gates are opened and closed by balance beams projecting over the lock side in the case of many small locks and by hand gearing in others. Electrically operated machines are largely

FIG. 2.—CROSS-SECTION OF BARGE CANAL BANKS, SHOWING THE SLOPING SIDES, THE STONE RUBBLE TO PROTECT AGAINST-WASH, AND THE BERM, A NARROW LEVEL STRIP THAT INCREASES THE CROSS-SECTIONAL AREA OF THE AVAILABLE CHANNEL IN CANALS LIABLE TO FLOOD WATER

employed on canals of modern construction in America and on the continent of Europe for opening and closing lock gates and sluices. (*See also Docks*.)

In order to economize water, canal locks are made only a little larger than the largest vessel they have to accommodate (*see below: Canal Barges and Modern Canal Development*). In many canals constructed since 1900, however, provision is made for admitting a train of barges; such long locks have sometimes intermediate gates by which the effective length is reduced when a single vessel is passing (fig. 6).

The lift of canal locks, *i.e.*, the difference between the levels of adjoining reaches, rarely exceeded 12ft. up to the end of the 19th century and in some locks the lift is as little as 1½ft. The modern practice is to build one lock with high lift in preference to a flight of shallower locks in all cases where the configuration of the ground and considerations of water supply allow of this being done. In Germany, for instance, there is at least one lock with

FIG. 3.—PLAN OF LOCKS, WEIR AND HAVEN, ON THE RIVER MAIN, NEAR FRANKFORT

a lift of over 65ft., and lifts of 20 to 40ft. are not uncommon in America and on the continent of Europe.

To save water, especially where the lift is considerable, side ponds are sometimes employed. They are reservoirs into which a portion of the water from a lock-chamber is run and stored instead of being discharged into the lower reach, and it is used once more for partially filling the chamber. The consumption of water is in some cases reduced by this means by 50%. Double locks, may also be used to save water, since each serves as a side pond to the other, and to save time, since vessels can pass up and down simultaneously.

**Lateral Canals.**—The name "lateral canal" is given to an artificial navigable locked waterway, constructed at the side of or near to the course of a river, which for varying reasons, such as the presence of rapids or falls, is not navigable and may be unsuitable for canalization or improvement. A lateral canal draws its supply of water from the river with which it is connected, and is, in fact, a "by-pass," vessels entering it from the river at the

to locks where many small pleasure boats have to be dealt with, is to fit the incline itself with rollers, upon which the boats travel; and at Boulter's lock on the Thames an electric conveyor is provided on the inclines. In some early cases boats were conveyed on a wheeled trolley or cradle running on rails. This plan was formerly in use on the Morris canal (New Jersey), built in 1825-31, in the case of 23 inclines, the rise of each varying from 44 to 100 feet. Between the Ourcq canal and the Marne, near Meaux, the difference of level is about 40ft., and small barges weighing about 70 tons are taken from the one to the other on a wheeled cradle over an incline nearly 500yd. long. Heavy loaded barges are, however, apt to be strained by being supported on cradles in this way, and to avoid this objection an incline carrying a tank on wheels filled with water in which the barge floated, was constructed about 1840 on the old Chard canal (England), now abandoned. Ten years later a similar incline was adopted on the Monkland canal in Scotland, where two tanks were used, one going up while the other was going down, counter-balancing each other. The power required was provided by steam engines.

**Lifts.**—Vertical lifts can only be used instead of locks at places where the difference in level occurs in a short length of canal, since otherwise long embankments or aqueducts would be necessary to obtain sites for their construction. An early example was built in 1809 at Tardebigge on the Worcester and Birmingham canal.

At Anderton a lift was erected in 1875 to connect the Weaver navigation with the Trent and Mersey canal, which at that point is 50ft. higher than the river. The lift is a double one, and can deal with barges up to 100 tons; the vessels are water-borne in a wrought-iron tank 75ft. long and 15½ft. wide. Until 1908 the tanks were raised and lowered by means of hydraulic rams but in that year electric power was substituted, each of the two tanks being counter-balanced by weights and operated by electric winches. (See J. A. Saner, *Proc. Inst. C.E.*, vol. clxx, 1910.) A similar hydraulic lift, completed in 1888 at Fontinettes on the Neufossé canal in France, can accommodate vessels of 300 tons, a total weight of 785 tons being lifted 43ft.; and a still larger example on the Canal du Centre at La Louvière in Belgium, built in 1888, has a rise of 50ft., with tanks that will admit vessels up

FIG. 4.—LONGITUDINAL SECTION OF CANALIZED RIVER MAIN, BETWEEN OFFENBACH AND KOSTHEIM, GERMANY, SHOWING THE WEIRS AND LOCKS WHICH DIVIDE THE RIVER INTO A SERIES OF LEVEL REACHES

higher end and re-entering the river at its lower end or vice versa. There are many examples of lateral canals in Canada, notably those connected with the river St. Lawrence, also in the United States and on the continent of Europe, particularly in France.

**Inclines.**—Economy of water can be effected by the use of inclined planes or vertical lifts in place of locks. In China rude inclines appear to have been used at an early date, vessels being carried down a sloping plane of stonework by the aid of a flush of water or hauled up it by capstans. On the Bude canal (England), now abandoned, this plan was adopted in an improved form for small boats. Another expedient, often adopted as an adjunct

to 400 tons, the total weight lifted amounting to over 1,000 tons. This lift, and three others of the same character, which, however, were not completed until 1921 although commenced many years before, overcome the rise of 217ft. which occurs in this canal in the course of 4½ miles.

The La Louvière lifts are the only examples constructed in Europe since 1899, when the Henrichenburg lift on the Dortmund-Ems canal was opened. The latter raises barges of 600 tons carrying capacity through a height of 46 feet. The single tank is 223 x 28ft. internally, the depth of water being 8½ feet. The operation of the lift is effected by an ingenious arrangement of

balancing floats immersed in deep tank-shafts. At Peterboro, Ontario, there are two hydraulic barge-lifts constructed about 1908. Neither lifts nor inclines are in use in the United States.

Generally speaking, canal constructors, both in America and on the continent of Europe, have, for many years, shown a decided preference for high-lift locks to either mechanical lifts or inclines.

**Canal Barges.**—The following table gives particulars of some of the typical barges in use on European canals and canalized rivers. (See also below: *Modern Canal Development*.)

|  | Length.<br>Ft. | Beam.<br>Ft. | Draft,<br>laden.<br>Ft. | Carrying<br>capacity.<br>Tons. |
|--|----------------|--------------|-------------------------|--------------------------------|
| <i>England.</i>  |                |              |                         |                                |
| Canal boat . . . . .   | 70-72          | 7            | 3-25                    | 30                             |

**Speed of Haulage on Canals.**—The horse or mule walking along a towpath and drawing or tracking a barge by means of a towing rope, still remains the typical method of conducting traffic on the smaller canals, not only in England, but on the continent of Europe. Horse traction is very slow; the maximum speed is about 3m. per hour, and the average, which, of course, depends largely on the number of locks to be passed through, much less.

At speeds over c. 3m. per hour the "wash" of the barge begins to cause erosion of the banks and thus necessitates the employment of protective measures which are commonly provided in all canals of modern construction (see above). Moreover the tractive effort required to haul a barge increases with the speed at a rate which much exceeds a direct proportion; and careful trials carried out in France and Germany since 1909 show that, on barge canals, a speed greater than 3m. or 3½m. per hour is uneconomical as regards both haulage and maintenance costs. The speed on French canals is limited to five km. (3.11m.) per hour; and a tug or tractor with its tow of barges usually does from 13 to 18m. per day on the average (including going through locks). The speed limitations (1928) on German, Belgian and Swedish canals are on a par with the French. It may be noted in passing that, in towing or hauling barges on a canal, the tractive force per barge decreases with the number of barges in tow.

**Tugs and Self-propelled Barges.**—Steam towage was first employed on the Forth and Clyde canal in 1802, when a tug-boat fitted with engines by W. Symington drew two barges for a distance of 19½ miles in six hours in the teeth of a strong headwind. Tugs are only economical where there are either no locks, or locks either large enough to admit the tug and its train of barges simultaneously or spaced at long intervals: otherwise the advantages are more than counter-balanced by the delays in locking. On the Bridgewater canal, which has an average width of 50ft. with a depth of 5½ft., and has no locks for its entire length of 40 miles except at Runcorn, where it joins the Mersey, tugs tow four barges, each carrying 60 tons, at a rate of nearly 3m. per hour.

On the Aire and Calder navigation, where the locks have a minimum length of 215ft., a large coal traffic is carried in trains of boat-compartments. The boats are nearly square in shape, except the leading one which has an ordinary bow. They are coupled

together so that they can move both laterally and vertically; and a wire rope in tension on each side enables the train to be steered. No boat crews are required, the crew of the tug regulating the train. Each compartment carries 35 tons, and the total weight in a train varies from 700 to 900 tons. On the arrival of a train at Goole the boats are detached and discharged into sea-going ships by means of cradles and hydraulic hoists.

Barges self-propelled by steam-power were first tried on the Forth and Clyde canal by Symington as early as 1789. Since 1910

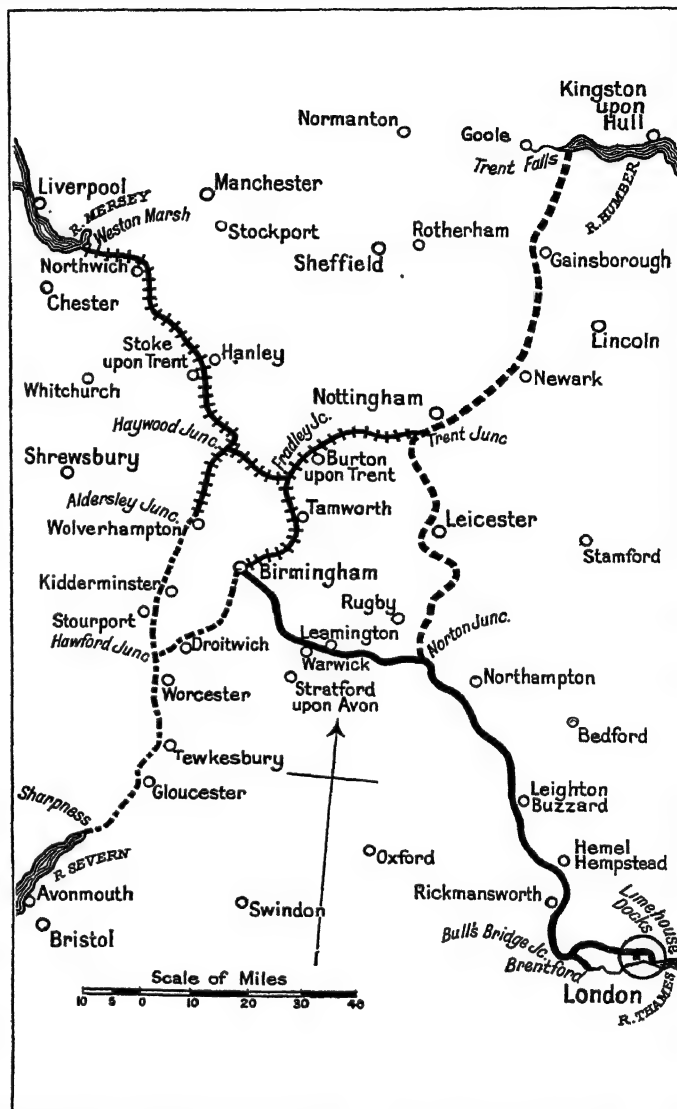

FIG. 5.—INLAND WATERWAYS AND CANALS, RECOMMENDED BY THE BRITISH ROYAL COMMISSION, 1909, FOR ENLARGEMENT TO TAKE BARGES OF 100 TONS CARRYING CAPACITY. The four groups of waterways, shown by different lines, were known as "The Cross".

the use of internal combustion motors as a means of propulsion on canals has considerably increased. Even on the smaller canals many barges in all parts of the world are now self-propelled.

**Mechanical Traction on Canals.**—In several long tunnels and deep rock cuttings in France where no towpaths have been provided, recourse has been had to a submerged chain which is passed round a drum on a tug; this drum is rotated by steam power and thus the tug is hauled through the reach. The same system is in use on the Regents Canal (London) for towing barges through the Islington tunnel. In the Mont-de-Rilly tunnel, at the summit level of the Aisne-Marne canal, a system of cable-traction was established in 1893, the boats being taken through by being attached to an endless travelling wire rope supported by pulleys on the towpath.

Small locomotives running on rails along the towpath were tried, towards the end of the 19th century, on the Shropshire Union canal, where they were abandoned on account of practical difficulties in working. About the same time similar experiments were made on canals in France and Germany, where, however, the financial results were not satisfactory. On portions of the Teltow canal, joining the Havel and the Spree, electric tractors run on rails along both banks, taking their current from an overhead conductor; they attain a speed of  $2\frac{1}{2}$  m. an hour when hauling two 600-ton barges. Electricity is also utilized for working the lock gates and for various other purposes along the route of this canal. Electric tractors are also employed on the Charleroi canal (Belgium), and petrol tractors on the Bourgogne canal (France).

Since about 1923 on the Canal du Nord, between St. Omer and Janville, electric tractors running on rails on the bank haul 300-ton barges in groups of two or more. On the Calais-St. Omer section light caterpillar road tractors of the Citroën type were established in 1925 for hauling two or more loaded barges. Electric rail tractors are also employed on sections of the St. Quentin and other canals in the north of France, and were experimented with on the Liège-Antwerp canals in Belgium in 1919, but soon abandoned. Mechanical traction has not developed in so marked a manner as towage; and, on the whole, the results do not show any considerable decrease in cost compared with other haulage or towage, nor has the speed of the boats been materially increased. The cost of installing and working a system of electric rail traction is only justified in cases where, as on some of the canals in the north of France, the traffic is intense; on the St. Quentin canal the traffic intensity before the war amounted to between six and seven millions of tons per annum and in 1926 had nearly returned to six millions. On the Nord system light tractors are preferred for the less busy sections. Electric capstans are provided at many French and a few Belgian and Dutch canal and river locks for facilitating the passage of barges. In some cases little use appears to be made of these facilities.

**Inland Ports.**—In the early days of canals the equipment of terminal and intermediate wharves at which goods in transit were handled was of the simplest description. The modern canal or other inland waterway, on the other hand, must provide adequate terminal and intermediate port facilities in the nature of lay-byes, wharves, warehouses, crane equipment, etc., if a large traffic has to be handled; or, alternatively, such facilities must be furnished by municipalities or local or private enterprise.

#### CANALIZED RIVERS

Rivers whose discharge is liable to become quite small at their low stage, or which have a somewhat large fall, as is usual in the upper part of rivers, cannot be given an adequate depth for navigation by regulation works alone; and their ordinary summer level has to be raised by impounding the flow with weirs at intervals across the channel (*see* WEIR and RIVER ENGINEERING), while a lock (*q.v.*) has to be constructed alongside the weir, or in a side channel, to provide for the passage of vessels (*fig. 3*). A river is thereby converted into a succession of fairly level reaches rising in steps up-stream, and providing a comparatively still-water navigation like a canal; but it differs from a canal in the introduction of weirs for keeping up the water-level and in the provision for the regular discharge of the river at the weirs. Canalization secures a definite available depth for navigation; and the discharge of the river is generally ample for maintaining the impounded water-level, as well as providing the necessary water for locking. The navigation, however, is liable to be stopped during the descent of high floods, which in many cases rise above the locks (*fig. 4*); and it is necessarily arrested in cold climates on all rivers by long, severe frosts, and especially on the break-up of the ice. (This also applies to canals, even in England; and the suspension of traffic during prolonged frosts is one of the disadvantages, compared with railways, under which canals have to operate.)

Many small rivers, like the Thames above its tidal limit, have been rendered navigable by canalization; and several fairly large rivers have thereby provided a good depth for vessels for considerable distances inland. Thus the canalized Seine has secured

a navigable depth of  $10\frac{1}{2}$  ft. from its tidal limit up to Paris, a distance of 135 miles and a depth of 6½ ft. up to Montereau, 62 miles higher up. Regulation works for improving the river Main, from its confluence with the Rhine opposite Mainz up to Frankfurt, failed to secure a minimum depth of 3 ft. at the low stage of the river, and canalization works, carried out between 1883 and 1900 by means of six weirs in the  $26\frac{1}{2}$  miles between the Rhine and

FIG. 6.—PLAN OF TYPICAL LOCK ON THE CANAL DU NORD, FRANCE  
The lock is 279 ft. long, but an intermediate gate, shown in the centre of the drawing, is used when a short lock chamber suffices for the passage of barges

Offenbach, above Frankfurt, provided a minimum depth of  $8\frac{1}{4}$  feet. (*See* below for other references.)

On ascending a river it becomes increasingly difficult to obtain a good depth by canalization owing to the progressive inclination of the river-bed. Thus, even on the Seine, with its moderate fall, a depth of  $10\frac{1}{2}$  ft. has been obtained on the Lower Seine by weirs placed on the average  $13\frac{1}{2}$  m. apart, but on the Upper Seine weirs are required at intervals of only about  $4\frac{3}{4}$  m. to attain a depth of 6½ ft.

#### MODERN CANAL DEVELOPMENT IN EUROPE AND AMERICA

Accounts of the canal systems will be found in the articles on the various countries: in this section some modern developments in connection with canals and canalized rivers are briefly referred to.

**Great Britain.**—When the era of railways commenced British waterways had attained to the highest point of their prosperity. As the development of the railway system advanced, many of the canal companies were alarmed for the future and sold their undertakings to the railway companies, who in 1906 owned 1,138 m. out of a total of 3,902 m. of inland waterways in the United Kingdom; the latter figure including about 1,500 m. of canalized rivers. These figures were practically unchanged in 1928. Public interest in the canal problem led to the appointment in 1906 of a Royal Commission to report on the canals and inland navigations of the Kingdom. (In England there is a particular meaning attached to the word *navigation* which implies a canalized river; *e.g.*, the Weaver Navigation, as distinct from an artificial canal.) Its report, published in 1909, was not unanimous and the recommendations of the majority of its members have not since been acted upon by the Government. The most important proposals were, (a) the creation of a Waterways Board, which was to acquire and manage the principal canals of England, and (b) the improvement of the main canal and river routes, linking the Mersey, Humber and Severn estuaries and the Port of London respectively with Birmingham and the Midlands, to the standard necessary for 100-ton barge traffic or alternatively for 300-ton barges. The system of canals proposed to be thus improved came to be known as "the Cross" (*fig. 5*). (*See* the Reports, Evidence, etc., Royal Commission on Canals and Waterways, 1906–09, 11 vol., particularly *Final Report* Cd. 4979 [1909].)

Comparison of British waterways with those of the continent of Europe often leads to fallacious conclusions unless the important differences, natural and economic, are recognized. In those parts of Europe where inland navigation is most successful, the canals are to a large extent feeders of, or links joining up, large and important rivers either free or canalized; and further, the average length of haul is immensely greater than in England,

the water supply is usually abundant, and the country generally flatter and in many respects less developed. Moreover, the continental waterways receive, either directly or indirectly, substantial subsidies from the State and are protected in most countries against railway competition. The improvement of the river Trent, between Newark and Nottingham, a small section of one of the routes proposed for enlargement by the Commission, was, however, carried out between 1921 and 1926, and the construction of four new locks on this portion of the river enables 120-ton barges to navigate from the Humber as far as Nottingham.

**France.**—The Canal du Nord, begun in 1907, and 58 miles long, connects the Sensée canal at Arleux and the Oise canal at Noyon. It is noteworthy on account of its considerable rise and fall, crossing two watersheds, its 19 locks, some of which have a rise of 21½ ft., and two long tunnels. The water supply is obtained by pumping, by means of electricity, from reach to reach the waters of the Sensée, the Somme and the Oise. The minimum bottom width is 33 ft., the depth 8½ feet. It is the best example of the improved standard type of 300-ton barge canal in France. The locks, 279 ft. by 19.6 ft. internally, taking two barges and a tug at once (fig. 6), are provided with cylindrical sluices and single-leaf gates all worked electrically. The works, which were wrecked in the course of the War, were completed in 1923.

**Holland.**—The principal inland navigations in Holland are the rivers and canals between the North Sea, the ports of Rotterdam and Amsterdam and the German frontier. Many improvements have been effected in the Dutch waterways since 1910; those affecting barge canals being in most cases such as will permit the navigation of the large Rhine barges carrying 2,000 tons. The largest of these vessels are about 400 ft. in length with a maximum beam of about 46 ft. and draught of 12 feet. The locks are constructed with internal dimensions, 855 ft. by 52½ ft., and a depth over sills of 12½ ft.; they accommodate two long barges and a tug in line ahead. Intermediate gates are provided for use in single barge locking. One of these large locks can usually be emptied or filled in about five minutes.

One of the most important of these new or improved waterways is that from Nijmegen to Maastricht. It is made up of the Meuse-Waal canal, completed 1927, the canalized Meuse and the Juliana canal. The standard canal section adopted is 130 ft. bottom width, 196 ft. at water level with side slopes of 1 in 3 and depths of from 11 to 13 feet. Electric pumping plant has been installed to deal with excess of flood water in the canal portions. Five locks have been constructed in a length of about 67 miles of the canalized Meuse. These locks have weirs with navigation openings about 200 ft. in width which can be used for the passage of barges when the water level is high.

**Central Europe.**—The navigation of the upper reaches of the Rhine above Strasbourg is complicated by clause 358 of the Treaty of Versailles by which France is authorized to build a lateral canal alongside the Rhine between Basle and Strasbourg and to draw water from the river for the production of electric power. Before the War the Swiss had built an inland port at Basle in anticipation of the improvement of the river channel below that town which is normally navigable only during the summer season by barges of small draught. Three distinct methods of providing an improved navigation are possible: (a) improvement of the river by regulation and deepening, (b) canalization of the river, and (c) the construction of a lateral canal. Swiss and German opinion favoured one or other of the two first alternatives: the French pressed strongly for the last. Prolonged discussion ended in 1925 in the approval by the Central Commission of the Rhine being given both to the carrying out of river improvements by Switzerland and Germany and to the construction by France of the lateral canal which must be navigable and as free as the river itself. The first section of the canal, that between Basle and Kembs, was begun by France, with the concurrence of Switzerland, in 1927. This section is probably the most important from the point of view of navigation, as it avoids the Istein rapids below Basle. The canal and its lock will accommodate Rhine barges of over 1,200 tons capacity.

The enlargement of the waterways system connecting the

Rhine and the Danube, by way of the Main, was commenced by Germany in 1921, and was (1928) in course of alteration by the improvement of certain existing river and canal navigations and the construction of some new canals. The enlarged waterways are intended for barges carrying from 1,200 to 1,500 tons.

**United States of America.**—The total length of improved navigable rivers in the United States is now upwards of 23,500 miles. At least 40 distinct and separate rivers have been improved by canalization. (See Col. E. H. Schulz, U.S. Army, *International Congress of Navigation Proceedings*, 1923.) Since 1900 an immense amount of improvement of the inland waterways, both natural and artificial, has been accomplished. As a rule, canalization is well inland, the lower and middle reaches of the great rivers being open navigations. For instance, on the Hudson, the first lock is at Troy, 153 miles from the sea; on the Mississippi, at Keokuk 1,461 miles; on the Tennessee, 1,339 miles; and on the Missouri there is open navigation to Fort Benton, Montana, 3,555 miles from the Gulf of Mexico. The construction of locked waterways near seaports to connect ocean traffic with inland navigations is comparatively modern. The New Orleans Industrial canal and the Lake Washington canal at Seattle (see below) are examples.

When traffic on American rivers began to be intense, recourse was had to extensive canalization in cases where shallow water and limited flow gave rise to difficulties either seasonal or continuous. Among the rivers so improved are the Ohio, with its tributaries, the Allegheny and Monongahela; the Kanawha, West Virginia; the Kentucky in Kentucky; the Cumberland in Kentucky and Tennessee; the Tennessee in Kentucky, Tennessee and Alabama; the Black Warrior and Tombigbee in Alabama; the Columbia River in Oregon and Washington, and the Mississippi above Keokuk.

The locks on the Ohio are among the largest on the great rivers of the United States. The river improvements carried out since 1910 include the construction of 50 locks between Pittsburgh and Cairo, a distance of 968 miles. The cost of the improvements exceeded \$100,000,000. Each lock is 600 x 110 ft. internally, with depth over sills ranging from 9 to 12 feet. The lift of the majority of the locks varies from 6 to 12 ft., but one, completed in 1921, has a lift of 29 feet. A navigable depth of 9 ft. is secured throughout by the construction of weirs, with movable crests, one at each lock. The movable weirs secure the advantages of open river navigation when the natural depth in the channel is 9 ft. or more.

The Keokuk lock, the lowest on the Mississippi, was completed in 1913. In this case the dam was constructed primarily as a part of a hydro-electric power project. The lock, 380 x 110 ft. internally,

FIG. 7.—CROSS-SECTION OF THE ENLARGED SUEZ CANAL, SHOWING A MINIMUM DEPTH OF 42½ FT., AND A MINIMUM WIDTH, AT DEPTH OF 33 FT., OF 197 FEET. THE ENLARGEMENT WAS IN PROGRESS IN 1928

with 7 ft. over the sills, has a considerable lift—41 feet. The upper gate is of floating-caisson type and is operated by compressed air.

Apart from the river improvements effected by the Federal Government, which controls all navigable rivers, several of the States have undertaken canal work; the most notable instance being the reconstruction, by New York, of the old Erie canal which now forms the New York State barge canal. This work, carried out between 1905 and 1918, at a cost, including branches and terminals completed subsequently, of over \$170,000,000, connects the Hudson river at Troy with Lake Erie at Buffalo.

(See N. E. Whitford, *History of the Barge Canal of New York State*, and the *Book of Plans*, published by N.Y. State, Albany, 1921-22.) Altogether, including branch canals and the Lake Champlain section, there are 525 miles of canal proper, with 57 locks. Ships and barges up to 300ft. in length and 44½ft. beam can navigate the canal. Some of the barges using it have a cargo capacity of 2,500 tons. All the locks have a depth of 12ft. over sills, and the maximum lift in any one is 40½ feet. All lock and other machinery is operated electrically and the canal and its terminal ports are equipped in lavish manner with mechanical appliances. There is at Oswego, on this canal, a novel and interesting system of siphons for emptying and filling the lock chamber. The traffic on the canal, up to 1928, had not justified the expenditure on its construction.

**Locks and Weirs in U.S.A.**—Since 1910 practically all locks on inland waterways in the United States have been constructed of concrete. No mechanical lifts or inclined planes are in use, and no provision is made at any of the locks for mechanical haulage of vessels through them. Electric locomotives for rack traction are, however, employed for towing ships through the locks of the Panama canal. The large majority of the navigable waterways of the States being rivers of very variable flow, the provision of dams or weirs with sluices has usually been necessary in conjunction with lock construction, and many of these works are of considerable magnitude. Steel lock gates of the double-leaf mitred type are adopted generally for new works; but rolling caisson gates are also used for closing many of the river locks, particularly at the upper ends of wide locks on rivers. The silting up of the caisson chambers has, however, given trouble in some cases; and their use has been abandoned in works carried out since 1916. "Tumbling" or flap gates ("bear trap") hinged on a horizontal axis have also been used in a few instances. Sluice valves are constructed in the lock walls and are frequently of the "butterfly" type, but Stoney gate sluices and cylindrical valves predominate. The practice of placing sluice valves in the gates has been abandoned. Movable weirs of the Chanoine and needle types were formerly much used, but in the dams and weirs of later construction some form of sliding or hinged sector gates has often been adopted. The Stoney sluice is typical of the first class and the Taintor gate of the second (see WEIR).

**Canada.**—The splendid inland navigation system of Canada mainly consists of natural lakes and rivers. Most of the artificial waterways are lateral canals cut in order to enable vessels to avoid rapids in the rivers. The earliest locked canal in America, completed in 1783, was made to avoid rapids on the St. Lawrence river between Lake St. Francis and Montreal. The lateral canals of the St. Lawrence have an aggregate length of about 46m., and afford a means of navigation from Lake Ontario to Montreal for all vessels which can pass the locks, which have usable dimensions of 270x44ft. with a depth of water of 14ft. on the sills (see GREAT LAKES).

### SHIP CANALS

Ship canals, from an engineering point of view, chiefly differ from barge canals in the magnitude of the works they involve, but there is no definite line of distinction. For instance, the so-called Marseille-Rhône ship canal has approximately the same limiting structural dimensions as the New York State barge canal. Speaking generally, ship canals accommodate ocean going ships, within the limits of their dimensions, while barge canals are restricted, normally, to inland navigation craft and special types of coasting vessels. The terminal works of a ship canal, e.g., sea approaches, locks, etc., are usually such as commonly form part of dock and harbour (q.v.) works.

Ship canals have mostly been constructed either to shorten the voyage between two seas by cutting through an intervening isthmus, or to convert important inland places into sea-ports. An early example of the first class is afforded by the Caledonian canal (q.v.) opened in 1822, while among later ones may be mentioned the Suez, Kiel and Panama canals (qq.v.). One of the earliest examples of the second class is the small ship canal between Sharpness and Gloucester, completed in 1827, and among later

ones are the Manchester ship canal (q.v.) and the canal from Zeebrugge on the North Sea to Bruges (q.v.).

Isthmian canals may be either open cuttings, like the Suez canal, or locked canals as at Panama. Many have been enlarged since their first construction; and this in the case of a simple cutting can be effected by degrees and in stages; as for instance in the Suez canal, whose dimensions have been increased by dredging and in other ways from a depth of 26ft. and bottom

FIG. 8.—CROSS-SECTION OF THE ROE TUNNEL, FRANCE, THE LARGEST TUNNEL SECTION IN THE WORLD

width of 72ft. to minima of 39½ft. and 148ft. respectively. Further enlargement, sanctioned in 1921, to a minimum depth of 42½ft. and a minimum width of 197ft. (at a depth of 33ft.) was still in progress in 1928 (fig. 7). Locked canals, if they have to be enlarged, present a different problem, of which the North Sea-Amsterdam ship canal furnishes an example. This canal, which is 15½m. in length from Ymuiden on the North Sea to Amsterdam, was constructed between 1865 and 1876 to supersede the Great North Holland canal made early in the 19th century from the Texel Roads to Amsterdam. Originally it had a depth of 23ft., bottom width of 88½ft., and an entrance lock 394x60ft. internally. In 1896 a second sea lock, 738x82ft. and 33ft. deep over the sill at mean tide level, was constructed to meet the increased dimensions of shipping, and the entrance channel and canal section were enlarged. In 1921 further enlargement was undertaken; and the building of a new lock, the largest in the world (1928), was begun in the following year. It is 1,315ft. long, 164ft. wide and 50ft. deep over the entrance sill at mean tide level. The harbour and canal have been deepened to 40ft. and the canal widened to 246ft. at the bottom.

The new lock (completed 1928) is, in fact, considerably larger than is necessary for the near future; but its dimensions will allow the harbour to be deepened and the section of the canal to be still further increased.

The Cronstadt canal (1878-84), connecting the roadstead of Cronstadt with the port of Leningrad (Petrograd), is a channel 28ft. deep. It is dredged through the Neva bay and protected by lateral moles or embankments on either side for a great part of its length of about 18 miles.

The Corinth canal cut through the Isthmus of Corinth, which connects the Morea to the mainland of Greece, is four miles long and is without locks. The canal passes through high land, mostly rock, and the deepest cutting is 285 feet. A small difference in tidal ranges at the two ends causes a current through the canal which rarely exceeds two knots. The bottom width is 72ft. and the depth 26½ft. below mean sea level. The cut was actually commenced in the time of Nero whose work was incorporated in the canal when it was completed between 1882 and 1893.

Belgium possesses several ship canals of moderate dimensions; the oldest is the Ghent-Terneuzen canal connecting the city of Ghent with the river Scheldt at Terneuzen, about 12m. above Flushing. Originally constructed during the years 1825-27, when Belgium was united with Holland, half of its length of 18 miles is now in Dutch and the other half in Belgian territory. It has been enlarged and now has a depth of 28½ft. with bottom width of 164ft., except in the Dutch section which is narrower but of the same depth. At Terneuzen there are three sea locks and near the Dutch frontier three regulating locks which are only used for flood water control. The canal is at one level throughout. Ships drawing 26-27ft. can navigate up to Ghent where an extensive and well equipped inland port has been constructed. The Roupel ship canal, between a tributary of the Scheldt and Brussels, where an inland harbour has been built, was opened in 1922. This waterway, 20m. long, has a minimum bottom width of 66ft. and a depth of 21 feet. The three locks are 374x52½ft. internally. Ships drawing 18ft. can pass by the canal from the sea up to Brussels.

The Bruges ship canal (1896-1907) begins in the harbour of

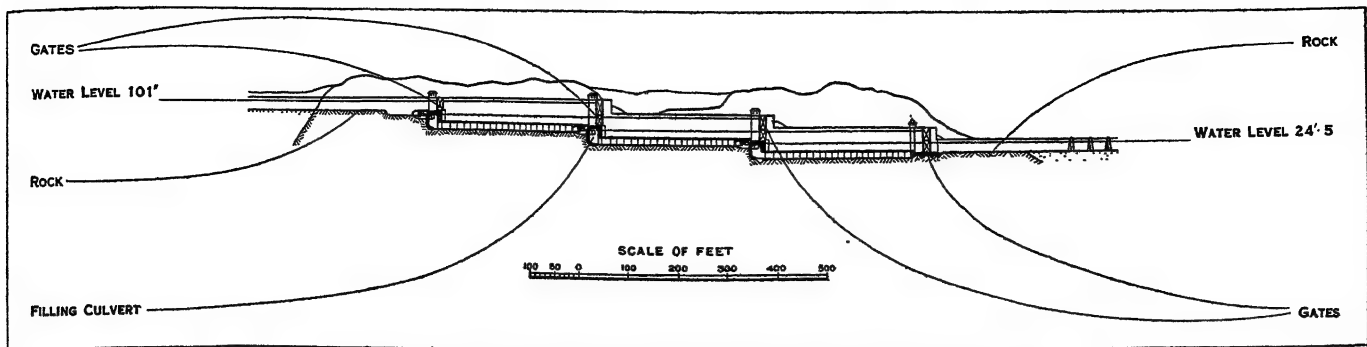

FIG. 9.—SECTION THROUGH LOCKS ON THE TROLLHÄTTE SHIP CANAL, SWEDEN

This canal completed in 1916, connects Gottenburg with Lake Vänern. The three locks shown overcome a total rise of 77ft., and are 321½ft. x 45ft. internally

Zeebrugge, on the Belgian coast, which was constructed at the same time. It connects this port with the city of Bruges, 6¼m. distant, where basins and quays for sea-going ships have been built. The entrance lock at Zeebrugge is 518x65½ft. internally and is closed by rolling caissons; the canal is 72ft. wide at the bottom, 229ft. at water level and 28ft. deep. The basins at Bruges are in communication with the canal system of Belgium.

Sweden possesses an abundance of lakes and rivers but, on account of the uneven nature of the country, the rivers generally are not naturally navigable and some of them have been canalized. The canal system dating, for the most part, from the middle of the 19th century, is extensive. In general the locks measure 117x24ft.x10ft. deep, but in some cases they are smaller. Three of these canals have been reconstructed as ship canals since the beginning of the 20th century.

The Trollhätte ship canal, completed in 1916, connects Göttenburg and the Kattegat with Lake Vänern in southern Sweden and is, for the most part, the canalized Göta river. It is remarkable for a flight of three contiguous locks overcoming a total rise of 77 feet. The canal is 52 miles long and the locks are 321½x45ft. internally with a depth of 18ft. The Göta canal, connecting Lakes Vänern and Vättern with the Baltic, having locks of less dimensions than those of the Trollhätte, enables small vessels to cross Sweden from Göttenburg to the Baltic.

The Södertälje canal between Lake Mälaren and the Baltic was reconstructed in 1924, the one lock being 450x67ft. and 27ft. deep. The canal itself was deepened in 1924 to take ships drawing about 20ft. and will be further enlarged, if required, up to the capacity of the lock.

The Hammarby canal, a short cut, completed in 1926, between Stockholm and Lake Mälaren, one of the larger Swedish lakes, has one lock with internal dimensions 358x57ft.x20½ft. deep. The locks on the Södertälje and Hammarby canals are interesting as having balanced sector gates of a novel type, which uphold moderate heads of water on either side.

The Marseille-Rhône ship canal, commenced before the War but only partially completed in 1928, does not accommodate large sea-going vessels, but is designed to open up the port of Marseille to barge traffic on the Rhône and the inland navigation system of France generally. It also places Marseille in direct inland water communication with the Étang de Berre, an inland lake over 70 sq.m. in area, capable of considerable industrial development. The total length of the waterway is about 48m. and it extends from the harbour of Marseille to Arles on the Rhône, passing through the mountainous district of Nerthe by a tunnel at Rove, thence through the Étang de Berre to Port-de-Bouc where it connects with an old barge canal to Arles which was being enlarged in 1928. The canal is level throughout, but has two regulating locks and one, at Arles, between the river and the canal. These are 525ft. long and 52ft. wide. The waterway, normally 75ft. wide at bottom, is 10ft. deep in the completed sections. The Rove tunnel, nearly 4¼m. in length, cut through rock, has a width of 72ft. and a height of 37ft. above the water level, the depth of water in the tunnel being 13 feet. The cross section is larger than that of any other tunnel in the world (fig. 8).

**United States and Canada.**—Important ship canals, in addition to the Panama canal (opened to traffic in Aug. 1914), have been made since the beginning of the 20th century. The New Orleans Industrial canal connects the Mississippi river with Lake Ponchartrain, 5¼m. distant. It was completed in 1923 at a cost of over \$25,000,000, and its construction was brought about mainly by the desire to provide increased waterside frontage at the port of New Orleans. Moreover, it forms part of a scheme (1928) for connecting New Orleans with the Gulf of Mexico by way of Lake Ponchartrain and a short artificial cut between the lake and the sea. The lock at the entrance to the canal is constructed on a foundation of 24,000 piles driven through a bed of very fine quicksand. The usable dimensions of the lock are 640x75ft., with 31ft. depth over sills at lowest water in the Mississippi river. The canal at its minimum section is 30ft. deep, 150ft. wide at bottom and 300ft. wide at water level.

The Lake Washington ship canal, eight miles long, extending from Puget sound to Lake Washington, was opened in 1916. The sea entrance at Seattle has two locks, the larger of which has a usable length of 825ft., with intermediate gates, and is 80ft. wide. The depth over the sill varies from 25 to 44ft. according to the state of the tide. Flood water is provided for by the construction of a dam with movable crest gates.

The Cape Cod canal, connecting Cape Cod bay on the east, with Buzzards bay on the west of the Cape Cod isthmus, is 7¼m. in length with dredged approaches which make the total length of the cut 13 miles. Its construction was begun in 1909 and the waterway was first opened to traffic in 1914, since when the works have been completed to give a depth of 25ft. at low water. There is at present no regulating lock on the canal; and on account of the difference in sea levels at the two ends there is at times a considerable current flowing through it. It provides a shorter route than the exposed open sea route between New York and Boston.

For the St. Mary's Falls canal, or, more correctly, canals, connecting Lakes Superior and Huron at Sault Ste. Marie, and, the new Welland ship canal connecting Lakes Erie and Ontario in Canada, see GREAT LAKES. The canal itself is excavated to 25ft. depth with provision for a depth of 30ft. later. The cost of the new waterway was about \$110,000,000.

An ambitious scheme for a waterway 25ft. deep between the St. Lawrence river at Montreal and Lake Ontario, combined with hydro-electric development, was under consideration by the Governments of the United States and Canada in 1928.

**BIBLIOGRAPHY.**—Among the early literature of canal navigation are works by C. Vallancey (Dublin, 1763); R. Fulton (1796); W. Tatham (1799); John Phillips (1803) and J. Priestly (1831). D. Stevenson's *Canal and River Engineering* (3rd ed., 1886) and L. F. Vernon-Harcourt's *Rivers and Canals* (2nd ed. 2 vol. 1896) are standard works by British engineers; *Rivers and Canals* is particularly valuable for its chapters on river improvements. E. S. Bellasis, *River and Canal Engineering* (1924) deals mainly with drainage and irrigation canals. J. Smeaton, *Reports* (2nd ed., 1837); Thomas Telford, *Autobiography* (1838); and S. Smiles, *Lives of the Engineers* contain interesting accounts of early canal construction. Bradshaw's *Canals, etc., of England and Wales* (1928) is a detailed route book: it contains a useful glossary of canal terms. B. F. Thomas and D. A. Watt, *The*

*Improvement of Rivers* (2nd ed., 1913) is the best modern work in English on canalized rivers (vol. ii.).

The most generally useful works in French are Paul Vidal, *Rivières Canalisées*; and O. Jacquinot and F. Galliot, *Canaux*, both volumes in section *Navigation Interieure* of the series "Encyclopédie de Génie Civil" (1922). For U.S.A. waterways see the *Annual Reports* of Chief of Engineers U.S. Army and the *Reports* of the Commissioner on Inland Waterways, etc. (Washington, 1909-13).

See also the *Reports*, etc., of the Royal Commission on Canals, including vol. iv. which is a valuable report by Sir W. H. Lindley on *Continental Waterways and Proceedings Inst. C.E.* The *Reports* of the International Navigation Congresses (1885 et seq.) contain valuable papers, particularly those of the Milan (1908), Philadelphia (1912) and London (1923) congresses. Exhaustive bibliographies have been issued by the I.N.C. Bureau, Brussels, at intervals since 1908.

(N. G. G.)

**CANANDAIGUA**, a city of New York, U.S.A., at the northern end of beautiful Canandaigua lake, 30m. S.E. of Rochester; the county seat of Ontario county and a popular summer resort. It is on Federal highway 20, and is served by the New York Central and the Pennsylvania railways. The population in 1930 Federal census was 7,541. There are several private schools at Canandaigua and also a number of endowed charitable institutions. The manufactures include spokes, ploughs and harrows, optical supplies, enamelled ware, corsets, pressed brick and rustless tin. Grape culture is important in the region.

The city occupies the site of an Indian village (Kanadarque) which was destroyed by Gen. John Sullivan in 1779. It was settled in 1789, incorporated as a village in 1812 and as a city in 1913.

**CANARD**, a sensational story, hoax, or false report, especially one circulated by newspapers. This use of the word in France dates from the 17th century, and is said to have originated in the old expression, *vendre un canard à moitié*, to half-sell a duck, i.e., to pretend to sell, to cheat.

**CAÑARIAN**, a group of tribes of South American Indians, supposed on very meagre evidence to constitute an independent linguistic stock. The Cañaris lived at the period of the Spanish conquest in the highlands of Southern Ecuador, from Alausi southward to the Jubones river, and extended west as far as the Gulf of Guayaquil. They were conquered and largely destroyed by the Incas in the course of expansion of their empire in the 15th century. The Cañaris were sedentary, agricultural folk, wearing poncho-like garments of cotton or woollen textiles, and living in thatched roof houses of poles plastered with mud. They were skilful workers in copper and gold. Their chief weapons were a wooden sword, a javelin and club. Chiefs were buried with much treasure in deep, well-graves. In their religious ceremonies they practised human sacrifice (chiefly of children) on a scale rare in South America.

See F. G. Suarez, *Estudio historico sobre los Cañaris* (Quito, 1878).

**CANARY**, a passerine bird (*Serinus canarius*), belonging to the family *Fringillidae* or finches (see FINCH). It is a native of the Canary Islands and Madeira, where it occurs abundantly in the wild state, and is of a greyish-brown colour, slightly varied with brighter hues. It was first domesticated in Italy during the 16th century. Since then, the canary has been the subject of careful artificial selection, the result being the production of a bird differing widely in the colour of its plumage, and even in size and form, from the wild species. The prevailing colour of most varieties of the canary is yellow. Size and form have also been modified by domestication, the wild canary being not more than 5½ in. in length, while one well-known Belgian variety usually measures 8 in. There are also hooped or bowed canaries, feather-footed forms; and top-knots, having a distinct crest on the head. Most of the varieties, however, differ merely in the colour and the markings of the plumage. Hybrids are common, the canary breeding freely with the siskin, goldfinch, citril, greenfinch and linnet. The hybrids thus produced are almost invariably sterile. In a state of nature canaries pair, but under domestication the male bird is polygamous. The canary is very prolific, producing three or four broods (of up to six eggs each) every year and in a state of nature it is said to breed still oftener. The work of nest-building and incubation falls chiefly on the female, while the duty of feeding

the young rests mainly with the cock. The natural song of the canary is loud and clear. They readily imitate other birds. In Germany gramophone records of the nightingale's song have been used to train cocks to sing almost like nightingales. Their young learn the new type of song from their fathers.

**CANARY ISLANDS** (*Canarias*), a Spanish archipelago in the Atlantic ocean; about 60m. W. of the African coast, between 27° 40' and 29° 30' N., and between 13° 20' and 18° 10' W. Pop. (est. 1925), 509,287; area 2,807 sq.m. The Canary Islands may be considered as two groups, one of which, including Tenerife, Grand Canary, Palma, Hierro and Gomera, consists of mountain peaks, isolated and rising directly from an ocean of great depth; while the other, comprising Lanzarote, Fuerteventura and six uninhabited islets, is based on a single submarine plateau, of far less depth. Ever since the researches of Leopold von Buch the Canary Islands have been classical ground to the student of volcanic action. Buch considered them to be representative of his "craters of elevation." In common with the other West African islands they are of volcanic origin. The lavas consist chiefly of trachytes and basalts.

**Climate**.—From April to October a north or north-east wind blows upon the islands, beginning about 10 A.M. and continuing until 5 or 6 P.M. In summer this wind produces a dense stratum of sea-cloud. In winter the islands are occasionally visited by a hot south-east wind from Africa, which is called the *Levante*, and sometimes brings locusts. In 1812 it is said that locusts covered some fields in Fuerteventura to the depth of 4ft. The climate generally is mild, dry and healthy. On the lower grounds the temperature is equable, the daily range seldom exceeding 6°. At Santa Cruz the mean for the year is about 71°.

**Fauna and Flora**.—The indigenous mammals of the Canary Islands are very few in number. The dog, swine, goat and sheep were alone found upon the island by the Spanish conquerors. The ferret, rabbit, cat, rat, mouse and two kinds of bat have become naturalized. The ornithology is more interesting, on account not only of the birds native to the islands, but also of the stragglers from the African coast. Among the indigenous birds are some birds of prey, such as the African vulture, the falcon, the buzzard, the sparrow-hawk and kite. There are also two species of owl, three species of sea-mew, the stockdove, quail, raven, magpie, chaffinch, goldfinch, blackcap, canary, titmouse, blackbird, house-swallow, etc.

The position of mountainous islands like the Canaries, in the subtropical division of the temperate zone, is highly favourable to the development, within a small space, of plants characteristic of both warm and cold climates. Buch refers to five regions of vegetation in Tenerife:—(1) From the sea-level to the height of 1,300ft. This he styles the African region. The climate in the hottest parts is similar to that of Egypt. Here are grown, among the other introduced plants, the coffee tree, date-palm, sugar-cane, banana, orange tree, American agave and two species of cactus; and among indigenous plants, the dragon tree on the north-west of Tenerife. A leafless and fantastic euphorbia, *E. canariensis*, and a shrubby composite plant, *Cacalia kleinia*, give a character to the landscape about Santa Cruz. (2) Between 1,300ft. and 2,800ft. This is the region of south European vegetation, the climate answering to that of southern France and central Italy, with vines and cereals. (3) The region of indigenous trees, including various species of laurel, *Ardisia*, *Ilex*, *Rhamnus*, *Olea*, *Myrica* and other trees found wild also at Madeira. It extends to the height of 4,000ft. (4) The region of the beautiful *Pinus canariensis*, extending to the height of 6,400 ft.; here the broad-leaved trees have ceased to grow, but aborescent heaths are found throughout its whole extent, and specimens of *Juniperus oxycedrus* may be met with. (5) The region of Retama (*Cytisus nubigenus*), a species of white-flowering and sweet-scented broom, which is found as high as 11,000ft. The number of wild flowering plants may be estimated at 900, upwards of 270 of which are peculiar to the Canaries.

**Inhabitants**.—The Guanches (*q.v.*), who occupied the Canaries at the time of the Spanish invasion, no longer exist as a separate race. The present inhabitants are slightly darker than

the people of Spain, but in other respects are scarcely distinguishable from them. The men are of middle height, well-made and strong. Spanish is the only language in use. Fully 80% of the inhabitants could neither read nor write in 1900; but education progresses more rapidly than in many other Spanish provinces. Good schools are numerous, and the return of emigrants and their children who have been educated in the United States, tends to raise the standard of civilization. The sustenance of the poorer classes is chiefly composed of fish, potatoes, and *gofio*, which is, as in Cuba, merely Indian corn or wheat roasted, ground and kneaded with water or milk.

**Government.**—The archipelago forms one Spanish province, of which the capital is Santa Cruz de Tenerife, the residence of the civil governor. The court of appeal, created in 1526, is in Las Palmas. The captain-general and second commandant of the archipelago reside in Santa Cruz de Tenerife, and there is a brigadier-governor of Grand Canary, residing in Las Palmas, besides eight inferior military commandants. The province furnishes no men for the Spanish peninsular army, but its annual conscription provides men for the local territorial militia, composed of regiments of infantry, squadrons of mounted rifles and companies of garrison artillery—about 5,000 men all told. The archipelago is divided into two naval districts, commanded by royal navy captains. Roman Catholicism is the official religion, and ecclesiastical law is the same as in other Spanish provinces. The convents have been suppressed, and in many cases converted to secular uses. Laguna and Las Palmas are episcopal sees, in the archbishopric of Seville.

**Industry and Commerce.**—Owing to the richness of the volcanic soil, agriculture in the Canaries is usually very profitable. Land varies in value according to the amount of water available, but as a rule commands an extraordinarily high price, irrigated land being worth ten or twelve times as much as the non-irrigable (*de secano*). Until 1853 wine was the staple product, and although even the finest brand (known as *Vidonia*) never equalled the best Madeira vintages, it was largely consumed abroad, especially in England. The annual value of the wine exported often exceeded £500,000. In 1853, however, the grape disease attacked the vineyards; and thenceforward the production of cochineal, which had been introduced in 1825, took the place of viticulture so completely that, twenty years later, the exports of cochineal were worth £556,000. France and England were the chief purchasers. This industry declined in the later years of the 19th century, and was supplanted by the cultivation of sugar-cane, and afterwards of bananas, tomatoes, potatoes, and onions. Bananas are the most important crop. Fishing is a very important industry, employing over 10,000 hands along some 600m. of the African coast, between Cape Cantin and the Arguin Bank. The chief ports are Las Palmas and Santa Cruz, which annually accommodate about 7,000 vessels of over 8,000,000 tons. In 1854 all the ports of the Canaries were practically declared free; but on Nov. 1, 1904, a royal order prohibited foreign vessels from trading between one island and another. This decree deprived the outlying islands of their usual means of communication, and, in answer to a protest by the inhabitants, its operation was postponed.

### HISTORY

The Romans learned of the existence of the Canaries through Juba, King of Mauretania, whose account of an expedition to the islands, made about 40 B.C., was preserved by the elder Pliny. He mentions "Canaria, so called from the multitude of dogs of great size." Both Plutarch and Ptolemy speak of the Fortunate Islands, but from their description it is not clear whether the Canaries or one of the other island groups in the western Atlantic are meant (*see ISLES OF THE BLEST*). In the 12th century the Canaries were visited by Arab navigators, and in 1334 they were rediscovered by a French vessel driven among them by a gale. A Portuguese expedition, undertaken about the same time, failed to find the archipelago, and want of means frustrated a grandson of Alphonso X. of Castile, named Juan de la Cerda, who had obtained a grant of the islands and had been crowned king of them at Avignon, by Pope Clement VI. In 1402, Gadifer de la Salle

and Jean de Béthencourt (*q.v.*) sailed with two vessels from Rochelle, and landed early in July on Lanzarote. Between 1402 and 1404 La Salle conquered Lanzarote and part of Fuerteventura, besides exploring other islands; Béthencourt meanwhile sailed to Cadiz for reinforcements. He returned in 1404 with the title of king, which he had secured from Henry III. of Castile. La Salle, thus placed in a position of inferiority, left the islands and appealed unsuccessfully for redress at the court of Castile. In Dec., 1406, Béthencourt left the Canaries, entrusting their government to his nephew Maciot de Béthencourt. Eight years of misrule followed before Queen Catherine of Castile intervened. Maciot thereupon sold his office to her envoy, Pedro Barba de Campos; sailed to Lisbon and resold it to Prince Henry the Navigator; and a few years afterwards resold it once more to Enrique de Guzman, count of Niebla. Jean de Béthencourt, who died in 1422, bequeathed the islands to his brother Reynaud; Guzman sold them to another Spaniard named Paraza, who was forced to re-sell to Ferdinand and Isabella of Castile in 1476; and Prince Henry twice endeavoured to enforce his own claims. In 1479 the sovereignty of Ferdinand and Isabella over the Canaries was established by the Treaty of Alcaçova, between Portugal and Castile. After much bloodshed, and with reinforcements from the mother country, the Spaniards, under Pedro de Vera, became masters of Grand Canary in 1483. Palma was conquered in 1491 and Tenerife in 1495 by Alonso de Lugo. In 1902 a movement in favour of local autonomy was repressed by Spanish troops. For administrative purposes the islands are considered as part of Spain. They have been used by Primo de Rivera as a place of exile for certain of his political opponents. (*See SPAIN: History.*)

**CANBERRA**, the national capital of the Commonwealth of Australia, was established as the seat of Government under powers conferred by s. 125 of the Commonwealth Constitution Act, which received the assent of Queen Victoria on July 9, 1900.

The provision for the establishment of a seat of Government was presented before the national conventions in various forms. The final convention, which agreed to a bill for submission to the people, sat in Melbourne from Jan. to March 1898. At a conference of premiers held in Melbourne in Jan. 1899 it was agreed and subsequently incorporated in s. 125 of the Constitution Act, that "The seat of Government of the Commonwealth shall be determined by the parliament, and shall be within territory which shall have been granted to or acquired by the Commonwealth, and shall be vested in and belong to the Commonwealth, and shall be in the State of New South Wales, and be distant not less than 100 miles from Sydney. Such territory shall contain an area of not less than 100 square miles, and such portion thereof as shall consist of Crown lands shall be granted to the Commonwealth without any payment therefor."

Before the end of 1899 the Government of New South Wales appointed Alexander Oliver, president of the Land Appeal Court, a royal commissioner, to enquire into and report upon sites for the federal capital. Oliver submitted his report on Oct. 26, 1900, and made Dalgety his first choice, and bracketed Canobolas (Orange) and Yass as his second choice. Not till Jan. 14, 1903, was any further definite step taken. On that date the Federal Government appointed a royal commission of four to inquire into and examine sites near Albury, Armidale, Bombala, Lake George, Orange (Bathurst and Lyndhurst) and Tumut, with instructions that consideration was to be given to the following:

(1) Accessibility to the state capitals; (2) means of communication; (3) climate; (4) topography; (5) water supply; (6) drainage; (7) soil; (8) building materials; (9) fuel; (10) general suitability; (11) cost of resumption of site and area and Crown lands available; (12) any other material matters.

On July 16, 1903, the commissioners presented their report and submitted an order of preference for certain sites under the various headings of their terms of reference but made no definite

PLAN OF AUSTRALIA'S NEW FEDERAL CAPITAL AT CANBERRA

recommendation in favour of any particular site. In a supplementary report dated Aug. 4, 1903, the commission gave special consideration to the advantages and disadvantages of the site at Dalgety.

On Oct. 8, 1903, an exhaustive ballot was taken in the House of Representatives which resulted in Tumut receiving the selection. A bill was introduced into parliament naming Tumut as the site. This bill also contained the provision that the territory granted to or acquired by the Commonwealth within which the seat of Government shall be, shall contain an area of not less than 1,000 square miles. The Senate amended the bill by substituting Bombala for Tumut. The House of Representatives declined to accept the Senate's amendment and the bill lapsed. What has been termed the "Battle of the Sites" proceeded. No agreement was reached until the Federal House of Representatives, after an exhaustive ballot, decided on the Yass-Canberra site, which included proposed sites at Yass, Lake George and Canberra. The Senate agreed by a ballot to the site chosen by the House of Representatives.

The Seat of Government Act was assented to on Dec. 14, 1908, and during the following year the actual site of Canberra—the future capital city—was determined. The Seat of Government Acceptance Act was proclaimed on Dec. 15, 1909 and on Jan. 20, 1910, the governor-general issued a proclamation which brought the Seat of Government Acceptance Act into force two days later. This proclamation vested the territory in the Commonwealth. A further act providing for the provisional government of the territory was assented to on Nov. 25, 1910. The State of New South Wales surrendered an area of approximately 900sq.m., which embraces the uninhabited catchment area of the Cotter river and the valleys of the Molonglo and Queanbeyan rivers. Subsequently 212,000 acres were acquired from private owners at a cost of £775,000.

On April 30, 1911, the Commonwealth Government, in a world wide competition, invited designs for the capital city, for prizes of £1,750, £750 and £500. Of 126 designs submitted, the first prize was awarded to Walter Burley Griffin, of Chicago. A depart-

mental board was subsequently appointed to report. It did not recommend the adoption of any of the designs, but submitted a design of its own which embraced certain features of the submitted designs and certain modifications of those designs. In June 1913 a change of Government occurred and the new Government rejected the departmental plan and adopted Griffin's plan with certain amendments. The foundation stones of a "commencement column" were laid on March 12, 1913, on Camp hill by the governor-general (Lord Denman), the prime minister (Andrew Fisher), and the minister for home affairs (King O'Malley).

The outbreak of war delayed building operations. The prince of Wales, during his visit in 1920, laid the foundation stone of the Capitol. A dam has been constructed to hold up the waters of the Cotter river and its tributaries. This ensures a splendid supply of crystal-clear water, sufficient for a population of 70,000 persons. Good roads have been constructed within the Federal capital area, water mains, sewers, electric light and power works, and brickworks have been installed. The city avenues and parks have been well laid out with ornamental trees and attractive gardens.

The temporary Parliament House was completed in time for the opening by the duke of York on May 9, 1927, of the first Federal parliament to sit at Canberra. It is a handsome structure and is elaborately furnished and appointed. Two secretariats which will temporarily house the permanent staffs have also been completed. The prime minister, Mr. Bruce, turned the first sod for the permanent secretariat in Oct. 1927. Attractive dwelling houses have been erected in the suburbs of Red Hill, Blandfordia, Acton, North and South Ainslie, Eastlake, Westridge and Manuka. Several hotels, boarding houses and guest houses have been opened. Excellent school accommodation has been supplied. There are extensive and attractive banking and shopping centres at Civic Centre (Ainslie) and Eastlake.

By the Seat of Government (Administration) Act which was assented to in July 1924, and which came into operation on Jan. 1, 1925, the administration of the territory was placed in the hands of a commission of three, of which Sir John Butters, K.B.E., is chairman. Of the three persons first appointed one shall be appointed for five years, one for four years, and the third for three years. Thereafter, each appointment shall be for a term not exceeding three years. The commission is subject to the control of the minister for home and territories. The commission, subject to the approval of the governor-general in council, may make by-laws and ordinances for the good government of the territory. The commission controls the lands of the territory and has power to levy and collect rates upon land, has charge of domestic housing and of the developmental works and administration of the territory.

The first ordinance, passed in 1911, when the administration of the territory was under an administrator, subject to the control of the minister for works and railways, contained a provision prohibiting the issue of licences for the sale within the territory of alcoholic liquors. That ordinance is still in force and will remain so until a plebescite is taken to determine the question. No date has yet been fixed, but the Government has expressed a view that the matter shall remain in abeyance until there is a "stable" population in the Federal capital. Up to the end of June 1928, the amount expended in the territory was £10,546,084. It is estimated that the present population (June, 1928) is rather more than 8,000.

The city of Canberra is beautifully situated in an amphitheatre of wooded hills at an elevation of approximately 2,000ft. above sea level in 35° 15' S. latitude and 149° 15' E. longitude. It lies approximately 80m. from the coast, is distant by rail 204m. from Sydney, 429 from Melbourne, 912 from Adelaide, 929 from Brisbane and 2,600 from Perth. Ultimately it will be connected with the sea by a railway covering a distance of about 123m., terminating in Federal territory at Jervis bay. Meteorological information: Average annual rainfall 22.65in.; mean summer temperature 67.5°; mean winter temperature 41.8°.

The name "Canberra" is of aboriginal origin. It is pronounced with the accent on the first syllable as if it were spelt "Cannbra."

**CANCALE**, a fishing port of north-western France in the department of Ille-et-Vilaine on the bay of Mont St. Michel, gm. E.N.E. of St. Malo. Pop. (1926), 3,463. It is noted for its oysters and for the pretty head-dress of the Cancellais. The old town (Cancale-Ville) stands on the cliffs, with the fishing village (La Houle) on the quay beneath. The harbour is protected by the rocks known as the *Rochers de Cancale*, a name frequently found on inn signs in France. In 1758 an English army under the duke of Marlborough landed here for the purpose of attacking St. Malo and pillaged the town. It was again bombarded by the English in 1779.

**CANCELLI**, in architecture, screens or parapets, similar to those used by the Romans, to divide off the judges' space in a basilica. The Latin name for these was *cancelli* (cf. the English legal use of the word "bar"). From their resemblance to such Roman screens the enclosures of the choir and chancel of a church are also known as cancelli. (See BASILICA, CHANCEL, CHOIR.)

**CANCER** ("The Crab"), in astronomy, the fourth sign of the zodiac denoted by the symbol ♋. The constellation contains a large loose cluster of stars known as Praesepe or the Beehive. The Tropic of Cancer is the northern limit of places on the earth where the sun can be vertically overhead.

**CANCER**, a term embracing several varieties of morbid new growth or tumour and, secondarily, the disease that results from the presence of these new growths and their mode of increase. Here, cancer will be considered as a disease; the microscopical appearances of the different varieties are described under TUMOUR, and the course of investigations under CANCER RESEARCH.

Though cancer affects man pre-eminently, it has been found in many other varieties of vertebrate animals, including fishes, and the cells constituting the new growths resemble in essential details the normal cells of the animal in which they arise. In every case of cancer the disease is local at first. In rodent cancer and in about a third of the cases affecting the neck of the womb it remains so throughout, but in the great majority of cases of all sites secondary growths or metastases occur sooner or later in distant parts of the body. Locally the growth extends by multiplication of the cells of which it is composed, destroying at the same time the surrounding tissues by pressure atrophy (see ATROPHY). Usually it degenerates and breaks down because the blood-supply of the tumour is insufficient to supply the needs of the growing cells. These processes occupy varying lengths of time according to the type of growth and its situation amongst other factors. Hence the duration of the disease varies within wide limits, but reckoning from the date of onset, as alleged by the patient, it is on an average two to three years. This is not all; even with cancer of the same site (e.g., breast), the duration varies in individual cases between, perhaps, six months and as many or more years. In cancer of any part where interference with nutrition is great or important structures are exposed to pressure or ulceration the average duration of the disease and the difference between maximum and minimum are less. Such is cancer of the alimentary tract, particularly in its upper part. In other cases the type of tumour naturally runs a rapid course; such are cancer of testicle and of periosteum.

**Early Symptoms.**—Naturally the symptoms vary according to the part primarily affected, but it is very common for cancer to be quite painless at first, a fact which explains, in part, why patients, to their own grave detriment, are slow in seeking medical advice when they have discovered an abnormality. Moreover, cancer is often superposed on an antecedent condition which is itself non-cancerous; e.g., some site of chronic irritation or a non-malignant tumour. A sudden increase in volume or rate of extension suggests that the pre-cancerous condition has become cancerous, but the actual transition from innocence to malignancy cannot be fixed even by means of the microscope. Thus the earliest symptoms of cancer in a part are in reality those of the pre-cancerous condition itself. When symptoms are present that can be ascribed, indubitably, to cancer the disease has already attained to some considerable size. These facts have an important

bearing on treatment (see below) and prevention and must be considered in more detail.

**Pre-cancerous Conditions.**—Certain conditions are so often followed by local cancer that a causal relation between them has been assumed. Such are various forms of chronic irritation of which the following are the chief. Irritation by a jagged tooth or ill-fitting denture, syphilitic leukoplakia of tongue, smoking of clay pipes (lip), eating of hot rice (oesophagus, Japan), chronic ulcers at the pylorus, gallstones (gall bladder), leukoplakia of vulva, cicatrices in the neck of the womb following childbirth, chronic mastitis (breast), chronic ulcers of skin, use of the *kangri* by dwellers in Kashmir (skin of lower abdomen and inner surfaces of thighs), pressure of the *dhobi* string in Indian washermen (skin of shoulder), betel-nut chewing (inside of cheek), bilharziosis (bladder, rectum), aniline (bladder), soot (scrotum), tar (hands and arms), paraffins (hands, arms and scrotum), X-rays and radium (hands). These sources of chronic irritation may have ceased to act several years before the cancer appears or it may supervene during their action. In either case they induce at first a warty condition of skin or other part upon which the actual cancer is imperceptibly engrafted at one or more points. In addition, certain varieties of tumour, themselves non-malignant, may take on malignant characters, particularly if subjected to chronic irritation. Such are moles and warts, especially if irritated by application of acids or caustics for their removal, fibro-adenomata of breast, villous tumours of bladder, fibromyomata of uterus.

Subject to these considerations reference may be made to the earlier signs of cancer at a few of the sites more commonly affected. In the *breast*, a lump is felt beneath the skin or the nipple is retracted and raised above the level of the other nipple, or a small amount of blood-tinged fluid exudes from the nipple with or without pressure, or stabbing pains are felt particularly at night. In the *uterus*, haemorrhage independent of menstruation, or a blood-tinged discharge, sometimes foul-smelling, though this is a later sign, pain especially in the back. In the *rectum*, slight haemorrhage, often ascribed to haemorrhoids or piles, discharge of mucus, perhaps some alteration in shape of faeces. In the *stomach*, indigestion coming on at a fairly fixed interval after food, often relieved by vomiting. In the *lip*, a raised sore with base of cartilaginous hardness. In *tongue*, *cheek* and *floor of mouth* an ulcer with hard edges and base painful if touched by salt or highly seasoned foods. In *skin*, a small non-healing indolent ulcer, enlargement or ulceration of a pre-existing mole or wart. In *bladder*, haematuria, passage of small clots. In *prostate*, difficulty in micturition or defaecation. In *bone*, local pain, often severe, or local enlargement. Of course many of the symptoms enumerated are not diagnostic of cancer exclusively, but their frequent occurrence in cancer indicates immediate recourse to skilled medical advice. It will be noticed that the sites mentioned above are easily accessible. With parts more deeply situated diagnosis is often impossible apart from exploratory operation unless some symptom obtains (e.g., persistent jaundice in cancer of the pancreas or liver obstructing the main bile ducts) and sometimes cancer is unsuspected till revealed by an autopsy.

**Later Symptoms and Course of the Disease.**—If a cancer runs its natural course it will extend until it reaches some free surface. Here, as the result of slight injury or because of local degeneration, putrefactive micro-organisms invade it, degeneration proceeds apace and a foul ulcer with thickened edges results. Long before this has occurred, however, in most cases cancer cells from the periphery of the mass have grown along the lymphatics to the nearest group of lymphatic glands and perhaps to further groups, or minute portions of the primary growth have been carried by the blood-stream to distant parts, particularly the liver or lungs. Wherever lodged, these transported cells multiply and form secondary growths or "metastases." These metastases undergo similar degenerative changes to those of the primary growth, but owing to their situation putrefaction does not occur readily. The total mass of metastases often greatly exceeds in size that of the primary mass. A cancer of the intestine weighing

half an ounce may give rise to metastases in the liver weighing altogether 8–10 lb.

When metastasis has taken place the symptoms associated with the primary mass may be greatly overshadowed by those due to the secondary growths. In cancer of the breast the local changes cause anxiety and a varying degree of pain. When the growth has reached the skin and broken down, the ulcerated surface is foetid and from its surface are absorbed into the system poisonous products of putrefaction. These interfere with blood formation so that a progressive anaemia (*see* ANAEMIA) sets in and the normal balance between numbers of red cells and leucocytes and numbers of different varieties of leucocytes is disturbed. The chemical composition of the blood is changed but not after a fashion characteristic of cancer unless it be that it contains more potassium than normal. This series of changes induces a general malnutrition, wasting and ill-health summed up under the name "cachexia."

But the secondary growths arising from this same cancer of breast may add their own peculiar symptoms. The enlarged glands in the armpit pressing on nerves and veins may produce in the arm very severe pain and a dropsical condition reaching to the hand so great that the affected limb is twice or more the size of that on the unaffected side. The other breast may become the seat of metastasis and the entire picture be repeated on that side also. Metastasis may occur in the thigh bone and lead to fracture, in the bodies of the vertebrae leading to severe pain from implication of nerve-roots, in the brain leading to excruciating headache or even insanity. Indeed, there are few varieties of cancer that metastasize so widely as that affecting the breast.

Cancer of the neck of the womb (cervix uteri) rarely metastasizes beyond the lumbar glands, but whether glands are secondarily involved or not (about one-third of the cases) the picture of the disease is essentially determined by local extension of the disease. Ulceration extends rapidly until the greater part or whole of the cervix is destroyed and a foul ulcer that bleeds very readily results. Growth followed by ulceration attacks the adjacent parts of the vagina and often involves the wall of the bladder or rectum or both. Hence fistulous openings are produced into these parts to the infinite discomfort of the patient. Growth extends into the broad ligaments, fixes the uterus with surrounding tissue into an immovable mass, and, involving the ureters, directly or indirectly, by way of an invaded and inflamed bladder, leads to changes in the kidneys whereby their structure and function become disorganized. (*See* KIDNEYS, DISEASES OF.)

Cancer of the tongue or other parts of the mouth and of the pharynx lead to symptoms dependent upon their situation. Food cannot be taken with comfort and some kinds cause so much pain that they are refused entirely. The jaws, too, may become fixed to an extent that the handle of a spoon can barely be inserted between the teeth. One of the most trying symptoms is profuse salivation. Malnutrition, however, is not so great as might be expected owing to the rapid course run by the disease. From the constancy with which lymphatic glands in the neck are invaded, secondarily by growth and septic organisms from the mouth, ulceration is frequent into the great blood vessels in their neighbourhood and leads to profuse, even fatal, haemorrhage. Another common and disastrous occurrence is septic pneumonia due to inhalation of putrid material from the surface of the cancerous ulcer. In cancer of the oesophagus interference with swallowing is so great that early in the disease solids cannot be taken at all and wasting is extreme. Owing to the contiguity of the trachea ulceration often takes place into it and septic pneumonia results.

**Site Distribution.**—The primary implication of sites differs in the two sexes. In England and Wales, roughly speaking, in males 80% of cancer is primary in some part of the alimentary tract, in females, 80% is primary in uterus or breast. But apparently this distribution does not hold in all countries; in some cancer of stomach is returned as a cause of death, even in females, far more commonly than in England and Wales. How far the difference is real or dependent upon methods of registration, the standard of medical education, recourse to hospitals, etc., it is impossible to say. But it is certain that in Holland and in Italy,

where death registration methods are comparable with those obtaining throughout Great Britain, cancer of cervix uteri does not predominate as it does in England and Wales. The reason for this difference, which is statistically significant, is unknown, though the Cancer Sub-Committee of the League of Nations instituted a special enquiry thereon, and examined a number of possible explanations. It follows that, quite apart from special forms of cancer associated with local customs, *e.g.*, kangri cancer in Kashmir, betel-nut cancer in the East generally, cancer of penis common in Hindus who do not circumcise, rare in Mohammedans who do, there is reason to believe that the site distribution of cancer is not identical throughout the world.

Viewed from the aspect of their microscopical characters (*see* TUMOUR) the different varieties of cancer show some well-marked site preferences. These depend upon the fact that the primary growth consists in a modification of normal cells in the part affected and subsequent multiplication of those altered cells. If the part normally contains pigment, *e.g.*, skin or choroid of eye, the cancer cells originating therefrom contain pigment also in great or small degree; if it originate from a member of the connective tissue group (*q.v.*), *e.g.*, bone, cartilage, fibrous tissue, the cancer cells retain in great or small degree the special characters of those tissues. The same is true for squamous, columnar and spheroidal epithelia (*q.v.*). Hence by microscopical examination it is often possible to narrow within certain limits the primary site of a growth. A pigmented cancer (melanoma) can only have originated in skin or choroid however widespread may be the distribution of secondary growths.

Very rarely a melanoma arises in the pineal body (*see* BRAIN) of man which normally is devoid of pigment, but phylogenetically, the pineal is the representative of a median eye, and in the Lacertilia it contains pigment. Similarly, a hypernephroma can only have originated in adrenal tissue, a squamous cell carcinoma in squamous epithelium, a spheroidal cell carcinoma in gland tissue of spheroidal character, a columnar cell carcinoma in gland tissue lined by columnar epithelium, a sarcoma from some member of the connective tissue group.

**Age Distribution.**—Cancer is pre-eminently a disease of adult and old age but no age is exempt. Moreover, if it be divided into its two great classes of carcinomata or epithelial cancers and sarcomata or connective tissue cancers a difference in age distribution appears. For whereas the carcinomata are rare before 30 and extremely rare before 20 and liability increases with advancing years (due correction being made for age distribution of the population), the sarcomata show a fairly even distribution throughout life. As a corollary, malignant disease in infancy or childhood, almost without exception, is sarcomatous and parts liable to sarcoma, *e.g.*, bone, kidney, are those commonly affected. In adult life or middle or old age it may be carcinoma or sarcoma, but probably the former since the total number of carcinoma cases greatly exceeds the total number of sarcoma cases.

In some instances, *e.g.*, cervix uteri, there is a fall in liability in advanced old age but this is counterbalanced by an increased liability at some other site, *e.g.*, skin, so that the statement that liability to cancer increases with increasing years is generally true. This does not mean that the greatest number of cancer cases seen are aged. On the contrary the greatest number falls between the ages of 45 and 65, uterine cases on the whole being a little younger than breast, and breast cases than skin. Even within the area of the same organ differences in age distribution occur, cancer of the body of the womb, on an average, affecting older women to a greater extent than that of the neck or cervix.

**Civil State.**—In the case of breast and uterus certain differences obtain in cancer incidence, between married and unmarried women. Correction being made for their respective numbers in the population, cancer of cervix is more common in the married, cancer of breast in the unmarried. It does not appear that the number of pregnancies has much influence upon the occurrence of cervical cancer, one childbirth being as liable to be followed by cancer as several. Cancer of the breast seems to be correlated with abeyance of the normal function and the occurrence therein of chronic inflammatory changes (chronic mastitis).

**Cancer Mortality.**—In England and Wales the death rate from cancer per million of the population, in 1926, was 1,362 as compared with 1,336 in 1925, 1,297 in 1924 and 1,267 in 1923. These figures do not indicate an actual rise in incidence, for important factors in the apparent rise are more accurate diagnosis, improved certification of the causes of death, and increased longevity resulting in a greater number of people reaching the age period of cancer than formerly. Probably, too, the greater attention attracted to the disease by recent national schemes of cancer research is reflected in the rise. It is noteworthy that in Switzerland where autopsies are common and death certification has long been highly efficient, the cancer death-rate has differed little from year to year during the past quarter century. In other civilized countries the figures are substantially of the same order as in England and Wales. From collected statistics for the United States registration area it has been estimated that the cancer death-rate for the whole country in 1920 was 834; in 1921, 860; in 1922, 868; in 1923, 894, and in 1924, 920 per million living.

**Treatment.**—In 1928 the official method of treating cancer remained wide surgical removal at the earliest possible date. When the disease is still local, efficient surgical removal may fairly be described as curative in the sense that the patient's expectation of life is as great as if he or she had not suffered from cancer. The stage of the disease in which operation is performed, however, fundamentally influences prognosis. Thus, in cancer of the breast, 90% of women undergoing the complete operation while the disease is still confined to the organ may expect to be alive and well ten years later, whereas of those in whom the disease has passed beyond the breast when they first seek medical advice 90% will be dead ten years later. The average period elapsing between strict localization to the breast and extension beyond its limits is no more than a few weeks or months. It is probable that essentially the same is true of cancer at other primary sites but in some dissemination is even more rapid and in others satisfactory surgical intervention is difficult or impossible.

The above-mentioned considerations, combined with the natural reluctance of patients to undergo extensive operations, have led to continued search for other methods of dealing with the disease than surgery. Of these treatment by radium or X-rays (*see* **RADIOTHERAPY, RADIUM THERAPY**) has established itself as in some measure effective. How far radiation is destined to replace surgery, as the mode of its action and technique of its application are better understood, it is impossible to say. Already there is statistical evidence that in cancer of the cervix uteri, on the basis of five years' survival, efficient radium treatment gives nearly as good results as efficient surgery and has the additional advantage of affording a five years' survival to some 12% of cases beyond the reach of surgery.

Treatment of Coley's mixed toxins of *B. prodigiosus* and *Str. erysipclatis* has, in his hands, been followed by good results in some cases of sarcoma. Blair Bell's treatment by intravenous injection of colloid lead is still in the experimental stage and, though highly dangerous, has given some striking results. No other method of treatment aiming at cure than the above is worthy of consideration and the majority are harmful.

The treatment of inoperable cancer is symptomatic; the pain, ulceration, anaemia, etc., are combated to afford the patient the utmost relief and length of life. Surgical procedures of various sorts such as ovariectomy (now discarded) lymphangioplasty, an endeavour to provide alternative paths for the lymph in the enlarged arm often seen in cancer of the breast, local removal of the growth to diminish the ulcerating area have been employed but the usual methods in vogue are radiation and drugs. Radiation in most instances relieves pain, and, in some, causes a diminution in the rate of local progress, but, in others, appears to cause a wider dissemination of metastases and in septic conditions materially worsens the patient's condition. With regard to local treatment and drugs much may be done to ease the patient. Mild disinfectants and frequent change of dressings diminish local putrefaction, reduce foetor, and the amount of toxic material liable to absorption; it is surprising how much benefit may accrue from keeping the cancerous ulcer clean.

In respect of drugs, the pain, with the sleeplessness it may entail, is the symptom calling most for attention. Those with the greatest experience are unanimous that opium and morphia should be reserved as a last resource for as long as possible, owing to the bad effects these drugs have upon the morale of the patients, the necessity for continuously increasing doses, the severity of the pain in the intervals between doses and the greater difficulty of nursing. For a long time a drink of warm milk, a dose of aspirin or of omnopon at night gives the needed relief, and the great majority of patients in an institute specially devoted to cancer cases never require opium or morphia from beginning to end of their illness.

**BIBLIOGRAPHY.**—Reports on Public Health and Medical Subjects Nos. 28, 32, 33, 34, 36 and 40, and Memoranda on Cancer I.–VI. issued by Ministry of Health, London. *See also* bibliography on **CANCER RESEARCH**, and *Index analyticus cancerologiae* (Paris, 1927).

### CANCER CONTROL

Cancer control is the practical application of the established facts and sound working opinions concerning the prevention and cure of cancer. Although, as has been indicated, no means has yet been discovered of completely suppressing or preventing cancer, there are various procedures which give some measure of protection against it. The present hope of reducing deaths depends upon the fullest possible employment of these protective procedures.

Looked at as a community problem, to control cancer it is necessary not only that the public should have information which will enable them to recognize the earliest suspicious symptoms, but be induced to apply for competent medical attention upon the first appearance of these signs. Periodical medical examinations are urged as a means of detecting cancer. Physicians, on their part, must be alert to come to an early decision as to the diagnosis and prompt and skillful in applying the proper treatment. To instruct the public and to give the medical profession a knowledge of the latest and most useful information on this subject is the object of an organized warfare against the disease, carried on in the United States since 1913 by the American Society for the Control of Cancer, composed of about 2,000 members and with official representatives in all the States of the Union. In the course of the year a large amount of printed matter in the form of circulars, booklets, newspaper articles, posters and magazine stories appears. There are lectures and scientific papers delivered, and radio talks given. In fact, every known means of publicity which is applicable for the instruction of the public upon the largest possible scale and with the least expenditure of money, is employed. The annual meeting of the society takes place on the first Saturday in March and a periodical has been issued by it every month since 1920, giving information of interest and service concerning the disease. And this is only one of many similar societies existing in most of the civilized countries of the world.

In 1926 an international meeting of representatives from most of the countries of Europe met in the United States under the auspices of the American Society for the Control of Cancer, in order to exchange experiences with regard to the methods available for prevention and treatment. During the course of the meeting resolutions were drawn up and unanimously agreed to as follows:—

(1) The causation of cancer is not completely understood, but it may be accepted that for all practical purposes cancer is not to be looked upon as contagious or infectious.

(2) Cancer itself is not hereditary, although a certain predisposition or susceptibility to cancer is apparently transmissible through inheritance. This does not signify that, because one's parent or parents or other members of the family have suffered from cancer, it will necessarily appear in other persons of the same or succeeding generation.

(3) The control of cancer, so far as this subject can be understood at the present time, depends upon the employment of measures of personal hygiene and certain preventive and curative measures, the success of which depends upon the intelligent co-operation of the patient and physician.

(4) Persons who have cancer must apply to competent physicians at a sufficiently early stage in the disease, in order to have a fair chance of cure. This applies to all forms of cancer. In some forms, early treatment affords the only possibility of cure.

(5) Cancer in some parts of the body can be discovered in a very early stage, and if these cases are treated properly the prospect for a permanent cure is good.

(6) The cure of cancer depends upon discovering the growth before it has done irreparable injury to a vital part of the body and before it has spread to other parts. Therefore, efforts should be made to improve the methods of diagnosis in these various locations and the treatment of the cancers so discovered.

(7) The public must be taught the earliest danger signals of cancer which can be recognized by persons without a special knowledge of the subject, and induced to seek competent medical attention when any of these indications are believed to be present.

(8) Practitioners of medicine must keep abreast of the latest advances in the knowledge of cancer in order to diagnose as many as possible of the cases of cancer which come to them.

(9) Surgeons and radiologists must make constant progress in the refined methods of technic which are necessary for the diagnosis and proper treatment not only of ordinary cases but of the more obscure and difficult ones.

(10) There is much that medical men can do in the prevention of cancer, in the detection of early cases, in the referring of patients to institutions and physicians who can make the proper diagnosis and apply proper treatment, when the physicians themselves are unable to accomplish these results. The more efficient the family doctor is the more ready he is to share responsibility with a specialist.

(11) Dentists can help in the control of cancer by informing themselves about the advances in the knowledge of the causes of cancer, especially with relation to the irritations produced by imperfect teeth and improperly fitting dental plates. They can also help by referring cases of cancer which they discover to physicians skilled in the treatment of cancer in this location. It may be doubted whether all dentists fully realize the help which can be obtained from X-ray photographs in revealing not only the state of the teeth but the condition of the bone surrounding them.

(12) Medical students should be instructed in cancer by the aid of actual demonstrations of cancer patients, and this to a sufficient extent to give them a good working knowledge of the subject.

(13) The most reliable forms of treatment, and, in fact, the only ones thus far justified by experience and observation, depend upon surgery, radium and X-rays.

(14) Emphasis should be placed upon the value of the dissemination of definite, useful and practical knowledge about cancer, and this knowledge should not be confused with that which is merely theoretical and experimental.

(15) Efforts toward the control of cancer should be made in two principal directions: (a) the promotion of research in order to increase the existing knowledge of the subject, and (b) the practical employment of the information which is at hand. Even with our present knowledge many lives could be saved which are sacrificed by unnecessary delay.

(G. A. S.)

**CANCER RESEARCH.** This subject falls naturally into two periods divided by the beginning of the present century. From 1850 to 1900 investigation was on the clinical and anatomical sides and the great work of Virchow between 1850 and 1860 upon cellular pathology and upon the malignant new growths laid the foundation of our present knowledge concerning cancer. When it is remembered that staining methods for microscopical purposes were not introduced until about 1872 the accuracy of Virchow's descriptions becomes even more remarkable. Virchow laid great stress upon the importance of chronic irritation in the causation of new growths and in large measure this view still holds the field. Reference is made to it later. The rival theory put forward by Cohnheim about 1880 that new growths arise from embryological remnants included within the tissues owing to some slight error in development has, at the present time, few adher-

ents. In the case of certain special varieties of tumour (teratomata, cysts), however, it is held to be a sufficient explanation.

**Main Divisions.**—As examination of cancer proceeded it became clear that it is not a single disease but rather a group of diseases having certain features in common. First there came the great division into (1) the carcinomata, growths built up on the type of squamous, columnar or spheroidal epithelium and (2) the sarcomata, growths built on the type of one of the members of the connective-tissue group. To these were added later (3) the endotheliomata, a group of somewhat undetermined characters, which are regarded as being derived from the flattened cells that line lymph spaces or channels or blood-vessels. In this way there has become recognized a long series of malignant growths with more or less defined microscopical characters.

**Special Divisions.**—Later it was found that the three main groups mentioned above were insufficient to include certain varieties of tumour arising in special organs, *e.g.*, muscle, lymphatic glands, testicle, adrenal, sympathetic ganglia, and special terms were applied to new growths originating in these parts. It was shown, further, that in some degree it is possible to correlate clinical with histological features, particularly so far as the primary growth is concerned. Thus it is probable that a primary cancer of external skin or of the lining of the alimentary tract between the lips and the lower end of the oesophagus will be a squamous-cell carcinoma, of intestine will be a columnar-cell carcinoma, of bone will be some variety of sarcoma, of cerebral meninges or of pleura will be an endothelioma. These tumours will breed true so that if secondary growths (metastases) are produced they will, within limits, resemble the parent growth in histological characters.

**Local or Constitutional Origin.**—To this 19th century period also belongs the great controversy whether the malignant growths are manifestations of a local or of a constitutional condition. The controversy is important in that treatment must depend largely upon the view held: if the disease be purely local it should be possible to eradicate it by surgery so long as it is dealt with before it passes from the local condition and becomes generalized; if, on the other hand, it be a manifestation of a constitutional or blood condition, local surgery must be ineffective. The local view received and still receives the greatest amount of assent, but it is becoming more generally accepted, even by those who hold that cancer depends upon local mechanical irritation, that some biochemical change of the tissues is necessary and that this change may be brought about by conditions affecting the body as a whole.

**Bacteriological Results.**—The remarkable results of bacteriological research about 1880, too, were not without effect, for attempts were made to show that cancer depends upon a micro-organism. That micro-organisms were cultivated from new growths is certain, but the varieties were so diverse that, no doubt, they depended upon faulty technique or upon prior and accidental infection of the growth. Moreover, inoculation of these micro-organisms into animals failed to produce new growths, though in some instances (torulae) tumour-like collections of inflammatory cells resulted. It is now generally agreed that no bacillus or micrococcus in the accepted sense of those terms is the cause of cancer.

**Cancer not "Infectious."**—Again, certain appearances met with in microscopical sections were regarded by their discoverers as being of an animal nature, parasitic and causative of the condition. It is now agreed that these appearances are due to the inclusion of tissue debris in living cells. It follows from what has been said above, that cancer is not an infectious disease in the sense that tuberculosis, diphtheria, typhus fever and malaria are infectious diseases. Many enquiries were carried out upon the subject of "cancer houses" and "cancer localities." Examples were adduced in which several persons inhabiting a single house or numbers dwelling in the same locality were said to have died of cancer. Careful examination, however, failed to show that they could not be explained by the average age distribution of the population, by improved diagnosis or by errors of random sampling. While, therefore, there is nothing to show that special

cancer houses and localities do not exist, there is no satisfactory proof of their occurrence.

**The Present Century.**—Since the year 1900 cancer research has entered upon a new phase largely owing to the fact that modern experimental methods have been adopted. Special laboratories devoted to cancer research were instituted and within a few years were at work at the Imperial Cancer Research fund, The Middlesex Hospital, the Cancer hospital (London), the Christie hospital (Manchester), the Royal Cancer hospital (Glasgow), the Samariterhaus (Heidelberg), the Crocker Foundation, the Memorial hospital, the Rockefeller Institute (New York City), the Gratwick Foundation (Boston, Mass.). Recently a large institute for cancer research has been opened at Buenos Aires. In addition, associations for the study of cancer have been founded in several countries. These associations differ somewhat in their aims, but in most instances through their agency statistical and sometimes laboratory investigations are being carried out. The most important of these associations are the Cancer Sub-committee of the Health section of the League of Nations, which, of course, is international; the Cancer Committee of the Ministry of Health in Great Britain; the British Empire Cancer Campaign; local committees in Manchester, Liverpool, Birmingham, Leeds; l'Association Française pour l'Étude du Cancer; Komite für Krebsforschung and similar bodies in Belgium, Holland, Austria, Switzerland and Japan. It must be understood that the institutions mentioned above are exclusive of numerous bodies such as the Medical Research Council, various universities and teaching hospitals which further cancer research as part of their general activities, and often to a considerable degree, but have no special department devoted to the subject. In 1926 The British Empire Cancer Campaigns founded *The Cancer Review* in which publications directly or indirectly bearing upon the cancer problems are analysed. In 1928 a somewhat similar journal was issued in France.

**Heredity in Cancer.**—In Chicago a laboratory was built and equipped on the most approved plan for investigating the question of heredity and cancer in mice. From three original mice, stocks were raised ultimately numbering many thousands of which the full history of each individual from birth to death was recorded including an account of the autopsy. The experiment has been in progress for some 20 years and by special breeding Miss Maud Slye has produced two strains, all members of which and no members of which, respectively, suffer from new growth. She has also produced familial proclivity to new growths of a special type, e.g., squamous-cell carcinoma, or affecting a special organ, e.g., the liver. From these experiments there can be no doubt that a hereditary factor obtains in cancer, but it is only by controlled work of the kind mentioned and intense inbreeding that its existence can be demonstrated. Even in so segregated a population as that of Gol and Hemsedal, two parishes on the eastern slope of the mountains in the centre of Norway where intermarriage is common, the most that a study of five large cancer families in which 367 deaths had occurred between 1902 and 1921 showed was that the crude mortality rate from cancer for persons over the age of 35 was 18.2% for these families compared with 12.1% for the total population.

**Other Statistical Enquiries.**—Much time has been spent and many papers have been published on the question whether the incidence of cancer is increasing. It cannot be said that this question has been settled beyond dispute. Increased notification of deaths from cancer has undoubtedly occurred in practically all countries, but how far correction of the annual figures has to be made for increase of population, improved diagnosis, improved standard of health whereby a larger portion of the population reaches the cancer age, improved education and means of transport whereby a large proportion of the population comes under observation and treatment, it is impossible to say. Nevertheless it is the opinion of most authorities that even if due allowance be made for all these factors there is still evidence of a gradual increase in the incidence of cancer particularly at more advanced ages. The opinion often expressed that cancer affects persons at an earlier age than formerly is apparently without foundation.

**Primary Sites.**—Statistical enquiries in various countries have shown that the commonest primary site of the disease differs considerably. Thus in England and Wales notified deaths from cancer of uterus and of breast are more numerous than from gastric cancer, whereas the reverse is the case in Holland and Italy. This observation has been made the subject of exhaustive enquiry by the Cancer Sub-committee of the Health section of the League of Nations with the result that it is fully substantiated but all endeavours to correlate it with habits of the respective peoples have failed entirely. It is said that the same peculiarity concerns descendants of the same nationalities when they have emigrated to another country and this point is receiving attention at the present time.

**Duration of Cancer.**—Another useful statistical enquiry concerns the natural duration of the untreated disease from alleged onset to death. Papers have been published giving the information derived from four different institutions in Great Britain. These have been collected and analysed statistically by the Cancer Committee of the Ministry of Health and present a base line against which all forms of treatment can be measured.

**Distribution by Races.**—Enquiries in all parts of the world have shown that cancer affects all races of mankind and examination of lower animals has demonstrated its occurrence in them also. It may not be, and certainly in the case of lower animals is not the fact, that all species and varieties are affected with equal frequency. Thus the mouse is the subject of cancer more frequently than the rat, and the rabbit and guinea-pig are far less frequently affected than either. Inasmuch as dogs, cats, horses and cattle are relatively more frequently attacked by cancer it is considered that it is a disease of domestication. Similarly there appears with great probability to be a higher incidence of cancer in the more civilized races of mankind.

**Experimental Transmission by Grafts.**—The observation that cancer affects the lower animals has rendered experimental work possible. The fact was first shown over 40 years ago by Hanau who successfully transplanted a squamous-cell carcinoma from the vulva of a rat into the peritoneal cavity of other rats. Ten years later Morau succeeded in transmitting a mammary adenocarcinoma from a white mouse to other white mice. For many years the indications afforded by these experiments were not followed up, in part because of a doubt how far the analogy between growths in these lower animals and cancer affecting man holds good. Extensive research, however, carried out mainly by the Imperial Cancer Research fund, proved clearly their essential similarity, and from that time much knowledge has accrued from the experiments on malignant tumours of the mouse and rat. Amongst the conclusions reached was that on the rigorous specificity exhibited by growths. Thus a tumour of the mouse will not grow if inoculated into the rat or vice versa. Under special conditions temporary growth may occur, but these do not invalidate the truth of the general statement.

**Susceptibility and Resistance.**—As might be expected much work has been done on the question of susceptibility and resistance to transplanted grafts in the hope that it might throw light upon treatment in man. Important differences were shown to obtain between spontaneous growths in respect of the ease or difficulty with which they can be transplanted into other animals of the same species. In some cases grafts take in nearly 100% of experimental animals, in others failure is consistent, even with the greatest care. It was found, however, that inoculation of a graft beneath the skin of the animal bearing the primary tumour (autologous grafting) is almost always successful. This indicates some peculiarity of the animal bearing a spontaneous tumour, but so far the difference has eluded explanation.

**Blood Content.**—It has been suggested that there is a larger amount of potassium in the blood and tissues of an animal bearing a spontaneous tumour. Supporting this view are the observations (a) that the blood and tissues of persons suffering from cancer contain more potassium than those of persons suffering from non-malignant diseases and (b) that if the potassium content of the blood of mice be raised by feeding them with potassium metaphosphate, transplanted grafts of a mouse carcinoma take in

a larger proportion of cases, appear earlier and grow at a more rapid rate.

**Immunity.**—An important observation, repeatedly confirmed, is that if an animal spontaneously recover from a transplanted tumour it is immune to subsequent inoculations with the same tumour. This has been made the basis of innumerable attempts on the curative side, the most important of which consists in removal of a portion of the tumour, irradiation to a degree just sufficient to prevent growth of the cells on re-inoculation and the introduction of the irradiated mass beneath the skin of the original patient. In experiments on rats the method has been shown to confer a large degree of resistance against growth of inoculated grafts, though it is not so effective against established tumours. It has been found, also, that introduction into liver or spleen is more effective than beneath the skin. In man the results are not conclusive.

In all experiments upon resistance and susceptibility to cancer a great subject of difference amongst workers lies in their view as to the essential factor concerned. Some investigators hold that it is the fluids of the body that are of importance, the cellular elements being subsidiary. For others the cells, and particularly the lymphocytes, are the prime factor in resistance; if the particular line of treatment adopted be associated with accumulation of lymphocytes locally, resistance is high; if lymphocytes be few or absent, resistance is low. Experiments can be adduced supporting or refuting either contention but if it be allowable to use the analogy of immunity and susceptibility to bacterial disease it may well be that tissue fluids and cells take varying parts according to circumstances as yet hardly understood.

**Serum Treatment.**—Here it is convenient to consider attempts at treatment of cancer by various sera. Influenced by a belief in the microbial causation of cancer and the efficacy of antisera produced against such a disease as diphtheria, earlier workers had endeavoured without success to treat the disease by injection of ascitic or other serous fluids derived from cancer patients. More recently attempts have been made in the laboratory to produce an antiserum by the usual methods and test its efficiency against cancer cells growing *in vitro*. The growing cancer cells were found to be killed almost instantaneously by this antiserum whereas normal cells were unaffected and the method was applied *in vivo*, with the addition that contact between the antiserum and the cancer cells was rendered more intimate and prolonged by combining venous and lymphatic obstruction with introduction of the antiserum. Grafts were inoculated into the hind feet of rats and when they had reached a certain size the antiserum was introduced in the neighbourhood of one of the growths and was held in position to a large degree by constriction of the thigh. In a large proportion of cases the growth in this foot underwent absorption and not only so but at a little later date the growth in the other foot also disappeared. It would seem that the antiserum led to absorption of the growth to which it was locally applied and that in accordance with the general principle that absorption of a cancerous mass in an animal is associated with increased resistance to the same type of growth, absorption of the first growth in the treated foot led to absorption of the second growth in the untreated foot.

**Criticisms.**—The main criticisms of these important observations are (1) that the growth treated was of the transplanted and not of the spontaneous variety, (2) that the foot is by reason of its small size, large amount of bone and tendon, and smallness of its blood-vessels a region naturally somewhat unfavourable to growth of a transplanted tumour and (3) that the constriction, which, apparently, is essential to success, is itself an abnormal condition and might well turn the scale against a growth that was struggling for existence or at least was not growing freely. Workers with these animal tumours know well how widely the behaviour of grafts varies even under conditions that are apparently identical. Although the experiment is of great interest and full of suggestion it must not be assumed at present that it paves the way to an analogous treatment of cancer in man.

**Tissue Culture in Vitro.**—This method was popularized by Carrel. By its means it is possible to determine the action of

various agents upon living cancer cells under controllable conditions. The technique itself is delicate. Originally the portions of living tissue were cultured in plasma, but the method has been simplified by adoption of a modified Ringer's solution with the addition of embryonic tissue juice. Subcultures must be made every two or three days, but under suitable conditions tissue can be kept alive and growing for prolonged periods. In 1922 the description was given of a ten-year old strain of fibroblasts originally obtained from the heart of a chick embryo and then in the 1860th generation; increase in size under the artificial conditions was as rapid as at first. Besides fibroblasts, large mononuclear cells and cartilage cells, each in pure culture, cardiac muscle from chick, duck, frog, etc., tissue from kidney, thyroid and from various animal tumours has been cultivated. It has been shown that foetal tissues are capable of growing *in vitro* 72 hours after death of the animal and in 1924 evidence was adduced that spleen, liver, kidney, ovary, lung and cornea from adult animals may develop *in vitro* many hours after death. The development very likely proceeds from surviving cells perhaps activated by the autolytic products of the dead ones. A remarkable point was shown in connection with *in vitro* cultures of kidney. It was possible to obtain cultures of fibroblasts or of renal cells and in each instance growth took place in all directions with production of a solid mass. But if fibroblasts were introduced into a mass already containing proliferated renal cells a tubulation occurred that recalled the microscopical structure of the kidney (see DIFFERENTIATION).

**Experiments in Aetiology.**—The frequency with which cancer of the tongue is associated with a jagged tooth or an ill-fitting denture, cancer of the lip with smoking of clay pipes, the occurrence of cancer of the skin in workers with paraffin and tar, of soot cancer in chimney-sweeps, arsenic cancer, kangri cancer amongst the Kashmiri users of the kangri basket, cancer of the cheek amongst betel-nut chewers, cancer of the bladder in workers with anilin and around the parasitic ova in persons infected with bilharzia, are examples where irritation caused by a mechanical agent seems to bear a causal relation to the cancer.

**X-Ray Cancer.**—Of recent years X-ray cancer has been added to the list, and a few cases of cancer of the skin have resulted from prolonged exposure to the gamma rays of radium. Lazarus-Barlow has found minute quantities of radium to exist in a large proportion of cancers examined for the purpose, and produced in the gall bladders of rabbits a condition indistinguishable from cancer by introducing into the gall bladder human gallstones into which small quantities of radium had been introduced artificially. The exact relation of chronic irritation to subsequent cancer is unknown, and there is no doubt that in an even larger number of cases chronic irritation occurs without any subsequent development of cancer. In most instances the chronic irritation must persist over a number of years and the actual cancerous condition is preceded by the formation of warty outgrowths and other local manifestations of cell destruction accompanied by cell proliferation.

**Tar Cancer.**—In the case of tar a cancerous condition of the skin has been produced in mice and rabbits, but hitherto never in rats, by repeated local painting with coal tar. The cancer is of the squamous variety and runs a normal course. Under the same conditions of painting the length of time before cancer supervenes varies between 3 and 18 months for individual mice. An observation that may have important bearings is that when growth has been produced in one part of the body by means of tar it is impossible to produce another cancer elsewhere by the same means. This is complementary to the experience derived from transplanted cancer in which resistance to one variety of new growth may coincide with susceptibility to another variety. Strenuous efforts have been made to isolate the carcinogenic principle in tar and crude paraffin oils but without success. On the other hand "tars" prepared from isoprene and acetylene by distilling at temperatures between 700 and 900° C. were some of the most effective cancer producers yet known.

**Artificial Infection.**—Fibiger succeeded in producing cancer of the stomach and tongue in rats by feeding them with cock-

roaches infected with *Spiroptera neoplastica*, and Bullock and his collaborators produced a malignant condition in rats by feeding them with *Taenia crassicolis*, a tapeworm infesting the cat. The sarcomatous growth occurred round the cysts formed in the liver by the tapeworm and was produced within a few weeks.

**The Rous Experiments.**—In the attempt to find some common factor behind the widely diverse conditions antecedent to cancer, attention was directed towards observations made by Peyton Rous on a chicken sarcoma that could be transmitted by inoculating with dead cells or, in the absence of cells, by a tumour extract that had passed through a Berkefeld filter. Subsequently Rous found two other varieties of sarcoma in hens which could be transmitted by filtered tumour juice. In each of the three instances the special characters of the original growth were repeated in the experimental tumours. He and his collaborators brought forward strong evidence that the filterable agent was a living but extremely small microbe.

**Gye's Two Factors.**—Although all attempts to discover a filterable virus in mammalian cancer had failed and successful transplantation can only be carried out by means of living cells, it occurred to Gye that two factors might be concerned in the production of one of these chicken sarcomata, viz.: a filterable virus and a specific factor derived from the animal. By special means he separated the two and found that either alone was insufficient to produce a tumour but in conjunction they were effective. He then applied these results to four standard malignant tumours in rats and mice and one human mammary cancer with the result that he obtained from all but one mouse tumour a factor he regards as almost certainly a filterable virus which can replace the virus of the Rous tumour in the production of a chicken sarcoma. The failure to transmit mammalian growths in the same fashion as the Rous chicken sarcoma he ascribes to the more rapid destruction of the mammalian specific factor, probably by oxidation. For the last-mentioned conclusion he has brought forward experimental evidence.

These researches, which are still in progress, have led Gye to look on cancer—using the term in its widest sense—as a specific disease caused by a virus (or group of viruses). Under experimental conditions the virus alone is ineffective; a second specific factor obtained from tumour extracts ruptures the cell defences and enables the virus to infect. Under natural conditions continued irritation of tissues sets up a state under which infection can occur. The filtered material isolated by Gye and supposed to contain a virus, after subculture, was examined photographically by Barnard with special optical apparatus, ultraviolet light and, where necessary, quartz in place of glass. Barnard obtained and has published appearances of a particular agent in the culture medium which he and Gye regard as the virus under discussion.

**Filterable Virus.**—This work, without doubt, is of great importance but caution must be exercised in its interpretation. Indeed, it still awaits confirmation in some essential points. Moreover, the occurrence of unsuspected minute bodies in what are regarded as normal animals has been shown in monkeys, rabbits and guinea-pigs, e.g., in the work on lethargic encephalitis, and Rivers and Pearce while investigating varicella found in rabbits a filterable virus which, at first thought by them to be that of varicella, proved ultimately to be indigenous in rabbits. This possibility must be eliminated before Gye's observations can be taken to prove that his filterable virus came from the sarcoma as distinguished from the chicken. Moreover, Rivers and Pearce also found that rabbits bearing intratesticular growths of a transplantable tumour, first discovered in syphilitised rabbits, are immune to their rabbit filterable virus, though the virus infects the growth itself and multiplies therein.

**Specific Factors.**—It may be that filterable viruses peculiar to certain animals exist but are unable to produce tumours until some "specific factor" is present, or that a filterable virus peculiar to new growths exists but also requires the presence of a specific factor, or it may be that the filterable virus inhabits the tumour and is, in a sense, accidental. It is clear that some stimulus for the increased and atypical multiplication of cells which characterizes the new growths is necessary but it seems that much more

work is needed before it can be accepted that a filterable virus is aetiological connected with all varieties of malignant new growth. For the sarcomata—with their many histological and clinical resemblances to infective and inflammatory conditions—causation by a particular filterable virus is more easily acceptable and it will be noted that Gye's experiments, with a single exception, are concerned with sarcomata. The great merit of his work lies in the experimental evidence it offers as to the interaction between an extrinsic and an intrinsic factor in tumour formation and the definiteness it aims at giving, at all events in certain instances, to the characters of the extrinsic factor.

**Concluding Remarks.**—Most of the work on biochemical lines is unsuited for remark here; Warburg of Berlin finds that tumour tissue splits up carbohydrates differently from normal tissue and has built thereon a hypothesis for the origin of tumours. Of the remainder much consists of diagnostic tests for cancer that have been put forward. Unfortunately none of these is sufficiently consistent in its results to carry conviction in a particular case. In view of the general belief that cancer in its earliest stages can often be successfully treated by surgery and of the frequency with which the disease first comes under observation at a stage when operation is impossible, a reliable diagnostic method is urgently needed. X-ray examination has facilitated diagnosis of internal cancer particularly when affecting the alimentary tract, but search must still continue for some chemical test applicable at an early date in the disease. Brief reference must be made to Dawson's recent work on the melanomata; from a consideration of all the data, and especially the pigment-forming function of epithelial cells, he concluded that the melanomata, usually termed melanotic sarcomata, are epithelial and therefore carcinomatous.

**Action of Radium.**—In treatment, research has been directed chiefly toward the action of radium and X-rays. At first employed empirically the scientific basis of their action is being discovered by degrees. The X-ray spectrum has been mapped out, and by means of apparatus of very high voltage (180–200 kv.) rays of wave-length and penetrating power approximating to the very short waves of gamma radiation have been produced. The biological action of rays of different wave-length has been studied and radiological treatment is becoming more scientific.

There are still wide gaps in knowledge both on the physical and the biological sides and though immediate results can be foretold with some degree of accuracy in certain varieties of cancer, late results often appear to be fortuitous. Upon the whole, however, treatment of cancer by radiation is a method with which the clinician has to reckon. This is more than can be said concerning medicinal or dietetic methods, none of which has been supported so far by evidence that can be regarded as sufficient to warrant its serious consideration. Here exception must be made for the lead treatment introduced by Blair Bell which is undergoing vigorous examination in many centres.

**CANDELABRUM**, a pedestal or shaft used to support a lamp or candle; in common usage limited to shafts for lamps or a group of candles, in contradistinction to candlestick for a single candle. The Romans, developing Hellenistic precedents, made them objects of great decorative richness. Two Roman types are found: the simpler, consisting of a slender shaft, often fluted, supported on a spreading base of animals' feet and acanthus scrolls, and carrying a flat shelf with vase-like mouldings. The multitude of such candelabra found in Pompeii proves them to have been a common form of household decoration. The more monumental type, either of marble or bronze, used in public buildings, had for the base a pedestal resembling a little altar which carried a heavy shaft, frequently decorated with row on row of acanthus leaves, but sometimes with a delicate moulded profile of baluster type, and a round shelf at the top. The lavishness of such examples made a great impression on Renaissance artists, and the general form known as the candelabrum shaft became a common decorative motive in the late 15th century, especially for the centre of pilasters. In modern work, exterior lighting fixtures often take candelabrum shapes.

**CANDIA**, the largest city of Crete (to which it has given its name), is situated on the northern shore in 35° 20' N. lat. and 25° 9' E. long. It is still surrounded by its extensive Venetian fortifications. The principal buildings are the Venetian loggia mutilated recently, the Prefecture, 14 mosques, the modern cathedral, two Greek churches, the Armenian church, the Capuchin monastery, the bazaars, the baths and some beautiful Venetian fountains. The town is the seat of a Greek archbishop. The highly interesting museum contains antiquities found during recent excavations. The chief trade is in oil and soap. The coasting trade is of considerable importance. Leather for home consumption is made and good wine is produced in the neighbourhood. The harbour is formed for the most part by the ancient moles, and was never deep enough to admit the larger vessels even of the Venetians, which were accustomed to anchor off the neighbouring island of Standia. The site of Candia, or, as it was till lately locally known, Megalocastro ("the great fortress"), has been supposed to correspond with that of the ancient *Heracleion*, the seaport of Cnossus, and this name is now officially revived. The ruins of Cnossus are about 3 m. to the south-east. Founded by the Saracens in the 9th century, Candia was fortified by the Genoese in the 12th, and was greatly extended and strengthened by the Venetians in the 13th, 14th and 15th centuries. It was besieged by the Turks under the vizier Achmet in 1667; and, in spite of a most heroic defence, in which the Venetians lost 30,000 in killed and wounded, it was forced to surrender in 1669. (See also CRETE.)

**CANDIDATE**, one who offers himself or is selected by others for an office or place, particularly one who puts up for election to parliament or to any public body. The word is derived from the Latin *candidatus*, clad in white (*candidus*). In Rome candidates for election to the higher magistracies appeared in the Campus Martius, the Forum and other public places, during their canvass, in togas with the white wool brightened by chalk.

**CANDLE**, a rod of fatty or waxy material through the centre of which runs a fibrous wick. Modern candles are the successors of the early rush-lights which consisted of the pith of rushes soaked in household grease. An improvement was made by the introduction of flax ("inkle") and cotton threads, which were dipped in tallow heated to a temperature slightly above its melting-point, and allowed to cool until the coating had solidified.

FIG. 1.—CONTINUOUS WICKING CANDLE-MOULDING MACHINE, SHOWING WICK SPOOLS BELOW, CANDLE MOULDS IN CENTRE, AND EJECTION CLAMPS ABOVE

Alternate dipping and cooling was continued until the desired thickness was obtained. The manufacture of such "tallow-dips"—one of the most ancient forms of illuminant—was for centuries a house industry. In Paris, in the 13th century, there was a guild of travelling candle-makers who went from house to house making candles.

Beeswax candles have been used from early times and are mentioned by the Roman writers. For mystical reasons the Catholic Church prescribes beeswax candles for Mass and other liturgical functions.

Spermaceti, a white crystalline wax obtained from the head-cavity of the sperm or "right" whale, came into use in the latter half of the 18th century; the sperm candle, weighing one-sixth of a pound and burning 120 grains per hour was adopted by the (London) Metropolis Gas Act of 1860 as the "standard candle" in photometry. Owing to its extreme brittleness, spermaceti requires to be mixed with a small proportion of other material, such as beeswax.

**Modern Candles.**—The bulk of modern candles are made of paraffin wax (introduced about 1854), or stearine, or mixtures of these. The crude paraffin wax from mineral oil refineries is "sweated" in ovens at a temperature slightly below the required melting-point to free it from lower melting waxes and traces of oils, and is subsequently purified by steaming with animal charcoal and fuller's earth. As pure paraffin wax becomes plastic at

temperatures considerably below its melting point, candles made from it are apt to bend, and it is usually stiffened with from 5 to 10% of stearine, which also makes the wax less transparent. Candles made from this mixture are known as "composite candles." The proportion of stearine is largely increased in candles intended for use in hot climates, and they may even be made entirely of stearine.

Ceresin, the hydrocarbon derived from ozokerite, or earth-wax, is also used as a candle-stiffener.

The manufacture of stearine is based on the researches of Chevreul, who, in 1815, showed that fats consist of fatty acids combined with glycerin. The glycerin must be removed, for, on incomplete combustion, it gives rise to the formation of acrid vapours, as may be noticed when a tallow candle is allowed to smoulder. The solid fats, tallow, palm oil and bone fat are split into fatty acids and glycerin (hydrolysed) by the following processes. In the *autoclave process*, which is used for good quality fats, the material is churned with water and 3-4% of lime or magnesia, with steam at 120 lb. pressure. The mixture separates into two, layers—the glycerin "sweet-water" and a mixture of lime soap and fatty acids above. The lime soap is decomposed with dilute sulphuric acid and the washed fatty acids crystallized. The solid "stearine" is freed from the liquid oleic acid by pressing in a hydraulic press. In the *acid saponification process*, the fat is treated with 4-6% of concentrated sulphuric acid and hydrolysed with open steam. The resulting fatty acids are dark coloured and must be distilled with superheated steam before pressing. The yield of stearine is greater by the second process (60%), as the action of the acid converts some of the oleic acid into solid products. The *Twitchell process*, which consists in boiling the fat with half its bulk of water and a small proportion of a special emulsifying reagent, is suitable for low-grade fats. The fatty acids can be bleached by distillation.

**Candle Wicks.**—The wick is one of the most important factors in candle-making; unless it is of the size and texture proper to the material used, the candle will be unsatisfactory. The material generally employed is cotton yarn, which, except for tallow dips and tapers, is braided by machinery into an ordinary flat plait and "pickled." This process, invented by Cambacères in 1825, consists in impregnating the fibre with a very small quantity of mineral matter which helps to fuse the ash of the wick and prevent smoking. After a preliminary bleaching, the wick is soaked in a pickling solution of boracic acid and nitre, or sal ammoniac, or phosphate, or chlorate of ammonia, centrifuged to expel the bulk of the retained solution and dried. It is essential that the wick should be burnt in one direction only. Early wicks, which were not plaited or pickled, did not bend over to the outer oxidizing region of the flame and consequently were incompletely consumed, the char requiring to be removed by frequent "snuffing."

Tallow candles (dips) are manufactured on a commercial scale by the old "dipping" process, each dip adding about one-eighth inch to the diameter of the candle. Tallow dips are principally used by plumbers as a flux, and a considerable quantity by certain African natives for anointing.

The dipping process is unsuitable for beeswax candles; owing to the wax's property of contracting on cooling and its liability to stick, moulding is impracticable. Recourse is had to the somewhat primitive method of "pouring" the melted wax over a suspended wick until the required thickness is obtained. The candle is then rolled on a marble slab to impart uniformity of finish. The difference of the two processes is illustrated by the existence of two Livery companies in the City of London, the Tallow Chandlers and the Wax Chandlers.

**Moulded Candles.**—Moulding machines of the continuous wicking type, first made by Morgan in 1834, are used for the bulk of candle-making. Machines are made to produce from 80 to 512 candles at one charge, and the output is from two to three charges per hour. The machine consists of tubular moulds (slightly tapered to facilitate ejection of the candles), fixed in a tank to which steam or water can be admitted. The lower ends are closed by the tip-moulds which are carried each on a hollow piston-rod connected to a common bed-plate. The upper ends (butt-ends)

open into a shallow trough. The moulds are made of tempered tin (98% purity) and the inner surfaces are polished. Above the apparatus are the "clamps" to hold the candles when ejected from the moulds. The spools of wick, one for each mould, are contained in a box under the machine. The wick is threaded through the piston, through a perforation in the centre of the tip-mould, and passes up the mould to be held centrally by the candle last ejected into the clamp. The moulds are heated to the required

FIG. 2.—LONGITUDINAL SECTION OF CANDLE MOULD SHOWING PARTS

temperature and the molten material poured in, leaving excess in the trough. The candles are then cooled by filling the tank with cold water, the wicks cut at the top and the clamps emptied. The superfluous wax in the trough is scraped out, the bed-plate screwed up, and the candles ejected into the clamps. The temperature of the moulds before filling and the speed of cooling have to be varied according to the material being moulded.

**Night-lights.**—Short thick candles designed to burn six to ten hours, formerly made of coconut stearine, but now usually of a low-melting paraffin wax, are moulded similarly but without a wick; the latter, stiffened by a coating of hard wax, is subsequently fixed in a hole drilled through the wax cake. Great care

is taken to avoid access of dust or dirt to the wax, as, since the flame is very small, the wick is easily clogged.

**Tapers.**—Tapers are made by "drawing" long strands of slightly twisted cotton yarn repeatedly through a bath of molten wax. The tapers are cut to length, the ends dipped in hot water and shaken. This process, called "feathering," removes the wax from one end, allowing a new taper to be lit easily without dripping wax. Small "birthday" and "Christmas" candles are made by this process, and also the "bougies" used in metal casting.

On the continent a candle with an air-passage down its length, supposed to minimize guttering, is popular.

Ornamental candles are made of wax stained with aniline dyes and decorated with transfers or by handwork.

A hot-flame, smokeless candle, giving very little light, made from the esters of amino- or imino-acids together with a small quantity of an oxidizing salt such as ammonium nitrate, has been patented in Germany.

See J. Lewkowitsch, *Oils, Fats and Waxes* (1923); L. L. Lamborn, *Soaps, Candles and Glycerine* (New York, 1906); Sadtler and Matos, *Industrial Organic Chemistry* (1923); Groves and Thorp, *Chemical Technology*, vol. ii. "Lighting" (1895) (for history); *Catholic Encyclopedia* (for ritualistic use). (E. L.; G. H. W.)

**CANDLEMAS**, the Church festival, celebrated on Feb. 2, in commemoration of the presentation of Christ in the Temple; called in the Greek Church *ἡ Παράκλησις τοῦ Κυρίου* ("the meeting of the Lord," i.e., with Simeon and Anna), in the West the Purification of the Blessed Virgin (Lat. *Candelaria*, *Festum candelarum sive luminum*, etc.). The late 4th-century pilgrim Etheria (Silvia) describes its celebration at Jerusalem on Feb. 14, 40 days after Epiphany; the Armenians still keep it on this day, as "the Coming of the Son of God into the Temple." The celebration spread from Jerusalem, being moved to Feb. 2, 40 days after the newly established feast of Christmas. In 542 it was established throughout the Eastern empire by Justinian. In the West, we find it (entitled, as now, Purification of the Blessed Virgin Mary) in the 8th-century *Gelasian Sacramentary*, which embodies a much older tradition; the procession was introduced by Pope Sergius I. (687-701). The blessing of candles did not come into common use until the 11th century.

In the East it has always been observed as a festival of Christ, in the West it is pre-eminently a festival of the Virgin Mother.

See L. Duchesne, *Christian Worship* (Eng. trans., London, 1904); *Catholic Encyclopedia*, vol. iii. (1908).

**CANDLE-POWER**, the quality of brightness or *intensity* of a light. The international unit of intensity used in photometry (*q.v.*) is the *international candle*, which is one-tenth of the light given out by the Harcourt 10 candle-power pentane lamp, burning in an atmosphere containing 0.8% parts by volume of water vapour and at normal pressure, and giving out ten times as much as the British standard candle (*see* CANDLE) of 1860.

**CANDLESTICK**, a receptacle, made in various forms, for holding a candle. The word was formerly used for any kind of support on which lights, whether candles or lamps, were fixed. The first candlesticks were perhaps made for ecclesiastical purposes, either for ordinary illumination or for some particular ceremony; their use as a household appliance did not come into notice until the middle ages. The domestic types were very simple in design,

EARLY 18TH CENTURY

so naturally the history of candlesticks deals largely with those of the church. Moses was commanded to make a candlestick for the tabernacle, of hammered gold, a talent in weight, and consisting of a base with a shaft rising out of it and six arms, and with seven lamps supported on the summits of the six arms and central shaft. When Solomon built the temple, he placed in it ten golden candlesticks, five on the north and five on the south side of the Holy Place. After the Babylonish captivity the golden candlestick was again placed in the temple, as it had been before in the tabernacle by Moses. On the destruction of Jerusalem by Titus, it was carried with other spoils to Rome. Representations of the seven-branched candlestick occur on the arch of Titus at Rome, and on antiquities found in the catacombs at Rome. The primitive form of candlestick was a torch made of slips of bark, vine tendrils or wood dipped in wax or tallow, tied together and held in the hand by the lower end, such as are frequently figured on ancient painted vases. The next step was to attach to them a cup (discus) to catch the dripping wax or tallow.

During the 11th and 12th centuries a certain amount of ornamentation appeared, first a dragon holding on his back the scone for the candle. This scone was provided with a short spike on which the candle could be pushed down; later a socket was used instead of the spike. Previous to the 17th century, iron, lat-ten, bronze and copper were chiefly used, but thenceforward the most elegant examples were chiefly of silver though in more modern periods Sheffield plate, silver plate and china became exceedingly popular. Sometimes the base and scone are of one material and the pillar of another, as when the former are of silver and the pillar of marble or china; the choice and combination of materials are, indeed, infinite. The golden age of the candlestick lasted, roughly speaking, from the third quarter of the 17th century to

the end of the 18th. The later Jacobean, Queen Anne and early Georgian forms were often extremely elegant, with broad bases, round, oval or square, and swelling stems. Fine examples of these periods, especially when of silver, are much sought after and command ever higher prices. As with most domestic appliances, the history of the candlestick shows an increasing tendency towards simplicity, the most elaborate and fantastic forms, animals and reptiles, the monstrous creatures of mythology, lions and men-at-arms, angels and cupids, having gradually given place to architectural motives such as the baluster stem and to the classic grace of the Adam style. Artistically the candlestick in its modern form is among the most important of household furnishings, and many of the various types have been handed down to the modern chandelier (*q.v.*).

**CANDLISH, ROBERT SMITH** (1806-1873), Scottish divine, was born at Edinburgh on March 23, 1806, and spent his early years in Glasgow, where he graduated in 1823. After short assistant pastorates at St. Andrew's, Glasgow, and Bonhill, Dumbartonshire, he obtained a settled charge as minister of the important parish of St. George's, Edinburgh. Here he came to be regarded as one of the ablest preachers in Scotland. His first Assembly speech, delivered in 1839, placed him at once among the leaders of the party that afterwards formed the Free Church, and his influence in bringing about the Disruption of 1843 was inferior only to that of Thomas Chalmers. After Chalmers's death in 1847 he was the most prominent leader in the Free Church. In the year 1862 he succeeded William Cunningham as the principal of New college with the understanding that he should still retain his position as minister of St. George's. He was a prolific writer. He died on Oct. 19, 1873.

See William Wilson, *Memorials of R. S. Candlish, D. D.* (1880), with a chapter on his position as a theologian by Robert Rainy.

**CANDOLLE, AUGUSTIN PYRAME DE** (1778-1841), Swiss botanist, was born at Geneva on Feb. 4, 1778. He studied at Geneva and settled in Paris in 1796. His *Historia Plantarum Succulentarum* (4 vols., 1799-1803) and *Astragalogia* (1802) introduced him to the notice of Cuvier and to J. B. Lamarck, who confided to him the publication of the third edition of the *Flore française* (1803-15). The *Principes élémentaires de botanique*, printed as the introduction to this work, contained the first exposition of his principle of classification according to the natural as opposed to the Linnean or artificial method. In 1804 he published his *Essai sur les propriétés médicales des plantes*, etc., and soon after, in 1806, his *Synopsis plantarum in flora Gallica descriptarum*. At the desire of the French Government he spent the summers of the following six years in making a botanical and agricultural survey of the whole kingdom, the results of which were published in 1813. He lectured on botany at Montpellier (1807-16) till he returned to Geneva to fill the chair of natural history there. The rest of his life was spent in an attempt to elaborate and complete his "natural" system of botanical classification, embodied in his *Regni vegetabilis systema naturale*, of which two volumes only were completed (1821). In 1824 he began a less extensive work of the same kind—his *Prodromus systematis regni vegetabilis*, 7 vols. He died on Sept. 9, 1841, at Geneva.

His son, ALPHONSE LOUIS PIERRE PYRAME DE CANDOLLE, born at Paris on Oct. 28, 1806, succeeded to his father's chair. He published continuations of the *Prodromus* in collaboration with his son, Anne Casimir Pyrame de Candolle; *Géographie botanique raisonnée* (1855); *Lois de la Nomenclature botanique* (1867); *Origine des plantes cultivées* (1883); and numerous other botanical works. He died at Geneva on April 4, 1893.

See A. de Candolle, *Mémoires et Souvenirs d'Augustin Pyrame de Candolle* (1862).

**CANDON**, a municipality (with administration centre and 15 *barrios* or districts) of the province of Ilocos Sur, Luzon, Philippine Islands, on the west coast, about 200 m. N. by W. of Manila by land, and 233 m. by water. Pop. (1918) 19,950, of whom none was white. Its inhabitants trade extensively with the so-called wild peoples of the neighbouring mountains. It is surrounded by an extensive, fertile plain. Rice and tobacco are grown in considerable quantity. The weaving of blankets, hand-

kerchiefs and cotton and silk cloths constitute important industries. Much of the sugar raised in the province is exported from Candon. It is the only place in the vicinity where coco-nut palms occur in any considerable quantity, and copra forms an important export. In 1918 it had 9 manufacturing establishments and 394 household industry establishments, the latter with an output valued at 93,800 pesos. The 11 schools were all public. The language spoken is Ilocano.

**CANDY:** see CONFECTIONERY.

**CANDYTUFT** (*Iberis amara*), a small annual herb (family Cruciferae) with white or purplish flowers, the outer petals of which are longer than the rest. It is a native of western Europe and found wild on dry soil in cultivated ground in the centre and east of England. This and several other species of the genus are known as garden plants, and are of easy culture in ordinary garden soil if well exposed to sun and air. The common candytuft of gardens is *I. umbellata*, a hardy annual, native of southern Europe, and known in a number of varieties differing in colour of flowers. *I. coronaria* (rocket candytuft) has long dense heads of white flowers and is also an annual. Some species have a shrubby growth and are evergreen perennials; the best-known is *I. sempervirens*, a native of southern Europe, a much-branched plant about a foot high with long racemes of white flowers.

**CANE**, a name applied to many plants which have long, slender, reed-like stalks or stems, e.g., the sugar-cane, the bamboo-cane. From the use as walking-sticks the name "cane" is given to sticks, irrespective of the source from which they are derived. Properly it should be restricted to a peculiar class of palms, known as rattans, included under the genera *Korthalsia*, *Plectocomia*, *Calamus* and *Daemonorops*. The plants are found throughout the islands of the Indian Archipelago, the Malay Peninsula, China, India and Ceylon; and also in Australia and Africa. The slender stems rarely exceed an inch in diameter and are generally much smaller. They creep or trail to an enormous length, often reaching 500 or 600 ft., and support themselves on trees or bushes by recurved spines borne on the stalk or back of the midrib of the leaf, or by stiff hooks replacing the upper leaflets. In some cases the midrib is elongated beyond the leaflets to form a long whip-like structure, bearing recurved hooks at intervals. The natives in preparing the canes for the market, strip off the leaves by pulling the cut plant through a notch made in a tree. The canes always present distinct rings at the junction of the sheathing leaves with the stem. They assume a yellow colour as they dry.

Canes, on account of their lightness, length, strength and flexibility, are used for a great variety of purposes by the inhabitants of the countries in which they grow. Split into thin strips they are twisted to form ropes and ships' cables. A more important application, however, is for basket-work, and for making chairs, couches, pillows, etc., as the great strength and durability of thin and easily prepared strips admit of such articles being made at once airy, strong and flexible. Much of the beautiful and elaborate basket-work of the Chinese and Japanese is made from thin strips of cane which are also used by the Chinese for larger works, such as houses and sheds.

A large trade is carried on in canes and rattans, the principal centres being Batavia, Sarawak, Singapore, Penang and Calcutta. In addition to the varieties used for walking-sticks, whip and umbrella handles, etc., the common rattans are in extensive demand for basket-making, the seats and backs of chairs, etc., and for purposes where their strength and flexibility make them efficient substitutes for whalebone. The walking-stick "canes" of commerce include many varieties, some of which, however, are not the produce of trailing palms. The well-known Malacca canes are obtained from *Calamus Scipionum*, the stems of which are much stouter than is the case with the average species of *Calamus*.

**CANEA** or **KHANIA**, the principal seaport and, since 1841, the capital of Crete, finely situated on the northern coast of the island, about 25 m. from its western extremity, on the isthmus of the Akrotiri peninsula, which lies between the bay of Canea and the bay of Suda (latitude 35° 31' N., longitude 24° 1' E.). Surrounded by a massive Venetian wall, it forms a closely built, irregular and overcrowded town, though of late years a few of

its streets have been widened. Many houses are of wood; but the more important buildings are of more solid materials. There are Turkish mosques, Greek churches and a Jewish synagogue; a Venetian structure serves as a military hospital. The town is the seat of a Greek suffragan to the metropolitan at Candia, and the official residence of the European consuls. The harbour, formed by an ancient transverse mole nearly 1,200 ft. long, and protected by a lighthouse and a fort, once admitted vessels of considerable tonnage, and has been partially dredged, but large vessels have to anchor outside, or make use of Suda bay. The principal articles of trade are oil, soap and leather. The fosse is laid out in vegetable gardens; public gardens have been constructed outside the walls; and artesian wells have been bored by the government. To the east of the town a large village was inhabited, under Turkish rule, by natives of Egypt and Cyrenaica, boatmen, porters and servants, but most of these have quitted the island. About a mile off on rising ground is Khalepa, where the consuls and merchants reside. Canea probably occupies the site of the ancient Cydonia. During the Venetian rule it was one of the strongest cities in the island, but it fell into the hands of the Turks in 1646, several years before the capture of Candia. In 1856 it suffered from an earthquake. The neighbouring plain is famous for its fruitfulness, and the quince is said to derive its name *Cydonia* from the town. See also CRETE.

**CANE FENCING** is the art of defending oneself with a walking-stick (Fr. *canne*). It may be considered to be single-stick fencing without a guard for the hand, with the important difference that in cane-fencing the thrust is as important as the cut, and thus *canne* approaches nearer to sabre-play. The cuts are practically identical with those of the single-stick (*q.v.*), but they are generally given after one or more rapid preliminary flourishes (*moulinets*, circles) which the lightness of the stick facilitates, and which serve to perplex and disconcert an assailant. The thrusts are similar to those in foil-play, but are often carried out with both hands grasping the stick, giving greater force and enabling it to be used at very close quarters. The canes used in French fencing schools are made of several kinds of tough wood and are about three feet long, tapering towards the point. As very severe blows are exchanged, masks, gloves, padded vests and shin-guards, similar to those used in football, are worn. Cane fencing never enjoyed any great measure of popularity in England or the United States. (A. R. H.)

**CANEPHORAE**, "basket-bearers," the title given of old to Athenian maidens of noble family, annually chosen to carry on their heads baskets with sacrificial implements and apparatus at the Panathenaic and other festivals. The term, also in the form of canephores, is applied, in architecture, to figures of both sexes which carry laden baskets on their heads or shoulders. They are sometimes used structurally as caryatides (*q.v.*), and sometimes decoratively as in many of the Renaissance Italian villas.

**CANE SUGAR:** see SUGAR.

**CANES VENATICI** ("the Hounds," or "the Grey-hounds"), in astronomy, a constellation of the northern hemisphere named by Hevelius in 1690, who compiled it from the stars between the older asterisms Ursa Major, Boötes and Coma Berenices. The constellation contains a famous spiral nebula first described by Lord Rosse (N.G.C. 5,194); also a bright globular cluster (Messier 3).

**CANEVA, CARLO** (1845–1922), Italian soldier, was born at Tarcento (Friuli) April 22, 1845, and entered the Italian army in 1866. He served in the African campaign of 1897, and in 1902 was promoted lieut.-general. Caneva commanded one side in the much-discussed manoeuvres of 1911, his opponent being Cadorna and it was probably owing to the result of the manoeuvres, in which Caneva was declared victor, that he was selected to command the Tripoli expeditionary force in Oct. 1911. Caneva was given a thankless task, being sent to occupy the coast towns in the belief that the Turkish garrison, unsupported by the tribesmen, could be easily overcome. He was recalled in Sept. 1912, and retired shortly afterwards. He presided over the commission that was appointed to enquire into the Caporetto disaster of 1917. He died Sept. 25, 1922.

**CANGAS DE ONÍS** or **CANGAS**, a town of northern Spain, in the province of Oviedo, on the right bank of the river Sella. It lies in a fertile, well-watered, partly wooded, undulating region, on the branch railway from Arriondas to Covadonga. Pop. (1920) 9,753. Cangas de Onís trades chiefly in live-stock and coal and copper from the neighbouring mines. It was the residence of the first Spanish kings after the spread of the Moors over the Peninsula. Here in the 8th century lived King Pelayo, who started the Christian reconquest of Spain. His historic cave of Covadonga is only 8m. distant. A Roman bridge of fine proportions crosses the Sella.

**CANGAS DE TINEO**, a town of northern Spain, in the province of Oviedo, and on the river Narcea. Pop. (1920) 23,668. There is no railway, but a road runs through Tinéo, Grado and the adjacent coal-fields, to the ports of Cudillero and Avilés. The inhabitants have thus an accessible market for the farm produce of the fertile surrounding hills, for the cloth and leather manufactured in the town, for the coal and lead from the neighbouring mines and for the marble quarried in the district.

**CANGUE** or **CANG**, the European name for the Chinese *Kia*, a portable pillory, carried by offenders convicted of petty offences. It consists of a square wooden collar about 4ft. square weighing from 20 to 60 lb., through a hole in which the victim's head is thrust. It fits tight to the neck and must be worn day and night for the period ordered.

**CANICHANAN**, a linguistic stock of South American Indians, consisting of a single tribe, the Canichanas. There is doubt as to the validity of the stock. The Canichanas lived in northern Bolivia on the Machupo and Mamore rivers between 13° and 14° S. Latitude. The remnants are still to be found at the missions of San Pedro and Trinidad. They were originally a war-like people, raiding and attacking their more peaceable Arawakan neighbours. They lived in entrenched villages and subsisted mainly on the products of fishing and hunting. They had the reputation of being cannibalistic. In general their culture resembled that of the nomadic tribes of the Chaco, rather than their sedentary agricultural neighbours.

See A. D'Oribigny, *L'Homme Américain* (Paris, 1839).

**CANINE DISTEMPER**. Distemper is an acute, contagious and infectious disease of dogs, septicæmic in nature and transmissible to certain other carnivorous animals. The condition occurs in all countries possessing a canine population. The early history of distemper has been lost in antiquity, but possibly it was introduced into Europe during the middle of the 18th century. Carré, in 1905, and later, Lignières, ascribed the cause of the disease to a filtrable virus. Ferry, McGowan and Torrey (1910-11) isolated a small, gram-negative bacillus, named by Ferry *B. bronchisepticus*. In 1923, the editors of the *Veterinary Journal* and the *Field* inaugurated the *Field* Distemper Research Fund, and since that date the disease has been the subject of extensive scientific research, carried out by veterinary and medical workers, under the Medical Research Council.

Although distemper is endemic in countries possessing a canine population, the disease becomes epidemic at varying intervals, and outbreaks may assume an exceptionally severe form with a heavy mortality; in many of the animals which survive, a permanently impaired constitution remains. Large towns are seldom free from the disease. A few animals appear to possess a more marked power of resistance, but it is probable that many of these have developed the disease and acquired a degree of immunity, without being subjected to the secondary complications, which are more usually the causes of the various sequelae.

Young animals are more susceptible than old; in suckling puppies the condition is often rapidly fatal. Weakly animals and pedigree dogs, in which blood interrelationships exist, are generally less resistant than coarsely bred animals. Healthy animals may contract the disease by exposure to the crude or filtered nasal discharge of affected animals, and the same is true of the blood and body fluids, the secretions and excretions. This applies more especially in the early stages of the disease.

The disease is air borne, but mediate and immediate contagion are the more fruitful sources; drinking bowls, feeding utensils,

brushes, the clothing and boots of attendants and contamination voided by infected dogs (more especially those in the early stages of the complaint) are all sources of infection. The early stages of the disease may pass unobserved; after exposure, an incubation period of 3-5 days elapses, *malaise* supervenes, and the thermometer reveals a temperature of 105°-106° F. This initial pyrexia is speedily followed by a fall of body heat to the region of normal, but the temperature may again rise after a few days. The patient is very infective during this period.

The most favourable course is towards resolution, and, save for some loss of condition and slight *malaise*, the disease may remain undetected; far more commonly, however, secondary infections supervene. Organisms, normally present in, and non-pathogenic to, the animal, may assume virulence; also extraneous infections may be acquired, especially in animals existing in unhygienic and overcrowded surroundings. Predisposing causes, such as chills and getting wet also play a part.

A virulent form of the disease is sometimes met with, characterized by persistent high temperature, asthenia, marked depression and death within a few days. The acute form is characterized by fever, often remittent, and the onset of symptoms showing a wide divergency. Although some of the symptoms may remain constant over a series of cases, they may be modified, or entirely absent, and the virus may appear to select some special group of organs, such as the respiratory, the alimentary tract, the central nervous system, the mucous membranes or the skin.

General *malaise*, rigors, capricious or complete loss of appetite, vomiting, diarrhoea or dysentery, may be some of the symptoms shown; also serous, muco-purulent or sanguineous, discharges from the conjunctival and catarrhal mucous membranes; matting of the orbital hair and scalding of the eyelids, photophobia, ophthalmia, iritis, ulceration of the cornea, protrusion of Descemet's membrane, synechia, and even extrusion of the lens; ulceration of the nostrils; herpetic rash round the lips, stomatitis, ulceration of the gums, lips, tongue and fauces. A characteristic short, moist cough is very common and indicates an inflammation or catarrh of the larynx which may be the onset of bronchopneumonia; later, mouth breathing and pouching of the lips indicate that the lungs are the seat of consolidation. Vomiting may be troublesome; at first catarrhal in character it becomes watery and bile stained. The small intestine and lower portions of the alimentary tract becoming involved, there supervenes profuse diarrhoea, which becomes foetid and haemorrhagic.

Nervous symptoms may occur at any stage of the disease, or during convalescence, and are of grave significance. The animal may show hypersensitiveness to sounds; epileptiform fits and convulsive muscular spasms, with chattering teeth and foaming jaws, terminating in unconsciousness or a meningitis in which the patient is partially or completely blind, wandering about in circles or standing with its head pressed up against the side of the kennel; partial, or complete, paralysis, especially of the hind quarters and the sphincters of anus and bladder. One of the commonest sequelae to recovery from the nervous forms of distemper is a persistent twitching of the muscles known as chorea; unfortunately this is usually permanent. In some cases a vesicular eruption develops which becomes pustular and may be confluent. If abraded, the vesicles are apt to form raw areas; otherwise they form dry, brownish scabs. These are to be looked for on hairless portions of the skin, such as under the armpits, thighs, and around the lips. Eruptions of this kind are, however, also seen in other conditions in puppies, such as teething.

The average duration of the disease is from a month to six weeks, the percentage of recoveries varying with the virulence of the disease. Catarrhal forms, associated with a free discharge from the nose and eyes, even when associated with some degree of broncho-pneumonia or gastro-intestinal catarrh, yield the highest percentage of recoveries. Skin lesions are troublesome, but comparatively unimportant, except as tending to exhaust the individual. Vomiting and diarrhoea, if severe, are of the utmost gravity as, naturally, they interfere with the nutrition of the patient, causing exhaustion and emaciation. The most hopeless type is that showing brain involvement associated with frenzy,

convulsions or coma. Paralysis will often yield to proper treatment and skilful nursing, but convalescence may take weeks, or even months, to establish.

**Treatment.**—Skilled nursing and attention to body hygiene are of extreme importance. The patient should be kept warm and free from draughts, but allowed plenty of fresh air; a flannel jacket is a useful adjunct. The temperature of the kennel or sick room should be as constant as possible. The eyes should be kept clean by the aid of antiseptic lotions and ointments, although, even with the utmost care, ulceration and permanent blindness may ensue; especially in the breeds (such as Pekinese, pugs and bulldogs) with prominent eyes. In the mouth antiseptics should be regularly employed to cleanse the gums, as these sometimes ulcerate and necrose. Food should be nourishing and easily digestible. The form and method of feeding must vary with the condition of the patient; milk, eggs, sponge cake, the various infant and invalid foods, meat extracts, liquid broth, boiled fish, and in the convalescent stages raw shredded or lightly-cooked beef and boiled rabbit or chicken. Rectal feeding by means of nutrient suppositories or peptonized foods is a useful help. With high fever and gastric complications a lump of ice placed on a piece of flannel in a saucer often appears to give relief.

There is no specific cure to suit every case, and treatment must be modified according to the symptoms shown. Expectorants, febrifuges, alimentary sedatives, astringents and antiseptics, nerve sedatives and, in the later stages tonics, all find uses. Various vaccines and anti-distemper sera have been advocated, but so far the results have not been satisfactory.

Laidlaw and Dunkin, working under the auspices of the Field Distemper Research Committee, have recently (1928) confirmed Carré's finding that the disease is due to a filter-passing virus (see FILTER-PASSING VIRUSES), and they have succeeded in conferring an immunity on the ferret; on the dog, however, their work is not yet complete and, although the reports published are very encouraging, it is too early yet to form any definite opinion. It is certain, however, that the possibility of immunization offers the best hopes, and, if success can eventually be achieved, an inestimable boon will have been conferred upon the canine world.

(F. T. G. H.)

**CANINI, GIOVANNI AGNOLO** (1617–1666), Italian designer and engraver, was born at Rome. He was a pupil of Domenichino and afterwards of Antonio Barbalonga. He painted some altar-pieces at Rome, including two admired pictures for the church of San Martino a' Monti, representing the martyrdom of St. Stephen and of St. Bartholomew. Having accompanied Cardinal Chigi to France, he was encouraged by the minister Colbert to carry into execution his project of designing from medals, antique gems and similar sources a series of portraits of the most illustrious characters of antiquity, accompanied with memoirs; but shortly after the commencement of the undertaking Canini died at Rome. The work, however, was continued by his brother Marcantonio, who, with the assistance of Picard and Valet, completed and published it in 1699, under the title of *Iconografia di Gio. Ag. Canini*. It contains 150 engravings. A reprint in Italian and French appeared at Amsterdam in 1731.

**CANISIUS, PETER**, also Kannees, Kanys (1521–1597), Jesuit scholar, was born in Nijmegen, Holland, on May 8, 1521. He was educated at Cologne, and after becoming a Jesuit in 1543, taught successively at the universities of Cologne, Ingolstadt and Vienna. Perhaps more than any of his contemporaries, Canisius delayed the advance of Protestantism by his participation in the religious discussions at Worms, at the Council of Trent and the Diet of Augsburg, by his friendship with the emperor and numerous magnates, by his zealous preaching in various German towns, by the extension of his own order and especially by his desire to provide worthy and scholarly priests. In 1580 he settled in Freiburg i/B. where he died on Dec. 21, 1597. He was beatified on Nov. 20, 1869.

His chief writings are the triple *Catechism* (1555–58); *Divi Cyrilli archiepiscopi Alexandrini Opera* (1546); *D. Leonis Papae I. . . Opera* (1546), *Epist. B. Hieronymi . . . selectae* (1562). His *Epist. et Acta* were edited by Braunsberger (5 vols., Freiburg i/B., 1896). See also Raderus, *De Vita Canisii* (Munich, 1614); O. Braunsberger, *Petrus*

*Canisius, ein Lebensbild* (Freiburg i/B., 1917); J. Metzler, *Petrus Canisius, ein Charakterbild* (1925), and Le Bachelet's article in *Dict. de Cath. Theol.*

**CANIS MAJOR** ("Great Dog"), in astronomy, a constellation placed south of the Zodiac, just below and behind the heels of Orion. *Canis minor*, the "little dog," is another constellation, also following Orion and separated from Canis major by the Milky Way. Both these constellations, or at least their principal stars, Sirius in the Great Dog and Procyon in the Little Dog, were named in very remote times, being referred to as the "dogs of Orion" or in equivalent terms. Sirius is the brightest star in the heavens; and the name is connected with the adjectives *σεῖρος* and *σέλπιος*, scorching. It may possibly be related to the Arabic *Sirāj*, thus meaning the "glittering one." Hommel has shown that Sirius and Procyon were "the two *S'iray*" or glitterers. It is doubtful whether Sirius is referred to in the Old Testament. By some it has been identified with the Hebrew *mazzaroth*, the *Lucifer* of the Vulgate; by others with *mazzaloth*, the *duodecim signa* of the Vulgate; while Prof. M. A. Stern identifies it with the Hebrew *kimah*, which is rendered variously in the Vulgate as Arcturus, Hyades and Pleiades. (See G. Schiaparelli, *Astronomy in the Old Testament* [1905].) The inhabitants of the Euphrates valley included both constellations in their stellar system; but considerable difficulty is encountered in the allocation of the Babylonian names to the dominant stars. With the Egyptians Sirius assumed great importance. Appearing with the sun when the Nile was rising, Sirius was regarded as a herald of the waters which would overspread the land, renewing its fertility and promising good harvests for the coming season. Hephaestion records that from its aspect the rise of the water was foretold, and the Roman historian Florus adds that the weather was predicted also. Its rising marked the commencement of their new year, the *annus canarius* and *annus cynicus* of the Romans. It was the star of Sept or Sothis, and, according to one myth, was identified with the goddess Hathor—the Aphrodite of the Greeks. It was the "second sun" of the heavens, and according to Maspero (*Dawn of Civilization*, 1894) "Sahū and Sopdit, Orion and Sirius, were the rulers of this mysterious world of night and stars."

The Greeks, borrowing most of their astronomical knowledge from the Babylonians, held similar myths and ideas as to the constellations and stars. Sirius was named *Σείρος*, *Κύων* (the dog) and *τὸ ἄστρον*, the star; and its heliacal rising was associated with the coming of the dry, hot and sultry season. Hesiod tells us that "Sirius parches head and knees"; Homer speaks similarly, calling it *κακὸν σῆμα*, the evil star, and the star of late summer (*ὀρώρα*) the rainy and stormy season. Procyon (*Προκύων*) was so named because it rose before *Κύων*. The Euphratean myth of the dogs has its parallel in Greece, Sirius being the hound of the hunter Orion, and as recorded by Aratus always chasing the Hare; Pindar refers to the chase of Pleione, the mother of the Pleiades, by Orion and his dogs. Similarly Procyon became Maera, the dog of Icarus, when Boötes became Icarus and Virgo his daughter Erigone.

The Romans adopted the Greek ideas. They named the constellation *Canis*, and Sirius was known as *Canis* also, and as *Canicula*. Procyon became *Antecanem* and *Antecanis*, but these names did not come into general use. They named the hottest part of the year associated with the heliacal rising of Sirius the *Dies caniculares*, a phrase which has survived in the modern expression "dog-days"; and the pestilences which then prevailed occasioned the offering of sacrifices to placate this inimical star. Festus narrates, in this connection, the sacrificing of red dogs at the feast of Floralia, and Ovid of a dog on the Robigalia. The experience of the ancient Greeks that Sirius rose with the sun as the latter entered Leo, *i.e.*, the hottest part of the year, was accepted by the Romans with an entire disregard of the intervening time and a different latitude. (See *SIRIUS*.)

**CANISTER**, another name for case shot, an artillery projectile for use at close quarters (from Lat. *canistrum*, a wicker basket).

**CANITZ, FRIEDRICH RUDOLF LUDWIG, FREIHERR VON** (1654–1699), German poet and diplomatist, was born at Berlin on Nov. 27, 1654. He attended the universities of Leyden

and Leipzig, travelled in England, France, Italy and Holland, and was appointed groom of the bedchamber (*Kammerjunker*) to the elector, Frederick William of Brandenburg, whom he accompanied on his campaigns in Pomerania and Sweden. In 1697 the elector, Frederick III., made him a privy councillor, and the emperor, Leopold I., created him a baron of the empire. He died at Berlin in 1699. Canitz's poems (*Nebenstunden unterschiedener Gedichte*) are for the most part dry and stilted imitations of French and Latin models.

A complete edition of Canitz's poems was published by U. König in 1727; see also L. Fulda, *Die Gegner der zweiten schlesischen Schule*, ii. (1883).

**CAÑIZARES, JOSE DE** (1676–1750), Spanish dramatist, was born at Madrid on July 4, 1676, entered the army and retired with the rank of captain in 1702 to act as censor of the Madrid theatres, and steward to the duke of Osuna. In his 14th year Cañizares recast a play by Lope de Vega under the title of *Las Cuentas del Gran Capitán*, and he speedily became a fashionable playwright. His originality, however, is slight, and *El Domine Lucas*, the only one of his pieces that is still read, is an adaptation from Lope de Vega. Cañizares produced a version of Racine's *Iphigénie* shortly before 1716, and is to some extent responsible for the destruction of the old Spanish drama. He died on Sept. 4, 1750, at Madrid.

**CANNÆ**, an ancient village of Italy, near the river Aufidus, situated on a hill above the right bank, 4m. S.W. from its mouth, and about 6m. below Canusium (*q.v.*). It is celebrated for the disastrous defeat which the Romans received there from Hannibal in 216 B.C. In later times the place became a *municipium*, and unimportant Roman remains still exist upon the hill known as Monte di Canne. In the middle ages it became a bishopric, but was destroyed in 1276.

There has been considerable discussion as to whether the battle took place on the right or the left bank of the Aufidus, and above or below Cannæ; but Kromayer's careful study both of the ancient authorities and of the ground leaves no room for further doubt. According to him, the battlefield is to be sought in the low ground below the village, and on the right bank of the river, which may well have changed its course to some slight extent, where it would seem neither side can have derived any appreciable advantage from the terrain.

After the operations round Gerunium (see *CALICULA*) the Roman and Carthaginian armies lay opposite to one another there until the beginning of the summer of 216 B.C., when Hannibal took the Roman generals by surprise by a rapid march to Cannæ, where he seized the Roman stores of provisions, which had been gathered from the neighbourhood of Canusium and were concentrated there; he then encamped on the high ground above the river valley, to the south-west of the village. He probably took the easier and shorter route by Arpi, a distance of some 65m., in as much as that followed later by the Via Traiana is longer and more hilly. The Roman forces followed, but kept on the seaward side of him, so as to be able to obtain supplies with greater ease. They fought a successful skirmish with his cavalry and light troops between Salapia and Aufidena, after which the consuls, Aemilius Paullus and Terentius Varro, who were in command of the Roman army reached the left bank of the Aufidus. Here they encamped in the plain, throwing a third of their troops onto the right bank of the river, which presented no great obstacle, and establishing a smaller camp there. Hannibal then, in order to persuade his enemy to accept battle, led the bulk of his troops over to the left bank of the river; but the offer was refused. Varro in his turn offered battle on the right bank, and Hannibal accepted the challenge. The Romans now faced south, with their right wing resting on the river, and the sea about 3m. in their rear. They had adopted an exceptionally deep formation, each maniple having a front of only six men and a depth of 24, which, as we shall see had its bearing on the sequel.

Hannibal, who had only about 40,000 infantry to oppose to the 70,000 Roman foot, placed the Gauls and Spaniards (about 25,000 men in all) in the centre, in a crescent shaped formation, the units in the middle being heavier and pushed farther

forward, while the sides were more lightly held by units in echelon, an arrangement which gave the necessary connection with the 7,000 Libyan heavy infantry who were placed on the wings. The whole formation was of course concealed from the Romans by a screen of light troops, about 8,000 in number. The result of these cleverly concealed dispositions was to leave the Roman wings entirely in the air, so that when they found that there were no troops in front of them it was inevitable that they should advance too far and lose touch with their centre. The latter, on the other hand, was at once heavily engaged with Hannibal's Gauls and Spaniards, and, despite their desperate resistance, was at first successful. Hannibal, it is true, had so disposed his line that his centre instead of losing touch as it gave ground, was driven closer together, and so at first actually became stronger; but after the rectilinear position was reached from which the original advance had been made, this advantage became less; and when it gave way still further, the day seemed to be lost. Indeed it can only have been then that the Roman troops that escaped the slaughter of Cannæ managed to break through the Carthaginian line. This, was, however, the moment for which Hannibal had been waiting. As soon as the shortened Roman front pressed so far forward that the Libyan heavy troops could fall on their flanks, the latter, supported by the light troops, attacked the legions on the wings, and prevented them from joining in the break through in the centre. The Roman forces were thus partially encircled, and their discomfiture was completed by Hasdrubal's cavalry (about 10,000 men in all) who, after routing in turn both the Roman cavalry wings, attacked them in the rear. Hannibal, who had taken his own place in the centre, must before this have succeeded in stopping the rout and restoring his front at this point. The Romans were, however, still superior in numbers, and it was only owing to the lack of capacity of independent manoeuvre of the individual units that they were unable to prevent themselves from being surrounded in the first instance; while the exceptional narrowness of front and the great depth in which the Roman legions had been drawn up for battle rendered it possible for Hannibal to surround them with a ring of troops through which they were, in the state of disorder into which they had fallen, quite unable to force a way, and were therefore cut down almost to a man. The 20,000 odd men who had broken through the Carthaginian centre were unable to effect a diversion, and when they saw their comrades surrounded, followed the example of those who had escaped at Trebia and Trasimenus, and marched to Canusium, the modern Canosa. Hannibal preferred not to besiege them there (an operation which might have taken him months) and instead of this marched through Apulia and Samnium to Capua, most of the towns through which he passed with his victorious army declaring themselves in his favour. The 10,000 Romans who were left in the main camp had nothing left but to surrender.

This was the worst defeat that the Romans had suffered at the hands of Hannibal; and yet his victory which gained him the practical annihilation of the Roman army may be said at one time to have hung upon a hair. The Roman generals never gave him another opportunity of a pitched battle, and while they did not give up operations in the open, they tried to wear down Hannibal's strength gradually by operation against him not with large armies, but with a number of smaller forces generally composed of a couple of legions apiece. The character of the warfare was thus completely altered. This and the fact that Polybius' narrative is only fragmentary from this point onwards explain the impossibility of following the operations of 216–207 in such detail as before.

The similarity of the tactics of Hannibal and of the result of the battle to that of the Trebia is striking; in both, the defeat of the Roman cavalry rendered it possible to outflank and consequently surround their infantry, while in both cases (and at Trasimenus also) the Roman centre was able to break through in considerable force, but without being able, or even attempting, to redeem the fortunes of the day.

See J. Kromayer, *Antike Schlachtfelder* (1912) iii. i. 278 sqq. for an authoritative treatment of the whole question. (T.A.)

**CANNAN, EDWIN** (1861– ), British economist, was educated at Clifton college and Balliol college, Oxford. He became lecturer in political economy in London university in 1897 and professor of political economy in 1907. He retired in 1927. His principal works are: *History of the Theories of Production and Distribution* (2nd ed., 1903), *History of Local Rates in England* (2nd ed., 1912); *Wealth* (1914); *Money* (5th ed., 1926), and an edition of Adam Smith. Cannan's chief services to economic theory have been on the theory of money, on questions of demography and in clarifying and modernizing the theory of supply and demand as laid down by Adam Smith.

See his *An Economist's Protest* (1928); and an introduction by Hugh Dalton to *London Essays in Economics in Honour of Edwin Cannan* (1927).

**CANNANORE**, town, British India, in the Malabar district of Madras, on the coast, 58 m. N. from Calicut and 470 m. by rail from Madras. Pop. (1921) 27,705. Cannanore belonged to the Kalahasti or Cherakal rajas till the invasion of Malabar by Hyder Ali. In 1498 it was visited by Vasco da Gama, who made a treaty with the raja, and built a fort in 1505. In 1656 the Dutch effected a settlement and built the present fort, which they sold to Ali Raja in 1771. It is now a military cantonment. In 1783 Cannanore was captured by the British, and the reigning princess became tributary to the East India Company. Here is the residence of the Moplah chief, who owned most of the Laccadive islands till 1911, when they were ceded, and the ruler was given a pension. There are cotton mills and biscuit works. Pepper, copra and coir are exported. Cannanore is a military station.

**CANNEL COAL**, a brightly burning coal rich in hydrogen, supposed to take its name from "candle." Cannel coal is found in Lancashire, England, and in Kentucky and Indiana, in the United States. It burns well in open fireplaces, and is also used to enrich gas made from other coal. (See COAL.)

**CANNES**, a winter resort of south-east France, in the department of Alpes Maritimes, on the Mediterranean, 19m. S.W. of Nice. Pop. (1926) 36,778. It enjoys a southern aspect on the Golfe de la Napoule, with the Estérels to the west. Previous to 1834 when its beauty and healthy climate first attracted the attention of Lord Brougham, it was an ancient little hill-town built on Mont Chevalier, which projects seawards and is crowned by the church (mainly 17th century, with a Romanesque chapel) and château (1070–1385). Of its early history little is known, save that it was twice destroyed by the Saracens in the 8th and 10th centuries, and was recolonized from Genoa. It is now one of the most fashionable resorts of the Riviera, the new town (La Bocca) having grown on either side of the old. A beautiful promenade runs along the beach.

Near the harbour, from which the Iles des Lérins are reached, lies the huge Casino Municipal. On the north, the modern town climbs up to Le Cannet (pop. 4,428), while on the east it practically extends along the coast to Golfe Jouan (3½m.), where Napoleon landed on March 1, 1815, on his return from Elba. From Cannes a railway runs north (12½m.) to Grasse. The country around is very beautiful and highly fertile; orange and lemon trees are cultivated, while olives, almonds, figs, peaches, grapes and other fruits are grown in abundance, and form, with fish, the chief exports of the town. Essences of various kinds are manufactured, and flowers extensively cultivated. Opposite the town is the island of Ste. Marguerite (one of the Lérins), in the citadel of which the Man with the Iron Mask was confined from 1687 to 1698, and which acquired notoriety as the prison whence Marshal Bazaine escaped in August 1874. On the other chief island (St. Honorat) of the Lérins is the famous monastery (5th century to 1788) which rose to great fame in the 6th century. The monastery is now occupied by Cistercians. On the island is an old castle (1088) while the shores have several ruined chapels.

**CANNES, CONFERENCE OF** (Jan. 6–13, 1922), a meeting of the Supreme Council of the Allies with the primary object of considering the Anglo-French suggestions for reparations, drafted at the preliminary Conference of London on Dec. 18–22, 1921 (see LONDON, CONFERENCE OF). The conference opened with a criticism of the Anglo-French suggestions by the French

Minister of Finance, who was supported by the Belgian representative. After long and complicated discussions this resulted in a modification of the London suggestions, and representatives of Germany, as well as the Reparation Commission, were summoned to Cannes to make proposals on the basis of the agreement finally reached between the Allies.

But wider questions of security and reconstruction were broached by Mr. Lloyd George in a memorandum submitted to M. Briand on Jan. 4, which declared that the three problems of reparations, security, and reconstruction were inter-related, and that any general scheme for European reconstruction must include Russia; and in which he offered to conclude an agreement by which Great Britain would pledge herself to assist France with all her forces in the event of unprovoked German aggression upon French soil. Mr. Lloyd George warned M. Briand that the British Empire would not be willing to incur military commitments in Central and Eastern Europe.

On Jan. 6 Mr. Lloyd George proposed the summoning of a general Reconstruction conference to which both Soviet Russia and the United States were to be invited, and this proposal was adopted by the Supreme Council, together with an outline agenda. Meanwhile M. Briand had been making counter-proposals respecting the Anglo-French pact. The guarantee must be reciprocal, and supplemented by a technical military convention. This second condition would probably have proved an insuperable obstacle from the British point of view, but M. Briand was violently attacked in the French Senate and Chamber in the belief that he was giving way unduly to Mr. Lloyd George. As a consequence he resigned on Jan. 12, and therewith the Conference came to a premature close. Its main results were the provision for the Genoa Conference and the avoidance of a deadlock over Reparations.

See British White Paper, *Resolutions adopted by the Supreme Council at Cannes, Jan. 1922, as the basis of the Genoa Conference* (Cmd. 1621 of 1922); A. J. Toynbee, *Survey of International Affairs, 1920–23* (1925).

**CANNIBALISM**, the eating of human flesh by men (from a Latinized form of Carib, the name of a South American tribe, originally from the West Indies), also called "anthropophagy," from Greek words meaning the eating of men. Evidence has been found in some of the palaeolithic deposits which point to occasional cannibalism. Herodotus, Strabo and others tell of peoples like the Scythian Massagetae, a nomad race north-east of the Caspian sea, who killed old people and ate them. In the middle ages reports, by Marco Polo and others, attributed cannibalism to the wild tribes of China, the Tibetans, etc. Cannibalism prevailed until recently, over a great part of West and Central Africa, New Guinea, Melanesia (especially Fiji), Australia, New Zealand, the Polynesian islands, Sumatra, other East Indian islands in South America, and in earlier days in North America. Sporadic cannibalism occurs among more civilized peoples as a result of necessity or as a manifestation of disease.

**Classification.**—Cannibalistic practices may be classified according to (1) the motives of the act; (2) the ceremonial regulations; (3) whether the victims are actually killed for food or whether only such are eaten as have met their death in battle or other ways.

Food cannibalism for the satisfaction of hunger may occur sporadically as a result of real necessity or may be kept up for the simple gratification of a taste for human flesh. Cannibalism from necessity is found not only among the lower races, such as the Fuegians or Red Indian tribes, but also among civilized races, as the records of sieges and shipwrecks show. Simple food cannibalism is found in West Africa. Human flesh formerly was exposed for sale in the market, and some tribes sold the corpses of dead relatives for consumption as food. The practice of devouring dead kinsfolk as the most respectful method of disposing of their remains, in a small number of cases, is combined with the custom of killing the old and sick, but in the great majority of peoples it is simply a form of burial, in parts of Australia, Melanesia, Africa and South America, and less frequently elsewhere. To this group belong the customs described by Herodotus

with, as a variant form, the custom of using the skull of a dead man as a drinking cup. Another modification of an original ritual cannibalism is the custom of drinking the ashes of the dead, practised by some African and South American tribes. The custom of holding burial feasts has also been traced to the same origin. Another form of cannibalism is the custom of partaking of the products of putrefaction as they run down from the body. The Australians smoke-dry the bodies of tribesmen; and consume the portions of the body which are rendered liquid by the heat. Ritual cannibalism shades over into and may have been originally derived from magical cannibalism, of which three sub-species may be distinguished. (i.) Savages eagerly desire some foods in order that they may, by partaking of the flesh, also come to partake of the mental or bodily peculiarities of the man or animal from which the meat is derived; thus, eating the heart of a lion is recommended for a warrior to make him brave; analogous motives lead to the eating of those slain in battle, both friends and foes. (ii.) An entirely different kind of magical cannibalism consists in the consumption of a small portion of the body of a murdered man, in order that his ghost may not trouble the murderer. (iii.) The practice is also said to have the effect of causing the relatives of the murdered man to lose heart or to prevent them from exercising the right of revenge. It may point to a reminiscence of a ritual eating of the dead kinsman. The custom of eating food offered to the gods is widespread, and we may trace to this origin Mexican cannibalism, perhaps, too, that of Fiji. For the origin of penal and revenge cannibalism, we may perhaps look to that of protective magic, but there may also be some idea of influencing the lot of the criminal in a future life; and the whole of the body is seldom eaten in protective cannibalism. Other cases, especially where the victim is an enemy, may be due to mere fury and bravado. In the west of North America a peculiar kind of cannibalism was confined to a certain body of magicians termed "Hametzen" and a necessary condition of admission to their order. Another kind of initiatory cannibalism prevailed in the south of Australia, where a magician had to eat a portion of a child's body before he was admitted.

Most kinds of cannibalism are hedged round with ceremonial regulations. Certain tribes go to war to provide human flesh; in other cases it is only the nearest relatives who may not partake of a body; in other cases it is precisely the nearest relatives on whom the duty falls. Sometimes the killer of the victim does not partake in the feast; in other cases the whole of the clan to which belonged the man for whom revenge is taken abstains also; elsewhere, this clan, together with any others of the same intermarrying group, takes part in the feast to the exclusion of (a) the clan or group with which they intermarry and (b) all outside clans. Some peoples forbid women to eat human flesh; in others, certain classes may be forbidden to eat it. But the variations are too numerous for any general account to be given of ceremonial limitations.

**Origin.**—The multiplicity of forms and the diversity of ceremonial rules point to a multiple origin. We shall probably be justified in referring all forms of endo-cannibalism to a ritual origin; otherwise the limitation is inexplicable; on the other hand exo-cannibalism, in some of its forms, and much of the extension of endo-cannibalism, must be referred to a desire for human flesh, grown into a passion.

**CANNING, CHARLES JOHN, EARL** (1812–1862), English statesman, governor-general of India during the Mutiny of 1857, was the youngest child of George Canning, and was born in London on Dec. 14, 1812. In 1836 he entered parliament and filled in succession the offices of under-secretary for foreign affairs,

commissioner of woods and forests and postmaster-general. From 1837, on the death of his mother, he had sat in the House of Lords as Viscount Canning. In July 1855 Lord Palmerston offered him the governor-generalship of India, and Lord Canning took up his duties at the close of Feb. 1856.

He was soon faced with a dangerous situation in Afghanistan, which involved Great Britain in war with Persia at the beginning of 1857. The policy Canning laid down for dealing with the question of Afghanistan was in principle that which he used to cope with the Mutiny and with the difficulties of its suppression and the subsequent reorganization of northern India. It was to give help liberally whenever it was needed for honest purposes, to punish wrong-doing quickly and sharply, to discourage tribal feuds on the *divide et impera* theory, and to be always better than his promises.

When the existence of British rule in India was at stake, he reinforced the British troops by intercepting the regiments being sent out to China and transferring them to the scene of the Mutiny on his own responsibility. In Oct. he issued the proclamation, which earned for him the name of "Clemency" Canning. British residents in India and the British public at home were clamouring for indiscriminate reprisals on the inhabitants of the disaffected areas. He maintained that, although he was prepared to strike down resistance without mercy wherever it showed itself, once resistance was over, "deliberate justice and calm patient reason" were to resume their sway. Hence not only did Canning do all that was possible to check the spread of the Mutiny and to re-establish order in north India, but his work of reconstruction established a more liberal policy and a sounder financial system, and left the people more contented than they had been before.

While rebellion was raging in Oudh he issued a proclamation declaring the lands of the province forfeited; and this step gave rise to much angry controversy. Lord Ellenborough, Secretary for India in Lord Derby's administration, published the despatch in which he had censured the viceroy for the proclamation. So strong was the condemnation of the article that Lord Ellenborough resigned. Canning, however, remained at his post, although strongly tempted to resign on account of the implied censure of the Government. In April 1859 he received the thanks of both Houses of Parliament for his services during the Mutiny. He was also made an extra civil grand cross of the order of the Bath, and in May of the same year was raised to the dignity of an earl. On his return to England he seemed destined to become Palmerston's successor, but the strain of his years in India, aggravated by the death of his wife towards the end of his term of office, had undermined his health. He died in London on June 17, 1862. About a month before his death he was created K.G. As he died without issue the title became extinct.

See Sir H. S. Cunningham, *Earl Canning* ("Rulers of India" series) (1891); A. J. C. Hare, *The Story of Two Noble Lives* (1893); Lord Edmond Fitzmaurice, *The Life of Lord Granville*, vol. i. (1906).

(E. F. M.-S.)

**CANNING, GEORGE** (1770–1827), British statesman, was born in London on April 11, 1770. The Cannings came originally from Bishop's Canning in Wiltshire, but in 1618 one of the family received the grant of the manor of Garvagh in Londonderry, Ireland. The father of the statesman, also named George, was the eldest son of Mr. Stratford Canning of Garvagh. He quarrelled with and was disowned by his family. Coming to London he was called to the bar, eking out a precarious livelihood, partly in the wine trade and partly in literature. In May 1768 he married Mary Annie Costello, and died on April 11, 1771, exactly one year after the birth of his son. His widow, left entirely destitute and cut off by her husband's family, went on the stage in order to support herself and her son, and married a dissolute and brutal actor of the name of Reddish. From his evil influence and upbringing Canning was rescued by the good offices of Moody, another actor, who approached his relatives in order to secure a more suitable education for the talented boy. An uncle, Stratford Canning, his father's younger brother, took charge of him, and his grandfather relented sufficiently to settle on him an estate to the value of £200 a year. Sheridan and Fox frequented the house, and it was Fox who persuaded Stratford Canning to send

his nephew to Eton in 1781. There and later at Oxford he became an accomplished classical scholar. His oratory was of so high an order that Sheridan referred to him as the rising hope of the Whigs, while his contributions to the *Microcosm*, a journal published by a group of Etonians, showed already the subtle humour and boisterous wit for which he later became famous.

In 1792 he came down from Oxford, where, according to Lord Holland, he had been noted as a Jacobin and hater of the aristocracy. He intended to read for the bar, but politics proved too great an attraction. In Sheridan's company he at first frequented Devonshire house and Carlton house, the strongholds of the Whigs, but when he entered parliament for the borough of Newton, Isle of Wight, in July, 1793, it was as a supporter of Pitt. There were three reasons for this change of party. First must be ranked the personal influence of Pitt, whose acquaintance Canning had made soon after his arrival in London. Self-interest dictated separation from a party controlled by the great "revolution families"—Cavendishes, Russells, Bentincks—who never allowed any man, however able, who did not belong to their connection to rise to the first rank. Lastly, the development of the French Revolution into a militant power for the overthrow of existing institutions in other countries drove him into opposition to its principles, and he regarded the Whig reformers as Jacobins and distrusted them accordingly. He soon won the reputation of being the most brilliant speaker on the Ministerial side, in opposition to such famous orators as Burke, Fox and Sheridan. His political patrons took care to provide for his private as well as his official prosperity, and their favour secured him a marriage with Miss Joan Scott, who possessed a fortune of £100,000, on July 8, 1800. One of the four children of this marriage became known to history as Earl Canning.

The public life of Canning falls into four stages. From 1793 to 1801 he was the devoted follower of Pitt, was in minor though important office, and was the wittiest of the defenders of the Ministry in parliament and in the press. From 1801 to 1809 he was partly in opposition, partly in office, fighting for the foremost place. Between 1809 and 1822 there was a period of comparative eclipse, during which he was indeed at times in office but in a very subordinate capacity, and was regarded with general mistrust. From 1822 to his death in 1827 he was the most powerful influence in English, and one of the most powerful in European politics.

In 1796 Canning became under-secretary for foreign affairs, an office of extreme delicacy, placed as he was between Pitt, his friend and prime minister, and Lord Grenville, his immediate chief. During the negotiations for peace with the Directory at Lille in 1797 he was the medium through which their often conflicting instructions reached Lord Malmesbury, the ambassador conducting the negotiations. Pitt and Grenville were mutually suspicious, although they were united in deceiving the Cabinet as to the real nature of the discussions. The part he was forced to play gained for Canning an unfortunate reputation for trickery. From November 20, 1797, until July 9, 1798, he was one of the most active and certainly the most witty of the contributors to the *Anti-Jacobin*, a weekly paper started to ridicule the French republicans, and to denounce their brutal rapacity and cruelty. In 1799 he left the Foreign Office and was named one of the twelve commissioners for India and became in 1800 joint paymaster of the forces. Although debarred from a seat in the Cabinet by the difficulties which then existed for a poor man to attain high office, and by the prejudice due to his defection from the Whig Party, a prejudice increased by his merciless wit, which "would have fetched the hide off a rhinoceros," he exercised more influence as the chief confidant of Pitt than most Cabinet ministers.

When Pitt resigned in 1801 Canning resigned with him, but proved an insubordinate follower. In 1802 he resigned his candidature for Newport and was returned as an independent member for the Irish borough of Tralee. His violent attacks on Addington damaged his own reputation as much as his victim's, while his attempts to act as a political go-between in Ministerial arrangements were unfortunate. On the formation of Pitt's second Ministry, he took the post of treasurer of the navy on May 12,

1804, but left office on Pitt's death on January 21, 1806. He refused to take office in Fox's Ministry of "all the talents," although he was offered the leadership of the House of Commons. After the death of Fox he joined the duke of Portland's Administration as secretary of state for foreign affairs, a post which he held from March 25, 1807, to September 9, 1810.

During these years Canning had a large share in the vigorous policy which defeated the secret articles of the Treaty of Tilsit by the seizure of the Danish fleet. This high-handed action did not pass without censure, but his defence in the House of Commons silenced his accusers, although he could not disclose the source from which he had gained his secret information. He threw himself eagerly into the prosecution of the Peninsular War, for he realised that Spain was Napoleon's vulnerable point. Unfortunately his tenure of office ended in circumstances which left him in deep discredit. Canning found that the War Office continually hampered him in the carrying out of his schemes, and he suggested to the duke of Portland that Castlereagh, secretary for war and the colonies, should be given another office, not on the ground of incompetence, but of incompatibility of policy. The duke, a sickly and vacillating man, took no steps in the matter, and after six months, when he found that his wishes were disregarded, Canning resigned. At that point Castlereagh heard of the negotiations but was misinformed as to their true content. Thinking that Canning had demanded his dismissal on the ground of incompetence and yet had continued to be his colleague, Castlereagh challenged him on September 19, 1810. In the duel on Putney heath which followed Canning was wounded in the thigh. Public opinion was strong against him, especially as the death of the duke of Portland made it impossible for him to clear himself, and he was regarded with mistrust. For twelve years he remained out of office or in inferior places, but his ability made it impossible that he should remain obscure. In 1810 he was a member of the bullion committee, and his speeches on the report showed his mastery of the subject. His reputation for economic knowledge recommended him to the electors of Liverpool, which city adopted him as its member in 1812, a connection which lasted until 1822 and which taught him a great deal of the commercial and democratic needs of the time. In 1816 he entered office as president of the board of control in Lord Liverpool's Cabinet, in which Castlereagh, with whom he had become reconciled, was secretary of state for foreign affairs. Under his direction Hastings waged a successful war against the Pindaris and the Mahratta confederacy, whereby their dominions were brought under the rule or protectorate of Great Britain. He also began the practice of appointing distinguished members of the East India Company to high administrative posts, instead of filling them invariably with men sent out from England. In this way Monro and Elphinstone owed their original appointments to him. In 1820 he resigned his post in order to avoid taking any part in the proceedings against a lifelong friend of his wife, Queen Caroline, the wife of George IV.

Canning returned to office on the suicide of Castlereagh in 1822. He had accepted the governor-generalship of India, and he refused to remain in England unless he received the "whole inheritance" of Castlereagh—the foreign office and the leadership of the House of Commons. He held that position from September 1822 until April 1827, when he became prime minister in succession to Lord Liverpool, but even before this he was the real director of the policy of the Cabinet—as Castlereagh had been from 1812 to 1822.

His fame as a statesman is based mainly on the foreign policy which he pursued in those years—the policy of non-intervention—and of the patronage, if not the actual support, of national and liberal movements in Europe. This policy had already been laid down in a State paper of May 5, 1820, so that it can safely be asserted that Castlereagh's views must have been influenced by Canning, since the policy therein contained was contrary to that pursued by Castlereagh during most of his term of office. At the congress of Verona the duke of Wellington defined England's position according to his instructions as one of "neutrality but not of indifference," and the point-blank refusal of England to join

the Powers in their intervention in Spain was the death-blow to the system of congresses and the beginning of a new era in Europe. His eloquence has associated with his name the responsibility for British policy. No speech of his is perhaps more famous than the one in which he claimed the initiative in recognizing the independence of the revolted Spanish colonies in South America in 1823: "I resolved that, if France had Spain, it should not be Spain with the Indies. I called the New World into existence to redress the balance of the Old" (December 12, 1826).

It has been well said that Portugal owed to Canning her security, Greece and the South American republics their existence, while it was owing to his influence that the Holy Alliance was dissolved and liberalism introduced into European diplomacy, for he was the first statesman to advance the doctrine of nationality.

When Lord Liverpool was struck down in a fit on February 17, 1827, Canning was obviously marked out as his only possible successor. Although the duke of Wellington, Sir Robert Peel and several other members of the Ministry, moved perhaps by personal animosity and certainly by dislike of advocacy of the claims of the Roman Catholics, refused to serve under him, he succeeded in forming a Ministry in April. His health, however, broke down under the strain. He had caught cold at the funeral of the duke of York in January and never recovered. He died on August 8, 1827, at Chiswick in the house of the duke of Devonshire, in the same room in which Fox had died, and was buried at the feet of Pitt.

**CANNING** is the method of preserving fresh foods by sterilizing them in hermetically sealed containers. The form, colour and quality of food after the process is practically the same as that of the product in its fresh state. No added substance or chemical need be used. Heat adequate to kill the bacteria which cause fermentation and decay is sufficient.

Primitive canning was originated by Appert, a Paris chef, 1783-95, though its scientific basis was not understood until the results of Pasteur's work on fermentation were first employed in 1895 by Russell at the University of Wisconsin, and by Prof. S. C. Prescott of the Massachusetts Institute of Technology, the latter working in collaboration with William S. Underwood. Appert's method consisted in placing the sealed bottles containing the food in a water bath and bringing the water to the boiling point. This original principle and method of food preservation differs from that of to-day only in the amount of heat and the manner of applying it, though Appert himself came to realize that greater heat than he was able to develop was necessary. But until 1895-98 canners believed almost entirely in the fallacious theory that preservation was due to the exclusion of air from the container.

### I. IN THE UNITED STATES

Science is being more and more intensively applied in the industry, and to-day canning has become a scientifically controlled industry. This result has been brought about through co-operation of the industry laboratories of the Canning Associations and of the Government and the universities. Surveys and intensive studies have been made of the bacterial flora associated with food. Thermal death points; *i.e.* the time temperature treatments of bacteria, have been accurately determined by the use of thermocouples which measure the rate of heat penetration into various foods in all sizes of containers during the sterilizing treatment. Knowledge of canning was brought to America from England about 1818, though very little progress was made in the industry until after 1860. Since that date the United States has become the greatest producer and consumer of canned foods in the world.

Development of the machinery of the modern cannery was slow. Practically all equipment up to 1870 was crude, cumbersome and

inefficient. The first important improvement was the heavy closed retort or autoclave, which made possible the higher temperatures needed for sterilization. This device was the invention of Appert's son, who also used a thermometer in the autoclave to enable the maintenance of a constant temperature. The adoption of steam under pressure finally placed the canning industry on a more definite but not, strictly speaking, scientific basis.

**Canning Vegetables and Fruits.**—Each variety of fruit, vegetable, meat and fish is prepared in a manner best suited to

BY COURTESY OF THE NATIONAL CANNERS ASSOCIATION

FIG. 1.—THE VINER, INTO WHICH THE PEA VINES WITH PODS ON THEM ARE DUMPED TO BE AUTOMATICALLY SHELLED AND GRADED

its particular type, yet the process is more or less uniform. Peas, the most delicate in flavour of all garden crops, must be picked when their tenderness and flavour are at their best. Furthermore, they must be in cans within a few hours from the time they are harvested. It would be impossible to secure sufficient labour to pick the peas from the vines, so the vines with the peas on them are mowed, as are hay and wheat, and immediately trucked to the factory where they are dumped in a "viner" (fig. 1). This machine consists of a large cylinder in which paddles revolve at a speed sufficient to open the pods. Each machine replaces the labour of 500 pea pickers in the field and 500 "podders" or "shellers" at the factory. As the peas come from the viner, they are automatically graded for sizes, then pass through a cleaner, which extracts broken pods, stems and "splits"; and then are washed in fresh hot water, a procedure known technically as "blanching." After "blanching" they go to the machines where they are automatically placed in cans with a measured quantity of seasoning brine. The can tops are next automatically placed in position and sealed by a closing machine; they then go to the "cooker." After cooking they are cooled quickly. Over-cooking has a tendency to impair the quality of the product and this is prevented by cooling, immediately after the cooking in the retort is completed.

Tomatoes are picked by hand, and on delivery at the factory, are given two thorough washings, scalded and peeled, and placed in cans either by automatic machines or by hand. Corn is hardly touched by hands after its arrival at the factory where it is husked, cut from the cob, conveyed to cookers and filled into cans for final processing—all by automatic machinery. Of the less important vegetables asparagus stands out as the most intensively cultivated for canning. While there is a very limited packing of asparagus in several States, California canners practically monopolize the industry in this particular item. The handling of asparagus is practically all manual operations. Fruits go through the cleaning and washing processes. They are then treated in accordance with their individual characteristics; *e.g.*, cherries are pitted; peaches are peeled by special processes; pears are generally peeled by hand; apples are pared, cored and sliced by machinery; and each of the products is then cooked at temperatures adjusted to the sterilization needed by that particular fruit.

**Canning Milk.**—The first attempts to can condensed milk were made by Gail Borden at Torrington, Conn., in 1856, though he never operated his small plant commercially at this place, as

### CANNING PROCESSES AND MACHINERY IN AMERICAN FACTORIES

1. Capping machine, right foreground, which automatically places lids on cans. In the centre is the exhaust box, syruer and drainer. Filled cans are fed into the exhaust box, then through the double seamer, where lids are pressed on and crimped, to the steam cooker
2. A modern high speed can-closing machine
3. Packing sardines. The cans are carried to and from the benches on a conveyor or endless belt
4. Peach-canning tables. The fruit is carried by conveyor from the grader to the tables or basins filled with fresh running water. After rinsing and final inspection the peach halves are packed by hand, then conveyed to the cooking department
5. Milk-sterilizing machines; preheater, sterilizer and cooler
6. Steam-cooking machines; the final process in canning. Recording instruments regulate time and temperature according to the product. After cooking, the cans are quickly cooled

funds were lacking. The first commercial condensed milk was canned the following year by Borden at Burrville, Conn., sugar being used as an added preservative. The Civil War gave the necessary impetus to establish the condensed milk industry. Many efforts were made to can milk without the aid of sugar. The first evaporated (unsweetened) milk successfully produced was at Highland, Ill., by the Helvetia Milk Condensing company, who finally succeeded in commercializing their product in 1890.

In general, the process of canning milk is as follows: evaporation of the water is brought about in a "vacuum pan" (fig. 2). This is a closed metal container, to which heat is applied by means of a steam jacket and steam coils. If the air is exhausted, the milk boils at a temperature of about 140° F. There is, therefore, little exposure of the milk to heat. When the removal of about 40% of the water has been effected, the concentrated milk is forced through apertures (fig. 3) so small that the fat globules are finely divided. The purpose of this process is to render the fat globules so small that they will not rise to the surface of the evaporated milk in the form of cream. The chemist now tests the milk to make sure of compliance with the Government standard and the next step is the filling of the cans. Ordinarily, the "vent hole" type of can is used. In this type the can manufacturer leaves a small opening in the centre of one end, and through this opening

BY COURTESY OF THE EVAPORATED MILK ASSOCIATION

FIG. 2.—THE "VACUUM PAN," WHERE WATER IS REMOVED FROM FRESH MILK AS THE FIRST STEP IN THE PROCESS OF CANNING

the evaporated milk is introduced by means of a small nipple. After filling, the hole is sealed with a drop of solder and the can is ready for the sterilizer.

**Products Used in Canning.**—It is estimated that more than 1,500,000 ac. of land in the United States are utilized in raising the various crops which find their way into cans or glass. In addition to this is the area used for grazing cattle and other animals, the edible portions of which, including milk, also go into canned food. Salmon, sardines, oysters, tuna fish, mackerel, shrimp, lobster, anchovies, codfish and other marine and fresh water products are

likewise important items in the list of canned goods. Vegetables and fruits in any climate and all kinds of fish, fowl, game and meats, may be preserved for future use through canning. Canning on a commercial scale is carried on in regions where soil and climate conditions are the most favourable for securing an average volume of a superior quality crop. Transport charges, while always of importance, do not necessarily operate against the merchandising of canned food no

matter how remote the factories may be from the large distributive markets of the country. As an illustration: Pacific coast fruits dominate the canned fruit sales of the Atlantic coast notwithstanding the fact that there are canneries packing excellent fruit more than 2,000 m. nearer this market.

Vegetables show a wider latitude of location possibilities, yet here, too, certain sections dominate. Practically every vegetable may be found in cans, yet the important staples are corn, tomatoes and peas. Wisconsin, New York and Utah canneries are characterized both by the quality and quantity of their peas. In corn, Maine, New York, Ohio, Indiana, Illinois, Iowa and Minnesota are the leading producers. Tomato canning is specialized in the States of Maryland, New Jersey, Delaware, Virginia, Indiana, Missouri and Utah.

The figures given in the following table are based on the United States Government census report of 1925, revised from later sources:

|  | Cases.                 | Value.        |
|--|------------------------|---------------|
| Asparagus . . . . .                    | 1,896,410              | \$10,487,334  |
| Green beans . . . . .                  | 7,624,156              | 19,602,257    |
| Baked beans . . . . .                  | 17,008,747             | 35,511,420    |
| Beets . . . . .                        | 1,557,201              | 3,810,464     |
| Corn . . . . .                         | 24,320,000             | 51,346,305    |
| Kraut . . . . .                        | 2,393,409              | 4,567,844     |
| Peas . . . . .                         | 17,816,469             | 42,825,952    |
| Spinach . . . . .                      | 2,045,217              | 5,455,990     |
| Tomatoes . . . . .                     | 21,733,600             | 42,570,418    |
| All other vegetables . . . . .         | 19,554,204             | 61,169,190    |
|  | 115,949,404            | \$277,347,174 |
| Fruits . . . . .                       | 25,718,497             | 101,920,889   |

| Other fish* . . . . .                  | 366,317                | 2,020,669     |
| Meat . . . . .                         | 8,576,431              | 40,344,000    |
|  | 55,291,184             | \$435,527,110 |
| Totals . . . . .                       | 171,240,588            | \$715,874,284 |

\*Editor's estimate.

There have been frequent charges that consumers of canned food are liable to "ptomaine poisoning." Such charges are unfounded. Sterilized food in air-tight containers cannot under any circumstances be dangerous. No case of poisoning has ever occurred from eating properly sterilized and sealed canned food.

## II. IN THE BRITISH EMPIRE

**Great Britain.**—The canning industry was of considerable importance in Great Britain before 1914, and a large export trade in canned meats, fish and vegetables had been developed. War demands gave a great impetus to the industry, particularly in the production of canned "rations," hams, etc., for the British and Belgian armies. The export trade, however, was greatly reduced, but it quickly revived after the war and to-day is an important factor in the trade of the country. The National Food Canning Council was set up in 1925 in order to promote the organization of food canning, and so increase the quantity and consumption of home-grown produce. This led to a great revival of the industry, and factories provided with the most up-to-date labour-saving American machinery, were established at Wisbech, Hereford, Evesham, and in Kent, chiefly for fruit and vegetable canning. These new ventures in Great Britain are proving most profitable to the grower, to the South Wales tinplate industry, to the workers in the canning factories, and to the consumer, who can now obtain a larger variety of fruit and vegetables. As an instance of the expansion of the industry, at the Wisbech factory the output in 1925 was about 1,000,000 cans, whereas in 1927 it was 7,000,000 cans. Other factories have shown equal progress.

**Australia.**—Here 276,000 ac. are under fruit trees, an increase during the last ten years of 85,455 acres. The industry employs 27,900 field hands and 5,000 factory hands. The following table shows the number of dozen tins of output:

|                    | 1922-23. | 1923-24. | 1924-25.  | 1925-26.  |
|--------------------|----------|----------|-----------|-----------|
| Apricots . . . . . | 245,244  | 284,194  | 413,150   | 271,350   |
| Pears . . . . .    | 274,772  | 510,345  | 545,056   | 416,950   |
| Peaches . . . . .  | 93,488   | 135,407  | 187,798   | 39,345    |
| (freestone)        |          |          |           |           |
| Peaches . . . . .  | 955,583  | 980,923  | 1,264,713 | 1,517,998 |
| (clingstone)       |          |          |           |           |

**New Zealand.**—In New Zealand the largest share of the industry is taken by canned meats. Sheep and ox tongues are the principal commodities canned, while other packs include boiled mutton, boiled beef, corned mutton, corned beef, and meat extract. Next in importance to the canned meats are jams and canned fruits. The latest production figures available are for 1925.

| Commodity.                       | No. of Factories. | Quantity.           | Value.                |
|----------------------------------|-------------------|---------------------|-----------------------|
| Preserved meat . . . . .         | 18                | 103,589 wts.        | 291,016 £             |
| Canned fish . . . . .            | 9                 | 7,238               | 7,238                 |
| Condensed milk . . . . .         | 1                 | 46,979              | 120,887               |
| Jams and canned fruits . . . . . | 7                 | { 53,878<br>{ 9,861 | { 185,404<br>{ 23,402 |

**Canada.**—Since 1910 the canning industry in Canada has considerably developed and the export trade is now a very large one. Packing and canning factories have been established in many parts of the Dominion and the closest attention is given to grading and standardization. The principal commodities canned are (1) Fish, including salmon, lobsters and sardines; (2) Fruits and vegetables of many kinds; (3) Meats, and (4) Milk products.

Exports of canned foods, the produce of Canada, during 1924 amounted in value to \$20,435,792, of which canned fish totalled \$13,358,901 and condensed milk \$5,319,364. Sardine canning is confined almost wholly to the province of New Brunswick. The name sardine is misleading, as the fish used in the canneries of New Brunswick are the young of the herring. The first mention of a sardine industry in Canada dates back to some time in the

late '60s. Although but three canneries were reported in 1924, with a total pack of 282,306 cases and a value of \$810,574, the importance of the industry to New Brunswick is explained by the fact that the factories of Maine, U.S.A., about 50 in number, depend almost wholly on the supplies of fish obtained from Canadian waters.

The canning of fruits and vegetables is carried on most extensively in the provinces of Ontario, British Columbia and Quebec. The vegetables canned include tomatoes, peas, corn, beans, beets, carrots, pumpkin, squash, spinach and asparagus.

The canning of meats is a branch of the great meat-packing industry and is not so extensively carried on in Canada as are other sections of the canned foods group of industries, being more in the nature of a side line of the main industry. The total value of canned meats manufactured in Canada during the year 1924 was \$840,192. The value of condensed milk produced in Canada as first reported in the decennial census of 1891 was \$83,000. In 1901 the value had increased to \$269,520, in 1906 to \$855,409, whilst in 1925 it had reached \$13,453,472.

**South Africa.**—The industry in South Africa, though of comparatively recent establishment, is nevertheless of considerable importance owing to the increased cultivation of fruits for the export market. Canned fruits, though consumed to a great extent in South Africa, are not in urgent demand there because at all times there are plentiful supplies of fresh fruit at reasonable prices. The principal fruits treated at the canneries are pineapples, grape fruit, golden berries or Cape gooseberries, apricots, pears and plums. The chief centres of the fruit canning industry are Durban, Port Elizabeth and Cape Town on the coast, the Paarl and Worcester districts of Cape Province, and the Transvaal, where fruit culture is now increasing. The canneries have been established at these places, partly on account of the better supply of suitable labour, and partly on account of the more economical working in these localities.

The following table shows the quantity and value of canned fruits exported from South Africa:

| Commodity.           | 1924.     |        | 1925.     |        | 1926.     |        |
|----------------------|-----------|--------|-----------|--------|-----------|--------|

There are now about 20 canning factories in South Africa dealing almost solely with crayfish, and operations are extending northwards so much that four large factories were established some years ago at Luderitz, South-West Africa, from which over 12 million lobsters were exported in 1921. The following table shows the quantity and value of the exports of crayfish from South Africa, as apart from South-West Africa, for the period 1924-26:

|                | lb.       | Value.   |
|----------------|-----------|----------|
| 1924 . . . . . | 3,565,698 | £225,854 |
| 1925 . . . . . | 4,290,975 | £234,637 |
| 1926 . . . . . | 3,273,630 | £175,623 |

**Federated Malay States.**—The pineapple is the only fruit exported, and the canning industry is entirely in the hands of the Chinese. The pines are canned for export in three forms—whole pine, sliced pines, and chunks or cubes. The most popular size is the 1½ lb. tin, which is shipped in wooden cases containing 4 dozen tins. In 1926 the export had risen to 40,633 tons valued at £894,808. In 1927 over 80% of the total import of canned pineapples into the United Kingdom came from Malaya.

## III. IN OTHER COUNTRIES

In Italy, where the canning industry is firmly established, the export of canned fruit and vegetables, particularly tomatoes and cherries, has shown a steady increase, the general standardization, packing and canning being most efficient. Since the World War, France, which has many canning establishments and exports a large quantity of sardines, vegetables and preserved

fruits, has practically re-established her trade and regained her lost markets. Norway's canned fish and meat industry is of great importance to the country. Since 1895, the fish-canning trade has expanded at an exceptionally rapid rate, and Norway is now one of the leading exporters of canned fish. This expansion is clearly instanced in the exports of brisling and sild, the main products of the industry, which are about 22,000,000 kegs yearly. Norway has over 200 canneries, employing some 6,500 hands. The total weight of canned goods exported in 1925 was 40,240 metric tons, of which 28,202 tons were smoked sardines, 5,061 tons unsmoked sardines and 5,389 tons kippers. Canning machinery is exported from Norway to other countries engaged in the industry.

Spain, Portugal and Siberia are all engaged in the canned sardine or salmon industry, the quantity and value exported from these countries in 1926 showing a large increase. Spain and Portugal also devote considerable attention to canned fruits, the exports of which are increasing. In Belgium the canning industry rapidly developed after 1910. The oldest and the most flourishing branch is that of canned vegetables. The manufacture of canned fruits on a very large scale has been developed largely in co-operation with British firms. An industry which has made great strides is the manufacture of canned and crystallized fruit, in which 22 manufacturing firms were engaged in 1925 as against less than ten before the war. The works engaged in the preparation of canned and dried fish are situated for the most part along the coast, and specialize in sprats and sardines and shell-fish.

Japan, through the organization of a large trust of canned provision merchants, has become practically the most important country in the canned crab and salmon trade. In 1923 she shipped to America and Europe 220,000 cases of crab, but in 1924 the output somewhat decreased and the value fell from yen 50 to yen 40 per case. As a result of the influence of the trust, however, and also of improved packings, the industry in 1925 showed signs of greater expansion, and has continued in that direction, the output and exports in 1926 and 1927 establishing a record. (A. F. W.)

**CANNIZZARO, STANISLAO** (1826-1910), Italian chemist, was born in Palermo on July 13, 1826. In 1845-46 he acted as assistant to Raffaele Piria (1815-65), known for his work on salicin, who was then professor of chemistry at Pisa and subsequently occupied the same position at Turin. He took part in the Sicilian Revolution and on the collapse of the insurgents he escaped to Marseille, and reached Paris in Oct. 1849. There he worked in the laboratory of M. E. Chevreul, and in conjunction with F. S. Cloëz (1817-83) prepared cyanamide by the action of ammonia on cyanogen chloride in ethereal solution (1851). In the same year he was appointed professor of physical chemistry at the National College of Alexandria, where he discovered that aromatic aldehydes are decomposed by alcoholic potash into a mixture of the corresponding acid and alcohol, e.g., benzaldehyde into benzoic acid and benzyl alcohol ("Cannizzaro's reaction"). In the autumn of 1855 he became professor of chemistry at Geneva university, and six years later, after declining professorships at Pisa and Naples, accepted the chair of inorganic and organic chemistry at Palermo. There he spent ten years, studying the aromatic compounds and continuing to work on the amines, until in 1871 he was appointed to the chair of chemistry at Rome university. Apart from his work on organic chemistry, which includes also an investigation of santonin, he rendered great service to the philosophy of chemistry when in his memoir *Sunto di un corso di Filosofia chimica* (1858) he insisted on the distinction, till then imperfectly realized, between molecular and atomic weights, and showed how the atomic weights of elements contained in volatile compounds can be deduced from the molecular weights of those compounds, and how the atomic weights of elements of whose compounds the vapour densities are unknown can be ascertained from a knowledge of their specific heats. For this achievement, of fundamental importance for the atomic theory in chemistry, he was awarded the Copley medal by the Royal Society in 1891. Cannizzaro entered the Italian senate in 1871. He

became its vice-president and a member of the Council of Public Instruction and in other ways he rendered important services to the cause of scientific education in Italy. He died in Rome on May 9, 1910.

**CANNOCK**, an urban district of Staffordshire, England, in the district known as Cannock Chase, 130 m. N.W. of London by the L.M.S.R. Pop. (1931), 34,588. The church of St. Luke is Perpendicular, enlarged in modern times. The famous political preacher, Henry Sacheverell, held the living early in the 18th century. Cannock is a great mining centre, with subsidiary metal-working industries. Cannock Chase, a tract generally exceeding 500 ft. in elevation, extends on an axis from north-west to south-east over some 36,000 acres. It was a royal preserve, and remains for the most part an uncultivated waste, but it is also a rich coal-field. Brownhills, Burntwood and Chase Town, Great Wyrley, Hednesford, Hammerwich and Pelsall are mining settlements; while Rugeley, Tamworth, Short Heath and Wednesfield are all included in the Cannock Chase field.

**CANNON, ANNIE JUMP** (1863- ), American astronomer, was born at Dover, Del., on Dec. 11, 1863. She graduated at Wellesley college in 1884, and did special work in astronomy at Radcliffe college. She was an assistant at the Harvard college observatory, 1896-1911, and after 1911 the curator of astronomical photographs there. In the course of her photographic work she discovered 300 variable stars, five new stars, one spectroscopic binary and completed a catalogue of 225,000 stellar spectra which fill nine quarto volumes of the annals, all of which are now published. She compiled a bibliography of variable stars comprising about 75,000 references and undertook the classification of faint stars in certain portions of the Milky Way. She is the author of various *Annals of the Harvard College Observatory*.

**CANNON, JOSEPH GURNEY** (1836-1926), American politician, was born in Guilford, N.C., on May 7, 1836. In 1858 he was admitted to the Illinois bar and from 1861 to 1868 he was a state's attorney. He settled at Danville, Ill., entered politics and was elected Republican representative in Congress for the periods 1873-91, 1893-1913 and 1915-23, retiring in his 87th year after serving for a total of 46 years in the House of Representatives, of which he was speaker for eight years, 1903-11. Although usually alining himself with the more conservative groups on questions of national policy, he was personally liked by the members of all factions and was popularly known as "Uncle Joe" Cannon. He died at Danville, Ill., on Nov. 26, 1926.

See L. White Busbey, *Uncle Joe Cannon* (1927).

**CANNON**, a gun or piece of ordnance. The word, first found about 1400 (there is an indenture of Henry IV. 1407 referring to *canones, seu instrumenta Anglicè gunnes vocata*), has been commonly applied to any form of firearm fired from a carriage or fixed mounting, in contradistinction to "small-arms," which are fired without a rest or support. An exception must be made, however, in the case of *machine guns* (q.v.), and the word as used in modern times may be defined as follows: "a piece of ordnance mounted upon a fixed or movable carriage and firing a projectile of greater calibre than 1½ in." In French, however, the term *canon* has been applied to the barrel of small arms, and also, as an alternative, to *mitrailleuse* or *mitrailleur*, to machine guns, as well as to ordnance properly so-called. For details see ARTILLERY, GUN, ORDNANCE, SMALL ARMS, etc. For "cannon" in billiards see BILLIARDS.

In the 16th and 17th centuries the "cannon" in England was distinctively a large piece, smaller natures of ordnance being called by various special names, such as culverin, saker, falcon, demi-cannon, etc. We hear of Cromwell taking with him to Ireland (1649) "two cannon of eight inches, two cannon of seven, two demi-cannon, two twenty-four pounders," etc.

Sir James Turner, a distinguished professional soldier contemporary with Cromwell, says: "The cannon or battering ordnance is divided by the English into Cannon Royal, Whole Cannon and Demi-Cannon. The first is likewise called the Double Cannon, she weighs 8,000 pound of metal and shoots a bullet of 60, 62 or 63 pound weight. The Whole Cannon weighs 7,000 pound of metal and shoots a bullet of 38, 39 or 40 pound. The Demi-

Cannon weighs about 6,000 pound and shoots a bullet of 28 or 30 pound. . . . These three several guns are called cannons of eight, cannons of seven and cannons of six." The generic sense of "cannon," in which the word is now exclusively used, is found along with the special sense above mentioned as early as 1474. A warrant of that year issued by Edward IV. of England to Richard Copcote orders him to provide "*bumbardos, canones, culverynes . . . et alios canones quoscunque, ac pulveres, sulfur . . . pro eisdem canonibus necessarias*." "Artillery" and "ordnance," however, were the more usual terms up to the time of Louis XIV. (c. 1670), about which time heavy ordnance began to be classified according to the weight of its shot, and the special sense of "cannon" disappears.

**CANNON-BALL TREE** (*Couroupita guianensis*), a native of tropical South America (French Guiana), which bears large spherical woody fruits, containing numerous seeds, as in the allied genus *Bertholletia* (Brazil nut). The timber is of value.

**CANO, ALONZO** (1601-1667), Spanish painter, architect and sculptor, was born at Granada. He learned architecture from his father, Miguel Cano, painting from Pacheco and sculpture from Juan Martinez Montañes. As a sculptor his most famous works are the Madonna and Child in the church of Nebrissa, and the colossal figures of San Pedro and San Pablo. As an architect he indulged in too profuse ornamentation, and gave way too much to the fancies of his day. Philip IV. made him royal architect and king's painter, and gave him the church preferment of a canon. His more important pictures are at Madrid. Cano was notorious for his ungovernable temper.

**CANO, MELCHIOR** (1509-1560), Spanish theologian, born at Tarançon, New Castile, joined the Dominican order in 1523 and succeeded to the theological chair in the University of Salamanca. He violently opposed Bartolomé de Carranza, also a Dominican and afterwards archbishop of Toledo, and took part in condemning him for heresy. After attending the Council of Trent in 1545, he was sent by Jesuit influence, in 1552, as bishop of the Canaries. His personal influence with Philip II., however, procured his recall and he became provincial of Castile. In 1556 he wrote his famous *Consultatio theologica*, advising the king to resist the temporal encroachments of the papacy, thus making Spain less dependent on Rome. Hence Paul IV. styled him "a son of perdition." The reputation of Cano rests on his *De Locis theologicis*, a work written in the humanist form and advocating, in place of scholastic subtleties in dogmatic theology, a return to patristic erudition and a scientific basis. Cano died at Toledo on Sept. 30, 1560.

See the Dominican *Mandonnet*, in *Dict. of Cath. Theol.* (1904).

**CANOE**, a general term for a boat sharp at both ends, originally designed for propulsion by one or more paddles (not oars) held without a fixed fulcrum, the paddler facing the bow. As the historical native name for certain types of boat used by savages (Columbus found the word *canóoa* in use in the West Indies; it has a curious resemblance to the French *canot*, a boat) it is applied in such cases to boats which are open within from end to end, and the modern "Canadian canoe" preserves this sense. The name is used in some countries for craft differing from such boats by being covered in with a deck except for a "well" or cockpit where the paddler sits. Modern developments are the cruising canoe, combining the use of paddle and sails, and the racing canoe, equipped with sails only.

The primitive canoes were light frames of wood over which skins, as in the old British coracle (*q.v.*) or in the Eskimo canoe or "kayak" (*q.v.*), or the bark of trees, as in the North American Indians' birch-bark canoe, were tightly stretched. The modern canvas covered canoe, built on Indian lines, was a natural development of this idea. Primitive peoples also used and still use the "dug-out," made from a tree hollowed by fire after the manner of Robinson Crusoe. Many of these are wonderfully carved and ornamented with inlay, and are of considerable size and carrying capacity; one in the New York Natural History museum from Queen Charlotte's island is 63ft. long, 8ft. 3in. wide, and 5ft. deep, cut from a single log. "The 'war canoe' of paddling races is its modern successor.

In the islands of the Pacific and elsewhere dug-out canoes are handled with great skill by the natives, who make long sea voyages in them, often stiffening them by attaching another hull (*see* PROA and CATAMARAN); in New Zealand the Maoris were formerly masters of the art of dug-out canoe construction, some of their ancient war canoes being of huge size. Along the coast of West Africa the fisher tribes still use large dug-out canoes for fishing at sea, remaining out of sight of land for days, and the return of the fishing canoes each with its large square sail set on sprits and travelling at great speed is a picturesque sight still to be witnessed all along the coast. In the earlier part of the 19th century, what was known as a "canoe" in England was the short covered-in craft with a "well" for the paddler to sit in, which was popularly used for short river practice; and this type still survives. But the sport of canoeing in any real sense dates from 1865, when John MacGregor (*q.v.*) designed the canoe "Rob Roy" for long journeys by water, using both double-bladed paddle and sails, yet light enough (about 70lb.) to be carried over land. The general type of this canoe is built of oak with a cedar deck; the length is from 12ft. to 15ft., the beam from 26in. to 30in., the depth 10 in. to 16 in. The paddle is 7ft. long and 6in. wide in the blade. The canoeist sits low in the cockpit, and in paddling dips the blades first on one side and then the other.

**The Royal Canoe Club.**—In 1866 the Royal Canoe Club was formed in England, and the prince of Wales (afterwards Edward VII.) became commodore. Its headquarters are at Kingston-on-Thames and it is still the leading organization. There is also the British Canoe Association, devoted to cruising. After the English canoes were seen in Paris at the exhibition of 1867, others like them were built in France. Branches and clubs were also formed at various centres in Great Britain. Sea voyages in canoes are no longer uncommon, and many rivers were explored by members of the Royal Canoe Club in inaccessible parts, like the Jordan, the Kishon, and the Abana and the Pharpar at Damascus, as well as the Lake Menzaleh in the Delta of the Nile, and the Lake of Galilee and Waters of Merom in Syria. The New York Canoe Club was founded in 1871.

The late W. Baden Powell and E. B. Tredwen, both members of the Royal Canoe Club, modified the "Rob Roy" and constructed paddlable sailing canoes, known as the "Nautilus" and "Pearl" respectively, by the introduction of a centre-board and yawl rig, and in 1886 Paul Butler of Lowell, Mass., added a sliding outrigger seat allowing the canoeist to slide out to windward as shifting ballast. This type of canoe was universal in racing till, under the influence of the late Linton Hope's designs, the Royal Canoe Club developed the "B class" canoe which in Great Britain has entirely taken its place as a racing machine and is a wonderful sea boat withal. These vessels are 17ft. long, 3ft. 6in. in beam and 1ft. in depth, decked, with the exception of the steering well, and are divided into three compartments by two watertight bulkheads. Out-board seats are barred. The rig is sloop with sliding gunter or Bermuda mainsail and roller foresail, the total sail area being 150 sq.ft. Speeds up to 10m. per hr. have been attained by these canoes in the Royal Canoe Club's races.

In the paddling races of the Royal Canoe Club, both the open Canadian type of canoe is used with single-bladed paddles, and a partly decked, very long, light and shallow type for team racing, propelled by double-bladed paddles. In Canada team racing with single bladed paddles in "war canoes" is a popular amateur sport. The "Canadian," an all wood canoe, clinker or carvel built with mahogany, cedar or basswood planking always popu-

lar in Canada and the canvas covered canoe with cedar hull, chiefly of United States manufacture, both on the general lines of the Indian birch bark, are as common on American rivers as the punt is on the Thames and are similarly used.

See MacGregor *A Thousand Miles in the "Rob Roy" Canoe*, *The "Rob Roy" on the Baltic*, etc. W. Baden Powell, *Canoe Travelling*; W. L. Alden, *Canoe and the Flying Proa*; J. D. Hayward, *Camping out with the British Canoe Association*; C. B. Vaux, *Canoe Handling*; Stephens' *Canoe and Boat Building*.

**The United States.**—The canoe in the United States is the direct descendant of the American Indian's birch-bark canoe and, being indigenous, it has a wider range of use than any other small water-craft. Although it is considered unsafe by persons unacquainted with its possibilities, its graceful appearance and the romance associated with it imparts a glamour even to the uninitiated. The white man found the Indian's birch bark a perfectly developed craft and promptly adopted it. The early explorers, the frontiersmen, all used the canoe. They and the Indians are inseparably bound with the canoe in the mind of a boy, and the youthful longing thus created to own a canoe is often the first to be fulfilled. Three other factors have been influential in the increased popularity of the canoe: the vogue of outdoor sports; the almost national ability to swim, both greatly accelerated by the World War; and the use of larger canoes. The fatalities for which the canoe was formerly blamed have decreased, not due to better handling of the craft, but to the fact that an upset to-day means only a ducking, and to the use of the 17 ft. canoe which is much harder to capsize than the smaller models favoured in earlier years.

Canoes are still built in almost any size from 10 ft. up, but the usual size in the United States is 17 ft. long and 34 in. wide. Its depth ranges from 12 to 14 in., the ends rising 4 to 6 in. higher. This size was gradually accepted as canoeemen found few lengthy portages in their usual waters and discovered that it was still within the limits that one man could conveniently handle.

**In Canada,** where long carries militate against the weight of the larger canoe, the general size is 16 ft. by 30 in. beam. The all wooden canoe is the favourite in Canada, while the canvas-covered craft is the more commonly used in the United States. The all wood is faster, the canvas-covered is more buoyant. The original birch-bark canoe, while almost impossible to obtain now, is slower than either of the other two, but it will keep going under stress of wind or water that would drown any other type.

Prior to the widespread use of the canoe which developed the 17 ft. craft, a great variety of sizes was tried. The earlier canoe-man ordered his craft according to his weight, just as he bought his clothes according to his size. The ultimate in this line was the "Sairy Gamp," the 10½ lb. clinker-built cedar canoe used by George W. Sears (Nessmuk). This canoe, 10 ft. long by 26 in. beam, is now in the Smithsonian Institution, Washington, D.C. At the same time the sail-and-paddle canoe flourished and the canoe with 3-ft. decks and cockpit coamings, canoe tents, and canoe awnings. One of the best known and most typical canoes of that period, "Rob Roy," found many adherents in the United States.

Modern canoeemen, however, are almost unanimous in their preference for a camp on shore entirely separated from the canoe (see *CAMPING OUT*). With the disappearance of the canoe-tent idea, the sail-and-paddle canoe was entirely superseded by the out-and-out sailing canoe and the simple, open paddling canoe, although the one may be paddled and the other sailed. Sailing canoes in the United States are used almost exclusively for racing, although they were formerly used considerably for cruising. The only notable cruise made in recent years was that of "Yakaboo," in 1911, sailed by Frederic A. Fenger northward through the Lesser Antilles.

The customary size to which sailing canoes are built is 16 ft. by 30 in. beam. Equipped as they are with centre-boards, rudders, decks and sliding seats to utilize the weight of the sailor as ballast, they are virtually small yachts. They are rigged with two masts, each carrying a batwing or Bermuda sail, the division spreading about 60% of the area in the foresail. These tiny racers have been known to outsail yachts of twice their size. Their development is largely based on the work of Paul Butler, an enthusiastic

canoe-man who invented the sliding seat, clutch cleats and reefing gears; built hollow spars and other accessories; introduced the sliding tiller, watertight bulkheads and self-bailing cockpits, all features in use to-day. They provide such excellent competitive sport that they have recently been adopted for class racing by several yacht clubs.

The organization and advancement of canoe racing, both sail and paddle, however, belongs to the American Canoe Association. The New York Canoe Club, its predecessor in the field, was too localized to wield the influence exerted by the A.C.A. The association, which was founded in 1880, also encouraged canoe cruising and the general use of the craft. In 1928 it was the controlling canoe organization in the United States and Canada. In its six divisions it covered the entire country and included the majority of the important canoe clubs.

See R. E. Pinkerton, *The Canoe* (1923); Nessmuk, *Woodcraft* (1895); S. Edward White, *The Forest* (1903); W. H. Miller, *Canoeing, Sailing and Motor Boating* (1928). (W. A. Go.)

**Canoe Racing in the United States** has developed under the guidance and rules of the American Canoe Association since that body was formed in 1880. The canoes in use in the early part of this period were of varied design, gradually becoming standardized until now two general types of canoes only are used for racing: the decked sailing canoe, fitted with centre-board, rudder and sliding seat, and the open canoe, generally built of white cedar strips without canvas covering. The decked sailing canoe was originally permitted as great a sail area as the boat could carry. It was this latter consideration which led Paul Butler, of Lowell, Mass., trophy winner in 1892 and 1893 to develop the sliding seat, thus enabling the lightweight man to throw his weight over-side to offset the normal advantage of the heavier man.

All of the trophy winning boats with the exception of Hilding Froling's "Doris" canoes (1921 and 1927) were 16 × 30's (16 ft. long by 30 in. beam). In 1907 George P. Douglass, several times trophy winner in decked canoe and cruising canoe races, began to advocate the use of larger boats with proportionately greater sail area, but in 1909 a rule was passed limiting the sail area to 90 sq.ft., thus effectively blocking the building of larger craft. Not until 1917, when Douglass, supported by Froling, renewed the advocacy of the larger boat, were the rules changed to provide a sliding scale of sail area in proportion to boat dimensions.

FIG. 2.—AMERICAN CANOE, MODELLED AFTER THE INDIANS' BIRCH BARK CRAFT. ITS LIGHTNESS AND SHAPE MAKE IT FAST, EASY TO HANDLE AND IDEAL FOR SHALLOW WATERS

Slowly, but with gaining favour, this privilege has been accepted until now there are several canoes with dimensions varying from 17' × 34" to 18' × 42", all built after designs by Froling. The sail types have varied from the bat-wing and lateen to the two leg-omutton with standing mast, now in use. While the decked sailing canoe has been recognized as the finest type of canoe sailing machine, it has frequently been outnumbered at regattas by the open or cruising canoe rigged with lateen sail and lee-boards.

Paddling racing has developed a few boat designs only, but by reason of the use of single and double-blade paddles and the possibility of manning a canoe with several paddlers, the number of different events at an A.C.A. regatta is large. There are two standard one- or two-man canoes. One is known as the cruising canoe. It is not as sea-worthy as other boats used for cruising only, having straight sides and being shorter on the water-line, but its combined speed and relative sea-worthiness make it popular. The other boat is known as the racing paddling

canoe. It is frail, but very speedy, being drawn in from the gunwales to the keel so as to have a V shape. A larger boat, 20' × 30", known as the Club Four, is used with four paddlers, using single or double blades. War canoes, manned by nine men with single blades, are used by a few clubs, principally those located in New England.

The American Canoe Association became a member of the Amateur Athletic Union in 1926, and canoe racing is included on the programme of the 1932 Olympics. (L. W. HU.)

**How to Handle a Canoe.**—The most popular canoe among Indians, guides, hunters, voyagers and pleasure seekers are built of cedar and spruce and covered with heavy canvas. They run in length from the 12 ft. "junior" model to the 30 ft. war canoe or freight carrier. The canoe in most favour is from 16 ft. to 20 ft. long.

This canoe may be paddled by one person with a single blade paddle which may be used continuously on one side without propelling the craft off its straight course. At the end of each stroke the voyager steers his boat by an overhand twist of the paddle. The trick is accomplished with the hand at the upper end of the paddle. This hand holds the paddle as it would the upper end of the handle of a snow shovel. At the end of each stroke the hand and paddle are so turned that the back of the hand is turned out toward the water on the same side of the canoe on which one is paddling. The blade of the paddle is kept in the water long enough to bring the canoe back on her course after each thrust of the paddle. The blade should be feathered on the recover stroke. It is better to paddle a canoe on the side opposite to that on which the wind strikes the hull. Thus the thrust of the paddle offsets the thrust of the wind. This obviates a great deal of the steering effort. Indeed if the wind blows hard enough a paddler may not be able to navigate his craft in a side wind. He may have to paddle straight in the eye of the breeze or run before it or go ashore and wait until the wind stops blowing.

A lone paddler should kneel in the canoe about one-third of the length of the boat from the stern. A thwart is placed there for this purpose. It is never good practice to try to sit on the stern seat unless there is a load of dunnage in the bow or thereabouts, or a second person in the boat. The paddler rests the buttocks partly on and partly against the aforementioned thwart. In heavy weather it may be necessary to move up almost to the centre of the craft in order to control it. In running before the wind or straight into the wind the ordinary position is safe. If a person cannot kneel down (owing to stiff knee joints or other cause) it is best to place a billet of wood in the bow provided no baggage is to be transported. Never place stones in the bow of a canoe. They will sink the boat in case of a tip-over. If capsized in a canoe hang on to the craft until it drifts ashore or is picked up by another boat. It will not sink unless loaded, in which case the operator may turn the boat all the way over and jettison the cargo. He then has the canoe for a life raft and it will float for months. Do not try to climb up on an overturned canoe. Just rest the hands lightly on rail or stem. There is enough cedar in the hull to float several people.

A properly trimmed canoe for ease in paddling should have the bow slightly higher out of the water than the stern. In the rapids a canoe should be bow-light going up stream when propelled by either pole or paddle. Going down stream it should be bow-heavy. Going ashore through the surf the canoe should be bow-heavy. Going out through the surf it should be bow-light.

(P. Mo.)

**CANON.** The Greek word *κανών* means primarily a straight rod, and metaphorically what serves to keep things straight, a rule. In Gal. vi. 16 it means rule or measure, in 2 Cor. x. 13, 15, 16, what is measured, a province. The word canon is used in various senses, mostly signifying either a rule or else a list (e.g., of books containing the rule).

**Music.**—A canon in part-music is a composition in which the successive parts repeat the same melody, each beginning at a stated period after its precursor. (See also under FUGUE, CONTRAPUNTAL FORMS and MUSIC.) When the first part completes its rhythmical sentence before the second enters, and then con-

tinues the melody as an accompaniment to the second, and so on for the 3rd or 4th, this form of canon in England was styled a "round" or "catch"; the stricter canon being one in which the succession of parts did not depend on the ending of the phrase. But outside England catches and canons were undifferentiated.

(H. C.)

**The Church Dignitary.**—A canon is a person who possesses a prebend in a cathedral or collegiate church. The name is probably derived from the list (*matricula*) of the clergy belonging to a church, *κανών* being thus used in the Council of Nicaea. In the synod of Laodicea the adjective *κανονικός* is found in this sense; and during the 6th century the word *canonicus* occurs commonly in western Europe in relation to the clergy belonging to a cathedral or other church. Eusebius, bishop of Vercelli (d. 371), lived with his clergy, leading a semi-monastic life in common and according to rule; and St. Augustine led a similar manner of life with his clergy at Hippo. St. Gregory's injunction to St. Augustine that at Canterbury the bishop and his clergy should live a common life together, similar to the monastic life in which he had been trained, is familiar; that these "clerics" at Canterbury were not monks is shown by the fact that those of them in the lower clerical grades were free to marry and live at home, without forfeiting their position or emoluments as members of the body of cathedral clergy (Bede, *Hist. Eccl.*, i. 27). This mode of life for the secular clergy, which became common in the West, came to be called *vita canonica*, canonical life, and was the object of various enactments of councils during the 6th, 7th and 8th centuries. Chrodegang, bishop of Metz (c. 750), composed a rule for the clergy of his cathedral, which was mainly an adaptation of the Benedictine Rule for secular clergy living in common. Chrodegang's Rule was adopted in many cathedral and collegiate churches. In 816 the synod of Aix-la-Chapelle (see *Mon. Germ. Concil.*, ii. 307) made further regulations for the canonical life, which became the law in the Frankish empire for cathedral and collegiate churches. The Rule of Chrodegang was supplemented and made less monastic in character. Each canon was allowed a dwelling-room within the cloister, and retained the use of his private property. The chief duty of the canons was the performance of the church services.

The canonical life thus regulated subsisted in the 9th and 10th centuries; but there was a constant tendency to relax the bonds of the common life. In England, by the middle of the 10th century, the prescriptions of the canonical life seem to have fallen into desuetude, and in nine cathedrals the canons were replaced by Benedictines. The turning point came in 1059, when a synod held at the Lateran abolished the Aix-la-Chapelle regulations, and imposed a stricter rule. Out of this reforming movement grew the religious order of Canons Regular or Augustinian Canons (q.v.), while the opposite tendency produced the institute of secular canons. The revenues of the cathedral were divided between the bishop and the clergy, so that each member of the clergy received his own separate income. All attempts at leading any kind of common life were frankly abandoned. In England the introduction of this order of things was due to St. Osmund (d. 1099). The nature and functions of the institute of secular canons are described in the article CATHEDRAL.

See Du Cange, *Glossarium*, under "Canonicus"; Amort, *Vetus Disciplina Canonica* (1747), to be used with caution for the earlier period; C. du Molinet, *Réflexions historiques et curieuses sur les antiquités des chanoines tant séculiers que réguliers* (1674); Herzog, *Realencyklopädie* (3rd ed.), art. "Kapitel"; Wetzzer und Welte, *Kirchenlexicon* (2nd ed.), art. "Canonica vita" and "Canonikat." The history of the canonical institute is succinctly told, and the best literature named, by Max Heimbucher, *Orden und Kongregationen*, i. sec. 55 (1896); also by Otto Zöckler, *Askese und Mönchtum*, pp. 422-425 (1897). On mediaeval secular canons a standard work is Chr. Wordsworth's *Statutes of Lincoln Cathedral* (1892-97); see also an article thereon by Edm. Bishop in *Dublin Review*, July 1898. (E. C. B.)

In the Church of England the canons of cathedral or collegiate churches retain their traditional character and functions, though they are now, of course, permitted to marry. Their duties, as defined by the canons of 1603, included residence at the cathedrals and preaching in the cathedral and other churches of the

diocese. A canon may hold a benefice in addition to his prebend, but may not make his canonry an excuse for neglecting his cure. The act of 1840 reduced the number of canonries, and made some applicable to the endowment of archdeacons and professorships. The obligatory period of residence, hitherto varying in different churches, was fixed at three months. The right of presentation to canonries is now vested in the Crown, in the lord chancellor, the archbishop or the bishop of the diocese. In the old cathedrals the title of honorary canon is conferred by the bishop as a mark of distinction. In new cathedrals, where no endowment exists for a chapter, the bishop may appoint honorary canons to act as a cathedral body. (*See CATHEDRAL.*)

Minor canons, sometimes styled priest-vicars, whose function is mainly to sing the service, are appointed by the dean and chapter. They may hold a benefice if it lies within six miles of the cathedral. In Protestant Continental churches canons as ecclesiastical officers have ceased to exist. In Prussia and Saxony, however, certain chapters, secularized at the Reformation, still exist; but the canons (*Domherren*) are usually laymen, cadets of noble families.

*See* Phillimore, *Eccles. Law*, 2 vols. (1895).

**The Scriptures.**—The origin of the term "canon," as applied to the writings used by the Christian Church, is uncertain. According to the most probable opinion the term included from the first the idea of a regulating principle. This idea lies in the New Testament and patristic use of the noun, down to the time of Constantine, as Credner has shown. The "*κανών* of the Church" in the Clementine homilies, "ecclesiastical *κανών*" and "*κανών* of the truth" in Clement and Irenaeus, *κανών* of the faith in Polycrates, *regula fidei* of Tertullian, and *libri regulares* of Origen imply a *normative principle*.

Its earliest application to a catalogue of the Old or New Testament books occurs in the Latin translation of Origen's homily on Joshua, where the original seems to have been *κανών*. The word itself is in Amphilochius, Jerome and Rufinus. The first occurrence of *κανονικός* is in the 59th canon of the Council of Laodicea, where it is contrasted with *ιδιωτικός* and *ἀκανόνιστος*. *Κανονίζουσα*, "*canonized books*," is first used in Athanasius's festal epistle. The early Fathers certainly believed the Old Testament books to be a Divine and infallible guide. But the New Testament was not so considered till towards the close of the 2nd century (about A.D. 180). Irenaeus applies the epithets divine and perfect to the Scriptures; and Clement of Alexandria calls them inspired.

When distinctions were made among the biblical writings other words were employed, synonymous with *κανονίζουσα* or *κεκανονισμένα*, such as *ἐνδιάθηκα*, *ὀρισμένα*. (*See* BIBLE: section *Canon*.)

The term "canonical" is applied to ecclesiastical vestments and to the hours set apart by the Church for prayer and devotion. (*See* BREVIARY.) (E. C. B.; W. A. P.; S. D.)

**CANON CITY**, a city of south-central Colorado, U.S.A., at the entrance to the Royal Gorge of the Arkansas river (1,100 ft. deep) and at the head of the beautiful irrigated Arkansas valley, which is covered with gardens, farms and orchards; the county seat of Fremont county. It has an elevation of 5,344 ft.; is on Federal highway 50; and is served by the Denver and Rio Grande Western and the Santa Fe railways. A picturesque highway connects it with Cripple Creek, and another with the top of the gorge, which is spanned by a suspension bridge 1,500 ft. long and 1,053 ft. above the bed of the river. Population in 1930, 5,938.

A rich coal-field to the south produces about 800,000 tons a year, and there are sandstone quarries and lime kilns near by. The city has smelters and brickyards. There are hot mineral springs in the vicinity, and the city natatorium is supplied with hot water from Artesian wells. The State penitentiary is located here. On Oil Creek, 8-rom. N.E., is a spot called Garden park, which has furnished many museums with skeletons of armoured dinosaurs and other prehistoric animals. Adjoining the city on the south is the San Isabel National forest.

Lieut. Pike, after whom Pike's Peak (*q.v.*) is named, camped here in 1806. A town sprang up during the gold rush of 1859-60,

and its early growth was stimulated by the discovery of oil in the county in 1872.

**CANONESS**, a female beneficiary of a religious college. The title first occurs in the 8th century, applied to communities of women vowed to obedience and chastity, though not to poverty, and generally under a rule less strict than that of nuns. The canonesses often taught girls, and also embroidered ecclesiastical vestments and transcribed liturgical books. A distinction grew up between regular and secular canonesses, the latter being of noble family and not practising austerity. Some of their abbesses were notable feudal princesses. In Germany several foundations of this kind still exist as Protestant institutions (*Stifter*), requiring of their members only celibacy and obedience to their superior during membership. They are now practically almshouses for the unmarried daughters of noble families or of deserving officials. The head is entitled abbess, prioress or provostess (*Pröbstin*), and the canonesses (*Stiftsdamen*) meet periodically in *Konvent* to discuss the affairs of the community. Some quaint pre-Reformation customs still survive, e.g., at Schleswig where the *Konvent* is held, on the day of the patron saint (St. John the Baptist), in a room draped in black, with a wax head of St. John on a charger in the centre of the table.

**CANONIZATION** in its widest sense, an act by which in the Christian Church the ecclesiastical authority grants to a deceased believer the honour of public *cultus*. In the early Church there was no formal canonization. The *cultus* applied at first to local martyrs, and it was only in exceptional circumstances that a kind judiciary enquiry and express decision became necessary to legitimate this *cultus*. The peculiar situation of the Church of Africa explains the *Vindictio martyrum*, which was early practised there (*Optatus Milevit*, i. 16). Gradually the canonization of saints came to be included in the centralizing movement which reserved to the pope the most important acts of ecclesiastical power. The earliest acknowledged instance of canonization by the pope is that of Ulrich of Augsburg, who was declared a saint by John XV. in A.D. 993. From that time the pontifical intervention became more frequent, and, in practice, the right of the bishops in the matter of canonization grew more restricted. In 1170 the new right was sufficiently established for the Pope Alexander III. to affirm that the bishops could not institute the *cultus* of a new saint without the authority of the Roman Church (Cap. *Audivimus*, Decret. *De Rel. et venerat, Sanctorum*, iii, 115). In the 12th and 13th centuries the method of canonization was summary and the inquiry was as rapid as the judgment; e.g., St. Thomas of Canterbury (died 1170, canonized 1173), St. Peter of Castelnau (died Jan. 15, 1208, canonized on Mar. 12 the same year), St. Francis of Assisi (died 1226, canonized 1228), and St. Anthony of Padua (died 1231, canonized 1232).

At this period there was no marked difference between canonization and beatification. In modern practice, as definitively settled by the decrees of Pope Urban VIII. (1625 and 1634), the two acts are totally distinct. Canonization is the solemn and definitive act by which the pope decrees the plenitude of public honours. Beatification consists in permitting a *cultus*, the manifestations of which are restricted, and is merely a step towards canonization.

The procedure at present followed at the Roman curia is either *exceptional* or *common*. The approval of immemorial *cultus* comes within the category of exceptional procedure. Urban VIII., while forbidding the rendering of a public *cultus* without authorization from the Holy See, made an exception in favour of the blessed who were at that time (1625) in possession of an immemorial *cultus*, i.e., dating back at least a century (1525). The procedure *per viam casus excepti* consists in the legitimation of a *cultus* which has been rendered to a saint for a very long time. The causes of the martyrs (*declarationis martyrii*) also are exceptional.

The *common* procedure is that in which the cause is prosecuted *per viam non cultus*. It is, in reality, a suit at law, pleaded before the tribunal of the Congregation of Rites, which is a permanent commission of cardinals, assisted by a certain number of subordinate officers and presided over by a cardinal. The supreme judge in the matter is the pope himself. The *postulator*, who is

the mandatory of a diocese or ecclesiastical commonalty, is the solicitor. He must furnish the proofs, which are collected according to very stringent rules. The *promoter of the faith*, popularly called "the devil's advocate" (*advocatus diaboli*), is the defendant, whose official duty is to point out to the tribunal the weak points of the case.

The first decisive step is the *introduction of the cause*. If, by the advice of the cardinals who have examined the documents, the pope pronounce his approval, the servant of God receives the title of "Venerable," but is not entitled to any manifestation of *cultus*. The essential part of the procedure consists in three distinct proceedings: (1) to establish a reputation for sanctity, (2) to establish the heroic quality of the virtues, (3) to prove the working of miracles. A favourable judgment on all three of these tests is called the decree *de tuto*, by which the pope decides that they may safely proceed to the solemn beatification of the servant of God (*Tuto procedi ad solemnen V.S.D.N. beatificationem*). In the ceremony of beatification the essential part consists in the reading of the pontifical brief, placing the Venerable in the rank of the Blessed, which is done during a solemn mass, celebrated with special rites in the great hall above the vestibule of the basilica of St. Peter.

The process of canonization, which follows that of beatification, is usually less lengthy. It consists principally in the discussion of the miracles (usually two in number) obtained by the intercession of the Blessed since the decree of beatification. After a great number of formalities and prayers, the pope pronounces the sentence, and indicates eventually the day on which he will proceed to the ceremony of canonization, which takes place with great solemnity in the basilica of St. Peter.

The Greek Church, represented by the patriarch of Constantinople, and the Russian Church, represented by the Holy Synod, also canonize their saints after a preliminary examination of their titles to public *cultus*.

See J. Fontanini, *Codex Constitutionum quas summi pontifices ediderunt in solemni canonizatione sanctorum* (Rome, 1729, a collection of original documents); Pr. Lambertini (Pope Benedict XIV.), *De servorum Dei beatificatione et beatorum canonizatione* (Bologna, 1734-38), several times reprinted, and more remarkable for erudition and knowledge of canon law than for historical criticism; Al. Lauri, *Codex pro postulatores causarum beatificationis et canonizationis, recognovit Joseph Fornari* (Romae, 1899); F. W. Faber, *Essay on Beatification, Canonization, etc.* (1848); A. Boudinhon, *Les Procès de beatification, et de canonisation* (1905); E. Golubinskij, *Istoriia Kanonizacii sviatich v russkoj cerkvi* (Moscow, 1903). (H. DE.)

**CANON LAW.** Canon law, *ius canonicum*, is the sum of the laws framed by the ecclesiastical body for its own regulation. It concerns the constitution of the Church and the relations between it and other bodies, religious and civil, and also matters of internal discipline. Canon law has been developed to a considerable extent chiefly under ecclesiastical hierarchies of the authoritarian type, and especially in the Roman Church.

The theory of Canon Law implies that its *sources* are of such a nature as to be binding upon the whole religious body, or at least upon a specified portion of it. In the highest rank are placed Christ and the Apostles, whose dispositions for the constitution and government of the Church are contained in the New Testament, completed by tradition. To the Apostles succeeded the episcopal body, with its chief the bishop of Rome, the successor of St. Peter, whose legislative and disciplinary power, by a process of centralization, underwent a slow but uninterrupted development. It is, then, to the episcopate, assembled in ecumenical council, and to its chief, that the function of legislating for the whole Church belongs.

We proceed briefly to describe those texts and collections of canons which to-day form the ecclesiastical law of the western Church: (1) up to the *Decretum* of Gratian, (2) up to the council of Trent, (3 and 4) up to the present day, including the codification ordered by Pius X.

**From the Beginning to the Decretum of Gratian.**—At no time, and least of all during the earliest centuries, was there any attempt to draw up a uniform system of legislation for the whole of the Christian Church. The various communities ruled themselves principally according to their customs and traditions, which,

however, possessed a certain uniformity resulting from their close connection with natural and divine law. Strangely enough, those documents which bear the greatest resemblance to a small collection of canonical regulations, such as the Didache, the Didascalia and the Canons of Hippolytus, have not been retained, and find no place in the collections of canons, doubtless for the reason that they were not official documents. The only pseudo-epigraphic document preserved in the law of the Greek Church is the small collection of the eighty-five so-called "Apostolic Canons" (*q.v.*). The compilers, in their several collections, gathered only occasional decisions, the outcome of no predetermined plan, given by councils or by certain great bishops.

These compilations began in the East. It appears that in several different districts canons made by the local assemblies were added to those of the council of Nicaea which were everywhere accepted and observed. The first example seems to be that of the province of Pontus, where, after the twenty canons of Nicaea were placed the twenty-five canons of the council of Ancyra (314), and the fifteen of that of Neocaesarea (315-320). These were afterwards increased to over 150, and formed a collection so well known that at the council of Chalcedon (451) several of them were read out and referred to by number. It was further increased by the twenty-eight (thirty) canons of Chalcedon; about the same time were added the four canons of the council of Constantinople of 381, under the name of which also appeared three (or seven) other canons of a later date. Towards the same date, also, the so-called "Apostolic Canons" were placed at the head of the group. Such was the condition of the Greek collection when it was translated and introduced into the West.

In the course of the 6th century the collection was completed by the addition of documents already in existence, but which had hitherto remained isolated, notably the canonical letters of several great bishops, Dionysius of Alexandria, St. Basil and others. It was at this time that the Latin collection of Dionysius Exiguus (*see below*) became known; and just as he had given the Greek councils a place in his collection, so from him were borrowed the canons of councils which did not appear in the Greek collection—the twenty canons of Sardica (343), in the Greek text, which differs considerably from the Latin; and those of the council of Carthage of 419, which itself included, more or less completely, in 105 canons, the decisions of the African councils. Soon after came the council in Trullo (692), also called the *Quinisextum*, because it was considered as complementary to the two councils (5th and 6th ecumenical) of Constantinople (553 and 680), which had not made any disciplinary canons. This assembly elaborated 102 canons, which did not become part of the Western law till much later, on the initiative of Pope John VIII. (872-881). Now, in the second of its canons, the council in Trullo recognizes and sanctions the Greek collection above mentioned; it enumerates all its articles, insists on the recognition of these canons, and at the same time prohibits the addition of others. This collection, together with the 22 canons of the council of Nicaea in 787, forms the official canon law of the Greek Church<sup>1</sup>.

For several centuries there is no mention in the West of any but local collections of canons, and even these are not found till the 5th century; we have to come down to the 8th or even the 9th century before we find any trace of unification. This process was uniformly the result of the passing on of the various collections from one region to another. The most remarkable, and the most homogeneous, as well as without doubt the most ancient of these local collections is that of the Church of Africa. It was formed, so to speak, automatically, owing to the plenary assemblies of the African episcopate held practically every year, at which it was customary first of all to read out the canons of the previous councils. The African collection has not come to us directly: we have two incomplete and confused arrangements of it, in two collections, that of the *Hispana* (*see below*) and that of Dionysius Exiguus. The latter reproduces more or less fully, almost all the synods of the collection; this was the celebrated

<sup>1</sup>For the further history of the law of the Greek Church and that of the Eastern Churches, *see* Vering, *Kirchenrecht*, §§ 14-183 (ed. 1893). The Russian Church, as we know, adopted the Greek ecclesiastical law.

*Concilium Africanum*, so often quoted in the middle ages, which was also recognized by the Greeks.

The Roman Church, even more than the rest, governed itself according to its own customs and traditions. Up to the end of the 5th century the only canonical document of non-Roman origin which it officially recognized was the group of canons of Nicaea, under which name were also included those of Sardica. The local law was founded on usage and on the papal letters called *decretals*. The latter were of two kinds: some were addressed to the bishops of the ecclesiastical province immediately subject to the pope; the others were issued in answer to questions submitted from various quarters; but in both cases the doctrine is the same. At the beginning of the 6th century the Roman Church adopted the collection drawn up at that time by the monk Dionysius, known by the name of Dionysius Exiguus (*q.v.*). At the desire of Stephen, bishop of Salona, he undertook the task of making a new translation, from the original Greek text, of the canons of the Greek collection. The manuscript which he used contained only the first fifty of the Apostolic Canons; these he translated, and they thus became part of the law of the West. This part of the work of Dionysius was not added to later; it was otherwise with the second part. This embodied the documents containing the local law, namely 39 decretals of the popes from Siricius (384-398) to Anastasius II. (496-498). As was natural this collection received successive additions as further decretals appeared. The collection formed by combining these two parts remained the only official code of the Roman Church until the labours undertaken in consequence of the reforming movement in the 11th century. In 774 Pope Adrian I. gave the twofold collection of the Scythian monk to the future emperor Charlemagne as the canonical book of the Roman Church; this is what is called the *Dionysio-Hadriana*. This was an important stage in the history of the centralization of canon law; the collection was officially received by the Frankish Church, imposed by the council of Aix-la-Chapelle of 802, and from that time on was recognized and quoted as the *liber canonum*. The *Dionysio-Hadriana* did not, when introduced into Gaul, take the place of any other generally received collection of canons. In this country the Church had not been centralized round a principal see which would have produced unity in canon law as in other things; even the political territorial divisions had been very unstable. The only canonical centre of much activity was the Church of Arles, which exercised considerable influence over the surrounding region in the 5th and 6th centuries. Evidently the impulse towards unity had to come from without; it began with the alliance between the Carolingians and the Papacy, and was accentuated by the recognition of the *liber canonum*.

In Spain the case, on the contrary, is that of a strong centralization round the see of Toledo. Thus we find Spanish canon law embodied in a collection which, though perhaps not official, was circulated and received everywhere; this was the Spanish collection, the *Hispana*<sup>1</sup>. The collection is well put together and includes almost all the important canonical documents. In the first part are contained the councils, arranged according to the regions in which they were held: Greek councils, following a translation of Italian origin, but known by the name of *Hispana*, African, Gallican and Spanish councils. Nearly all these were held at Toledo, beginning with the great council of 589. The series continued up to 694 and was only interrupted by the Muslim invasion. Finally, the second part of the *Hispana* contains the papal decretals, as in the collection of Dionysius. From the middle of the 9th century this collection was to become even more celebrated; for, as we know, it served as the basis for the famous collection of the False Decretals.

The churches of Great Britain and Ireland remained still longer outside the centralizing movement. Their contribution towards the later system of canon law consisted in two things: the Penitentials and the influence of the Irish collection, the other sources of local law not having been known to the predecessors of Gratian nor to Gratian himself. The Penitentials are collections

intended for the guidance of confessors in estimating the penances to be imposed for various sins, according to the discipline in force in the Anglo-Saxon countries. They are all of Anglo-Saxon or Irish origin, and although certain of them were compiled on the continent, under the influence of the island missionaries, it seems quite certain that a Roman Penitential has never existed<sup>1</sup>. They are, however, of difficult and uncertain ascription, since the collections have been largely amended and remodelled as practice required. Among the most important we may mention those bearing the names of Vinnianus (d. 589), Gildas (d. 583), Theodore of Canterbury (d. 690), the Venerable Bede (d. 735) and Egbert of York (732-767); the Penitentials which are ascribed to St. Columbanus, the founder of Luxeuil and Bobbio (d. 615), and Cumean (Cumine Ailbha, abbot of Iona); in the Frankish kingdom the most interesting work is the Penitential of Halitgar, bishop of Cambrai<sup>2</sup> from 817 to 831. As penances had for a long time been lightened, and the books used by confessors began to consist more and more of instructions in the style of the later moral theology (and this is already the case of the books of Halitgar and Rhabanus Maurus), the canonical collections began to include a greater or smaller number of the penitential canons. The Irish collection<sup>3</sup>, though it introduced no important documents into the law of the Western Church, at least set canonists the example of quoting passages from the Scriptures and the writings of the Fathers. This collection seems to date from the 8th century; besides the usual sources, the author has included several documents of local origin, beginning with the pretended synod of St. Patrick.

In the very middle of the 9th century a much enlarged edition of the *Hispana* began to be circulated in France. To this rich collection the author, who assumes the name of Isidore, the saintly bishop of Seville, added a good number of apocryphal documents already existing, as well as a series of letters ascribed to the popes of the earliest centuries, from Clement to Silvester and Damasus inclusive, thus filling up the gap before the decretal of Siricius, which is the first genuine one in the collection. The other papal letters only rarely show signs of alteration or falsification, and the text of the councils is entirely respected<sup>4</sup>. For a study of the historical questions connected with the famous False Decretals, see the article DECRETALS (FALSE); here we have only to consider them with reference to the place they occupy in the formation of ecclesiastical law. In spite of some hesitation, with regard rather to the official character than to the historical authenticity of the letters attributed to the popes of the earlier centuries, the False Decretals were accepted with confidence, together with the authentic texts which served as a passport for them. All later collections availed themselves indiscriminately of the contents of this vast collection, whether authentic or forged, without the least suspicion.

The False Decretals did not greatly modify nor corrupt the Canon Law, but they contributed much to accelerate its progress towards unity. For they were the last of the chronological collections, i.e., those which give the texts in the order in which they appeared. From this time on, canonists began to exercise their individual judgment in arranging their collections according to some systematic order, grouping their materials under divisions more or less happy, according to the object they had in view. This was the beginning of a codification of a common canon law, in which the sources drawn upon lose, as it were, their local character. This is made even more noticeable by the fact that, in a good number of the works extant, the author is not content merely to set forth and classify the texts; but he proceeds to

<sup>1</sup>This is proved by M. Paul Fournier, "Étude sur les Penitentiels," in the *Revue d'histoire et de littérature religieuses*, vol. vi. (1901), pp. 289-317, and vol. vii., 1902, pp. 59-70 and 121-127.

<sup>2</sup>In Migne, *P. L.* 105, col. 651.

<sup>3</sup>Edited by Wasserschleben (Giessen, 1874). See also P. Fournier, "De l'influence de la collection irlandaise sur la formation des collections canoniques," in *Nouvelle Revue historique de droit français et étranger*, vol. xiii. note 1.

<sup>4</sup>The collection of the False Decretals has been published with a long critical introduction by P. Hinschius, *Decretales Pseudo-Isidorianae et capitula Angilramni* (Leipzig, 1863). For the rest of the bibliography, see DECRETALS (FALSE).

<sup>1</sup>*Collectio canonum Ecclesiae Hispanae* (1808); reproduced in Migne, *P. L.* 84.

discuss the point, drawing conclusions and sometimes outlining some controversy on the subject, just as Gratian was to do more fully later on. During this period, which extended from the end of the 9th century to the middle of the 12th, we can enumerate about forty systematic collections, of varying value and circulation, which played a greater or lesser part in preparing the juridical renaissance of the 12th century, and most of which were utilized by Gratian.

**The Work of Gratian.**—The work of Gratian (*q.v.*), though prepared and made possible by those of his predecessors, greatly surpasses them in scientific value and in magnitude. It is certainly the work which had the greatest influence on the formation of canon law; it soon became the sole manual, both for teaching and for practice, and even after the publication of the decretals was the chief authority in the universities. Gratian is lacking in historical and critical faculty; his theories are often hesitating; but on the whole, his treatise is as complete and as perfect as it could be; so much so that no other work of the same kind has been compiled, just as there has never been made another Book of the Sentences. These two works, which were almost contemporary, were destined to have the same fate; they were the manuals, one for theology, the other for canon law, in use in all the universities, taught, glossed and commented on by the most illustrious masters. From this period dates the more marked and definitive division between theology and ecclesiastical law.

Gratian published, probably in 1148, his treatise called at first *Concordantia discordantium canonum*, but soon known under the name of the *Decretum*. Nowadays, and for some time past, the only part of the *Decretum* considered is the collection of texts; but it is actually a treatise, in which the author endeavours to piece together a coherent juridical system from the vast body of texts, of widely differing periods and origin, which are furnished by the collections. These texts he inserts bodily in the course of his dissertation; where they do not agree, he divides them into opposite groups and endeavours to reconcile them; but the really original part of his work is the *Dicta Gratiani*, inserted between the texts, which are still read. Gratian drew his materials from the existing collections, and especially from the richer of them; when necessary, he has recourse to the Roman laws, and he made an extensive use of the works of the Fathers and the ecclesiastical writers; he further made use of the canons of the recent councils, and the recently published decretals, up to and including the Lateran council of 1139. His immense work consists of three parts (*partes*). The first, treating of the sources of canon law and of ecclesiastical persons and offices, is divided according to the method of Paucapalea, Gratian's pupil, into 101 *distinctiones*, which are subdivided into *canones*. The second part consists of 36 *causae* (cases proposed for solution), subdivided into *quaestiones* (the several questions raised by the case), under each of which are arranged the various *canones* (canons, decretals, etc.) bearing on the question. The third part, which is entitled *De Consecratione*, gives, in five *distinctiones*, the law bearing on church ritual and the sacraments.

Considered from the point of view of official authority, the *Decretum* occupies an intermediate position very difficult to define. It is not and cannot be a really official code, in which every text has the force of a law. There was as yet no idea of demanding an official compilation. The *Decretum* has thus remained a work of private authority, and the texts embodied in it have only that legal value which they possess in themselves. On the other hand, it actually enjoys a public authority which is unique; for centuries it has been the text on which has been founded the instruction in canon law in all the universities; it has been glossed and commented on by the most illustrious canonists; it has become, without being a body of laws, the first part of the *Corpus iuris canonici*, and as such it has been cited, corrected and edited by the popes. It has thus, by usage, obtained an authority perfectly recognized and accepted by the Church<sup>1</sup>.

Gratian's collection, for the very reason that it had for its aim the creation of a systematic canon law, was a work of a transi-

tional character. Henceforth a significant differentiation began to appear; the collections of texts, the number of which continued to increase, were clearly separated from the commentaries in which the canonists continued the formation and interpretation of the law. Thus the way was prepared for official collections. The disciples of Gratian, in glossing or commenting on the *Decretum*, turned to the papal decretals, as they appeared, for information and the determination of doubtful points. Their idea, then, was to make collections of these points, to support their teaching; this is the origin of five large *Compilationes* which were afterwards embodied in the collection of Gregory IX. These compilations were intended by their authors to complete the *Decretum* of Gratian; in them were included the decretals called *extravagantes*, i.e., *quae vagabantur extra Decretum*. The most important is the *Breviarium extravagantium*, compiled about 1190 by Bernard of Pavia.

The result of these and numerous other supplements to Gratian's work, apart from the inconvenience caused by their being scattered, was the accumulation of a mass of material almost as considerable as the *Decretum* itself, from which they tended to split off and form an independent whole, embodying as they did the latest state of the law. From 1230 Gregory IX. wished to remedy this condition of affairs, and gave to his penitentiary, the Dominican Raymond of Pennaforte, the task of condensing the five compilations in use into a single collection, freed from useless and redundant documents. Raymond does not attempt any original work; to the texts already included in the *Quinque compilationes*, he adds only nine decretals of Innocent III. and 196 chapters of Gregory IX. This first official code was the basis of the second part of the *Corpus iuris canonici*.

Gregory IX. wished to supersede the *compilationes*, but he had no idea of superseding the *Decretum* of Gratian, still less of codifying the whole of the canon law. Though his collection is still in theory the chief monument of ecclesiastical law, it only marked a certain stage and was before long to receive further additions. The reason for this is that in most cases the decretals did not formulate any law, but were merely solutions of particular cases, given as models. Two important results, however, were achieved: on the one hand, supplementary collections on private authority ceased to be made, for this Gregory IX. had forbidden; on the other hand, the collections were no longer indefinitely swelled by the addition of new decisions in particular cases, those already existing being enough to form a basis for the codification of the abstract law; and for this reason subsequent collections contain as a rule only the "constitutions" of popes or councils, i.e., rules laid down as of general application. Two new official collections followed. The first was prepared by a committee of canonists under Boniface VIII., and published in 1298. As it came as an addition to the five books of Gregory IX., it was called the sixth book, the *Liber Sextus*. It includes the constitutions subsequent to 1234, and notably the decrees of the two oecumenical councils of Lyons; the last title, *de regulis iuris*, contains no less than eighty-eight legal axioms, mostly borrowed from Roman law. The next collection, the *Clementinae*, was prepared under the care of Clement V., and even promulgated by him in consistory in March 1314; but, in consequence of the death of the pope, which took place almost immediately after, the publication and dispatch of the collection to the universities was postponed till 1317, under John XXII. It includes the constitutions of Clement V., and above all, the decrees of the council of Vienne of 1311, and is divided, like preceding collections, into books and titles; it is cited in the same way, with the additional indication *Clem-(entina)*.

At this point the official collections stop. The two last, which have found a place in the editions of the *Corpus*, are collections of private authority, but ones in which all the documents are authentic. Evidently the strict prohibition of the publishing of collections not approved by the Holy See had been forgotten. The *Extravagantes* (i.e. *extra collectiones publicas*) of John XXII. number 20, and are classified under fourteen titles. The *Extravagantes communes* (i.e. coming from several popes) number 73, from Boniface VIII. to Sixtus IV. (1484), and are classified in books and titles. These two collections were included in the edition

<sup>1</sup>See Laurin, *Introductio in corpus juris canonici*, c. vii. p. 73.

of Jean Chappuis in 1500; they passed into the later editions, and are considered as forming part of the *Corpus iuris canonici*. As such, and without receiving any complementary authority, they have been corrected and re-edited, like the others, by the *Rectores romani*. They are cited, like the decretals, with a further indication of the collection to which they belong: *Extrav. Jo. XXII.*, or *inter-communes*.

Thus was closed, as the canonists say, the *Corpus iuris canonici*; but this expression, which is familiar to us nowadays, is only a bibliographical term. Though we find in the 15th century, for example, at the council of Basel the expression *corpus iuris*, obviously suggested by the *Corpus iuris civilis*, not even the official edition of Gregory XIII. has as its title the words *Corpus iuris canonici*, and we do not meet with this title till the Lyons edition of 1671.

Though the collections of canon law were to receive no more additions, the source of the laws was not dried up; decisions of councils and popes continued to appear; but there was no attempt made to collect them. Canonists obtained the recent texts as they could. Moreover, it was an epoch of trouble: the great Schism of the West, the profound divisions which were its result, the abuses which were to issue in the Reformation, were conditions little favourable for a reorganization of the ecclesiastical laws. Thus we are brought to the third period.

**After the Council of Trent.**—The numerous important decrees made by the council of Trent, in the second part of its sessions, called *de reformatione*, are the starting-point of the canon law in its latest stage, *jus novissimum*; it is this which is still in force in the Roman Church. It has in no way undermined the official status of the *Corpus iuris*; but it has completed the legislation of the latter in many important respects, and in some cases reformed it. During this period, the legislative power becomes strongly centralized in the hands of the pope: since the reforming decrees of the council of Trent it is the pontifical constitutions alone which have made the common law; the ecumenical council has not become obsolete but no such council was held until that of the Vatican (1870), and this latter was unable to occupy itself with matters of discipline. This centralization, in its turn, has greatly increased the tendency towards unity and uniformity, which have reached in the present practice of the Roman Church a degree never known before, and considered by some to be excessive.

If we now consider the laws in themselves, we shall find that the dispersed condition of the legislative documents has not been modified since the closure of the *Corpus iuris*; on the contrary, the enormous number of pontifical constitutions, and of decrees emanating from the Roman Congregations, has greatly aggravated the situation; moreover, the attempts which have been made to resume the interrupted process of codification have entirely failed. As regards the texts, the canon law of to-day is in a very similar position to that of English law, which gave rise to J. S. Mill's saying: "All ages of English history have given one another rendezvous in English law; their several products may be seen all together, not interfused, but heaped one upon another, as many different ages of the earth may be read in some perpendicular section of its surface<sup>1</sup>." Nothing has been abrogated, except in so far as this has been implicitly demanded by subsequent laws. From this result insoluble controversies and serious uncertainties, both in the study and practice of the law; and, finally, it has become impossible for most people to have a first-hand knowledge of the actual laws. For this third period, the most important and most considerable of the canonical texts is the body of disciplinary decrees of the council of Trent (1545-63). In consequence of the prohibition issued by Pius IV., they have not been published separately from the dogmatic texts and other acts, and have not been glossed<sup>2</sup>; but their official interpretation has been reserved by the popes to the "Congregation of the cardinal interpreters of

the Council of Trent," whose decisions form a vast collection of jurisprudence. Next in importance come the pontifical constitutions, which are collected together in the *Bullarium*; but this is a collection of private authority, if we except the *Bullarium* of Benedict XIV., officially published by him in 1747; further, the *Bullarium* is a compilation arranged in chronological order, and its dimensions make it rather unwieldy. In the third place come the decrees of the Roman Congregations, which have the force of law. Several of these organs of the papal authority have published official collections, in which more place is devoted to jurisprudence than to laws; several others have only private compilations, or even none at all, among others the most important, viz. the Holy Office (*see CURIA ROMANA*). The resulting confusion and uncertainty may be imagined.

**The Future Codification.**—Neither Clement VIII. nor, at a later date, Benedict XIV., could have dreamt of the radical reform at present in course of execution. Instead of accumulating the texts of the laws in successive collections, it is proposed entirely to recast the system of editing them. This codification in a series of short articles was suggested by the example of the French codes, the history of which during the 19th century is well known. From all quarters the Catholic episcopate had submitted to the Vatican council petitions in this sense.

"It is absolutely clear," said some French bishops, "and has for a long time past been universally acknowledged and asserted, that a revision and reform of the canon law is necessary and most urgent. As matters now stand, in consequence of the many and grave changes in human affairs and in society, many laws have become useless, others difficult or impossible to obey. With regard to a great number of canons, it is a matter of dispute whether they are still in force or are abrogated. Finally, in the course of so many centuries, the number of ecclesiastical laws has increased to such an extent, and these laws have accumulated in such immense collections, that in a certain sense we can well say: We are crushed beneath the laws, *obruimur legibus*. Hence arise infinite and inextricable difficulties which obstruct the study of canon law; an immense field for controversy and litigation; a thousand perplexities of conscience; and finally for the laws<sup>3</sup>."

We know how the Vatican council had to separate without approaching the question of canonical reform; but this general desire for a recasting of the ecclesiastical code was taken up again on the initiative of Rome. On March 19, 1904, Pius X. published a *Motu proprio, de ecclesiae legibus in unum redigendis*. After briefly reviewing the present condition of the canonical texts and collections, he pointed out their inconvenience, referred to the many requests from the episcopate, and decreed the preparation of a general code of canon law. This immense undertaking involved the codification of the entire canon law, its tabulation in a clear, short and precise form, and the introduction of any expedient modifications and reforms. For this purpose the pope appointed a commission of cardinals, of which he himself became president; also a commission of "consultors" resident at Rome, which asked for a certain amount of assistance from canonists at various universities and seminaries. As a result of these labours, a Codex of Canon Law was promulgated by Benedict XV. under the Bull *Providentissima Mater* in 1917.

The common law of the Roman Church cannot by itself uniformly regulate all the churches of the different nations; each of them has its own local law, which we must briefly mention here. In theory, this law has as its author the local ecclesiastical authorities, councils or bishops; but this is true only for laws and regulations which are in harmony with the common law, merely completing or defining it. But if it is a question of derogating from the common law, the authority of the Holy See must intervene to legalize these derogations. This intervention takes the form either of "indults," i.e. graceful concessions granted at the request of the episcopate, or of special approbation of conciliary resolutions.

**Canon Law in England and in the Anglican Communion.**—The historical position of the general canon law of the Catholic Church in the English provinces has, since the separation from Rome, been the subject of much consideration by English lawyers and ecclesiastics. The view taken by the king's courts

<sup>1</sup>Quoted by Hogan, *Clerical Studies*, p. 235.

<sup>2</sup>There are innumerable editions of the council of Trent. That which is favoured by canonists is Richter's edition (Leipzig, 1863), in which each chapter *de reformatione* is followed by a selection of decisions of the S.C. of the council.

<sup>3</sup>*Omnium concilii vaticani . . . documentorum collectio*, per Conradum Martin (Paderborn, 1873), p. 152.

and acquiesced in by the ecclesiastical courts, since Henry VIII. is that the Church of England was always an independent national church, subject indeed to the general principles of the *Ius commune ecclesiasticum* (Whitlock J. in *Ever v. Owen*, Godbolt's Reports, 432), but unbound by any particular constitutions of council or pope; unless those constitutions had been "received" here by English councils, or so recognized by English courts (secular or spiritual) as to become part of the ecclesiastical custom of the realm. The sources of English ecclesiastical law (purely ecclesiastical) were therefore (1) the principles of the *Ius commune ecclesiasticum*; (2) foreign particular constitutions received here, as just explained; (3) the constitutions and canons of English synods (see Phillimore, *Ecclesiastical Law*, part i. ch. iv., and authorities there cited).

An important departure in the grant of legislative autonomy to the Established Church was effected by the Church of England Assembly (Powers) Act of 1919 (often referred to as the "Enabling Act"), which was the result of the report of a special committee appointed by the archbishops of Canterbury and York, and of what was known as the "Life and Liberty Movement" in the Church of England. The act gives power to the newly constituted Church Assembly, consisting of bishops, clergy and laity (men and women), to pass measures "relating to any matter concerning the Church of England"; such measures to have the effect of an act of parliament after the passing of resolutions in both houses, and the granting of the royal assent (see ENGLAND, CHURCH OF).

The Church Assembly is free to discuss any proposal concerning the Church of England, and to make provision in respect of such matters, but where this includes parliamentary sanction for any alteration contemplated, this authority is to be sought in the manner prescribed by the Enabling Act. It is specially provided that any innovation touching doctrinal formulae, or the services or ceremonies of the Church, or the administration of the Sacraments or sacred rites thereof, must be debated and voted upon by each of the three houses sitting separately, and must then be either accepted or rejected by the Assembly in the terms in which it is finally proposed by the House of Bishops. It is further laid down that the Assembly or any of the three houses may debate and formulate its judgment by resolution upon any matter concerning the Church, or otherwise of religious or public interest, but the Assembly may not issue any statement purporting to define the doctrine of the Church on any question of theology. None of the powers belonging to the Convocations of Canterbury and York is to be diminished or derogated by the Assembly, which is also prohibited from exercising any power or performing any function distinctively belonging to the bishops by right of their episcopal office. The following measures have been passed by the Assembly, to the end of 1926 (the date of the royal assent is given in brackets):—

*Convocations of the Clergy*, 1920 (Dec. 23, 1920); *Parochial Church Councils (Powers)*, 1921 (July 1, 1921); *Ecclesiastical Commissioners*, 1921 (July 28, 1921); *Union of Benefices*, 1921 (Aug. 17, 1921); *Representation of the Laity (Amendment)*, 1922 (April 12, 1922); *Pluralities Act*, 1838 (*Amendment*), 1922; *Revised Tables of Lessons*, 1922 (Aug. 4, 1922); *Benefices Act*, 1898 (*Amendment*), 1923; *Bishopric of Blackburn*, 1923; *Diocese of Southwell (Division)*, 1923; *Ecclesiastical Dilapidations*, 1923; *Union of Benefices*, 1923 (July 14, 1924); *Diocese of Winchester (Division)*, 1923 (Aug. 1, 1924); *Interpretation*, 1925 (May 28, 1925); *Bishopric of Leicester*, 1925 (July 31, 1925); *Diocesan Boards of Finance*, 1925 (Dec. 22, 1925); *Rural Deaneries of Pontefract and Hemsworth*, 1926; *Bristolington Parishes (Transfer)*, 1926 (March 26, 1926); *Parish of Manchester Division Act*, 1850 (*Amendment*), 1926 (April 29, 1926); *First Fruits and Tenths*, 1926 (July 15, 1926); *Ecclesiastical Commissioners*, 1926 (July 15, 1926); *Clergy Pensions*, 1926 (August 4, 1926); *Episcopal Pensions*, 1926 (Dec. 15, 1926); *Benefices (Ecclesiastical Duties)*, 1926 (Dec. 15, 1926).

**Ireland.**—In the case of Ireland, the canon law of the Protestant Episcopal Church becomes important after 1869, when the Irish Church Act (32 and 33 Vict. c. 42) "disestablished" the Irish Church, and in sect. 19 repealed any act of parliament, law or custom whereby the bishops, clergy or laity of the said church were prohibited from holding synods or electing representatives thereto for the purpose of making rules for the well-being and

ordering of the said church. The Church of Ireland, so set free, created for herself new legislative authorities, unknown to the old canon law, viz., mixed synods of clergy and laity, and a system of representation by election, unknown to primitive or mediæval times. Under the provisions of this statute, the "archbishops and bishops of the ancient Apostolic and Catholic Church of Ireland," together with representatives of the clergy and laity, assembled in 1870, in "General Convention," to "provide for the regulation" of that church. This Convention declared that a General Synod of the archbishops and bishops, with representatives of the clergy and laity, should have chief legislative power in the Irish Church with such administrative power as might be necessary and consistent with the church's episcopal constitution. This General Synod was to consist of two houses—the House of Bishops and the House of Lay and Clerical Representatives. No question was to be carried unless there were in its favour a majority of the clerical and lay representatives, voting either conjointly or by orders, and also a majority of the bishops, should they desire to vote. This General Synod was given full power to alter or amend canons, or to repeal them, or to enact new ones. For any alteration or amendment of "articles, doctrines, rites or rubrics," a two-thirds majority of each order of the representative house was required and a year's delay for consultation of the diocesan synods. Provisions were made as to lay representation in the diocesan synods. The convention also enacted some canons and a statute in regard to ecclesiastical tribunals (see ECCLESIASTICAL JURISDICTION). It expressly provided that its own legislation might be repealed or amended by future general synods.

**Scotland.**—The post-Reformation history of canon law in the Anglican communion in Scotland has differed from the story of that law in the last four centuries in Ireland. After the legislation under William and Mary, disestablishing episcopacy in Scotland and subjecting its professors to civil penalties, little attention was given to canon law for many years. The canon law in Scotland before the 16th century was generally that of the continent of Europe. The usages of the church were similar to those in France, and had not the insular character of those in England and Ireland. The canon law regulating marriage, legitimacy and succession was taken over by the Scottish secular courts (see ECCLESIASTICAL JURISDICTION) and survived as part of the common law of the land almost unimpaired. Thus, the courts recognize marriages by *verba de praesenti* or by *verba de futuro cum copula*—in this last matter following a decree of Gregory IX.—and also legitimation *per subsequens matrimonium*. But though it is one of the *fontes iuris Scotiae*, canon law never was of itself authoritative in Scotland. In the canons of her national provincial councils (at whose yearly meetings representatives attended on behalf of the king) she possessed a canon law of her own, which was recognized by the parliament and the popes, and enforced in the courts of law. Much of it, no doubt, was borrowed from the *Corpus iuris canonici* and the English provincial canons. But the portions so adopted derived their authority from the Scottish Church. The general canon law, unless where it has been acknowledged by act of parliament, or a decision of the courts, or sanctioned by the canons of a provincial council, is only received in Scotland according to equity and expediency.

**The United States.**—The "Protestant Episcopal Church in the United States" is the successor of the Anglican communion in the American colonies before the Revolution. This communion was subject to "all the laws of the Church of England applicable to its situation" (Murray Hoffman, *A Treatise on the Law of the Protestant Episcopal Church*, New York, 1850, p. 17). This body of law the Protestant Episcopal Church of the United States took over (*op. cit.* p. 41 et seq.; F. Vinton, *A Manual Commentary on the General Canon Law and the Constitution of the Protestant Episcopal Church*, New York, 1870, p. 16 et seq.). Much, however, of the English post-Reformation canonical legislation was not applicable to the United States, owing to different circumstances. In 1789, a General Convention, consisting of clerical and lay deputies as well as of bishops, assumed for itself and provided for its successors supreme legislative power. The concurrence of both "orders," clerical and lay, was required for the validity of any

vote. Since 1853 a lay deputy to the convention has been required to be a communicant (*ib.* p. 102). Upon the American bishops numbering more than three, they became a separate "House" from the "Convention." The House of Bishops was given a right to propose measures to the "House of Deputies," and to negative acts of the House of Deputies, provided they complied with certain forms. Similar "constitutions" providing for representation of the laity have been adopted by the different dioceses (Hoffman, *op. cit.* p. 184 et seq.). A great body of legislation has been put forth by these bodies during the past century.

Since 1870, at least, the "Church of the Province of South Africa" has secured autonomy while yet remaining a part of the Anglican communion. By its constitution of that year the English Church in South Africa adopts the laws and usages of the Church of England, as far as they are applicable to an unestablished church, accepts the three creeds, the Thirty-Nine Articles, the Book of Common Prayer, the decisions of the undisputed general councils, the Authorized English Version of the Scriptures, and disclaims the right of altering any of these standards of faith and doctrine, except in agreement with such alterations as may be adopted by a general synod of the Anglican Communion. But in interpreting these standards of faith and doctrine, the Church of the Province of South Africa is not bound by decisions other than those of its own Church courts (*see* Wirgman, *The English Church and People in South Africa*).

**BIBLIOGRAPHY.**—The literature of the subject in all its branches is very elaborate. The articles "Law (Christian), Western," "Law (Christian), Eastern," by A. Fortescue, and "Law (Christian), Anglican," by A. J. Maclean, in Hastings, *Encyclopaedia of Religion and Ethics*, give concise statements of information with references for further study. For fuller accounts, *see* articles on Canon Law in Herzog-Hauck, *Realencyklopädie für Protestantische Theologie*; in the *Catholic Encyclopaedia*; and in Vacant-Mangenot, *Dictionnaire de Théologie Catholique*. Among the classical authorities, the following may be mentioned: P. and J. Ballerini, *De Antiquis Collectionibus Canonum* xxx.; in Migne, *Patrologia Latina*, vol. 56 (to Gratian); Schulte, *Geschichte der Quellen u. Literatur des canonischen Rechts von Gratian bis auf die Gegenwart* (1875). For information as to the sources *see*: Schneider, *Die Lehre von den Kirchenrechtsquellen* (1892); and the works mentioned above. (*See* also the article, ECCLESIASTICAL JURISDICTION.)

**CANONSBURG**, a borough of Washington county, Pennsylvania, U.S.A., 17m. S.W. of Pittsburgh; on Federal highway 19, and served by the Pennsylvania railroad. The population in 1920 was 10,632, and it was 12,558 in 1930. It is in a rich farming district, with coal-mines and gas-wells near by. The borough has important manufactures (steel, tin-plate, tin cans, pottery and novelties) with an output in 1925 valued at \$19,492,892.

**CANOPUS** or **CANOBUS**, ancient coast town of Lower Egypt, 15m. E. of Alexandria, was the principal port in Egypt for Greek trade before the foundation of Alexandria. The Canopic (westernmost) branch of the Nile, which entered the Mediterranean at the western end of the Bay of Aboukir, is entirely silted up, but on the shore about 2m. from Aboukir there are extensive traces of the city with its quays, etc. Excavation has disclosed granite monuments with the name of Rameses II., but they may have been brought at a late period for the adornment of the place. In the 9th year of Ptolemy Euergetes (239 B.C.) a great assembly of priests at Canopus passed an honorific decree, *inter alia*, conferring the title *Eὐεργέτης*, "Benefactor," on the king. Two examples of this decree are known, inscribed in hieroglyphic, demotic and Greek. A temple of Osiris was built by Euergetes, but very near to Canopus was an older shrine, a temple of Heracles mentioned by Herodotus as an asylum for fugitive slaves. The decree shows that Heracles here stands for Ammon. Osiris was worshipped at Canopus under a peculiar form, a vase with a human head, and was identified with Canopus, the pilot of Menelaus, who was said to have been buried here.

**CANOPUS**, the second brightest star in the sky, situated in the constellation Carina. It is in S. Dec. 53° and therefore invisible from latitudes above 37° N. It is an F type star of magnitude —0.9. No sensible parallax has been detected, and there is no indirect method of measuring its distance. It must certainly be one of the most luminous and massive stars, but much still remains to be learned about it.

**CANOPY**, a hood or cover, supported or suspended above an object; a tester. The canopy over an altar, when disconnected from the wall and supported on columns, is known as a baldachino (*q.v.*), one suspended from the ceiling or bracketed from the eastern wall is usually termed a tester. The word also designates any projecting hood, such as that over choir stalls or niches; also, the embroidered hangings, supported on poles, carried over the officiating priest in religious processions. By extension, the projecting arch or gable mouldings over doors or windows are sometimes known as canopies even when the projection is slight. During the Gothic period canopies received lavish decoration, usually by means of small architectural features such as buttresses, tracery, pinnacles, gables, etc., and the under side frequently took the form of a miniature vault. The canopies over thrones sometimes received rich architectural treatment such as that for the throne of Napoleon in the Luxembourg palace in Paris, where caryatides of great delicacy are used as supports. A canopy porch, usually small, is one whose primary purpose is to furnish a hood over a door. In modern usage the term is synonymous with awning.

**CANOSA DI PUGLIA**, a town of Apulia, Italy (anc. *Canusium*), in the province of Bari, on the right bank of the Ofanto (anc. *Aufidus*), 505ft. above sea-level, 15m. S.W. of Barletta by rail. Pop. (1921) 26,375. It was rebuilt by the Normans after its devastation by the Saracens in the 9th century. The former cathedral of S. Sabino (the bishopric passed in 1818 to Andria), in the southern Romanesque style, was consecrated in 1101: it has five low domes and eighteen ancient columns. The archiepiscopal throne and pulpit are also fine. Sabinus, the patron saint of Canosa and of Bari, was bishop of Canosa from 514 to 566, and erected a baptistery which is still in existence (carefully described by Nachod in *Römische Mitteilungen*, 1915, 116 seq.). On the south side of the cathedral is the detached mausoleum of Bohemund, son of Robert Guiscard, who died in 1111, constructed partly in Byzantine, partly in the local style. It has fine bronze doors with long inscriptions; the exterior is entirely faced with cipollino (Carystian) marble. A mediaeval castle crowns the hill on the side of which the city stands. (See CANUSTUM.)

**CANOSSA**, a ruined castle, 1,890ft. above sea-level, in Emilia, Italy, 12m. S.W. of Reggio Emilia, commanding a fine view of the Apennines. It belonged to the countess Matilda of Tuscany (d. 1115) and is famous as the scene of the penance performed by the emperor Henry IV. before Pope Gregory VII. in 1077. The castle was destroyed by the inhabitants of Reggio in 1255.

See E. N. Campanini, *Guida Storica di Canossa* (Reggio, 1915).

**CANOVA, ANTONIO** (1757–1822), marquis of Ischia, Italian sculptor, was born at Passagno, a little village near Treviso, on Nov. 1, 1757, of a family of stonemasons. He worked in his grandfather's shop until he was 12, when one of the Falieri family in Venice noted his talent and sent him to study under Bernardo (generally known as Torretto), and then under a nephew of Torretto's at Venice. According to tradition, the boy's genius was discovered through a lion he had modelled in butter. In Venice he occupied a monk's cell, which served as workshop, and worked at sculpture, languages and the study of antiquities. There he executed several groups, among them one of Daedalus and Icarus, and at 23 he went with a pension from the Venetian Senate, to Rome, where he found many patrons, among them Pope Clement XIV. He opened a studio in the Via del Babuino, and there spent two years on a monument to the Pope in the church of the Holy Apostles, completed in 1787. Then followed the cenotaph of Clement XIII. in St. Peter's, on which he was engaged for five years. In 1798 he visited Vienna and Berlin; in 1802 he went to Paris, to make studies for a statue of Napoleon, and he visited London in 1815. He received from the Pope the titles of marquis of Ischia, and "prefect of the fine arts." From time to time he returned to his native village in the hills, and there he was buried, in a temple designed by himself. He died in Venice on Oct. 13, 1822. The most distinguished funeral honours were paid to his remains, which were deposited in the temple at Passagno.

Among Canova's more celebrated works, in addition to those mentioned above, may be mentioned "Amor and Psyche" (Louvre, Paris); "Perseus with the head of Medusa" (Vatican); "Napoleon I." (Brera Palace, Milan); the cenotaph of Alfieri (Santa Croce, Florence); "Venus," modelled from the princess Pauline Borghese (Villa Borghese, Rome); "The Three Graces" (Hermitage Gallery, Leningrad); and others. Canova's work marks the reaction towards classicism from the school of Bernini; it was placed by his contemporaries on a footing with the great works of antiquity on which, in externals, it was modelled. His reputation since that date has declined. For a general appreciation of his work (see SCULPTURE).

**BIBLIOGRAPHY.**—See Quatremère de Quincy, *Canova et ses ouvrages* (1834); Anselmi, *Opere scelte di Antonio Canova* (Naples, 1842); A. G. Meyer, *Canova* (1898); and Angelo Borzelli, *La Relazione del Canova con Napoli . . . memorie con documenti inediti* (1901).

**CANOVAS DEL CASTILLO, ANTONIO** (1828–1897), Spanish statesman and author, was born at Malaga on Feb. 8, 1828. He studied law at the University of Madrid, earning his living meanwhile by literature and journalism. He entered the *cortes* in 1854, and held various offices in Liberal cabinets be-

tween 1860 and 1868. After the abdication of King Amadeus and the proclamation of the federal republic Canovas advocated the return of the Bourbons, and it was he who drew up the manifesto issued in 1874 by Alphonso XII., then a cadet at Sandhurst. But he opposed the method of the pronunciamiento. On the proclamation of Alphonso as king he formed a ministry, and held office, with two brief interruptions, for six years. He had to reconstruct a Conservative party out of the least reactionary parties of the days of Queen Isabella and out of the more moderate elements of the revolution. With such followers he made the constitution of 1876 and all the laws of the monarchy, putting a limited franchise in the place of universal suffrage, curtailing liberty of conscience, rights of association and of meeting, liberty of the press, checking democracy, obliging the military to abstain from politics, conciliating the Carlists and Catholics by his advances to the Vatican, the Church and the religious orders, adopting a protectionist tariff policy, and courting abroad the friendship of Germany and Austria after contributing to the marriage of his king to an Austrian princess. Canovas crowned his policy by countenancing the formation of a Liberal party under Sagasta, flanked by Marshal Serrano and other Liberal generals, which took office in 1881. Henceforth Sagasta and he alternated as prime ministers. He became prime minister for the fourth time in March 1895 immediately after the outbreak of the Cuban insurrection, and prepared to send 200,000 men to the West Indies to carry out his policy of no surrender, no concessions and no reforms. He was making up his mind for another effort to enable Gen. Weyler to enforce the reforms that had been wrung from the Madrid government, more by American diplomacy than from a sense of the inevitable, when the bullet of an anarchist, in Aug. 1897, at the baths of Santa Agueda, cut short his career. Canovas was the author of numerous historical and other works, among which may be mentioned: *Estudios literarios* (1868); *Historia del dominio austriaco en España* (1869); and *Estudios del reinado de Felipe IV.* (1888–90).

See Casado Sanchez de Castilla, *Canovas, apuntes biograficos* (1887).

**CANROBERT, FRANÇOIS CERTAIN** (1809–1895), marshal of France, was born at St. Céré, Lot, on June 27, 1809, and educated at St. Cyr. He received a commission as sub-lieutenant in 1828, and in 1835 went to Algeria, serving with distinction in various campaigns against the Arabs. In 1839 he was employed in organizing a battalion of the Foreign Legion for the Carlist Wars. In 1841 he was again serving in Africa, and later commanded the 3rd regiment, afterwards transferring to the Zouaves. For his campaigns against the Arabs and Kabyles he was promoted in 1849 to the rank of general of brigade and received the commandship of the Legion of Honour. Summoned to Paris in 1850 he was made aide-de-camp to Louis Napoleon, and took part in the *coup d'état* of Dec. 2, 1851. In the Crimean War he commanded a division at the Alma, where he was twice wounded. He held a dormant commission entitling him to command in case of St. Arnaud's death, and he thus succeeded to the chief command of the French army a few days after the battle. Disagreements with the English commander-in-chief and, in general, the disappointments due to the prolongation of the siege of Sevastopol led to his resignation of the command, but he did not return to France, preferring to serve as chief of his old division almost up to the fall of Sevastopol. After his return to France he was sent on diplomatic missions to Denmark and Sweden, and made a marshal and senator of France, receiving the grand cross Legion of Honour and honorary G.C.B. He commanded the III. Army Corps in Lombardy in 1859, distinguishing himself at Magenta and Solferino. In the Franco-German War he commanded the VI. Army Corps, which won the greatest distinction in the battle of Gravelotte, where Canrobert commanded on the St. Privat position. The VI. Corps was amongst those shut up in Metz and included in the surrender of that fortress. After the war Canrobert was appointed a member of the superior council of war, and was also active in political life, being elected senator for Lot in 1876 and for Charente in 1879 and again in 1885. He died in Paris on Jan. 28, 1895.

See L. Bapst, *Le Maréchal Canrobert* (1898–1904).

**CANT, ANDREW** (1590?–1663), a leader of the Scottish Covenanters. About 1623 the people of Edinburgh called him to be their minister, but he was rejected by James I. Ten years later he was minister of Pitsligo in Aberdeenshire, a charge which he left in 1638 for that of Newbattle in Mid-Lothian. In July of that year he went with other commissioners to Aberdeen in the vain attempt to induce the university and the presbytery of that city to subscribe to the National Covenant, and in the following November sat in the general assembly at Glasgow which abolished episcopacy in Scotland. In 1640 he was chaplain to the Scottish army and then settled as minister at Aberdeen. He resigned his charge in 1660. Though a staunch Covenanter, he was a zealous Royalist, and advocated the restoration of the monarchy in the time of the Commonwealth. His son Andrew was principal of Edinburgh university (1675–85).

**CANT.** (1) A term used in architecture where the corner of a square is cut off, octagonally or otherwise (possibly from Lat. *cantos*, corner). Thus a bay window, the sides of which are not parallel, or at right angles to the spectator, is canted. (2) A word appearing in English in the 16th century for the whining speech of beggars (Lat. *cantare*, to sing); hence it is applied to thieves' or gipsies' jargon, to the peculiar language of any class or sect, and particularly to the hypocritical use of pious phraseology.

**CANTABILE** (It.), a musical direction meaning "in a singing style" and employed in instrumental pieces to signify that the passage so marked is to be played in a song-like manner.

**CANTABRIAN MOUNTAINS**, a mountain chain which extends 300 m. across northern Spain, from the Pyrenees to the borders of Galicia, and near the coast of the Bay of Biscay. East of the pass of Leitariegos they are nearly parallel to the coast but to the west they trend southward between Leon and Galicia. Their western boundary is marked by the valley of the river Miño, by the lower Sil and by the Cabrera. Some geographers regard the mountains of Galicia beyond the Miño as a part of the same system; others confine the name to the eastern half of the highlands between Galicia and the Pyrenees, and call the western half the Asturian mountains. There are many local names for the subsidiary ranges within the chain. Intricate ramifications characterize the chain, but almost everywhere, especially in the east, it is possible to distinguish two principal ranges, from which the lesser ridges radiate. One series of ranges closely follows the coast; and short swift streams flow down it into the Bay of Biscay; the other series is loftier and there is a gradual descent to the high plateaux of Leon and Castile. Several large rivers, notably the Ebro, rise here and flow to the south or west. The breadth of the chain increases from about 60 m. in the east to about 115 m. in the west. Many peaks are above 6,000 ft. high, the highest, Peña Vieja (8,743 ft.), Prieta (8,304 ft.) and Espingüete (7,988 ft.), and an unnamed summit in the Peñas de Europa (8,045 ft.), all being in the central ridges, whilst farther west are the peaks of Manipodre (6,837 ft.), Ubiña (7,552 ft.), Rubia (6,331 ft.) and Cuiña (6,575 ft.). A conspicuous feature of the whole region is the number of its isolated plateaux (*parameras*). From the pass of Leitariegos the Sierra de Jistredo and Montañas de Leon curve towards the east and south-west whilst the Sierra de Picos, Sierra del Caurel and other ranges curve towards the west and south-east, and the two arms enclose El Vierzo, an old lake-basin now an alluvial plain drained by the upper Sil. The Cantabrians are rich in coal and iron; an account of their geological structure is given under Spain. They are crossed at many points by good roads and in their eastern and central parts by several railways.

**CANTABRI**, an ancient tribe which inhabited the north coast of Spain near Santander and Bilbao and the mountains behind—a district hence known as Cantabria. Savage and untamable mountaineers, they long defied the Roman arms and made themselves a name for wild freedom. (Cf. Horace, *Odes*, ii. 6, 2, *Cantabrum indoctum juga ferre nostra*.) They were first attacked by the Romans about 150 B.C. and were not subdued till Agrippa and Augustus had carried out a series of campaigns (29–19 B.C.) which ended in their partial annihilation. Thenceforward their land was part of the province Hispania Tarraconensis, with some measure of local self-government.

**CANTACUZINO** or **CANTACUZENE**, the name of a family which traces its origin to the Byzantine emperors and writers of the same name (see under JOHN V., Cantacuzene). The founder of the family, Andronik, migrated to Rumania in 1633, and from his two sons Constantine and Gheorge sprang the two principal lines which afterwards branched into numerous families of nobles and high dignitaries.

(1) **SHERBAN CANTACUZINO** (1640–1688), appointed hospodar of Walachia in 1679, served under the Turks in the siege of Vienna, and after their defeat is said to have planned a march on Constantinople to drive the Turks out of Europe. In the midst of his preparations he died suddenly, poisoned, it is said, by the boyars who were afraid of his vast plans. He introduced the maize plant into Rumania; maize is now one of the staple foods of the country. He founded the first Rumanian school in Bucharest; and under his auspices the famous Rumanian Bible appeared in Bucharest in 1688. Through his influence also the Rumanian was substituted for the Slavonic language in the liturgy. (2) **STEFAN CANTACUZINO**, son of Constantine, was prince of Walachia, 1714–1716. (3) **DEMETRIUS CANTACUZINO**, was prince of Moldavia, 1674–1676.

Descendants of Demetrius and Sherban emigrated to Russia, and held high positions there as governors of Bessarabia and in other responsible posts. (4) Of the Moldavian Cantacuzinos, **THEODORE** is well known as a chronicler of his times (c. 1749). (5) **GHEORGE CANTACUZINO** (b. 1837), son of **GREGORI** (1800–1849), was appointed in 1870 minister of public instruction in Rumania; in 1889, president of the chamber; in 1892, president of the senate; from 1899 he was head of the Conservative party, and from 1905 to 1907 prime minister (see also **RUMANIA: History**).

**CANTAGALLO**, an inland town of the State of Rio de Janeiro, Brazil, about 100 m. by rail N.E. of the port of Rio de Janeiro, with which it is connected by the Cantagallo Railway. The population of the municipality (1926) was 30,463, of whom less than one-fourth live in the town. Cantagallo is situated in the fertile Parahyba valley and is the commercial centre of a rich coffee-producing district. There are exhausted gold placer mines in its vicinity, but they were not rich enough to cause any considerable development in mining. Coffee production is the principal industry, but sugar-cane is grown to a limited extent, and some attention is given to the raising of cattle and swine. The district is an excellent fruit region.

**CANTAL**, a department of central France, formed from Haute-Auvergne, the southern portion of the old province of Auvergne. It is bounded north by the department of Puy-de-Dôme, east by Haute-Loire, south-east by Lozère, south by Aveyron and Lozère, and west by Corrèze and Lot. Area, 2,231 sq.m. Pop. (1926) 196,999. It extends eastwards into the heart of the Plateau Central and consists largely of crystalline schists, granites and recent volcanic rocks. The Monts du Cantal, a volcanic group, occupy its central region, and are continued towards the north and east by spurs of lower altitude. The Plomb du Cantal attains a height of 6,096 ft.; and its neighbours, the Puy Mary and the Puy Chavaroche, attain a height of 5,863 and 5,722 ft. respectively. Immediately to the east of this central mass lies the fertile plateau of Planèze, which merges into the Monts de la Margeride on the eastern border. The valley of the Truyère skirts the Planèze on the south and divides it from the Monts d'Aubrac, at the foot of which lies Chaudesaigues, noted for its thermal springs. Northwards the Monts du Cantal are connected with the Monts Dore by the volcanic range of Cézaillier and the plateaux of Artense. The central ridge notched by steep, narrow valleys, is the principal watershed. The chief rivers are the Alagnon, a tributary of the Allier; the Celé and Truyère, tributaries of the Lot; and the Cère and Rhue tributaries of the Dordogne.

The cold, damp climate of the plateaux restricts the cultivation of wheat, but rye and buckwheat are grown in considerable quantities. Cattle are reared, especially around Salers and in the Monts d'Aubrac, and butter and Roquefort cheese are made. Large flocks of sheep pasture in the Monts d'Aubrac, and else-

where in the department goats also are kept. The principal articles of food are rye, buckwheat and chestnuts. This poor fare has seriously affected the physique of the people and many migrate to Paris and other parts of France. The internal resources of the department are considerable; but the difficulty of land-transport prevents their being sufficiently developed. Game and fish are plentiful. Cantal produces aromatic and medicinal plants; and its mineral products include coal, antimony and lime. The department has no prominent manufactures. Live-stock, cheese, butter and coal are the principal exports; coal, wine, cereals, flour and earthenware are imported. The department is served by the Orléans and Southern railways.

It is divided into three arrondissements—Aurillac, Mauriac and St. Flour—23 cantons and 267 communes. It belongs to the region of the XIII. Army Corps and to the académie (educational division) of Clermont-Ferrand. Its bishopric is at St. Flour and depends on the archbishopric of Bourges. Its court of appeal is at Riom. The capital is Aurillac (*q.v.*).

**CANTALOUPE:** see MELON.

**CANTARINI, SIMONE** (1612–1648), called SIMONE DA PESARO, painter and etcher, was born at Oropezza near Pesaro in 1612. He was a disciple of Guido Reni and a fellow-student of Domenichino and Albano. His pictures, though masterly and spirited, are deficient in originality, and some of his works have been mistaken for examples of Guido Reni. Among his principal paintings are "St. Anthony," at Cagli; the "Magdalene," at Pesaro; the "Transfiguration," in the Brera gallery, Milan; the "Portrait of Guido," in the Bologna gallery; and "St. Romuald," in the Casa Paolucci. His most celebrated etching is "Jupiter, Neptune and Pluto honouring the arms of Cardinal Borghese." He died at Verona in 1648.

**CANTATA** (Italian for a song or story set to music), a vocal composition accompanied by instruments and generally containing more than one movement. In the 16th century, when all serious music was vocal, the term had no reason to exist, but with the rise of instrumental music in the 17th century cantatas began to exist under that name as soon as the instrumental art was definite enough to be embodied in sonatas. From the middle of the 17th till late in the 18th century a favourite form of Italian chamber music was the cantata for one or two solo voices, with accompaniment of harpsichord and perhaps a few other solo instruments. It consisted at first of a declamatory narrative or scene in recitative, held together by a primitive aria repeated at intervals. Fine examples may be found in the church music of Carissimi; and the English vocal solos of Purcell (such as "Mad Tom" and "Mad Bess") show the utmost that can be made of this archaic form. With the rise of the da capo aria the cantata became a group of two or three arias joined by recitative. Handel's numerous Italian duets and trios are examples on a rather large scale. His Latin motet *Silete Venti*, for soprano solo, shows the use of this form in church music.

The Italian solo cantata soon became indistinguishable from a scene in an opera. In the same way the church cantata, solo or choral, is indistinguishable from a small oratorio. This is equally evident in the 200 church cantatas of Bach or in the Chandos anthems of Handel. Many of Bach's larger cantatas are actually called oratorios; and the *Christmas Oratorio* is a collection of six church cantatas originally intended for performance on six different days, though together forming as complete an artistic whole as any classical oratorio.

Bach's church cantatas formed part of a church service, well-organized for a coherent musical scheme. Many of Bach's greatest cantatas begin with an elaborate chorus followed by a couple of arias and recitatives, and end with a plain chorale. Such a scheme is pointless in the concert-room, but it is magnificently appropriate to the Lutheran Church service. The text was based upon the gospel or lessons for the day; unless the cantata was short, the sermon probably took place after the first chorus or one of the arias, and the congregation joined in the finale chorale. Thus the unity of the service was the unity of the music; and, in the cases where all the movements of the cantata were founded on one and the same chorale tune, this unity has never been equalled,

except by those 16th century masses and motets which are founded upon the Gregorian tones of the festival for which they are written. In modern times the term cantata is applied almost exclusively to choral, as distinguished from solo vocal music. It is also used as equivalent to "secular oratorio."

It is possible to recognize as a distinct artistic type that kind of early 19th century cantata in which the chorus is the vehicle for music more lyric and song-like than the oratorio style, though at the same time not excluding the possibility of a brilliant climax in the shape of a light order of fugue. Beethoven's *Glorreiche Augenblick* is a brilliant "pot-boiler" in this style; Weber's *Jubel Cantata* is a typical specimen, and Mendelssohn's *Walpurgisnacht* is the *locus classicus*. Mendelssohn's "symphony cantata," the *Lobgesang* (Hymn of Praise), is a hybrid work, partly in the oratorio style. It is preceded by three symphonic movements, a device avowedly suggested by Beethoven's ninth symphony; but the analogy is not accurate, as Beethoven's work is a symphony of which the fourth movement is a choral finale of essentially single design, whereas Mendelssohn's "symphony cantata" is a cantata with a triple symphonic prelude.

The full lyric possibilities of a string of choral songs were realized at last by Brahms in his *Rinaldo*, set to a text which Goethe wrote at the same time as he wrote that of the *Walpurgisnacht*. The point of Brahms's only experiment in this genre has been missed by critics who expected so voluminous a work to be on more elaborate lines. But it represents a definite art form. The remaining types of cantata (beginning with Beethoven's *Meeresstille*, and including most of Brahms's and many notable English small choral works) are merely so many different ways of setting to choral music a poem which is just too long to be comprised in one movement. (D. F. T.)

**CANTEEN**, a small shop or store connected with a military or naval post, and sometimes with an industrial establishment, where eatables, drinkables, tobacco, etc., are sold. In the 18th and early part of the 19th centuries sutlers or hawkers, followed armies both in peace and war, selling their goods, usually drink and food, to the troops. In peace they had their stalls outside the barracks or billeting areas and were generally a nuisance. In order to cater properly for the troops, sutlers were permitted to establish their shops in barracks under regimental supervision. From these sutlers sprang the sutling-shop or canteen (French *Cantine*, Italian *Cantina*). These early canteens developed into small general stores, enabling the soldier to purchase sundry items in barracks. They are now also established in ships, factories, large offices, etc. The term "canteen" is also applied to the tin utensil carried as part of the soldier's equipment, in which he carries some food and in which he sometimes cooks it in camp or on the march. In a commercial sense the term is applied to a case of cutlery.

**Service Canteens.**—Ordinarily canteens are managed under regimental arrangements in the army and by a ship's committee in the navy, but in war-time the rapid growth of the services calls for some wider organization. During the South African War of 1899–1902 the troops were catered for in South Africa by the "Expeditionary Force Canteens," the success of which was largely due to the energy and interest of Lady Roberts, wife of the commander-in-chief. The profits from these canteens were devoted to the service man's welfare by the building of the Union Jack club, and Union Jack hostel, situated in the Waterloo road, near Waterloo station, London. In the World War, from 1915 onwards, the Expeditionary Force canteens became a vast organization, providing shopping facilities, rest and entertainment for all ranks right up to the front lines. The Navy and Army Canteen Board, meanwhile, made similar provision for the forces at home and at permanent stations abroad. In addition to the canteens (known as institutes) provided by the services in ships and barracks, many institutes ("Soldiers' homes") have been erected by the Y.M.C.A. and various Churches on war department land. The Church of England, the Wesleyan and Presbyterian Churches have erected homes (or institutes) in all the great naval ports and military garrisons and camps, both at home and abroad. In Great Britain, the canteen organization

was eventually taken over by the Navy, Army and Air Force Institution, which, from 1921, assumed control of nearly all the services canteens. With the American army during the World War, the canteen work was largely carried out by the Y.M.C.A. and by the U.S. Red Cross Society, already established in France, and to a certain extent by regimental institutions.

**Civilian Canteens.**—In Great Britain the need for providing canteens for industrial workers is widely recognized and under the Police, Factories (Miscellaneous Provisions) Act, 1916, the home secretary is empowered to require employers to provide canteens or messrooms where it appears that such are necessary for securing the welfare of the workers. Welfare pamphlet No. 2, issued in 1924, by the Stationery Office, London, gives advice on this subject. (T. J. E.)

**CANTEMIR**, the name of a celebrated family of Moldavia, origin which came from the Crimea in the 17th century and settled in Moldavia.

CONSTANTINE CANTEMIR became a prince of Moldavia, 1685-1693. He was succeeded on the throne by his son Antioch, who ruled twice, 1696-1700 and 1705-1707.

His youngest brother, DEMETRIUS or DEMETER CANTEMIR (b. October 26, 1673), was made prince of Moldavia in 1710; he ruled only one year, 1710-1711, when he joined Peter the Great in his campaign against the Turks and placed Moldavia under Russian suzerainty. Beaten by the Turks, Cantemir emigrated to Russia, where he and his family finally settled. He died at Kharkov in 1723. He was one of the greatest linguists of his time, speaking and writing eleven languages. The best known of his works is his *History of the Growth and Decay of the Ottoman Empire*. He also wrote a history of oriental music (no longer extant) the first critical history of Moldo-Wallachia; the first geographical, ethnographical and economic description of Moldavia, *Descriptio Moldaviae*, under the name of *Historia Hieroglyphica*, to which he furnished a key, and in which the principal persons are represented by animals; also the history of the two ruling houses of Brancovan and Cantacuzino; and a philosophical treatise on the old theme of the disputation between soul and body, written in Greek and Rumanian under the title *Divanul Lumii*.

His son, ANTIOCH CANTEMIR (1700-1774), became in 1731 Russian minister in Great Britain, and in 1736 minister plenipotentiary in Paris. He brought to London the Latin MS. whence the English translation of his father's history of the Turkish empire was made by N. Tindal (London, 1756), to which he added an exhaustive biography and bibliography of the author (pp. 455-460). He was a Russian poet and almost the first author of satires in modern Russian literature.

**BIBLIOGRAPHY.**—*Operele Principelui D. Cantemir*, ed. Academia Română (1872 foll.); A. Philippide, *Introducere în istoria limbii și literat. române* (Iasi, 1888), pp. 192-202; O. G. Lecca, *Familie boeresti romane* (Bukarest, 1898), pp. 144-148; M. Gaster, *Chrestom. româna*, i. 322, 359 (in Cyrillic).

**CANTERBURY, CHARLES MANNERS-SUTTON**, 1st VISCOUNT (1780-1845), speaker of the House of Commons, was the elder son of Charles Manners-Sutton (q.v.), afterwards archbishop of Canterbury, and was born on Jan. 29, 1780. Educated at Eton and Trinity college, Cambridge, he was returned (1806) to parliament in the Tory interest as member for Scarborough, and in 1809 became judge-advocate-general in the ministry of Spencer Perceval. In June 1817 he was elected speaker in succession to Charles Abbot, created Baron Colchester, refusing to exchange this office in 1827 for that of home secretary. In 1833 he was elected speaker for the seventh time. Some feeling had been shown against him on this occasion owing to his Tory proclivities, and the Whigs frequently complained that outside the House he was a decided partisan. When a new parliament met in Feb. 1835 a sharp contest ensued for the speakership, and Manners-Sutton was defeated by James Abercromby, afterwards Lord Dunfermline. In March 1835 he was raised to the peerage. He died in London on July 21, 1845.

**CANTERBURY**, a city and county borough, the metropolis of an archdiocese of the Church of England, and a municipal,

county and parliamentary borough of Kent, England, 62 m. E.S.E. of London by the S.R. Pop. (1931) 24,450. It lies on the river Stour, which here debouches from a beautiful narrow valley of the North Downs, the elevations of which command fine views of the city from the west and south, while the river presently enters upon the flat belt of land which separates the elevated Isle of Thanet from the rest of Kent. This belt represents the existence, in early historic times, of a sea-strait, and Fordwich, little more than 2 m. N.E. of Canterbury, was once accessible for shipping. Along the North Downs ran the prehistoric track which was to become the Pilgrims' Way, ending at the focus which marked the site of Canterbury. Hither came routes from the numerous ports clustering round the south-eastern angle of Great Britain, and here continental influences found a common expression. The various forms of artistic inspiration seen in the numerous ecclesiastical buildings are only one aspect of the rich culture produced by the intermingling of thoughts at this famous entry. In detail this ancient human site is seen to be related also to a ford over the river Stour where navigation received a check and where the east-west ridgeway along the open chalk had to face the crossing of a marshy valley. The Romans utilized the Canterbury ford, and the Romano-British *Durovernum* was a flourishing town on the road from the Kentish ports to London. The city, known by the Saxons as *Cantwaraburh*, the town of the men of Kent, became the metropolis of the kingdom of Aethelbert, the fourth Saxon king of Kent. It was here that Augustine and his fellow-missionaries came from Rome, and their settlement in the capital in 597 originated its position, maintained ever since, as the metropolis of the Church in England. Aethelbert, whose queen, Bertha, was already a Christian, gave the missionaries a church whose mythical founder was King Lucius. Augustine was a Benedictine and established the monastery of that order attached to the cathedral; this foundation was set upon a firm basis after the Norman Conquest by Archbishop Lanfranc, who placed its charge (as distinct from that of the diocese) in the hands of a prior. At the time of the Domesday survey Canterbury formed part of the royal demesne. In the 13th and 14th centuries, two bailiffs presided over the burghmote, assisted by a larger and smaller council. Henry II., by an undated charter, confirmed former privileges. In 1256 Henry III. granted the city to the citizens at an annual fee farm of £60, and the right of electing their bailiffs. Additional liberties were granted by later sovereigns, and Henry VI. incorporated Canterbury, which he called "one of our most ancient cities," under the style of the mayor and commonalty, the mayor to be elected by the burgesses. James I. confirmed these privileges, giving the burgesses the right to be called a body corporate and to elect twelve aldermen and a common council of twenty-four. Canterbury was first represented in parliament in 1283, and it returned two members until 1885, when the number was reduced to one. A fair was granted by Henry VI. to the citizens to be held in the city or suburbs on the 4th of August and the two days following; other fairs were in the hands of the monasteries; the corn and cattle markets and a general market have been held by prescription from time immemorial. Canterbury was a great centre of silk-weaving in the 17th century, large numbers of Walloons, driven by persecution to England, having settled there in the reign of Elizabeth. In 1676 Charles II. granted a charter of incorporation to the Walloon congregation under style of the master, warden and fellowship of weavers in the city of Canterbury. The market for the sale of corn and hops was regulated by a local act in 1801.

#### THE CATHEDRAL

**History of the Building.**—The old city surrounds the precincts of the cathedral. The Romano-British church of basilica form, occupied by St. Augustine, was largely rebuilt by Archbishop Odo, c. 950; after other hazards it was destroyed by fire in 1067. Archbishop Lanfranc, taking up his office in 1070, undertook the building of an entirely new church, but under Anselm (c. 1100) Prior Ernulf rebuilt the eastern part, and his successor Conrad carried on the work. A fire destroyed much of this part of the building in 1174, and from that year the architect, William of Sens, took up the work of rebuilding until 1178, when another

William, commonly distinguished as the Englishman, carried on the work and completed it in 1184. In 1376 Archbishop Sudbury entered upon the construction of a new nave, and Prior Chillenden continued this under Archbishop Courtenay. The building of the central tower was undertaken c. 1495 by Prior Goldstone.

**Exterior.**—This Perpendicular tower is the most notable feature of the exterior. It rises in two storeys to a height of 235 ft. from the ground, and is known variously as Bell Harry tower or as the Angel steeple from the gilded figure of an angel which formerly adorned the summit. The Perpendicular nave is flanked at the west front by towers, whose massive buttresses, rising in tiers, enhance by contrast the beautiful effect of the straight lines of Bell Harry tower. The south-western tower is an original Perpendicular structure by Prior Goldstone, while the north-western was copied from it in 1834–40, replacing a Norman tower which had carried a spire until 1705 and had become unsafe. The south-east transept exhibits Norman work; the projecting chapel east of this is known as Anselm's tower. It contains a Decorated window (1336), a style not common in the cathedral. The cathedral terminates eastward in a graceful apsidal form, with the final addition of the circular eastern chapel built by William the Englishman, and known as the Corona or Becket's Crown. St. Andrew's tower or chapel on the north side, corresponding to Anselm's on the south, is the work of Ernulf. From this point westward the various monastic buildings adjoin the cathedral on the north side.

**Interior.**—An unusual feature of the interior is its separation into two parts which represent the two main periods of building. In most English Cathedrals the choir is separated from the nave by a screen; at Canterbury the separation is further marked by a broad flight of steps leading up to the screen, the choir floor (but not its roof) being much higher than that of the nave. Chillenden, in rebuilding the nave, retained only the lower parts of some of the early Norman walls of Lanfranc and the piers of the central tower arches. These piers were encased or altered on Perpendicular lines. In the choir, the late 12th-century work of the two Williams, the notable features are its great length, the fine ornamentation and the use of arches both round and pointed, a remarkable illustration of the transition between the Norman and Early English styles; the prolific use of dark marble in the shafts and mouldings strongly contrasting with the prevailing light stone; and, finally, the graceful incurve of the main arcades and walls at the eastern end of the choir where it joins the chapel of the Trinity. From the altar eastward the floor of the church is raised again above that of the choir. The choir screen was built by Prior de Estria, c. 1300. There are several tombs of archbishops in the choir. The south-east transept serves as the chapel of the King's school and exhibits the work of William of Sens in alteration of that of Ernulf.

**Becket's Shrine. Pilgrimages.**—Behind the altar is Trinity Chapel, in the centre of which stood the celebrated shrine of St. Thomas of Canterbury. The priory owed its chief fame to the murder of Archbishop Becket (1170) in the church, his canonization as St. Thomas of Canterbury, and the pilgrimages of the Christian world to his shrine. Miracles were almost immediately said to be worked at his grave in the crypt and at the well in which his garments had been washed; and from the time when Henry II. did his penance for the murder in the church, and the battle of Alnwick was gained over the Scots a few days afterwards—it was supposed as a result—the fame of the martyr's power and the popularity of his worship became established in England. On the rebuilding of the cathedral after the fire in 1174, a magnificent shrine was erected for him in Trinity Chapel, which was built for the purpose, and became thronged for three centuries by pilgrims and worshippers of all classes. Henceforward the interests of the city became bound up in those of the cathedral, and were shown in the large number of hostels for the accommodation of pilgrims, and of shops; for trade has ever been associated with pilgrimages. The poet Chaucer, writing in the 14th century, gives an admirable picture of the pilgrimages, with the manners of a party of pilgrims, leisurely enjoying the journey and telling stories on the road. The English language preserved two words originating in these cus-

toms—"a canterbury," or a "canterbury tale," a phrase used for a fiction, and a "canter," short for a "canterbury gallop," an allusion to the easy pace at which these pilgrimages were performed. The shrine with its vast collected wealth was destroyed, and every reminiscence connected with it as far as possible effaced, by King Henry VIII.'s commissioners in 1538. But some of the beautiful old windows of stained glass, illustrating the miracles wrought in connection with the saint, are preserved.

Close to the site of the shrine is the fine tomb of Edward the Black Prince, with a remarkable portrait effigy, and above it his helmet and shield. In this chapel is the tomb of Henry IV. The Corona, at the extreme east of the church, contains the marble chair in which the archbishops are enthroned. Though called St. Augustine's, it dates probably from c. 1200. The western part of the crypt, beneath the choir, is the work of Ernulf, and perhaps incorporates some of Lanfranc's work. The chapel of St. John or St. Gabriel, beneath Anselm's tower, is still used for service, in which the French language is used; it was devoted to this purpose in 1561, on behalf of French Protestant refugees, who were also permitted to carry on their trade as weavers in the crypt. The eastern and loftier part of the crypt, with its apsidal termination, is the work of William the Englishman. Here for some time lay the body of Becket, and here the celebrated penance of Henry II. was performed.

**Monastic Buildings.**—The ornate Christchurch gateway, built by Prior Goldstone in 1517, gives entrance to the monastic buildings at the south-west. Their remains include the Norman ruins of the infirmary, the fine two-storeyed treasury and the lavatory tower, Norman in the lower part and Perpendicular in the upper. The cloisters, containing some rich Norman work, were very largely rebuilt by Prior Chillenden. The upper part of the chapter-house is also his work, but the lower is by Prior de Estria. The library is modern. The site of the New Hall of the monastery is covered by modern buildings of King's school, but the Norman entry-stair is preserved—a magnificent example of the style, with highly ornate arcading.

The principal dimensions of the cathedral are: length (outside) 522 ft., nave 178 ft., choir 180 ft. The nave is 71 ft. in breadth and 80 ft. in height.

**Province and Diocese.**—The archbishop of Canterbury is primate of all England; the ecclesiastical province of Canterbury covers England south of Cheshire and Yorkshire; and the diocese covers a great part of Kent with a small part of Sussex.

The following is a list of archbishops of Canterbury:

- |                                       |   |
|---------------------------------------|---|
| 1. Augustine, 597 to 605.             | 31. Eadsige, 1038 to 1050.                        |
| 2. Lawrence (Laurentius), 605 to 619. | 32. Robert of Jumièges, 1051 to 1052.             |
| 3. Mellitus, 619 to 624.              | 33. Stigand, 1052 to 1070.                        |
| 4. Justin, 624 to 627.                | 34. Lanfranc, 1070 to 1089.                       |
| 5. Honorius, 627 to 653.              | 35. Anselm, 1093 to 1109.                         |
| 6. Deusdedit (Frithona), 655 to 664.  | 36. Ralph de Turbine, 1114 to 1122.               |
| 7. Theodore, 668 to 690.              | 37. William de Corbeil (Curbellio), 1123 to 1136. |
| 8. Brethwald (Berhtwald), 693 to 731. | 38. Theobald, 1139 to 1161.                       |
| 9. Taetwine, 731 to 734.              | 39. Thomas Becket, 1162 to 1170.                  |
| 10. Nothelm, 734 to 740.              | 40. Richard, 1174 to 1184.                        |
| 11. Cuthbert, 740 to 758.             | 41. Baldwin, 1185 to 1190.                        |
| 12. Breogwine, 759 to 762.            | 42. Reginald Fitz-Jocelyn, 1191.                  |
| 13. Jaenbert, 763 to 790.             | 43. Hubert Walter, 1193 to 1205.                  |
| 14. Aethelhard, 790 to 803.           | 44. Stephen Langton, 1207 to 1228.                |
| 15. Wulfred, 803 to 829.              | 45. Richard Wethershed, 1229 to 1231.             |
| 16. Fleogild, 829 to 830.             | 46. Edmund Rich (de Abbendon), 1234 to 1240.      |
| 17. Ceolnoth, 830 to 870.             | 47. Boniface of Savoy, 1241 to 1270.              |
| 18. Aethelred, 870 to 889.            | 48. Robert Kilwardby, 1273 to 1278.               |
| 19. Plegemund, 889 to 914.            | 49. John Peckham, 1279 to 1292.                   |
| 20. Aethelm, 914 to 923.              | 50. Robert Winchelsea, 1293 to 1313.              |
| 21. Wulfelm, 923 to 942.              | 51. Walter Reynolds, 1313 to 1327.                |
| 22. Odo, 942 to 959.                  | 52. Simon de Meopham, 1328 to 1333.               |
| 23. Aelsine, 959.                     | 53. John Stratford, 1333 to 1348.                 |
| 24. Dunstan, 960 to 988.              |   |
| 25. Aethelgar, 988 to 989.            |   |
| 26. Sigeric, 990 to 994.              |   |
| 27. Aelfric, 995 to 1005.             |   |
| 28. Alphege (Aelfeah), 1005 to 1012.  |   |
| 29. Lyfing, 1013 to 1020.             |   |
| 30. Aethelnoth, 1020 to 1038.         |   |

54. John de Ufford, 1348 to 1349.
55. Thomas Bradwardin, 1349.
56. Simon Islip, 1349 to 1366.
57. Simon Langham, 1366 to 1368.
58. William Whittlesea, 1368 to 1374.
59. Simon Sudbury, 1375 to 1381.
60. William Courtenay, 1381 to 1396.
61. Thomas Arundel, 1396 to 1414.
62. Henry Chicheley, 1414 to 1443.
63. John Stafford, 1443 to 1452.
64. John Kemp, 1452 to 1454.
65. Thomas Bourchier, 1454 to 1486.
66. John Morton, 1486 to 1500.
67. Henry Dean (Dene), 1501 to 1503.
68. William Warham, 1503 to 1532.
69. Thomas Cranmer, 1533 to 1556.
70. Reginald Pole, 1556 to 1558.
71. Matthew Parker, 1559 to 1575.
72. Edmund Grindal, 1575 to 1583.
73. John Whitgift, 1583 to 1604.
74. Richard Bancroft, 1604 to 1610.
75. George Abbot, 1610 to 1633.
76. William Laud, 1633 to 1645.
77. William Juxon, 1660 to 1663.
78. Gilbert Sheldon, 1663 to 1677.
79. William Sancroft, 1678 to 1691.
80. John Tillotson, 1691 to 1694.
81. Thomas Tenison, 1694 to 1715.
82. William Wake, 1716 to 1737.
83. John Potter, 1737 to 1747.
84. Thomas Herring, 1747 to 1757.
85. Matthew Hutton, 1757 to 1758.
86. Thomas Secker, 1758 to 1768.
87. Frederick Cornwallis, 1768 to 1783.
88. John Moore, 1783 to 1805.
89. Charles Manners-Sutton, 1805 to 1828.
90. William Howley, 1828 to 1848.
91. John Bird Sumner, 1848 to 1862.
92. Charles Thomas Longley, 1862 to 1868.
93. Archibald Campbell Tait, 1868 to 1882.
94. Edward White Benson, 1882 to 1896.
95. Frederick Temple, 1896 to 1903.
96. Randall Thomas Davidson, 1903 to 1928.
97. Cosmo Gordon Lang, 1928.

The archbishop has a seat at Lambeth Palace, London. There are fragments in Palace Street of the old archbishop's palace which have been incorporated with a modern palace.

**Other Ecclesiastical Foundations.**—The most important religious foundation, apart from the cathedral, was the Benedictine abbey of St. Augustine, named after its founder in spite of his dedicating it to St. Peter and St. Paul. This was erected on a site granted by King Aethelbert outside his capital, in a tract called Longport. The site is now occupied by St. Augustine's Missionary College, founded in 1844. Some remnants are preserved, the principal being the entrance gateway (1300), with the cemetery gate and the guest hall, now the refectory. The scanty ruins of St. Pancras' chapel are of great interest, and embody Roman material. The chapel is said to have received its dedication from St. Augustine on account of the special association of St. Pancras with children, and in connection with the famous story of St. Gregory, whose attention was first attracted to Britain when he saw the fair-faced children of the Angles who had been brought to Rome, and termed them "not Angles but angels."

There were lesser houses of many religious orders in Canterbury, but only two, those of the Dominicans and the Franciscans, both in St. Peter's Street, have left notable remains. The Dominican refectory is used as a chapel. Among the many churches, St. Martin's, Longport, was the scene of the earliest work of Augustine in Canterbury, and had seen Christian service before his arrival. There are Norman, Early English and later portions; and the font may be in part pre-Norman, while there are traces of Roman masonry. St. Mildred's church exhibits Early English and Perpendicular work, and the use of Roman material is again visible here. St. Paul's is Early English; St. Dunstan's, St. Peter's and Holy Cross are mainly Decorated and Perpendicular. The village of Harbledown, on the hill west of Canterbury on the London road, has many associations with the ecclesiastical life of Canterbury, being mentioned by Chaucer in his pilgrimage under the name, appropriate to its site, of "Bob up and down." The almshouses, which occupy the site of Lanfranc's hospital for lepers, include an ancient hall and a chapel in which the west door and northern nave arcade are Norman. Among the numerous charitable institutions in Canterbury several are the descendants of mediæval ecclesiastical foundations.

**City Buildings, etc.**—The old city walls may be traced, and the public walk called the Dane John (derived probably from *danjon*) follows the summit of an artificial mound within the lines.

Only the massive turreted west gate, of the late 14th century, remains out of the former six city gates. The site of the castle is not far from the Dane John, and enough remains of the Norman keep to show its strength and great size. The guildhall, in High Street, is early 18th century. A modern statue of a muse commemorates the poet Christopher Marlowe (1564–1593) a native of the city. The King's school, adjacent to the cathedral, developed out of the early teaching furnished by the monastery. It was refounded in 1541 by Henry VIII., whence its name, and is still connected with the ecclesiastical foundation, the dean and chapter being its governors. Canterbury has considerable agriculture trade, tanneries and brickworks. The parliamentary borough returns one member. Area of county borough, 3,975 acres.

See A. P. Stanley, *Historical Memorials of Canterbury* (London, 1855); J. Brent, *Canterbury in the Olden Time* (Canterbury, 1879); J. W. Legg and W. H. St. J. Hope, *Inventories of Christchurch, Canterbury* (London, 1902); *Victoria County History, Kent*; G. R. Stirling Taylor, *The Story of Canterbury* (Mediaeval Town Series, 1912).

**CANTHARIDES**, or SPANISH FLIES, the common blister-beetles (*Cantharis vesicatoria*) of European pharmacy, are bright, iridescent, golden-green or bluish-coloured beetles (see COLEOPTERA), from half-an-inch to an inch in length, found in the south of Europe.

Cantharides owe their value to the presence of a chemical principle (*cantharidin*). Cantharidin constitutes from  $\frac{1}{2}$  to 1% of cantharides. It has the formula  $C_{10}H_{12}O_4$ , and on hydrolysis is converted into cantharinic acid,  $C_{10}H_{14}O_6$ . It crystallizes in colourless plates and is readily soluble in alcohol, ether, etc., but not in water.

The external action of cantharides or cantharidin is characteristic. When it is applied to the skin there are no obvious consequences for some hours, then the part becomes warm and painful. Soon afterwards there is an accumulation under the epidermis of a serum derived from the dilated blood-vessels. The numerous small blisters or vesicles thus derived coalesce, forming a large sac full of "blister-fluid."

Taken internally in any but minute doses the drug causes the most severe gastro-intestinal irritation, the vomited and evacuated matters containing blood, and the patient suffering agonizing pain and extreme depression. The further characteristic symptoms are displayed in the genito-urinary tract. The effect of large doses is to cause great pain in the renal region and urgent wish to micturate. The urine is nevertheless small in amount and contains albumen and blood owing to the local inflammation produced in the kidney by the passage of the poison through that organ. The drug often has a marked aphrodisiac action, producing priapism, or in the female sex the onset of the catamenia or abortion. Its criminal employment is usually intended to heighten sexual desire, and has frequently led to death.

A very large number of other insects belonging to the same family possess blistering properties owing to their containing cantharidin. Of these the most remarkable is the Telini "fly" of India (*Mylabris cichorii*), the range of which extends from Italy and Greece through Egypt and central Asia as far as China. It is very rich in cantharidin, yielding fully twice as much as ordinary cantharides. Several green beetles are, on account of their colour, used as adulterants to cantharides, but are easily detected by examination with the eye, or, when they have been powdered, under the microscope.

**CANTICLES.** This is another name (cf. the Vulgate *Canticum Canticorum*) for the Old Testament book called in the A.V. "The Song of Solomon," and in the R.V. "The Song of Songs." The latter title, taken from the opening words of the Hebrew, does not mean that the book is a collection of songs, but that it is the choicest of the songs which Solomon was traditionally supposed to have written (1 Ki. iv. 32). By modern scholars, however, this traditional authorship is rejected, on linguistic and other grounds, whilst many of them do regard it as a collection of love lyrics, more or less connected with the marriage customs of the Hebrews.

In the Hebrew Bible the book stands in the third and latest part, known as the *Writings*, and in the special group known as the *Megilloth*, or "Rolls," which are read in the synagogue on

certain days of commemoration. The Song of Songs is used on the first of these in the Jewish Year, namely Passover, and this use is dependent on the Jewish exegesis of the book, which makes it an allegory of the relation of Israel to Yahweh, with reference to the national history from the Exodus to the Messianic glory and final restoration. This interpretation is given in the *Targum* (the free Aramaic rendering of the Hebrew given in the synagogue when Hebrew was no longer understood). For this book the Targum is really a paraphrastic commentary; thus on i. 8 we read, "Let the congregation, which is compared with a beautiful girl, whom my soul loveth, walk in the ways of the righteous, and offer prayer according to the ordinance of her shepherds and the guides of her generations, and let her teach her sons, who are compared with kids of the goats, to go to the synagogue and schoolhouse." Except for some such spiritualizing interpretation, it would be impossible to explain the inclusion of a book of secular poetry in the sacred canon. The strong assertion of the holiness of the book by Rabbi Akiba in the 2nd century A.D. goes with other evidence to show that it was not so included without reluctance and opposition.

There is no reference to Canticles in the New Testament, but from at least the 3rd century the book claimed an important place in the thought and the language of the Christian Church. We may see this in the commentary of Origen in ten books (only part of which is extant) on the Septuagint translation of Canticles. He regards the book as historically a drama in which there are four speakers or speaking groups, viz., the bridegroom, the bride and the respective companions of both. In the higher (allegorical) meaning the bridegroom becomes Christ, with the angels, the prophets and patriarchs, the Church teachers, as His companions; the bride is either the Church or the soul of the individual believer, the latter view being more emphasized in the later work of Origen. The allegorical application to the Christian Church is represented in the chapter headings of our A.V., which, e.g., make the little sister without breasts of viii. 8 into the Gentiles. The individual use of the allegory has greatly influenced the language of devotion, not always to its advantage.

The return to a more literal and historical interpretation is found already in Theodore of Mopsuestia (392-428), who was anathematized in 553 for his view that the book was Solomon's defence of the Egyptian princess whom he married, against the dislike of his people for her dark colour (Song i. 5). It is not, however, until the 18th century (Herder, 1778) that we meet with the modern view of the book as a collection of independent love lyrics, whilst throughout the 19th century the prevalent view of scholars was that the book is a drama. According to this view, of which the most notable exponent was Ewald (1826), whilst it was accepted by Robertson Smith when writing for this Encyclopaedia in 1876, the heroine of the book is a peasant maiden in Solomon's harem, who longs for her shepherd lover, and utters her feelings to the ladies of the court, who lead her on to describe her lover, and to tell how she came to be carried off by Solomon. Finally her constancy secures her release, and the curtain falls on the sentiment of the triumph of true affection in viii. 6, 7.

The attractiveness of this theory, when worked out in detail, cannot be denied; but it may be asked whether the attraction does not lie in the appeal to modern taste of a story which is largely the product of modern imagination. It supposes a freedom of intercourse between lovers inconceivable for the East. The initial situation of the maiden in the harem of Solomon is left as a problem for the reader to discover, until he comes to its supposed origin in vi. 11; the expedient might be granted in the case of one of Browning's *Men and Women*, but seems very improbable in the present case. The more elaborate dramatic theories can find no parallel in Semitic literature to the "drama" of Canticles, the book of Job being no exception to this statement; whilst even the simpler theories ask us to believe that the essential parts of the story—the rape of the Shulamite, the change in Solomon's disposition, her release from the harem—are to be supplied by the reader from obscure and disputable references. More serious still is the fact that any progress of action from first

to last is so difficult to prove. In the first chapter we listen to a woman speaker desiring to be kissed by the man who has brought her into his chambers, and speaking of "our bed," in the last we leave her "leaning upon her beloved." The difficulties of detail are equally great. To suppose that all the male love-making, by hypothesis unsuccessful, belongs to Solomon, whilst the heroine addresses her passionate words to the continuously absent shepherd, is obviously unconvincing; yet, if this shepherd speaks in iv. 8-v. 1, how are we to explain his appearance in the royal harem? This and other difficulties were acknowledged by Robertson Smith, notably the presence of vii. 1-9, which he proposed to set aside as an interpolation, because of its sensuality and of the difficulty of working it into the dramatic scheme. The fact that this passage has subsequently become a central element in the new interpretation of the book is, perhaps, a warning against violent measures with difficulties.

Attention has already been drawn to Herder's proposal, accepted by some later writers, including Diestel and Reuss, to regard the book as a collection of detached songs. This received new and striking confirmation from the anthropological data supplied by J. G. Wetstein (1873), Prussian consul at Damascus. His observations of the wedding customs of Syrian peasants led him to believe that Canticles is substantially a collection of songs originally sung at such festivities. Wetstein's contribution was republished shortly afterwards by Delitzsch, in an appendix to his *Commentary*; but it received little attention. The first amongst Old Testament scholars to perceive its importance seems to have been Stade, who accepted Wetstein's view in a footnote to his *History of the Jewish People* (ii. p. 197) published in 1888; to Budde, however, belongs the distinction of the systematic and detailed use of Wetstein's suggestions, especially in his *Commentary* (1898). This interpretation of the book was accepted by Kautzsch (1896), Siegfried (1898), Cheyne (1899), and other eminent scholars, and is now generally adopted. The last-named stated the theory tersely as follows: "The book is an anthology of songs used at marriage festivals in or near Jerusalem, revised and loosely connected by an editor without regard to temporal sequence" (*Ency. Bibl.* 691). The character of the evidence which has contributed to the acceptance of this view may be indicated in Wetstein's own statements:—

"The finest time in the life of the Syrian peasant consists of the first seven days after his wedding, in which he and his young wife play the part of king (*melik*) and queen (*melika*), both being so treated and served by their village and the invited communities of the neighbourhood. The majority of the greater village weddings fall in the month of March, the finest of the Syrian year. . . . The winter rains being over, and the sun still refreshing, not oppressive as in the following months, the weddings are celebrated in the open air on the village threshing-floor, which at this time of the year is with few exceptions a flowery mead. . . . We pass over the wedding-day itself with its displays, the sword-dance of the bride, and the great feast. On the morrow, bridegroom and bride awake as king and queen. Already before sunrise they receive the leader of the bridesmen, as their vizier, and the bridesmen themselves; the latter thereupon fetch the threshing-board and bring it to the threshing-floor, singing a rousing song of battle or love, generally both. There it is erected as a throne, and after the royal couple have taken their seats and the necessary formalities are gone through, a great dance in honour of the young couple begins; the accompanying song is concerned only with themselves, its principal element being the inevitable *wasf*, i.e., a description of the physical perfections of both and their ornaments. The eulogy of the queen is more moderate and praises her visible, rather than veiled, charms; this is due to the fact that she is to-day a married woman, and that the *wasf* sung on the previous day during her sword-dance has left nothing to desire. This *wasf* is the weak element in Syrian wedding-songs according to our taste; its comparisons are to us frequently too clumsy and reveal the stereotyped pattern. It is the same with the little collection of charming wedding-songs and fragments of them which has been received into the canon of the Old Testament under the name of Canticles; the *wasf* (iv.-

vii.) is considerably below the rest in poetical value. With this dance begin the sports, lasting seven days, begun in the morning on the first, shortly before midday on the other days, and continuing far into the night by the light of the fires that are kindled; on the last day alone all is over by sunset. During the whole week both royalties are in marriage attire, must do no work and have no cares; they have only to look down from the *merteba* (throne) on the sports carried on before them, in which they themselves take but a moderate part; the queen, however, occasionally gives a short dance to attract attention to her bridal attire." (Wetstein, *Zeitschrift f. Ethn.*, 1873, pp. 270-302; quoted and condensed by Budde as above in *Comm.* p. xvii.; for a fuller reproduction of Wetstein in English see Harper, *The Song of Songs*, pp. 74-76.)

For the general application of these and the related customs to the interpretation of the book reference should be made to Budde's *Commentary*, which recognizes four *wasfs*, viz., iv. 1-7 (describing the bride from head to breasts), v. 10-16 (the bridegroom), vi. 4-7 (similar to and partly repeating iv. 1-7) and vii. 1-9, belonging to the sword-dance of the bride, her physical charms being sung from feet to head (*cf.* vi. 13; "Why look ye on the Shulamite as [on] a dance of camps?" *i.e.*, a war-dance). This dance receives its name from the fact that she dances it with a sword in her hand in the firelight on the evening of her wedding-day, and amid a circle of men and women, whilst such a *wasf* as this is sung by the leader of the choir. The passage relating to the litter of Solomon (iii. 6-11)—an old difficulty with the dramatizers—relates to the erection of the throne on the threshing-floor. The terms "Solomon" and "the Shulamite" are explained as figurative references to the famous king, and to Abishag the Shulamite, "fairest among women," on the lines of the use of "king" and "queen" noted above. Other songs of Canticles are referred by Budde to the seven days of festivities. It need hardly be said that difficulties still remain in the analysis of this book of wedding-songs; whilst Budde detects 23 songs, besides fragments, Siegfried divides the book into 10. Such differences are to be expected in the case of a collection of songs, some admittedly in dialogue form, all concerned with the common theme of the love of man and woman, and without any external indication of the transition from one song to the next.

Further, we must ask whether the task has been complicated by any editorial rearrangement or interpolation; the collector of these songs has certainly not reproduced them in the order of their use at Syrian weddings. Can we trace any principle, or even any dominant thought in this arrangement? In this connection we touch the reason why some scholars were slow to accept the above interpretation, viz., the alleged marks of literary unity which the book contains (*e.g.*, Driver, *Introduction*). These are (1) general similarity of treatment, seen in the use of imagery (the bride as a garden, iv. 12; vi. 2, 3), the frequent references to nature and to particular places, and the recurrence of descriptions of male and female beauty; (2) references to "Solomon" or "the king," to "the Shulamite" and to "the daughters of Jerusalem" (from which, indeed, the dramatic theory has found its chief inspiration); (3) indications that the same person is speaking in different places (*cf.* the two dreams of a woman, and the vineyard references, i. 6; viii. 12); (4) repetitions of words and phrases especially of the refrains, "disturb not love" (ii. 7; iii. 5; viii. 4), and "until the day break" (ii. 17; iv. 6). But of these (1) is no more than should be expected, since the songs all relate to the same subject, and spring from a common world of life and thought of the same group of people; (2) finds at least a partial parallel and explanation in the use of "king" and "queen" noted above; whilst (3) and (4) alone seem to require something more than the work of a mere collector of the songs. It is, of course, true that, in recurrent ceremonies, the same thought inevitably tends to find expression in the same words. But this hardly meets the case of the refrains, whilst the reference to the vineyard at the beginning and end does suggest some literary connection. It is to be noted that the three refrains "disturb not love" severally follow passages relating to the consummation of the sexual relation, whilst the two refrains "until the day break" appear to form an invitation and an answer in the same

connection, whilst the "Omnia vincit Amor" passage in the last chapter forms a natural climax (*cf.* Haupt's translation). So far, then, as this somewhat scanty evidence goes, it may point to some one hand which has given its semblance of unity to the book by underlining the joy of consummated love—to which the vineyard and garden figures throughout allude—and by so arranging the collection that the descriptions of this joy find their climax in viii. 6-7.

Whatever conclusion, however, may be reached as to the present arrangement of Canticles, the recognition of wedding-songs as forming its nucleus marks an important stage in the interpretation of the book; even Rothstein (1902), whilst attempting to resuscitate a dramatic theory, "recognizes . . . the possibility that older wedding-songs (as, for instance, the *wasfs*) are worked up in the Song of Songs" (Hastings' *D.B.* p. 594b).

Canticles thus describes, in a number of separate poems, not necessarily referring to marriage, the central passion of human life, and is wholly without didactic tendencies. Of its earliest history as a book we have no information. It is already included in the Hebrew canon (though its right to be there is disputed) when the first explicit mention of the book occurs. We have no evidence, therefore, of the theory of interpretation prevalent at the time of its incorporation with the other books of the canon. It seems, however, fair to infer that it would hardly have found acceptance but for a theory of Solomonic authorship and a "religious" theory of meaning. The problem raised by its present place in the canon occurs in relation to mistaken Jewish theories about other books also; it suggests, at least, that divine inspiration may belong to the life of a people rather than to the letter of their literature. Of that life Canticles portrays a central element—the passion of love—in striking imagery and graceful language, however far its oriental standard of taste differs from that of the modern West. In recent times, beginning with Erbt in 1906, and culminating in the elaborate study of W. Wittekindt (1926; *Das Hohe Lied und seine Beziehungen zum Istarkult*), an attempt has been made to interpret the book as a cycle of cult-songs connected with the Tammuz-Ishtar festival as celebrated in the temple of Jerusalem in the time of Manasseh. The Shulamite thus becomes a temple-prostitute, representing the goddess Ishtar, whilst the masculine figure is Tammuz or Adonis, with whom are mingled traits drawn from the Babylonian Marduk. The theory is ingeniously, and at some points plausibly, worked out by Wittekindt; but it is open to the same objection as the dramatic theory, in that too much has to be supplied from imagination, helped out by excessive emendation of the text. It seems, moreover, highly improbable that the ritual of a cult which justifiably aroused the passionate indignation of Israel's prophets should ever have been admitted into the sacred canon. The erotic interpretation of the imagery seems also to be carried to excess.

From the nature of the book, it is impossible to assign a precise date for its origin; the wedding-songs of which it chiefly consists must belong to the folklore of more than one century. The only evidence we possess as to date is drawn from the character of the Hebrew in which the book is written, which shows frequent points of contact with new Hebrew. On this ground, we may suppose the present form of the work to date from the Greek period, *i.e.*, after 332 B.C. This is the date accepted by most recent writers, *e.g.*, Kautzsch, Cheyne, Budde, Rothstein, Jacob Haupt, Buchanan Gray, Jordan, Sellin, Meinhold. This late date finds some confirmation in the fact that Canticles belongs to the third and latest part of the Old Testament canon, and that its canonicity was still in dispute at the end of the 1st century A.D.

BIBLIOGRAPHY.—Ginsburg, *The Song of Songs* (1857), gives much information as to the history of the exegesis of Canticles; Diestel's article, "Hohes Lied," in Schenkel's *Bibel Lexikon* (1871), reviews well the history of interpretation prior to Wetstein; *cf.* also Riedel, *Die Auslegung des Hohenliedes in der jüdischen Gemeinde und der griechischen Kirche* (1898). The most important commentary is that by Budde, in Marti's *Kurzer Hand-Commentar (Die fünf Megilloth)* (1898), where references to the literature of the 19th century are given. To his list add Siegfried, "Prediger und Hoheslied," in Nowack's *Handkommentar* (1898); Cheyne's article "Canticles," in the *Encyclopaedia Biblica* (1899); Dalman, *Palästinischer Diwan*

(1901), parallels to the songs; Rothstein's article, "Song of Songs," in Hastings' *Dictionary of the Bible* (1902); G. Jacob, *Das Hohelied auf Grund arabischer und anderer Parallelen von neuem untersucht* (1902); A. Harper, *The Song of Songs* (1902); Haupt, "The Book of Canticles," in *The American Journal of Semitic Languages* (July 1902), and his *Biblische Liebeslieder* (1907); Scholz, *Kommentar über das Hohelied und Psalm 45* (1904) (written from the Roman Catholic dogmatic standpoint of allegorical interpretation, with a vigorous criticism of other positions); G. C. Martin in the *Century Bible* (1908); D. R. Scott, *Pessimism and Love* (1915); W. G. Jordan, in *Peake's Commentary* (1919).

**CANTIGNY**, a small village in north-east France, west of Montdidier and 18m. south of Amiens, was the scene of the first United States offensive in the World War. After the great German advance in March 1918, the 1st Div. of the American Expeditionary Force, under Gen. Bullard, relieved two French divisions in the Picardy section of the Allied front. The German line ran west of Montdidier and formed a small salient, of which Cantigny was the nucleus, immediately facing the American front. It was decided to reduce the salient, and for this task the 28th Regt. with 150 men of the 1st Engineers were detailed, supported by French tanks. On May 28, at 6.45 A.M., after an hour's artillery preparation, the United States infantry advanced on a front of 2,200yd., and in 45min. they had overcome the German defences, capturing 250 prisoners. The Germans made fierce counter-attacks, extending over three days, but failed to retake the position. The total casualties sustained by the American forces in this operation were 45 officers and 1,022 men. (See ST. QUENTIN, BATTLE OF.)

**CANTILENA** (It.), a musical term signifying literally a small song; hence a passage, either in vocal or instrumental music, of a melodious and song-like character and, by further extension, the appropriate rendering of such passages.

**CANTILEVER**, a beam supported at one end and carrying a load at the free extremity, or distributed evenly all along the exposed portion. The upper half of the thickness of such a beam is subjected to tensile stress, tending to elongate the fibres; the lower half to compressive stress, tending to crush them. Cantilevers are employed extensively in building, steel constructional work, and machines. In the first specified any sort of wood or steel or masonry or concrete beam built into a wall and with free end projecting forms a cantilever; brackets of braced type are also used in small and large dimensions. The longer cantilevers have to be incorporated in a building when clear space is required below, the cantilevers carrying a gallery, roof, canopy, part of the building above or a runway for an overhead travelling crane.

FIG. 1.—LONG CANTILEVER OF THE TYPE USED IN SUSTAINING A PORTION OF A WORKSHOP, BUILT OVER A YARD

A good example of a cantilever sustaining a portion of a workshop out over a yard appears in fig. 1.

In bridge building a cantilever construction is employed for large spans, the classic type being that of the Forth bridge, having girders connecting up the ends of the huge cantilevers, fig. 2. The clear span between the piers is nearly one-third of a mile. Cantilever cranes are necessary when a considerable area has to be served, as in steel stockyards, and shipbuilding berths. In the lighter types a central travelling tower sustains the cantilever girders on either side: the big hammer-head cranes (made in capacities up to 300 tons) for fitting-out basins have a fixed tower and revolving pivot reaching down therein, to rotate the

cantilever in a circle. These cranes are outlined in fig. 2. Block-setting Titan cranes have a very large reach of the cantilever, besides being mounted on a travelling carriage, to move out to sea as the block-setting proceeds.

In motor-car construction a cantilever spring is much used for rear suspensions, affording a long and easy-riding effect. Such a

FIG. 2.—THE CANTILEVER IN BRIDGE BUILDING AND IN CRANES  
The upper drawing shows the cantilever Forth Bridge, Scotland, in which the span between the piers is nearly one-third of a mile. The cantilever principle is also applied to the large cranes used in steel stock-yards and ship-building berths

spring is anchored to the frame at the centre and at the forward end, the rear end being supported by the axle housing.

**CANTILUPE, THOMAS DE** (c. 1218–1282), English saint and prelate, was a son of William de Cantilupe, the 2nd baron (d. 1251), one of King John's ministers, and a nephew of Walter de Cantilupe, bishop of Worcester. He was educated at Paris and Orleans, afterwards becoming a teacher of canon law at Oxford and chancellor of the university in 1262. During the Barons' War Thomas favoured Simon de Montfort and the baronial party. He represented the barons before St. Louis of France at Amiens in 1264; he was made chancellor of England in February 1265, but was deprived of this office after Montfort's death at Evesham, and lived out of England for some time. Returning to England, he was again chancellor of Oxford university. In 1274 he attended the second Council of Lyons, and in 1275 he was appointed bishop of Hereford. Cantilupe was now a trusted adviser of Edward I., and attended the royal councils. The archbishop of Canterbury, Robert Kilwardby, was also his friend; but after Kilwardby's death in 1279 a series of disputes arose between the bishop and the new archbishop, John Peckham, and this was probably the cause which drove Cantilupe to visit Italy. He died at Orvieto, on August 25, 1282, and he was canonized in 1330. In 1905 the Cantilupe Society was founded to publish the episcopal registers of Hereford, of which Cantilupe's is the first in existence.

See the *Acta Sanctorum*, Boll., Oct. 1; and the *Register of Thomas de Cantilupe* with introduction by W. W. Capes (1906).

**CANTILUPE, WALTER DE** (d. 1265), bishop of Worcester, came of a family which had risen by devoted service to the crown. His father and his elder brother are named by Roger of Wendover among the "evil counsellors" of John, apparently for no better reason than that they were consistently loyal to an unpopular master. Walter took minor orders, and, in 1236, although not yet a deacon, received the see of Worcester. As bishop, he identified himself with the party of ecclesiastical reform, which was then led by Edmund Rich and Robert Grosseteste. At first a court favourite, the bishop came at length to the belief that the evils of the time arose from the alliance of crown and papacy. He raised his voice against papal demands for money, and after the death of Grosseteste (1253) was the chief spokesman of the nationalist clergy. At the parliament of Oxford (1258) he was elected by the popular party as a representative on the committee of 24 which undertook to reform the administration. In the war he sided with Montfort and, through his nephew Thomas, who was then chancellor of Oxford, brought over the university to the popular side. He was present at Lewes and blessed the Montfortians before they joined battle with the army of the king; he entertained Simon de Montfort on the night before the final rout of Evesham. During Simon's dictatorship, the

bishop appeared only as a mediating influence; in the triumvirate of "Electors" who controlled the administration, the clergy were represented by the bishop of Chichester. Walter de Cantilupe died in the year after Evesham (1266).

See the *Chronica Maiora* of Matthew Paris ("Rolls" series, ed. Luard); the *Chronicon de Bellis* (ed. Halliwell, Camden Society); and the *Annales Monastici* ("Rolls" series, ed. Luard); also T. F. Tout in the *Political History of England*, vol. iii. (1905).

**CANTO**, one of the divisions of a long poem, a term dating from the time when poetry was more usually sung by the minstrel to his own accompaniment than read (from Lat. *cantus*, a song). In music, *canto*, as a common Italian word, has many meanings, including music itself, song, singing (as in *bel canto*, beautiful singing), etc. More specifically it signifies the melody in a composition of many parts, usually given to the soprano nowadays, but in old music more frequently to the tenor. *Canto fermo* (or *cantus firmus*) is a melody of this kind which retains its shape unaltered throughout a contrapuntal work; such also in church music is the simple straightforward melody of the old chants as opposed to that of a more florid kind known as *canto figurato*.

**CANTON, JOHN** (1718–1772), English physicist, born at Stroud, Gloucestershire, on July 31, 1718, was a weaver's apprentice, and became a schoolmaster in Spital square, London. In 1749 he read a paper before the Royal Society on a method of making artificial magnets, which procured him election as a fellow of the society and the award of the Copley medal. He was the first in England to verify Benjamin Franklin's hypothesis of the phenomenon of lightning, and invented an electroscope and an electrometer. In 1762 and 1764 he published experiments in refutation of the decision of the Florentine academy, at that time generally accepted, that water is incompressible; and in 1768 he described the preparation, by calcining oyster-shell with sulphur, of the phosphorescent material known as Canton's phosphorus. He died in London on March 22, 1772.

**CANTON**, the great commercial metropolis of South China (23° 11' N., 113° 14' E.), is the regional capital and outlet of the Basin of the Sikiang or West River which is the focus of the life of South China, separated from the Yangtze Basin, the heart of Central China, by a broad highland zone across which there is as yet no through railway communication. The Sikiang is formed by the convergence of a large number of head-water streams rising in the Highlands of Kweichow and Yunnan and affording west-east navigation for nearly 1,000 miles. Although wide bottomlands occur in the valleys of the main river and its tributaries there is no focal basin in the middle or upper portions of the system at all comparable to the Central (Hupeh) or Red Basin in the Yangtze system. This gives enhanced significance to the rich deltaic tract of Canton. The city is not placed on the main stream of the Sikiang, which keeps near the southern limit of the terminal lowlands, but on a northern tributary—the Canton or Pearl River, diverging at Samshui. Below Canton this tributary forms a very complex delta intersected by canals. At Canton, the apex of this delta, the Pearl River is also joined by a branch or tributary of the Pei-kiang from the north, whose valley affords the easiest route through the Nan-ling by way of the Cheling Pass to the Siang tributary of the Yangtze and so to the Central Basin of Hankow. This has always been one of the two great routes linking south with central and north China and is the predestined course of the Peking-Hankow-Canton trunk railway, completed save for the mountain section from a point above Chuchow on the Siang to Shiuchow on the Pei-kiang. The alternative historic route to the north by the Mei-ling Pass and the Kan tributary of the Yangtze is also approached by the valley of the Pei-ho, diverging from the first at Shiuchow. Finally a little below Canton the Pearl River is joined by the Tung-kiang the chief outlet of the highland country of north-east Kwangtung, most of which is thus orientated to the Delta. The space-relations of Canton thus make it at once the outlet of the vast Basin of the Sikiang, the inevitable terminus of the two great routes from north to south and the focal centre of the greater part of Kwangtung Province. Moreover, lying at the head of the broadest deltaic channel, it has been at the limit of ocean navigation and

the meeting-point of river and sea trade, although with the increasing size of ocean-going vessels its port facilities are somewhat inadequate and Hong Kong is now in a sense its outport.

Owing to the relatively late advance of the Chinese to the South China sea the Canton delta was for long a kind of outpost in a barbarian region. It was incorporated in the Chinese Empire by the Chin Dynasty (249–206 B.C.), and from the time of the

VIEW ALONG THE PEARL RIVER AT CANTON

Han Dynasty (206 B.C.–A.D. 221) the city was known as Kwangchow, still the official name of Canton as capital of Kwangtung province, created by the Ming Dynasty (1368–1644). Owing to the great distance from the capital and the differences of social custom, speech and outlook Canton early and repeatedly exhibited a separatist tendency. It has been called "The Ulster of China" but a closer parallel is perhaps that of Catalonia in relation to Spain. The difference in its outlook from that of China as a whole is to be largely explained by the intimate contact with foreign traders established from a very early period. Canton has been identified with the port of the "Sinae" called Cattigara by the classical geographers and it was certainly very early drawn into the orbit of Indo-Malayan trade. After centuries of contact with Hindu, Parsee and later Arab merchants, who established a settlement near Canton, it was the first Chinese sea-port to be regularly visited by European traders, especially by the Portuguese who attempted to establish a monopoly which was strenuously resisted by the Spanish, Dutch and British. It was at this time the main outlet of the coveted Chinese products of tea, silk and rhubarb. In the 17th century the British made several abortive attempts to settle at Canton, but it was not until the Portuguese monopoly was broken that the East India Company secured a firm foothold in 1684. The French in 1725 and the Dutch in 1762 also established factories in Canton. From this period it became the pivot of the official Chinese policy towards foreign trade. This took the form of making Canton the sole port for foreign trade (Imperial decree of 1757) and of the establishment of the "Hong" system whereby the foreign traders, then mainly in the employ of the British East India Company, were confined to a special "factory" quarter and compelled to deal only with a small group of Chinese merchants who were directly responsible to the Imperial Government. The system led to increasing friction, especially when in the later eighteenth century the rapid rise in the imports of Indian opium began to alarm the Chinese authorities and by reversing the trade balance, hitherto favourable to China, to create a financial problem. The special Trade Missions sent out from Great Britain under Lord Macartney (1793) and Lord Amherst (1816) both

started on their fruitless journeys to Peking from Canton, which after the lapse of the East India Company's charter in 1834 became the headquarters of the official British "Superintendent of Trade in China." Under this new régime the friction with the Chinese authorities quickly came to a head and resulted in the so-called "Opium War" between Great Britain and China (1841-42). The Treaty of Nanking (1842) which closed the war destroyed the "Hong" régime and substituted the Treaty Port system (for this and a discussion of the events leading up to the "Opium War" see CHINA). It also gave Great Britain possession of the island of Hong-Kong destined to be transformed into her greatest commercial base in the Far East and distant only 80 m. from Canton. Canton itself was one of the first five treaty-ports established by the treaty and was declared open to foreign trade. But conditions remained unsatisfactory and it was friction in Canton which led to the second war between Great Britain and China known as the "Arrow War" of 1856. The city was then occupied by British and French troops. After its evacuation in 1861 foreign business houses and consulates were concentrated in a new concession area, a reclaimed sandbank in the Pearl River known as the "Shameen," divided from the city front by a narrow channel and well situated for purposes of trade.

The commercial importance of Canton in the modern period has naturally been affected by the steady rise of Hong-Kong as a deep-water port. Modern ocean vessels cannot reach further than Whampoa on the south-east branch of the Pearl River, 12 m. below Canton. Foreign goods for Canton are usually transhipped at Hong-Kong and sent up the river in small shallow-draft vessels. In 1922 Hong-Kong supplied no less than 94% of the imports and took 99.5% of the exports of Canton's foreign trade. Hong-Kong also deals directly with treaty ports higher up the river, notably with Wuchow. But Canton is the chief link in Hong-Kong's, and therefore Britain's, trade with South China, and serves as the main collecting and distributing centre for all the foreign trade of the interior not in immediate connection with Hong-Kong, especially that of non-treaty ports inaccessible to Hong-Kong in its official status of a "foreign country." The trade of the two ports is in this sense complementary but were Whampoa to be developed successfully as the outpost of Canton the situation would be materially altered.

Canton is becoming an important railway centre. Apart from the completed section of the Canton-Hankow main line (Canton-Shiuchow: 140 miles), there is an important railway between Canton and Kowloon, opposite Hong-Kong, of which 89½ m. are Chinese and 22½ m. British, and a local line to Samshui (32 miles). Further lines are contemplated to Macao and Amoy. The completion of the Canton-Hankow railway will greatly increase Canton's trade with the Yangtze valley and compete with the coastal traffic.

The Canton delta is devoted to the production of rice and silk. Rice production is however insufficient to feed the vast population and quantities up to six million piculs are imported annually from the Wuhu basin along the Yangtze and from Siam and French Indo-China. The two most important silk-producing regions of China are the Yangtze and Canton deltas and in the amount though not in the quality of production the Canton delta is the greater. Silk is exported in the form of raw silk, which has simply passed through the filatures, rather than of silk yarn or of silk piece-goods. Apart from electricity plants, steam filatures are the chief expression of western industrialism in the Canton delta and these only treat the silk preparatory to spinning. Steam filatures are more important just to the south of Canton than in Canton itself. For industrial requirements Canton, like Shanghai, is dependent on coal coming by sea from the Kaiping coalfield in north China and from the Kyushu fields in south Japan. Coal resources do exist in the hinterland of Canton; in Kwangsi and around Shiuchow on the upper Pei-kiang, but they are as yet undeveloped save for local consumption. It is often held that further industrial development in the Canton delta will have to await the utilization of these upstream coal resources.

In common with the other south China ports (see AMOY) and reflecting its southward aspect, Canton has long been a centre of

overseas China emigration which sets especially towards the less densely populated lands of Indo-China and Malaya.

The total trade of Canton coming under the cognizance of the Imperial Maritime Customs amounted in 1925 to Hk. Tls. 201,720,711, ranking her fifth among Chinese ports, after Shanghai, Dairen, Hankow and Tientsin.

During the last 20 years Canton has played a conspicuous and constructive part in keeping with its traditions and illustrating the Chinese saying that "Everything new originates in Canton." Always restive under the Imperial régime and a source of anxiety to the great emperors of the early Manchu Dynasty, Canton became the centre of the active revolutionary propaganda which produced the downfall of the dynasty in 1911. The principal parts were played by Cantonese, many of them, notably Dr. Sun Yat Sen, trained in the United States, with which Canton has long had intimate contact. In the subsequent Civil Wars Canton became the centre of opposition to the Northern Militarists and the seat of the southern Government in opposition to that of Peking. It produced the *Kuomintang* or People's Party which, under Dr. Sun's leadership, developed an ambitious programme of reconstruction and became the rallying point of the nationalist cause. After many vicissitudes, it was from Canton that the nationalist armies, professing these principles, advanced northwards by the historic Cheling Pass route, already described, to the conquest of Hankow and the lower Yangtze in 1926-27. The present Nanking Government is the direct outcome of the movements focussed in Canton and is based on the principles defined by Dr. Sun Yat Sen.

Canton has also been deeply involved both in the disturbances arising out of intense Communist propaganda, which at times have threatened to break up the *Kuomintang*, and in the struggle against the treaty rights possessed by foreign powers. It took the lead in the organization of strong labour unions of a western type. Chiefly through their agency was organized in 1923 a remarkable boycott against Hong-Kong, by which the trade of this sea-port was almost paralyzed for months.

Especially in the development of municipal government has Canton been conspicuously active. The local administration consists of the mayor and a council appointed by the provincial government to represent various classes: merchants, scholars, the professions and labourers. It is generally admitted that, notwithstanding the political disturbances, real progress towards an efficient local government has been made. The outward appearance of the city has been largely transformed. Broad boulevards occupy the sites of the old city walls, destroyed in 1921, thousands of ancestral graves outside have been transferred to distant hills, and new suburbs, connected with the city by trackless trolley lines, have taken their place. Wide streets have been driven through congested areas, public parks created, and a new Bund, similar in character to that of Shanghai or Hankow, has come into existence on the water front. The programme includes a new system of docks, bridges over the Pearl River, deepening of water-channels and, not least, active development of Whampoa as an outpost with a dredged channel to the sea.

Canton claims to be the most progressive city in China. The extent to which in the future it will identify itself with the interests of the country as a whole may turn to a considerable extent on the linguistic question. Canton is the centre of the most important of the non-mandarin language zones of south-east China and the Cantonese "dialect" is spoken by some 15 to 20 millions of people, but it is significant that at the National Educational Conference of 1921 the Cantonese delegates, in common with those from the other coastal provinces, gave their adhesion to the principle that Mandarin should be taught in all primary schools and recognized as the *lingua franca* of China. The population of Canton is estimated at about 900,000.

(P. M. R.)

**CANTON**, a city of Fulton county, Illinois, U.S.A., near the Illinois river, about 150 m. N. of St. Louis. It is served by the Burlington and the Toledo, Peoria and Western railways. The population was 10,928 in 1920, and was 11,718 in 1930 by the Federal census. It is the trade centre of a rich agricultural and coal-mining district. The county mines over 2,000,000 tons of coal in a

normal year. Ploughs have been made here since 1842, when William Parlin began using steel for their construction. The industry he founded is now a plant of the International Harvester Company, employing 1,500 men. Other manufactures include pit-cars, spark-plugs, clothing, cigars, millwork, brick and tile. The aggregate factory output in 1925 was valued at \$4,352,725. Canton was laid out in 1825, and was chartered as a city in 1854. Its name was suggested by that of Peking, a city 20m. east.

**CANTON**, a town of Norfolk county, Massachusetts, U.S.A., 14m. S. of Boston, on the New York, New Haven and Hartford railroad. The population in 1930 Federal census was 5,816. It has numerous and varied manufactures, including textiles, patent leather, fish-lines and fire-alarm systems. Canton has been a manufacturing town since colonial days. It was the site of Paul Revere's brass and bell foundry. In the shade of Blue hill, John Eliot began his missionary work among the Indians. The town was separated from Stoughton and incorporated in 1797.

**CANTON**, a village of northern New York, U.S.A., on the Grasse river, 17m. S.E. of Ogdensburg; the county seat of St. Lawrence county. It is on Federal highway 11, and is served by the New York Central railway. The population in 1930 was 2,822 Federal census. The village is in a prosperous dairy-farming region. It has a condensed-milk plant and several other manufacturing industries. For many years it was famous for its canoes, which went to all parts of the world. It is the seat of St. Lawrence university (chartered 1856), which includes a State school of agriculture (established 1906), the Brooklyn law school and the Clinton Liberal Institute (founded at Clinton in 1832). There is a U.S. weather bureau station at the university. The first settler, Daniel Harrington from Connecticut, came in 1800. The village was incorporated in 1845. From 1804 to 1807 it was called New Cairo. It was the home of Silas Wright, Frederic Remington, Irving Bacheller and A. B. Hepburn.

**CANTON**, a city of north-eastern Ohio, U.S.A., 60m. S. by E. of Cleveland, at an altitude of 1,065ft.; the county seat of Stark county. It is on the Lincoln highway, and is served by the Baltimore and Ohio, the Pennsylvania and the Wheeling and Lake Erie railways, and the electric lines of the Northern Ohio Power and Light Company. The area is 12.6 square miles. The population in 1920 was 87,091 (81.6% native white), and was, 1930, 104,906 Federal census. Canton is a rapidly growing, important manufacturing centre, surrounded by rich farm lands and deposits of clay, shale and coal. It has over 300 factories, making 1,500 diversified products. Steel is manufactured from ore to billet and bar, and is the basic material for the majority of the other products, such as safes, vaults, bridges, structural steel, steel "lumber" and furniture, bank grilles, elevator enclosures, roller bearings, ornamental street-lighting standards, and so on. Brick and tile, in many varieties, china and stone ware, constitute a second large group of industries, dating back to 1840. Rubber gloves, rubber tyres, paints, varnishes, enamels, toys and watches are other important products. The output of the factories in and near the city in 1926 was valued at \$370,000,000. Incoming freight amounted to 3,284,428 tons; outbound, to 1,498,365. The assessed valuation of property was \$225,203,220; and bank debits to individual accounts were \$570,138,285.

From 1867 Canton was the home of President McKinley. His dwelling, the scene of the "front-porch campaign," is now used as a hospital annex. He is buried in a beautiful granite memorial, erected by the nation, in a park of 26ac. on Monument hill. Canton was laid out in 1805, became the county seat in 1808, and was chartered as a city in 1854. Its great industrial development has taken place in the 20th century. In 1850 the population was 2,603; in 1880, 12,258; in 1900, 30,667. Between 1900 and 1910 it increased 63.7%; between 1910 and 1920, 73.4%.

**CANTON**, a word used for certain divisions of some European countries. In France, the canton, which is a subdivision of the *arrondissement*, is a territorial, rather than an administrative, unit. The cantons were created by the law Dec. 22, 1789, but their administrative character was taken away by the Consular constitution of the year VIII. There are 2,908, each comprising on an average, about 12 communes. The canton, the seat of a

justice of the peace returns a member to the *conseil d'arrondissement* (see FRANCE). In Switzerland, canton is the name given to each of the 22 States comprising the Swiss confederation (see SWITZERLAND).

In heraldry, a "canton" is a corner or square division on a shield, occupying the upper corner (usually the dexter). It is in area two-thirds of the quarter (see HERALDRY).

**CANTONMENT**. When troops are distributed in small parties amongst the houses of a town or village, they are said to be in cantonments, which are also called quarters or billets. Formerly, when in the field, armies lived as a rule in camp (*q.v.*) or, when the provision of canvas shelter was impossible, in bivouac. With the growth of national armies, however, it became unusual, in Europe at any rate, for troops on active service to hamper themselves with a great quantity of tentage. Hence cantonments or bivouacs, or a combination of the two, took the place of the old long rectilinear lines of tents that marked the resting-place and generally, too, the order of battle of an 18th century army. The difficulty of controlling the troop when scattered in private houses in parties of six or seven, is the principal objection to this system of cantonment. But since Napoleon introduced the "war of masses," the only alternative to cantoning the troops is bivouacking, which if prolonged for several nights is more injurious to the well-being of the troops than the slight relaxation of discipline necessitated by the cantonment system, when the latter is well arranged and policed. The troops nearest the enemy, however, which have to be maintained in a state of constant readiness for battle, cannot as a rule afford the time either for dispersing into quarters or for rallying on an alarm, and they are usually required to bivouac. In the World War, the prolonged siege warfare, with its system of frequent reliefs, and the vast number of troops always in rest areas, both facilitated and necessitated the use of tented camps to supplement cantonments. In India the term "cantonment" means more generally a military station or standing camp. The troops live, not in private houses, but in barracks, huts, forts or occasionally camps. The large cantonments are situated in the neighbourhood of the North-Western frontier, of the large cities and of the capitals of important native states.

**CANTOR, GEORG** (1845-1918), German mathematician, was born at St. Petersburg (Leningrad) on March 3, 1845. He was educated at Zürich, Berlin and Göttingen. He was appointed tutor of mathematics in the University of Halle (Wittenberg) where in 1872 he became extraordinary professor and in 1879 ordinary professor of mathematics. Cantor's research work is marked by originality, and for some time the full value of it was not appreciated by his contemporaries. Mittag-Leffler, the editor of the *Acta Mathematica*, estimated Cantor's work at its true value, and published a number of his papers in his journal. Cantor's early work was on Fourier Series, and in extending the results obtained he developed a theory of irrational numbers which has since become classical. He developed an arithmetic of the infinite and a new branch of mathematics—the theory of sets of points. In 1895-97 he published papers on *Begründung der transfiniten Mengenlehre* which formed the basis of his well known work *Contributions to the founding of the theory of transfinite numbers* (London and Chicago, 1915). Cantor held honorary degrees of the universities of Christiania (Oslo) and St. Andrews and was awarded the Sylvester Medal of the Royal Society in 1904.

He died on Jan. 6, 1918, at Halle.

**CANTOR, MORITZ** (1829-1920), German mathematician, was born at Mannheim on Aug. 23, 1829. He studied mathematics at Heidelberg, Göttingen and Berlin. In 1853 he became a tutor and in 1863 professor of mathematics at Heidelberg. At a scientific meeting at Bonn he read a paper on Ramus, Stifel and Cardan; this was so warmly received that Cantor decided to concentrate on the history of mathematics. His first important book was *Mathematische Beiträge zum Kulturleben* (1861); this was followed by his well known *Vorlesungen über die Geschichte der Mathematik*, the first volume of which was published in 1880, the second in 1892 and the third in successive parts between 1894

and 1898. By this time Cantor was too old to undertake the fourth volume; consequently the work was divided between nine men, each responsible for one section and under the editorship of Cantor. This work gives a clear, accurate account of the history of mathematics from earliest times up to 1799. A number of small inaccuracies which were in the *Vorlesungen* have since been corrected by Gustav Eneström, editor of the *Bibliotheca Mathematica*. Between 1856 and 1898 Cantor wrote a number of papers which were published chiefly in the *Zeitschrift für Mathematik und Physik*, among them being "Euclid und seiner Jahrhundert" (1867) and "Die Römischen Agrimensoren" (1875). Cantor's eyesight failed him towards the end of his life. He died on April 10, 1920, at Heidelberg.

**CANTOR**, in music, literally "singer"; and in church usage, the one (chanter, precentor, succentor) whose business it is to lead the singing or, if not actually to do this himself, to be responsible for its being properly done by others. In German usage the term, with *Kapellmeister* as its equivalent, includes the further meanings of choir-master and organist, as is recalled by the time-honoured description of Bach as the "Leipziger Cantor." In French, *maître de chapelle* is the corresponding term.

**CANTÙ, CESARE** (1804-1895), Italian historian and novelist, was born at Brivio, Lombardy, on Dec. 5, 1804. On his father's death he was left in charge of his brothers and sisters, and supported them by the proceeds of teaching and writing. His early books include some of his best work, notably *La Lombardia nel secolo XVII.* (1832) and the novel *Margherita Pusterla* (Milan, 1838). This novel was written with a tooth-pick as pen and candle-smoke for ink in an Austrian prison, where he was confined for political reasons. In 1838 he began a universal history, *Storia Universale* (Turin, 35 vols., 10th ed., 1890), completed in 1846, and repeatedly revised, which brought a fortune to the publisher and a competence to its author. During the revolution of 1848 he fled from Turin to Milan to escape arrest, but after the Five Days he returned, and began to edit *La Guardia Nazionale*. He was one of the few liberals who responded to the pacific overtures of the archduke Maximilian, a fact that was often brought up against him in later days. After the establishment of the Italian monarchy he was a deputy to the chamber for a short time. He founded the Lombard historical society, and was appointed superintendent of the Lombard archives. He died in Milan on March 11, 1895. Among his numerous other works may be mentioned: *Gli Eretici in Italia* (Milan, 1873), and *L'abate Parini e la Lombardia nel secolo passato* (1854).

See his *Reminiscenze* (1883); and P. Manfredi, *Cesare Cantù* (1905).

**CANUSIUM**, an ancient city of Apulia (Gr. *Κανύσιον*, mod. *Canosa*), on the right bank of the Aufidus (Ofanto), about 12 m. from its mouth, and situated upon the Via Traiana, 85 m. E.N.E. of Beneventum. It was said to have been founded by Diomedes, and even at the time of Horace (*Sat.* i. 10, 30) both Greek and Latin were spoken there. The legends on the coins are Greek, and a very large number of vases have been found in the necropolis, fine polychrome vases being actually made there (3rd. century B.C.). The town came voluntarily under Roman sovereignty in 318 B.C., afforded a refuge to the Roman fugitives after Cannae, and remained faithful for the rest of the war. It revolted in the Social War, in which it would appear to have suffered, inasmuch as Strabo (vi. 283) speaks of Canusium and Arpi as having shrunk considerably in his day. It had a trade in agricultural products and in Apulian wool (there dyed and cleaned); its position on the high-road was important. It was a *municipium* under the early empire, but was converted into a *colonia* under Antoninus Pius by Herodes Atticus, who provided it with a water-supply. In the 6th century it was still the most important city of Apulia. A few buildings are still preserved.

See T. Ashby and R. Gardner in *Papers of the British School at Rome*, viii., 154 seq. and ref.

**CANUTE** (CNUT), known as "the Great" (c. 995-1035), king of Norway, Denmark, and England, son of Sweyn Forkbeard, king of Denmark, was born c. 995. In 1013 he sailed, with his father, for England and shared in the conquest of Wessex. After Sweyn's death, in Feb. 1014, and the return of King Ethelred,

who had fled to Normandy, Canute was driven out of the country, only to return again in 1015 with a strong Danish fleet. He landed at Sandwich, plundered Dorset, Wiltshire, and Somerset, and, advancing through Wessex, proceeded to subdue northern England as far as York. The fact that he met with so little resistance points to the probability of a general Danish supremacy already existing in England, north of the Thames. Wessex, however, put up a good fight against Canute's army, which was soon reinforced by Eadric and the East Anglians. At Ethelred's death, in April 1016, Canute persuaded the Witan at Southampton to elect him king; but London was obstinate in its support of Edmund Ironside, Ethelred's son. After the failure of several attempts to take London by siege, and a reverse at Sheppey, Canute at last defeated Edmund at Assandune in Essex. After this a conference was held at Olney, an island in the Severn, at which it was settled that Canute should rule over Mercia and the north, while Edmund retained East Anglia and Wessex, with London. A few months later, in Nov. 1016, Edmund died, and Canute was elected king of all England. Edmund's two young sons fell into his hands and were sent to the court of Sweden.

Canute experienced, naturally, the advantages as well as the disadvantages of his position as a foreign conqueror. For one thing he could always resort to the expedient of importing large bodies of Scandinavian troops in case of difficulties in England, and in the second place he was free from the tribal jealousies of the various English kingdoms, being a foreigner and equally king of all England. To counteract the disadvantages, too, he was careful to pursue an anti-Danish policy; after banishing his first wife, Aelgifu, and her two sons Harold and Sweyn, he married Ethelred's widow, Emma; and he sent back all his Danish ships and soldiers with the exception of the crews of 40 ships, who were to form his bodyguard of "huscarles." Canute's firm alliance with the native clergy, his numerous benefactions, his consecration of the church at Assandune and restoration of that of St. Edmund at Bury were all part of the same policy. In 1026 he went on pilgrimage to Rome and was present at the coronation of Conrad III. as emperor (1027).

Canute's reign was a period of unusual order and security; he seems to have had more idea of central government than had any of the earlier Saxon kings, and the body of secretaries who travelled with him on his journeys represent the first trace of a permanent administrative staff, though their functions are uncertain; and though his division of the kingdom into four earldoms was feudal in tendency, Canute seems to have looked on his earls simply as royal officials, witness the summary dismissal of earl Thorkil, in 1021, and the appointment of the Saxon, Godwin, as earl of Wessex in his place. Canute is responsible for a code of laws, but these are no more than a recapitulation of the earlier Saxon laws of Ethelred and Eadgar and contain no innovations. In 1018 Canute's brother, Harold, king of Denmark, died without issue, and in 1019, Canute, who succeeded him, paid a visit to his Scandinavian dominions. His work of reform and reconciliation was interrupted in 1026 by the attempt of Olaf Haraldson, king of Norway, in conjunction with Anund Jakob, king of Sweden, to conquer Denmark. Canute defeated the Swedish fleet at Stangebjerg, and so seriously injured the combined squadrons at the mouth of the Helgeaa in East Scania, that in 1028 he was able to subdue the greater part of Norway "without hurling a dart or swinging a sword." But the conquest was not permanent, the Norwegians ultimately rising successfully against the tyranny of Alfifa, who misruled the country in the name of her infant son Sweyn. Canute also succeeded in establishing the dominion of Denmark over the southern shores of the Baltic, in Witland and Samland, then forming part of the coast of Prussia. Of the details of Canute's government in Denmark proper we know but little. His most remarkable institution was the *Tingld*, a military brotherhood, originally 3,000 in number, composed of members of the richest and noblest families, who not only formed the royal bodyguard, but did garrison duty and defended the marches or borders. The story that he rebuked the flattery of his courtiers by showing that the advancing waves paid no heed to his command, is told by Henry of Huntington, about 1130. He was the first Danish

king who coined money, with the assistance of Anglo-Saxon mintmasters. At some uncertain date Canute took an army into Scotland, after the Scots had defeated the Northumbrians at Carham in 1018, and ultimately Malcolm, the king of the Scots, is said to have acknowledged his overlordship.

Canute died at Shaftesbury on Nov. 12, 1035, in his 40th year, and was buried at Winchester.

See *Danmarks Riges Historie. Old Tiden og den aeldre Middelalder*, pp. 382-406 (1897-1905); E. A. Freeman, *Norman Conquest* (1870-75); Steenstrup, *Normannerne* (1876-82).

**CANUTE VI.** (CNUT) (1163-1202), king of Denmark, eldest son of Valdemar I., was crowned in his seventh year (1170) as his father's co-regent, and in 1182 succeeded to the throne. During his reign Denmark consolidated and extended her dominion over the North Baltic coast and adopted a more independent attitude towards Germany. The emperor Frederick I's claim of overlordship was rejected, and his attempt to stir up Duke Bogislav of Pomerania against Denmark's vassal, Jaromir of Rügen, was defeated by Archbishop Absalon, who destroyed 465 of Bogislav's 500 ships in a naval action off Strela (Stralsund) in 1184. In the following year Bogislav did homage to Canute, who, henceforth, styled himself king of the Danes and Wends. This victory led two years later to the voluntary submission of the two Abodrite princes, Niklot and Borwin, to the Danish crown, whereupon the bulk of the Abodrite dominions, which extended from the Trave to the Warnow, including modern Mecklenburg, were divided between them. In 1197 Otto, Margrave of Brandenburg, invaded Pomerania, while in the following year, in conjunction with Duke Adolf of Holstein, he wasted the dominions of the Danophil Abodrites. The war continued intermittently till 1201, when Duke Valdemar, Canute's younger brother, conquered the whole of Holstein and Duke Adolf was subsequently captured at Hamburg and sent in chains to Denmark. North Albingia, as the district between the Eider and the Elbe was then called, became Danish territory. Canute died on Nov. 12, 1202.

See *Danmarks Riges Historie. Oldtiden og den aeldre Middelalder*, pp. 721-735 (1897-1905).

**CANVAS**, a stout cloth which probably derives its name from *cannabis*, the Latin word for hemp. This would appear to indicate that canvas was originally made from yarns of the hemp fibre, and there is some ground for the assumption. This fibre and that of flax have certainly been used for ages for the production of cloth for furnishing sails, and for certain classes of cloth used for this purpose the terms "sailcloth" and "canvas" are synonymous. Warden, in his *Linen Trade*, states that the manufacture of sailcloth was established in England in 1590, as appears by the preamble of James I., cap. 23. But this, or a like cloth of the same name had been used for centuries before this time by the Egyptians and Phoenicians. Since the introduction of the power loom the cloth has undergone several modifications, and it is now made both from flax, hemp, tow, jute and cotton, or a mixture of these, but the quality of sailcloth for the British government is kept up to the original standard. All flax canvas is essentially of double warp, for it is invariably intended to withstand some pressure or rough usage.

In structure it is similar to jute tarpaulin; "bagging," "tarpaulin" and "canvas" form an ascending series of cloths so far as fineness is concerned, although the finest tarpaulins are finer than some of the lower canvases. The cloth may be natural colour, bleached or dyed, a very common colour being tan.

Amongst other articles made from it are: receptacles for photographic and other apparatus; bags for fishing, shooting, golf and other sporting implements; shoes for cricket and other games, and for yachting; travelling cases and hold-alls, letter-bags, school-bags, and nose-bags for horses. Large quantities of the various makes of flax and cotton canvases are tarred, and then used for covering goods on railways, wharves, docks, etc.

Sail canvas is, naturally, of a strong build, and is quite different from the canvas cloth used for embroidery purposes, often called "art canvas." The latter is similar in structure to cheese-cloths and strainers, the chief difference being that the yarns for art

canvas are, in general, of a superior nature. All kinds of vegetable fibres are used in their production, chief among which are cotton, flax and jute. The yarns are almost invariably two or more ply, an arrangement which tends to obtain a uniform thickness—a very desirable element in these open-built fabrics. The plain weave

CANVAS WEAVES

A. Plain weave. B. Hop-sack weave. C and D. Imitation gauze weaves

A in the figure is extensively used for these fabrics, but in many cases special weaves are used which leave the open spaces well defined. Thus weave B is often employed, while the "imitation gauze" weaves, C and D, are also largely utilized in the production of these embroidery cloths. Weave B is known as the hopsack, and probably owes its name to being originally used for the making of bags for hops. The cloth for this purpose is now called "hop pocketing," and is of a structure between bagging and tarpaulin. Another class of canvas, single warp termed "artists' canvas," is used, as its name implies, for painting in oils. It is also much lighter than sail canvas, but must, of necessity, be made of level yarns. The best qualities are made of cream or bleached flax line, although it is not unusual to find an admixture of tow, and even of cotton in the commoner kinds. When the cloth comes from the loom, it undergoes a special treatment to prepare the surface for the paint.

**CANVAS-BACK**, a diving duck related to the pochard (*q.v.*), but larger. The canvas-back (*Marila vallisneria*) is an American bird much esteemed for the table. It takes its name from the light colour of the back. The head is chestnut, the beak long and narrow. The canvas-back is found in the whole of North America, and breeds in Colorado, Nevada, Minnesota and northward to Fort Anderson and Fort Yukon.

**CANVASS**, to sift through canvas, hence to examine carefully. To solicit subscriptions, interest, votes in a prospective election, etc.

**CANYNGES** or **CANYNGE, WILLIAM** (c. 1399-1474), English merchant, was born at Bristol in 1399 or 1400, a member of a wealthy family of merchants and cloth-manufacturers in that city. Canynges was five times mayor of, and twice member of parliament for, Bristol. He owned a fleet of ten ships, the largest hitherto known in England, and employed, it is said, 800 seamen. By special licence from the king of Denmark he enjoyed for some time a monopoly of the fish trade between Iceland, Finland and England, and he also competed successfully with the Flemish merchants in the Baltic, obtaining a large share of their business. In 1456 he entertained Margaret of Anjou at Bristol, and in 1461 Edward IV. Canynges undertook at his own expense the great work of rebuilding the famous Bristol church of St. Mary, Redcliffe. In 1467 he himself took holy orders, and in 1469 was made dean of Westbury. He died in 1474. The statesman George Canning and the first viscount Stratford de Redcliffe were descendants of his family.

See Pryce, *Memorials of the Canynges Family and their Times* (Bristol, 1854).

**CANYON**, an anglicized form of the Spanish word *cañon*, signifying a valley with high cliff-like sides, such as are found in the western parts of the United States and in Mexico. A few of the more notable examples in the United States are the Grand Canyon (*q.v.*) of the Colorado; the Canyon of the Yellowstone, in Yellowstone National park; and the Black Canyon of the Gunnison, in Colorado.

**CANZONE**, a form of verse which has reached us from Italian literature. The word is derived from the Provençal *cansò*, a song, but it was in Italian first that the form became a literary one, and was dedicated to the highest uses of poetry. The canzone-strophe consists of two parts, the opening one being distinguished by Dante as the *fronte*, the closing one as the *sirma*. These parts are connected by rhyme, it being usual to make the rhyme of the last line of the *fronte* identical with that of the first line of the *sirma*. In other respects the canzone has great liberty as regards number and length of lines, arrangement of rhymes and conduct

of structure. An examination of the best Italian models, however, shows that the tendency of the canzone-strophe is to possess 9, 10, 11, 13, 14 or 16 verses, and that of these the strophe of 14 verses is so far the most frequent that it may almost be taken as the type. In this form it resembles an irregular sonnet. The *Vita Nuova* contains many examples of the canzone, and these are accompanied by so many explanations of their form as to lead us to believe that the canzone was originally invented or adopted by Dante.

The *Canzoniere* of Petrarch is of great authority as to the form of this species of verse. In England the canzone was introduced at the end of the 16th century by William Drummond, of Hawthornden, who has left some very beautiful examples. In German poetry it was cultivated by A. W. von Schlegel and other poets of the Romantic period. It is doubtful, however, whether it is in agreement with the genius of any language but Italian.

**CAOINE** (pron. *Keen*), an Irish term for the wailing lamentations uttered over the body of the deceased at wakes and funerals. These wailings, which are sometimes led by professional or semi-professional mourners, are more or less musical in character. The practice still lingers in remote parts of Ireland.

**CAOUTCHOUC**, the principal constituent of natural rubber (see RUBBER: BOTANY, CULTIVATION AND CHEMISTRY) and therefore sometimes called pure rubber. It occurs as a vegetable gum, mixed with from  $\frac{1}{10}$  to 8 times its own weight of other substances. Caoutchouc is a white resilient solid; at 0–10° C it is hard and opaque, but it becomes soft and translucent above 20° C. It contains carbon and hydrogen only, and belongs to the terpenes (*q.v.*). By polymerization (*q.v.*) isoprene can be converted to a product resembling caoutchouc but inferior to that synthesized by the plant. *Mineral caoutchouc* is one of the names of elaterite (*q.v.*), or elastic bitumen.

**CAPACITANCE** is the term applied to the effective capacity of a circuit in which an alternating electric current is flowing. (See ELECTRICITY: *Alternating Current*.)

**CAPACITOR**, in a radio set, is an instrument for storing electrical energy in electro-static form (see ELECTRICITY). It ordinarily consists of two conducting surfaces, approximately parallel separated by an insulator or dielectric material. It is also called a condenser (*q.v.*).

**CAPACITY**, the ability to contain a definite quantity. Cubical capacity is measured in units of volume. Electrical capacity is denoted by the charge  $Q$  (see ELECTRICITY) which a system can hold on the application of a given voltage  $V$ , and is given by the ratio  $\frac{Q}{V}$ . (See CONDENSER; BROADCASTING: *Technical As-*

*pects*; TELEGRAPHY; WIRELESS, THEORY OF.) *Thermal capacity* measures the capability of a body for absorbing heat (*q.v.*), and numerically is the product of its specific heat and its density.

**CAP-À-PIE**, O.Fr., meaning from "head to foot," a mediaeval expression to indicate that a knight or man-at-arms was equipped with full body armour.

**CAPE BRETON**, the north-east portion of Nova Scotia, Canada, separated from the mainland by a narrow strait, known as the Gut of Canso; length (north to south) 110 m., greatest breadth about 87 m., and area 3,120 sq. m. It juts out so far into the Atlantic that it has been called "the long wharf of Canada," the distance to the west coast of Ireland being less by 1,000 m. than that from New York. A headland on the east coast is also known as Cape Breton, and is said by some to be the first land made by Cabot on his voyage in 1497–98. The large, irregularly shaped, salt-water lakes of Bras d'Or communicate with the sea by two channels on the north-east; a short ship canal connects them with St. Peter's bay on the south, thus dividing the island into two parts. Except on the north-west, the coast-line is indented with numerous bays, several of which form excellent harbours. The most important are Aspy, St. Ann's, Sydney, Mira, Louisburg, Gabarus, St. Peter's and Mabou; of these, Sydney Harbour, on which are situated the cities of Sydney and North Sydney, is one of the finest in North America. There are numerous hill streams not navigable for any distance; the largest, are

the Denys, the Margaree, the Baddeck and the Mira. Lake Ainslie in the west is the most extensive of several fresh-water lakes. The surface of the island is hilly and the northern part is a table-land 1,000 ft. high, consisting of gneiss, and fringed by a narrow border of carboniferous rocks. South of this a Cambrian belt continues the same formation on the Atlantic coast of Nova Scotia. On the west and south sides of the island at Seacoal Bay and Little River (Richmond county), valuable seams of coal are worked. Still more important is the Sydney coal-field on the east coast from Mira Bay to St. Ann's. The outcrop is plainly visible at various points along the coast, and coal has been mined in the neighbourhood from a very early period. Since 1893 the operations have been greatly extended, and over 3,000,000 tons a year are now shipped, chiefly to Montreal. The coal is bituminous, of good quality and easily worked, most of the seams dipping at a low angle. Several have been mined for miles beneath the ocean. Slate, marble, gypsum and limestone are quarried, the latter being of great value as a flux in the blast-furnaces of Sydney.

The lumber, agricultural products and fisheries of Cape Breton are also important. Nearly covered with forest at the time of its discovery, it still exports pine, oak, beech, maple and ash. Oats, wheat, turnips and potatoes are cultivated, chiefly for home consumption; horses, cattle and sheep are reared in considerable numbers; butter and cheese are exported. The Bras d'Or lakes and the neighbouring seas supply an abundance of cod, mackerel, herring and whitefish, and the fisheries employ over 7,000 men. Salmon and trout abound, attracting large numbers of tourists and sportsmen from the other provinces and from the United States. The Canadian National railway extends to Sydney and crosses the Gut of Canso on a powerful ferry. From the same strait a railway runs up the west coast, and several shorter lines are controlled by the mining companies. Of these the most important is that connecting Sydney and Louisburg. Numerous steamers, with Sydney as their headquarters, ply upon the Bras d'Or lakes. The inhabitants are mainly of Highland Scottish descent, and Gaelic is largely spoken in the country districts. On the south and west coasts are found a number of descendants of the original French settlers and of the Acadian exiles (see NOVA SCOTIA), and in the mining towns numbers of Irish are employed. Several hundred Mic Mac Indians, for the most part of mixed blood, are principally employed in making baskets, fish-barrels and butter-firkins. Nearly the whole population is divided between the Roman and Presbyterian creeds.

### HISTORY

There is some evidence in favour of early Norse and Icelandic voyages to Cape Breton, but they left no trace.

In 1629 Lord Ochiltree settled a small colony at Baleine, on the east side of the island; but he was soon after taken prisoner with all his party by Captain Daniell of the French company. By the peace of St. Germain, in 1632, Cape Breton was formally assigned to France; and when, by the treaty of Utrecht (1713), the French were deprived of Nova Scotia and Newfoundland (*qq.v.*) they were still left in possession of Cape Breton, and their right to erect fortifications for its defence was formally acknowledged. They accordingly transferred the inhabitants of Plaisance in Newfoundland to the settlement of Havre à l'Anglois, which soon after, under the name of Louisburg, became the capital of Cape Breton (or Ile Royale, as it was then called), and an important military post.

Cod-fishing formed the staple industry, and a large contraband trade in French wines, brandy, and sugar was carried on with the English colonies to the south. In 1745 it was captured by a force of volunteers from New England, aided by a British fleet. By the treaty of Aix-la-Chapelle the town was restored to France; but in 1758 was again captured by a British force. On the conclusion of hostilities the island was ceded to England; and on Oct. 7, 1763, it was united by royal proclamation to the Government of Nova Scotia. In 1784 it was separated from Nova Scotia, and a new capital founded at the mouth of the Spanish river which received the name of Sydney in honour of Lord Sydney, then secretary of state for the colonies. In 1820, in spite of strong

opposition, it was again annexed to Nova Scotia, since when, its history has been uneventful.

**BIBLIOGRAPHY.**—Richard Brown, *A History of the Island of Cape Breton* (1869), and Sir John Bourinot, *Historical and Descriptive Account of Cape Breton* (1892), are both excellent. See also Denys, *Description géogr. et hist. des côtes de l'Amérique septentrionale* (1672); Pichon, *Lettres et mémoires du Cap Breton* (1760), also *Reports of Geological Survey, 1872 to 1882-86, and 1895 to 1899*, by Robb, H. Fletcher and Faribault; Richard Brown, *The Coal Fields of Cape Breton* (1871; reprinted, 1899). H. Fletcher, *The Sydney Coal Fields, Cape Breton, N.S.* (1900); L. B. Runk, *Fort Louisbourg: its two sieges, and site to-day* (Philadelphia, 1911); J. Emerson, *Diary Kept at the Siege of Louisbourg, 1745* (Cambridge, Mass., 1910); *Un Journal inédit du siège de Louisbourg . . . en 1758* (1913).

**CAPE COAST**, a port on the Gold Coast, British West Africa, in 5° 5' N., 1° 13' W., about 80 m. W. of Accra. (Pop. 1921, 14,921, a decrease of 50% in 20 years.) Europeans number about 100. The town is built on a low bank of gneiss and micaeous slate which runs out into the sea and affords some protection at the landing-place against the violence of the surf. This bank was the *Cabo Corso* of the Portuguese, whence the English corruption of Cape Coast. The castle faces the sea.

The first European settlement on the spot was that of the Portuguese in 1610. In 1652 the Swedes established themselves here and built the castle, which they named Carolusburg. In 1659 the Dutch obtained possession, but the castle was seized in 1664 by the English under Captain (afterwards Admiral Sir) Robert Holmes, and was held by them in spite of an attack by De Ruyter in 1665, a French attack in 1757, and various assaults by the native tribes. Next to Elmina it was considered the strongest fort on the Guinea coast. Up to 1876 the town was the capital of the British settlements on the coast, the Administration being then removed to Accra. This and, later, the opening of a railway from Sekondi to Kumasi deprived it of much of its importance. Formerly it was the starting-point for the north.

See A. Ffoulkes "The Company System in Cape Coast Castle" in *Jnl. African Soc.* vol. vii. (1908); see also GOLD COAST.

**CAPE COD CANAL** joins Cape Cod Bay, Mass., with the waters of Buzzards Bay, an inlet of Long Island sound, and traverses the narrow isthmus of Cape Cod. It is 8 m. long with a dredged approach channel 5 m. long. The width varies between 100 to 300 ft. and the depth at low water is 25 feet. The canal was first projected in early American colonial times and was subsequently a national project. It was finally put into operation in 1914 by private capital after five years of construction work. The canal has cut the distance, for water-borne traffic, between New York and Boston, via the East river, Long Island sound and the canal, by more than 75 miles. The Cape Cod canal was purchased by the U.S. Government in 1928 and is operated toll free for both commercial and naval vessels. The traffic is in excess of 800,000 cargo tons annually.

**CAPE COLONY**, or, officially, the "Province of the Cape of Good Hope," consists of the southernmost part of Africa, and is one of the four provinces which constitute the Union of South Africa. Its area is 276,966 sq.m., i.e., 59% of the total area of the Union. It is bounded by the Atlantic and Indian oceans, and by Natal, Basutoland, the Orange Free State, the Transvaal, the Bechuanaland Protectorate, and South-West Africa, the boundary following, for the greater part of its length, the course of rivers and escarpments.

**Structure and Topography.**—Topographically, Cape Colony can be divided into two main regions. The first of these consists of part of the inner plateau of South Africa, the altitude of which averages, in the Colony, about 3,000 feet. About the Orange river the western portion of the plateau descends to about 2,000 ft.; toward the east it rises over 4,000 feet. The limits of the plateau are, as a rule, clearly defined by a great escarpment (see SOUTH AFRICA), which runs more or less parallel with the coast, and which is known by several local names, such as the Drakensberg, Stormberg, Sneeuwberg, Nieuwveld, Komsberg, Roggveld, Bokkeveld and Kamiesberg. Here the greatest heights in the Colony are attained. Near the Basutoland border Ben Macdhui reaches about 10,000 feet. In the Sneeuwberg range the Kompas Berg is said to be 8,500 feet. The high plateau forms undulating country,

broken by ranges of hills and isolated kopjes. The general aspect varies greatly from east to west, according to the rainfall. In the west the rusty brown rocks, practically unrelieved by any running water, stretch away to the horizon. In day time, with the heat of a fierce sun being reflected from bare surfaces, one is made to think of the dry skeleton of a country; but round about sunset the scene is painted over as by magic with soft and yet brilliant colours, blues, amethysts, silver greys. The extraordinary charm of the veld at night can only be experienced. The greater part of this region consists of scarcely disturbed strata of the Karroo system, with older and more disturbed formations outcropping to the north-west of a Prieska-Kimberley line. (See SOUTH AFRICA.)

The second main region, lying between the great escarpment and the sea, is more diversified, and can be divided into several sub-regions. The first of these is the Great Karroo, an arid, almost desert, area bounded on the north by the escarpment, and on the south by the Folded Belt (see below). Its elevation varies from 1,000 to about 4,000 feet. It is floored mainly by sandstones and shales of the lower part of the Karroo system, reinforced in the northern part by dolerites. Owing to the gentle dip of the strata, the topography consists of a number of minor plateaux or terraces, which are due to the more resistant sandstones, the softer shales being more easily eroded. In the southern part of the Karroo the beds have been steeply tilted, and the topography has acquired a definite east to west grain, owing to differential erosion along the outcrops of hard and soft strata.

The boundary between the Great Karroo and the second sub-region is indefinite and largely a matter of climatic gradation. This second area, the south-eastern region, includes the country to the north-east of Graaff Reinet, which lies between the Sneeuwberg, Stormberg, Drakensberg and the coastal belt. It is built very largely of Karroo rocks, and consists of a series of great terraces, due to the greater resistance of outcrops of sandstones and dolerites. In East Griqualand, large masses of intrusive, basic rocks, having a considerable petrological range, give rise to the Ingeli mountains (over 7,000 ft.), Mt. Currie and Insizwa. At Port St. Johns a horst of Table mountain sandstone is cut across by the Umzimvubu river, which forms a deep cañon.

**The Folded Zone.**—Late in the Karroo period a series of mountain ranges was folded along a number of axes. In the western part of the area these trend north-north-west to south-south-east, but about Karroo Poort, in the Ceres district, the direction changes, and the axes have a more or less east to west trend. Each axis is somewhat curved and has its concave side towards the coast. At the northern end the folding dies away about Van Rhyn's Dorp. When traced eastward the folded zone passes beneath the sea between Cape Agulhas and the Peddie district, owing to the north-easterly trend of the coast. The rocks involved in the folding belong to the Cape and the Karroo systems, and include tough, quartzitic sandstones (Table mountain sandstones, and Witteberg series) and softer shaly beds (Bokkeveld). The former still give rise to mountain ranges which coincide with the old anticlinal axes, while the shales outcrop chiefly in the synclinal valleys, where they are sometimes overlain unconformably by cretaceous shales and conglomerates (the Uitenhage beds). These later formations do not occur to the west of Worcester, but they are well represented about Uitenhage, Oudtshoorn, Riversdale and Swellendam. Near the axes of some of the anticlines pre-Cape granites, slates or limestones reach the surface. The Cango caves near Oudtshoorn occur in an outcrop of dolomitic limestone. Toward the west these older rocks play a more important part. About the Paarl granite is extensively quarried for building purposes. Among the folded ranges are the Cedarberg, Groote Zwartberg, Zuurburg, Drakenstein, river Zondereinde mountains, Langeberg, Outeniqua, etc. The highest point among these ranges is the Seven Weeks' Poort mountain in the Zwartberg (7,627 ft.), but many peaks reach over 6,000 feet. The skylines of those mountains, which do not exceed 4,000 ft., are remarkably even, and apparently represent remains of an old plain. Toward the east the remains of this plain become more conspicuous, and are well developed from about Oudtshoorn eastward into the Albany

district. A remarkably fine plain runs from just north of Grahamstown, where it stands about 2,200 ft. above sea-level, away to the north, where it reaches the foot of the Great Winterberg at about 4,500 feet. Where the outcrops of the resistant Table mountain sandstone reach the sea, bold cliffs and headlands are formed between Cape St. Blaize and Cape Recife.

The Coast Belt varies considerably in width, and consists of a terrace, which may reach an elevation of 700 to 1,000 feet. It slopes gently seaward, and may end in cliffs, 400 or 500 ft. high, as at Knysna and Mossel bay, or dip gently to a line of sand dunes. The coast belt can be traced northward to beyond the Orange river, where it merges into the Namib. South of the Olifants river, between the great escarpment and the sea, there occur mountain groups, formed of Table mountain sandstone, resting comparatively undisturbed on the worn down edges of the older rocks, e.g., Piquetberg, Cape peninsula, etc. Along the western side of the latter, granites and Malmesburg slates and grits (Transvaal system) are well exposed. The same sandstones, still but little disturbed, forms part of the coastal lands between False bay and Cape Infanta. East of Knysna the coastal terrace, which is well developed about George, where it is clearly a plain of marine denudation, becomes very narrow. North-eastward from Algoa bay the coast lands are formed of Karroo rocks, except for the horst of Table mountain sandstone at St. Johns. (For coast line, see SOUTH AFRICA.)

**Drainage.**—The great escarpment is a major water parting. The interior plateau is drained by the Orange and its tributaries (see ORANGE RIVER). In the escarpment rises a number of streams, which flow across the Karroo and the Folded Belt to the sea. Most of these receive insufficient alimentation during the dry season to maintain their flow, and become a series of pools along channels, lined with accumulations of sand, mud or gravel. Between the Albany district and the Ceres Karroo are the remains of a post-Cretaceous plain, with an elevation of about 2,500 feet. This has been much eroded. The rivers of the folded area flow for long stretches in wide valleys, parallel with the strike of the beds, and then, in short sections, escape across the ranges, by means of "poorts," or steep, narrow and rugged valleys, such as the poorts of the Gamka, Gouritz, etc. In the south-eastern region the rivers alternate with long, gently graded sections, with many meanders and cut-offs, and shorter, tumultuous reaches, where they drop to a lower terrace over the outcrops of dolerites and sandstones. Their volume is more constant than that of the Karroo rivers, though it is liable to much diminution in the winters.

Owing to the low rainfall, and the high evaporation, which, from a free water surface is 97 in. per annum at Kimberley, there are no lakes. The nearest approach is a number of "vleis," or shallow pools, the areas of which vary considerably with the seasons, and "pans," or shallow hollows, which contain water after rain, but soon dry up, often leaving an incrustation of salt.

**Climate** (see SOUTH AFRICA).—The amount of rainfall varies greatly, according to distance from the sea, situation with regard to mountain ranges, etc. Thus the Royal Observatory at Cape Town records an average of 25.6 in., while Bishopscourt, 3 m. away, registers 55.2 inches. Again, while George has 34.36 in., Ezeljagt, 12 m. away, but on the landward side of the Outeniqua mountains, receives only 14.98 inches. Between the mountain ranges the rainfall is much less than near the coast. The Little Karroo, lying between the River Zonder Einde mountains, the Langebergen and the Outeniqua on the south, and the Zwartebergen on the north, has an almost desert climate. The annual rainfall at Oudtshoorn is 10.4 in., and at Ladysmith 14.5. The same may be said of the Great Karroo, between the Zwartebergen and the Great Escarpment, where Beaufort West has 9.7 in. of rain, and Prince Alfred 11.4. As one proceeds northward along the coast from Cape Town the rainfall also diminishes. The annual precipitation at Port Nolloth is 2.17 inches. The Eastern province enjoys a higher rainfall, much of it falling in short heavy showers, often accompanied by thunder. Port Elizabeth has 22.23 in., East London 33.39, Port St. Johns 48.56, Cathcart 26.17, Aliwal North 24.36. There is also an important seasonal difference in the incidence of rainfall.

Winter rains, April to September, predominate in a comparatively narrow strip of territory near the south-west coasts. A line, drawn through places having 50% of their rain in the winter, would run from the west coast, just south of Walvis bay to near Swellendam, and then, turning eastward would pass somewhere near Oudtshoorn, and reach the coast a little to the north-east of Port Elizabeth. Within the region is a district, between George and Humansdorp, which receives a fairly plentiful rainfall, about 40 in., well distributed through the year. This is the only important forest area of Cape Colony.

Near the coast frosts are almost unknown, and the temperature ranges are comparatively small. Inland they are much greater, owing to the altitude, and to the clearness and dryness of the air. Snow is seen on Table mountain about once in six or seven years, but on the mountains in the north-east of the Colony, it is of yearly occurrence.

**Vegetation.**—Cape Colony can be divided into several botanical provinces. The first of these may be called the *Cape*, or *South Western Region*. It includes the area of the Fold mountains and the coast belt between the Olifants and Sunday rivers, and on the seaward side of the Cedarberg, Hex river, Zwarteberg, Baviaan's Kloof, and Elandsberg mountains. In this region vegetation has to withstand long summer droughts and bright sunshine. The plants, therefore, show many devices for checking the transpiration of water. Most of them are evergreen, though dark or greyish green tints predominate. The leaves tend to be small and tough. The general appearance is that of the *Macchia* of Corsica, and is due to the dominance of low bushes and shrubs, from 2 to 8 ft. high. Among the principal families represented are the Proteaceae, with 262 species, including the sugar bush (*Protea mellifera*) and the silver tree (*Leucodendron argenteum*); and the Ericaceae, which is particularly common, one genus alone, *Erica*, being represented by 456 species. These are characteristic of the coastal districts and of the mountain slopes. In spring, about September, when they are in bloom, the whole countryside is splashed with colour. In the inland valleys the rhenoster bush (*Elytropappus Rhinocerotis*), and a great number of plants belonging to the Restiaceae, give to the vegetation a prevailing greyish tint. Below the bushes and shrubs grow large numbers of bulbous and tuberous plants belonging to the Iridaceae, Liliaceae, etc. Along the rivers and by the vleis the typical plants are the palmiet (*Prionium Palmiæ*) and the pig lily (*Zantedeschia aethiopica*).

Within the south-western region are the evergreen forests between George and Humansdorp, on the seaward slopes of the Outeniqua, Langkloof and Zitzikamma ranges. Among the more important timber trees are the yellow woods (*Podocarpus elongatus*, and *P. Thunbergii*), the former growing to a height of 130 ft., stinkwood (*Ocotea bullata*) and black ironwood (*Olea laurifolia*). Climbing plants are abundant. In addition to the indigenous trees, oaks, pines, gums and wattles have been introduced into the Colony. They are grown in plantations, though oak is chiefly used for lining the streets of such towns as Stellenbosch, George, etc. Owing to its rapid growth, its wood is much softer than European oak.

Along the west coast, north of the Olifants river, the climate becomes increasingly dry. There is no continuous covering of vegetation, and only xerophyllous types can exist. Desert grasses and succulents are found, and low acacia bushes grow along the dry river beds.

Except just after rains, the *Karroo*, and the adjacent western portion of the inner plateau, appear almost desert. Trees grow only near the river beds, and are represented by species of small acacia, etc. Almost everywhere succulent forms—aloes, euphorbias, mesembryanthemums are dominant. In places, small bushes, 1 to 3 ft. high, manage to maintain themselves. On the upper Karroo the various shrublets of the family Compositae become important.

After the rains tuberous and bulbous plants and annuals come into bloom, but in a few weeks the Karroo relapses to its arid condition. In some areas the prickly pear, introduced by man, has covered the hillside.

In the South African *Steppe and Forest Area* are included the high country in the north-east of the Colony, and the coastlands beyond Algoa bay. This is largely a grassland area. The higher lands are pure steppe, in which *Themeda triandra* is dominant. Other common grasses are *Andropogon amplexans*, *A. schirensis*, *Heteropogon contortus*, etc. Between the great escarpment and the coast belt, i.e., approximately between 6,000 and 1,000 ft., Savannah is the characteristic association. The grasses include *Themeda triandra*, *Eragrostis plana*, *Sporobolus indicus*, *Andropogon amplexans* and *A. schoenanthus*. The trees consist chiefly of acacias—*A. caffra*, *A. karroo*, *A. Benthami* and *Zizyphus mucronata*, *Ehretia hottentotica*, etc. On the drier slopes succulents become dominant, and include *Aloe ferox*, *A. Bainsii*, *Euphorbia grandidens*, *E. ingens*, etc. On mountain-slopes, facing between south-east and south-west, patches of forest occur up to about 6,000 feet. Among the more important trees are the yellowwoods (*Podocarpus elongata*, *P. latifolia*), ironwood (*Olea laurifolia*), lemonwood (*Xymalos monospora*), *Celtis kraussiana*, etc. Along the coast belt, i.e., below 1,000 ft., where frost is rare or absent, the country was originally covered, from about East London to Natal, with bush or forest, which has tropical affinities. It consisted of low trees 20–30 ft. high. Here are to be found *Rhus longifolia*, *Mimusops caffra* (red milkwood), *Albizia fastigiata* (flat crown), *Millettia caffra* (umzimbiti). Very characteristic are the palm, *Hyphaene crinita*, and *Strelitzia augusta* (wild banana). In these woods are many climbing plants, such as *Rhoicissus capensis* (wild grape), *Cassine natalensis* (Natal cherry), etc.

**Fauna.**—The fauna is very varied, but some of the wild animals common in the early days of the Colony have been exterminated (e.g., quagga and blaauwbok), and others (e.g., the lion, rhinoceros, giraffe) driven beyond the confines of the Cape. Other game have been so reduced in numbers as to require special protection. This class includes the elephant (now found only in the Knysna and neighbouring forest regions), buffalo and zebra (strictly preserved, and confined to much the same regions as the elephant), eland, oribi, koodoo, haartebeest and other kinds of antelope and gnu. The leopard is not protected, but lingers in the mountainous districts. Cheetahs are also found, including a rare woolly variety peculiar to the Karroo. Both the leopards and cheetahs are commonly spoken of in South Africa as tigers. Other Carnivora more or less common to the colony are the spotted hyena, aard-wolf (*Proteles*), silver jackal, Cape hunting dog (*Octocyon*) and various kinds of wild cats. Of ungulates, besides a few hundred of rare varieties, there are the springbuck, of which great herds still wander on the open veld, the steinbok, a small and beautiful animal which is sometimes coursed like a hare, the klipspringer or "chamois of South Africa," common in the mountains, the wart-hog and the dassie or rock rabbit. There are two or three varieties of hares, and a species of jerboa and several genera of mongooses. The English rabbit has been introduced into Robben island, but is excluded from the mainland. The ant-bear or aard-vark, with very long snout, tongue and ears, is found on the Karroo, where it makes inroads on the ant-heaps which dot the plain. There are also various species of pangolins, of arboreal habit, which live on ants. Baboons are found in the mountains and forests, otters in the rivers. Of reptiles there are the crocodile, confined to the Transkei rivers, several kinds of snakes, including the cobra di capello and puff adder, numerous lizards and various tortoises, including the leopard tortoise, the largest of the continental land forms. Of birds the ostrich may still be found wild in some regions. The great kori bustard is sometimes as much as 5 ft. high. Other game birds include the francolin, quail, guinea-fowl, sand-grouse, snipe, wild duck, wild goose, widgeon, teal, plover and rail. Birds of prey include the bearded vulture, aasvogel and several varieties of eagles, hawks, falcons and owls. Cranes, storks, flamingoes and pelicans are found in large variety.

Parrots are rarely seen. The greater number of birds belong to the order Passeres; starlings, weavers and larks are very common, the Cape canary, long-tailed sugar bird, pipits and wagtails are fairly numerous. The English starling is stated to be the only European bird to have thoroughly established itself in the colony.

The Cape sparrow has completely acclimatized itself to town life and prevented the English sparrow obtaining a footing.

Large toads and frogs are common, as are scorpions, tarantula spiders, butterflies, hornets and stinging ants. The most interesting of the endemic insectivora is the "golden mole" (*Chrysochloris*), so called from the brilliant yellow lustre of its fur. There are not many varieties of freshwater fish, the commonest being the baba or cat-fish and the yellow fish. Both are of large size, the baba weighing as much as 70 lb. The smallest variety is the culper or burrowing perch. In some of the vleis and streams in which the water is intermittent the fish preserve life by burrowing into the ooze. Trout have been introduced into several rivers and have become acclimatized. Of sea fish there are more than 40 edible varieties. The snock, the steenbrass and geelbeck are common in the estuaries and bays. Seals and sharks are also common in the waters of the Cape. Whales visit the coast for the purpose of calving.

Of the domestic animals, sheep, cattle and dogs were possessed by the natives when the country was discovered by Europeans. The various farm animals introduced by the whites have thriven well.

**Population.**—In 1921 the population of Cape Colony amounted to 2,782,719. Of this number 650,609 were classed as "Europeans." Under this term are included settlers of Dutch origin, to whom the term "Boer" (farmer) is often, though obviously not always justifiably, applied. They are often known as Afrikanders, and speak a debased form of the Dutch language. Among them will be found many French names, which are due to Huguenot immigrants, who were soon absorbed by the Dutch colonists. Most important, numerically, after the Dutch is the British element. Formerly, colonists of British stock were concentrated in the towns, while the land was held by Dutch. Within recent years, however, many Dutch have moved into the towns, and much land has been bought by British settlers. On the whole the British element is more strongly represented in the eastern part of the Colony, while the western part is mainly Dutch. Cape Town is probably fairly equally divided. Early in the 19th century considerable numbers of German immigrants arrived in South Africa. Many of their descendants are still to be found among the farmers in the country between East London and King William's Town, and also in the Cape peninsula. Many of them retain their own language. An appreciable number of Scandinavians are engaged in the whaling industry, and in the timber industry about Knysna. In and near Cape Town is a large Jewish element, estimated at about 10,000. Many of these are probably recent arrivals from east-central Europe.

The native, i.e., the Bantu, population totals 1,640,162, of whom 124,572 are classed as urban. The Bantu, in their spread to the south-west, were arrested by Europeans along the Great Fish river, which may still be regarded as the limit of any important native population. The Transkei territories, between the Kei river and Natal, contain a native population of about 900,000. In recent years large numbers of natives have been attracted, perhaps beyond their natural climatic limit, to the area about Cape Town, by the freer social atmosphere than exists in the other provinces of South Africa. The number of natives living in Cape Town in 1921, is given as 4,680, but the present number is probably considerably in excess of this, and has caused much anxiety to the city authorities, on account of housing difficulties. Many natives are also employed in Port Elizabeth and East London.

The Asiatics, amounting to 7,963, include Mohammedan Indian traders, Parsees and Syrians. Grouped by the Census under the heading "Mixed or Coloured" are Bushmen, Hottentots, Griquas, Korannas, Namaques, Cape Malays and Cape Coloureds. Together they amount to 484,252. The pure Bushmen and Hottentots probably total no more than a few thousand. The Griquas are a Dutch-Hottentot cross. Many of them settled about Kokstad in Griqualand East. The Cape Malays were originally introduced as slaves by the Dutch. There are still considerable numbers in Cape Town, where they play an important part in the fishing industry. The greater part of this mixed group is formed by Cape Coloureds, who represent mixtures in varying pro-

portions of Dutch, Hottentot, Malay, Negro and Bantu blood. The distribution of the coloured people is complementary to that of the natives. They occur in greatest numbers in and about Cape Town, and through the Folded and Coastal Belts to Port Elizabeth. They are found, however, throughout the Colony, and provide most of the unskilled and semi-skilled labour in town and country, though of late they have been experiencing considerable native competition in the labour markets.

Owing to the arid and mountainous nature of the interior, the population of Cape Colony is largely concentrated near the coast, though the diamond mines of Kimberley have given rise to a distinct centre of density. Inland the population is denser in the better watered eastern districts. In 1921 the density of rural population for the Colony as a whole was Europeans 1.06, non-Europeans 6.51 per square mile. In the districts of Gordonia and Fraserburg the total population, all races included, fell below one person to the square mile.

**Towns.**—The chief towns are placed on the coast. Cape Town has a population of 129,749 whites and 93,807 coloured; Mossel Bay, a town which lost its prosperity on the decline of the ostrich feather trade, has 2,649 whites and 3,053 coloured; Port Elizabeth 33,071 and 19,817; East London 23,010 and 14,800. There are also a few minor ports, such as Port Nolloth; Simonstown, the naval station, with a population of 3,026 whites and 2,372 coloured; Knysna (1,700 white); Port Alfred (1,200 and 1,500) and Port St. Johns. The largest inland centre is Kimberley (17,198 and 21,095). The other towns of the Colony are small, and are largely market centres, railway junctions, such as Mafeking (2,297 white), and De Aar (2,151 white, 2,841 coloured); pleasure or health resorts, such as Caledon and Aliwal North, or administrative or educational centres, like Grahamstown (7,648 whites; 7,860 coloured). Their names and position will be best obtained from a map (*see also separate articles*). They are practically all laid out on a rectangular plan. Near the centre is a large market-place or square about which are to be found a church and many of the public buildings. In some cases rivulets are led in channels along the streets, which may be lined with trees.

**Occupations.**—Much of the country is unsuitable for agriculture, because of its aridity. In the Karroo and in the valleys among the Fold mountains, cultivation depends on irrigation. The eastern districts are better favoured and produce a certain amount of maize, wheat, oats and fruit. The south-west is the great fruit growing area.

Most of the wheat produced in South Africa is grown in Cape Colony, chiefly about Queenstown, in the Eastern province, and in the south-west, especially about Malmesbury. The yield per acre is low. Flour milling is an important industry in the Cape district and in Port Elizabeth. Oats and barley are grown fairly generally for green forage, as well as for grain, but nowhere on a large scale. Viticulture flourishes in the south-western area of winter rainfall. The districts especially concerned are the Paarl, Worcester and Stellenbosch, while large quantities of vines are cultivated also in the Malmesbury, Cape, Robertson, Tulbagh, Montagu and Caledon districts. Altogether there are 54,405 ac. under vines. The wines are mostly of the sweet and heavy types, but efforts are being made to produce lighter wines. The quality has been improved in recent years. Brandy is also made in considerable quantities. Grapes are grown for table purposes, and many are converted into raisins, of which there is a growing export, which increased from 1,830,531 lb. in 1903-04 to 15,641,352 in 1921-22. The same area produces large quantities of peaches, apricots, pears, plums, etc. Some of these are marketed fresh, and others are dried. The growth of citrus fruit is increasing, and is more widely spread through the southern districts and about Port Elizabeth and East London. There is a considerable production of pineapples in Albany district. At Port Elizabeth, Cape Town, and about Paarl and Worcester, factories have been established for canning fruit. Olive cultivation has probably passed the experimental stage, but as yet the production is insignificant.

The cultivation of tobacco is increasing. The country about Oudtshoorn, George, Swellendam and the Piquetberg grows a medium to heavy type of Virginian tobacco. Turkish tobaccos for

cigarettes are grown about Stellenbosch, the Paarl, Wellington and Tulbagh.

Much of Cape Colony is devoted to the pastoral industry. According to the 1922 Census the number of cattle in the country was 2,976,168. Many of these are of the old Afrikander breed, which was especially valued for transport purposes. Since the Boer War much progress has been made, and the Colony possesses good herds of pedigree and cross-bred stock—the most popular imported breeds appear to be Frieslands and Shorthorns, though most of the well known British breeds are represented. The cattle are concentrated very largely in the eastern area. There is a distinct falling off of numbers to the west of Port Elizabeth, though dairying is being developed in connection with the irrigated lands further west, and in the wheat area, north of Cape Town. There are very few cattle in the Karroo districts, such as Beaufort West, Fraserburg, etc. The ox is still used very largely for transport purposes, where the country is not too dry to support him.

The flock of woolled sheep numbered 13,784,728, and consisted mostly of merinos and crossbreeds. In addition there were over 4,000,000 of the original hairy, fat-tailed breed. Practically all the wool clip is sent overseas. In 1922 the Colony exported over 71,000,000 lb. of wool. Most of the clip is sent to brokers at the principal ports, who undertake its sale. Annual wool sales, however, are held at some inland towns, such as Caledon, Swellendam, Riversdale.

The official returns show 2,054,500 Angora goats and over 4,000,000 other goats. The yield of mohair was over 8,000,000 lb., most of which is sold to the Bradford market. Goats are bred principally in the dry Karroo and in the native areas, while the main sheep area lies somewhat further east, where grass is more plentiful.

Horses do well where sheep thrive, though horse sickness may take a heavy toll at irregular intervals. The horse is used almost entirely for riding and driving. The Cape Colony horse has some of the characteristics of the thoroughbred. He usually has a fine head and good shoulders, but is light in the hind quarters. Owing to insufficient feeding in the winter months, and in time of drought, he is generally undersized. Recently a heavier type of horse has been used to some extent for farm work in the growing areas. In 1922 Cape Colony possessed 431,588 horses. In the drier areas the horse is often replaced by the donkey. The chief area for donkey breeding is Bechuanaland and the adjoining regions; Vryburg is the largest market for them. The donkey is also used in the Karroo and the southern districts, where a span of 16 to 20 is often seen harnessed to the large four-wheeled wagon, which they pull along at about 1½ m. per hour. The number of donkeys in 1922 was 435,911. Mules, of which there were 78,800, are of a good type. They are more resistant than horses to horse sickness, though they are not immune from it.

Ostrich farming, which was so profitable up to 1913, has fallen on evil days. In that year over 1,000,000 lb. of feathers were exported, but in 1925 the export was only 269,528 lb. The number of birds has fallen from 756,923 in 1913 to 204,388 in 1924, since when there has probably been a further decline. The breeding of ostriches was associated with the growing of lucerne under irrigation. The birds were most numerous about Oudtshoorn, Ladismith, Robertson and Montagu. The lucerne fields are now being used for intensive dairy work, or are being replaced by tobacco and fruit cultivation.

Parts of the great stretches of heather lands in the "South-western Region" offer opportunities for beekeeping. As yet the industry is in its infancy, though in 1921 the Colony produced 279,746 lb. of honey. The prospects of any place for development in this direction depend largely on the species of heaths found in the locality. Those about Albertinia appear to be quite suitable.

Cape Colony, like South Africa as a whole, is deficient in timber. The Knysna forests are exploited and yield yellowwoods for building purposes and furniture making, and, after being impregnated with creosote, for railway sleepers. Other woods obtained from the same area are stinkwood, a rare heavy wood, much in demand for furniture making, and ironwood and white pear (*Apodytes dimidiata*) for wagon making. The patches of forest,

which occur on the hill slopes in the east of the country, have been mostly denuded of their valuable timber. The trees are of the same species as about Knysna, except that stinkwood rarely occurs, but sneezewood (*Ptaeroxylon utile*) is fairly common, and is very useful for making fencing posts. In the Transkei territories considerable patches of forest remain, owing largely to their inaccessibility. A considerable amount of tree planting is being done by the Government and by private individuals; 113,721 ac. are shown by the census returns to be under indigenous forests or plantations. Even so, large quantities of timber have to be imported from overseas.

The fishing industry is still in the early stages of development. The coast is deficient in small harbours, which might serve as bases for fishing smacks. At present most of the fishing is done from rowing boats, or from a few large trawlers. There are considerable possibilities for improvement in the methods of catching, curing and distributing fish. There is no lack of good fishing grounds, where stationary species, such as the silverfish, red stumpnose, etc., and migratory types, such as the geelbek, kabeljauw, mackerel, etc., may be caught. Soles occur very abundantly on the Agulhas banks. In the colder waters along the west coast a species of crawfish is plentiful, and has given rise to an important industry. In 1922 there were ten canning companies at work, and over 14,000,000 crawfish were caught. In 1925 crawfish to the value of £234,637 was exported, almost wholly to France.

A whaling industry is also based in Cape Town. In 1922 over 1,000 whales were captured, and whale oil, valued at £447,833 was exported. The supply of whales is, however, liable to severe fluctuations. (See CETACEA.)

**Mining.**—The chief mineral wealth of Cape Colony consists of diamonds which occur in "pipes," filled in with "blue ground," or kimberlite, a basic, eruptive material. Such are the occurrences at Kimberley. Diamonds, of a better quality, are found also in alluvial gravels, which are worked in the Barkly West district. The production of diamonds has been liable to much fluctuation. It is now controlled by an agreement, which fixes the quota to be marketed by each of the four great producers—De Beers, South-West Africa, Premier and Jagersfontein.

Copper was formerly mined in Namaqualand with much profit, but in 1919 the two principal companies had to close down. The future of this industry depends on the exploitation of low grade ore. Smelting was re-commenced in 1922. Tin has been worked at Kuils river, 16 m. from Cape Town. It occurred in lodes traversing the granite, and in alluvial deposits. Near Prieska are inexhaustible supplies of crocidolite, or blue asbestos, which occurs in a belt, from 4 to 20 m. wide, running from 30 m. S. of the Orange river to the Bechuanaland border, a distance of 250 miles. The fibre is short, and rarely exceeds 2 inches. Its value on the London market ranges up to £25 per ton. At present it is necessary to haul the mineral by road for an average distance of 100 m., which proves a handicap to development. The production of coal in the Molteno and Indwe areas has practically ceased.

**Manufactures and Trade.**—In 1921–22, 3,028 factories were recorded. Of these 916 were concerned with the production of food and drink, such as creameries, breweries, jam-making, fruit-canning; 379 dealt with textiles, boots and clothing, as for instance the large boot factories at Port Elizabeth. The making of vehicles gave rise to 368 factories. In nearly every town there is at least one wagon-making establishment, while the lighter two or four wheeled "buggy" or "spider" is also of local provenance. Building and contracting, including brick, tile and cement making, account for 265 enterprises, and the metals and engineering for 292.

These industries employ 23,557 Europeans at an average wage of £219 per annum, and 37,554 coloured people at an average wage of £63.

The exports of the Colony (see SOUTH AFRICA) consist largely of diamonds, wool, mohair, hides and skins, fruit and wines. The chief imports are textiles, foods, whiskey, hardware and machinery, timber and coal. Much of trade, done in the country, is connected with the transit of goods to and from the inland provinces of the Union.

**Education.**—Education, other than higher, that is, university education, is subject to the provincial administrator, directed by the Provincial Education Department, at the head of which is the superintendent-general. Most schools for white children are controlled by school boards, and those for non-European children by religious organizations. The department fixes salaries, lays down syllabuses, grants loans for building and inspects the schools. It will also grant bursaries to meet the travelling and hostel expenses of suitable rural scholars to enable them to attend secondary schools, and so to equalize opportunity, as far as possible, between urban and rural children. Two-thirds of the members of the school board are elected by ratepayers, and one-third are nominated by the Government, or by the municipal or divisional council. Boards have powers to establish and maintain schools, to control their finances, and to enforce attendance by children between the ages of seven and 16. Each school is usually managed by a committee, elected by the parents or nominated by the board. The committee's duty is to supervise the school and select the teachers.

The cost of teachers' salaries, buildings and equipment is defrayed almost entirely by provincial revenue funds. Up to and including Standard VI., education is free for Europeans and non-Europeans, with the exception of some special high schools intended for the more advanced scholars.

Cape Colony has the following schools:—338 farm schools, which give primary education at centres where it is not possible to obtain an average attendance of ten pupils; 1,945 primary schools; 84 high schools; and 98 secondary schools. Above these are the training schools and colleges, in which 1,500 students are being trained for the teaching profession. There are also special schools for the blind and for deaf mutes; and for the teaching of art, music, domestic science. Fifteen industrial schools give a vocational training to the children of poor parents, and 16 part time, mainly evening, schools cater for those children who would otherwise have escaped the educational net.

The educational needs of the natives have been met by the establishment of 1,600 schools, and those of coloured children by over 400. There are also training schools, accommodating 1,700 native and 300 coloured scholars, who are being trained as teachers.

**Religion.**—Among the Christian denominations, the Dutch Churches have the greatest number of white adherents. Next comes the Church of the Province of South Africa (English Church), with 126,634. Then follow the Methodist Churches, 40,482; Church of Rome, 24,760; Presbyterian Church, 23,873. The Hebrew congregation is numbered at 21,242. Of the non-European peoples 1,002,450 are returned as heathens. The next most important body, numerically, is the Methodist denomination, with a membership of 353,603. It is followed by Anglicans, 232,193; adherents of Dutch Churches 167,800; Congregationalists, 111,306; Presbyterians, 81,823; Lutherans, 67,087; Mohammedans, 24,434; and Roman Catholics, 22,533. South Africa forms a province of the English Church, the seat of the archbishop being at Cape Town. Cape Colony is divided into the following dioceses: Cape Town, George, Grahamstown, St. Johns, Kimberley and Kuruman. The Dutch churches in Cape Colony are ruled by a Synod, which has the highest legislative judicial and administrative authority. The Synod divides the country into Church circles for purposes of administration.

**Press.**—About 150 newspapers, in English or Dutch, are published in the Colony. The chief English papers are the *Cape Times* and *Cape Argus*, published in Cape Town; the *Diamond Fields Advertiser*, published in Kimberley; and the *Eastern Province Herald*, published in Port Elizabeth. *Onsland* and *Het Dagblad* are Dutch publications. There are also five native newspapers.

See SOUTH AFRICA for geology, communications, posts and telegraphs, trade, law and justice, revenue, standard time, weights and measures, etc.

**BIBLIOGRAPHY.**—*A Guide to Botanical Survey Work* (Pretoria, 1922); A. W. Rogers, *The Geological Structure of the Union* (Pretoria, 1925); A. Du Toit, *The Geology of South Africa* (1926); *Official Year Book of South Africa; Census Reports*; and books cited under SOUTH AFRICA. (R. U. S.)

## HISTORY

**The South African Dutch.**—In 1652 the Dutch East India Company (*q.v.*) formed a naval station at Table Bay; and this was converted subsequently into a colony. Although the soil and climate of the Cape were proved quite early to be suitable for European colonization, it was not easy for the company to find emigrants in Holland. The directors, therefore, had recourse to the public orphanage and to foreign exiles. From 1685 onwards they sent out parties of orphan girls in their outward-bound ships, as opportunity offered; and they obtained at least 150 excellent settlers from among the French protestants driven from France by the revocation of the Edict of Nantes, 1685 (*q.v.*). Concurrently the company sent out an equal number of Dutch emigrants; and all necessary measures were taken to secure the rapid absorption of the Huguenots by the Dutch. As no special effort to secure fresh emigrants was made after 1688, the population of the settlement in 1691 may be regarded as the parent stock of the colony. It was composed of (1) soldiers, sailors, and other discharged servants of the company; (2) Dutch families or individuals, the majority of whom were sent out concurrently with the Huguenots; (3) Dutch orphan girls; and (4) the Huguenots. The number of permanent settlers of both sexes and all ages, according to the census, was approximately 1,000, of whom two-thirds were Dutch, one-sixth French, a small fraction Swedish, Danish, or Belgian, and one-seventh Low German and almost identical in racial characteristics with the Dutch. At the same time there was a non-European imported population of 50 free Asiatics and Central Africans, with their wives and some 60 or 70 children, and 386 slaves, men, women, and children. Apart from the predominance of the Dutch element, this parent stock is noticeable as being composed largely of settlers who had emigrated in circumstances tending to weaken the natural ties of kinship and pride of race that bind the average emigrant to his mother country. The illiterateness of the Dutch population whom the company left in Cape Colony at the close of the 18th century, and their abandonment of the language of Holland for the *Taal* (*q.v.*), a meagre *patois* limited to a few hundred words, may be attributed to the illiberal and inefficient system of administration under which they lived; but the intense devotion to the country of their adoption, and the deep distrust of European civilization, which they afterwards manifested in so marked a degree, must be connected

FROM W. B. WORSFOLD, "HISTORY OF SOUTH AFRICA," BY PERMISSION OF J. M. DENT & SONS  
CAPE COLONY IN 1795 UNDER THE DUTCH AND HUGUENOT COLONISTS  
The boundary of the settlement is indicated by a dotted line

with the character and circumstances of the parent stock. In 1795 Cape Colony was drawn suddenly within the orbit of the 100 years' contest between France and England for maritime and commercial supremacy, which had been renewed in 1793 by the republic's declaration of war against England and Holland.

**British Temporary Occupation.**—With the arrival of Admiral Elphinstone's ships at False bay, the southern inlet of the Cape peninsula, the history of the colony is merged for a time in the main current of world-events. It will suffice, therefore, to recall the dates which bridge the interval between 1795 and 1806, when the period of British rule began. From 1795 to 1803 Great Britain held the Cape in the name of the prince of Orange, who, after the seizure of Holland by the French and the consequent

constitution of the Batavian republic, had taken refuge in England. During this temporary British occupation the company's restrictions upon trade were removed. Under the Treaty of Amiens, 1802 (*q.v.*) the colony was restored to Holland; and, while it was under the direct administration of the Dutch government (1803-6), many necessary reforms were effected. The peace of Amiens lasted barely a year; and on the resumption of hostilities the command of the sea passed to England by the destruction of the combined fleets of France and Spain at Trafalgar (Oct. 21, 1805). Three months later (Jan. 19, 1806) a British force, under Sir David Baird, took possession of Cape Colony—Holland being then a dependency of France—in the name of the King of England. The possession of the colony thus gained by conquest was ratified, on the downfall of Napoleon in 1814, by international agreement and by Holland's formal cession of the territory to Great Britain.

**Under British Rule.**—In 1806, when British rule began, the colony had a total population of 73,633, composed of 26,720 Europeans, 17,657 Hottentots, and 29,256 persons returned as slaves. In Cape Town there were some 17,000 people, of whom 6,000 were European. The rest of the inhabitants were scattered over a belt of coastlands extending for some 500 miles from the Cape to the Fish river, and similar in its relationship to the plains and high plateaux of the interior, and in its general physical features, to the Tell of north-west Africa. The annual value of the goods imported was rather more than £100,000, and that of the produce exported rather less than £60,000. While the resistance of the indigenous Hottentots and Bushmen of the colony had been overcome, outside its boundaries the Bantu peoples had increased in numbers and drawn nearer to the zone of European occupation. The military tribes, who had established themselves in the fertile littoral east of the great mountain ranges, confronted the European colonists on the further bank of the Fish river. The industrial tribes, to whom, as being weaker in arms, the inhospitable deserts and steppes to the west of the ranges had fallen, were less advanced in their southward progress. The former, whose Central African blood had been mingled with that of the Asiatic settlers on the east coast of the Continent, were destined to dispute the possession of South Africa with the Europeans in the long series of wars which have given a sinister familiarity to the words Kaffir, Zulu, Basuto, and Matabele. They were then a mass of cruel and untamed humanity, ready whenever opportunity offered to break over the eastern frontier of the colony and engulf its lonely homesteads in fire and rapine. A century later the area of European occupation, or control, under the British Crown extended from the Cape to the Belgian Congo; the European population numbered over a million, and their external trade, of the annual value of £75,000,000, was larger per head of (European) population than that of any other British state overseas. And within this area the non-European peoples, five or six times as numerous as the European, had been brought under European administration. Up to 1835 Cape Colony contained the whole, and from that date up to the foundation of Johannesburg in 1886, approximately two-thirds, of the European population of South Africa. The governors of the colony from 1847 (Sir Henry Pottinger) to 1901 (Lord Milner) were also high commissioners in South Africa, and as such concerned with the sub-continent as a whole. The history of Cape Colony in the 19th century, therefore, is often hardly distinguishable from that of South Africa as a whole; and it is related in this sense under the title SOUTH AFRICA, UNION OF. The account following is limited accordingly to what may be called its internal, or domestic, development.

**Before British Colonization.**—During the 20 years between the beginning of the permanent occupation and the report of the royal commissioners (1806-25), the colony was administered, broadly speaking, as a Dutch colony in British possession. The institutions and personnel of the former government were maintained, few new measures were introduced, and economic progress was confined to agriculture and stock-raising. The Hottentots were removed from the authority of their chiefs and placed under special regulations identical in principle with those sub-

sequently adopted under British administrations in Natal and the Transvaal for the control of African unskilled labourers in European employment. In the original enactment (1809) the practice of retaining the children of Hottentot servants as apprentices was made illegal; but this provision was subsequently rescinded (1812) in deference to the wishes of the colonists. Circuit courts were instituted in order that no one should be prevented by distance from seeking redress in the high court. The insecurity of land tenure was remedied by the conversion of the occupation licenses revokable at will, issued by the Dutch company, into perpetual quit-rent tenures (1812); and the (Dutch) farmers thus obtained a virtual freehold of their farms, which ranged from 6,000 to 20,000 ac. in area. Government schools were established in outlying districts; the production of fine wool, soon to become the staple industry of the colony, was promoted by the importation of merinos from England and the provision of breeding-farms; and a beginning of efficient road-communication was made by piercing the Drakenstein range at French Hoek (1824). Twice, in 1811-12 and 1817-18, the colony was cleared of Bantu invaders by force of arms; and definite progress was made in the protection of the districts on the eastern frontier against these Kaffir inroads. A post of British regulars was placed (1812) where afterwards Grahamstown (so called from the name of its commander) grew up; and after the expulsion of the Amakosa clans in 1818, the colonial boundary was made more secure by the exaction of an undertaking from their chiefs to withdraw eastward to the line of the Keiskamma river, thus leaving an unoccupied zone between the Bantu and the Europeans on the west side of the Fish river. The military advantage thus gained was supplemented by the settlement of 4,000 British emigrants (1820) on the west side of the Fish river, in the country between it and the (more western) Bushman river, subsequently known as the Albany district. The measure was proposed by the governor, Lord Charles Somerset, and approved by the British government. Out of 90,000 applicants, 4,000 persons of varying social conditions were selected and established at State expense. This event, second only in historical significance to the foundation of the colony by the Dutch East India Company in 1652, as marking the first appearance of an appreciable British population in South Africa, brought this early period to a natural close. Before the Albany settlement the European population of the colony, almost entirely of Dutch descent, had risen from 26,000 to 42,000; and had not the "rebellion" of Slachter's hek revealed the complete estrangement of the rural Dutch from the European civilization of the 19th century, the period would have seemed one of slow, but assured, material progress.

**Administrative Changes.**—The Albany settlers and their descendants not only founded Grahamstown and Port Elizabeth and made the population of these districts predominantly British, but they bore a large part of the burden of defending the eastern frontier, and contributed materially to the industrial development of the colony. The introduction of these settlers must rank as the most conspicuous of the services which Lord Charles Somerset, the last of the early British governors, rendered to the colony, but it was none the less the immediate cause of his resignation. At the time in question much English labour, hitherto locked up in the war with Napoleon, had been set free; and during the 20 years following the battle of Waterloo (1815) large numbers of emigrants left the British isles to find homes in Canada and Australia. Coming, as they did, from a country where the government was so firmly established that complete freedom could be allowed to all its subjects, they keenly resented the restrictions of speech and action which dangers unknown in the homeland made necessary in the colonies. Although the Albany settlers were mainly drawn from the ranks of the manual labourers, there were men of education among them, and some of these latter, in search of more congenial employment, came to Cape Town. In 1824 the first South African newspaper, edited by Pringle and Fairbairn, was published. And here at the Cape, as in Canada and Australia, the new English settlers, coming into conflict with the colonial government, became a cause of political disturbances, which led subsequently to the establishment of more liberal sys-

tems of administration. In response to complaints against the arbitrary methods of the governor, and on other grounds, the British government sent out commissioners in 1823 to enquire into the general administration of the colony, and the condition of the Hottentots and the Albany settlers. Their report was presented in 1826, and in the meantime Lord Charles, to avoid the necessity of defending his action, had resigned. As there was now an English population, although it was only one-eighth of the European population of the colony, it was thought that some, at least, of the Dutch institutions might be replaced by English; and on the recommendation of this commission changes tending to assimilate the Cape system of administration to that of other British colonies, were introduced. The arbitrary powers of the governor had been limited before by the constitution of an (official) executive council in 1825; but now his salary and those of all officials were reduced and, while the cost of the administration was lessened, its efficiency was increased. Ordinances were issued, and the proceedings of the law courts conducted, in English. The Dutch system of local government was replaced by an English system in which the *heemraden* (courts of principal inhabitants) disappeared, and the judicial and administrative duties of the landrost were assigned respectively in each district to a resident magistrate and a civil commissioner. Further, in view of the evidence recorded by the royal commissioners on the condition of the Hottentots, and the powerful pleading of the missionaries, the new governor, General Bourke, under instructions from the British government, issued in 1828 an ordinance which removed the free non-European population from the operation of the special laws hitherto applicable to them, and placed them on an equality in point of law with the Dutch and English colonists. These changes were of doubtful expediency. The virtual introduction of English as the official language was premature in view of the large preponderance of Dutch colonists; although it must be remembered that the more enlightened Dutch were perfectly conversant with it, while to the backward and Taal-speaking majority the Dutch of Holland was as strange as English. The Hottentot ordinance was felt to be an unjustifiable interference on the part of the British government. For, while the abstract justice of the principle of racial equality was not disputed, the colonists knew—what the people of England at that time did not know—that before the principle could be applied successfully, the non-European must have acquired an elementary knowledge of the laws of civilized life; and that without this knowledge his freedom was as harmful to himself as it was dangerous to his European neighbours. This enactment reveals the greatest of the special difficulties which together made the administration of Cape Colony a more complex and arduous task than any similar undertaking of the British nation. They were: (1) The long separation of the preponderant European population from intercourse with Europe. (2) The division of the colonists into two nationalities. (3) The fact that the possession of the sub-continent was disputed by the Bantu, who, greatly outnumbering the colonists, so far from weakening by contact with civilization, increased both in numbers and military capacity. (4) The accentuation of the differences in the Dutch and British attitudes towards the African natives by missionary enterprise, as the exponent of the humanitarian sentiment of the early 19th century. As these difficulties were imperfectly understood in England, "divergences of opinion" between the governor and the secretary of State were of frequent occurrence.

**The Emancipation Act (1833).**—The inherent justice of the measure which, in Lord Brougham's words, dissipated throughout the British dominions "the wild and guilty fantasy that man can hold property in man," was recognized in Cape Colony; but, while there was no such complete destruction of industry as in the West Indies, a very severe strain was put upon the resources of the small community of some 60,000 colonists. The immediate monetary loss of approximately £2,000,000 was not confined to the actual slave-owners, but fell also upon investors in this form of property, who in some cases were reduced to absolute penury. For some time agriculture and stock-raising, almost the sole industries, were dislocated; since it was found

difficult to replace the slaves by free labour within the period provided by the Act, which in the case of Cape Colony ran from Dec. 1, 1833 to Dec. 1, 1838. When the colonists had just begun to adapt their concerns to the economic situation thus created, they were overtaken by a more violent catastrophe. On the last day of 1834, news, which had taken five days to come hot-haste, reached the new governor, Sir Benjamin Durban, at a party which he was giving on New Year's eve. On Christmas Day the Kaffirs had swept across the frontier, murdering the farmers, plundering and burning their farmsteads and driving off their cattle. When, after more than six months' hard fighting, the British regulars, aided by all the able-bodied colonists, Dutch and English, had driven back the Bantu invaders, Sir Benjamin made a new and more secure disposition of the eastern frontier. By treaty with the chiefs (Sept. 1835) the Kaffirs were to withdraw eastward to the line of the Kei river. The country between the Fish and Keiskamma rivers was to be given to those settlers whose losses had been most severe, but subject to their personal occupation of their holdings. Eastward of this belt, between the Keiskamma and the Kei, a belt of friendly Kaffirs, with military posts, was to be placed. The responsibility of the colonial government for the losses thus incurred—the official returns showed that 456 farmsteads had been completely, and 350 partially, destroyed—was aggravated in the eyes of the colonists by the circumstances that normal defensive measures had been postponed in deference to the emphatic assurances of the peaceful intentions of the Kaffir chiefs, given by Dr. Phillip, the very influential general superintendent of the London Missionary Society's missions in South Africa. In any case, however, Sir Benjamin recognized that the frontier farmers were entitled to compensation. These proposals were forwarded to London for the approval of the home government. The reply, which came in a despatch written on Dec. 26, 1835, by Charles Grant (afterwards Lord Glenelg), was of a very unexpected nature. In it, the opinion was expressed that the long continued encroachments of the colonists amply justified the warlike action of the Kaffirs; and in accordance with this opinion Sir Benjamin was instructed to reinstate the Kaffirs in the territory which they had given up. So far from giving compensation to the colonists, all grants of land east of the Fish river made since 1817 were to be cancelled. The despatch seemed incredible, and Sir Benjamin protested. He was recalled and superseded by Sir George Napier (1837). The position of the frontier settlers seemed intolerable.

**The Boer Secession (1835–38).**—The longstanding grievances of the Dutch colonists, arising from the inherent difference between the Dutch and British attitudes towards the natives, were brought to a head by this despatch. In the year following (1836) there began the withdrawal from the colony of the Dutch farmers, or Boers (to give them the name which they subsequently made famous), known as the Great Trek. The motives which led them to divest themselves of their allegiance to the British government, and seek new homes in the regions beyond the Orange river, were stated at length in a document signed by their leader, Piet Retief, and published in the *Grahamstown Journal* of Feb. 2, 1837. But the less lengthy account contributed by Retief's niece (Mrs. Steenekamp) to the *Cape Monthly Magazine* of Sept. 1876, is probably not less authentic.

"The reasons for which we abandoned our lands and home-steads, our country and kindred, were the following:—

"1. The continual depredations and robberies of the Kaffirs, and their arrogance and overbearing conduct; and the fact that, in spite of the fine promises made to us by our government, we, nevertheless, received no compensation for the property of which we were despoiled.

"2. The shameful and unjust proceedings with reference to the freedom of our slaves; and yet it is not so much their freedom that drove us to such lengths, as their being placed on an equal footing with Christians, contrary to the laws of God and the natural distinction of race and religion, so that it was intolerable for any decent Christian to bow down beneath such a yoke; wherefore we rather withdrew in order thus to preserve our doctrines in purity."

The population thus withdrawn numbered from 7,000 to 10,000 persons. The epic of the *Voortrekkers* is to be found under the title SOUTH AFRICA, UNION OF. It will suffice to add that the communities to which they gave birth, the Transvaal and Orange Free State, were recognized by the British government as (internally) independent republics respectively under the Sand River (1852) and Bloemfontein (1854) conventions. Natal was occupied also by the Boers; but there, on account of its maritime situation and earlier occupation by Englishmen, British authority, established in 1843, was maintained; and during the years 1845–48 it was administered as a part of Cape Colony.

**The Defence of the Frontier.**—The penetration of the Bantu area by the Boers, together with the insecurity in which the eastern frontier of the colony had been left by the reversal of Durban's plans for its defence, made the 20 years 1834–54 a period of recurrent and onerous native wars. In the course of them, large numbers of British soldiers lost their lives, and the heavy military expenditure incurred was borne almost entirely by British tax-payers. At the same time, the progress of Cape Colony, as compared with that of other British colonies, was regarded as most inadequate. In these circumstances the British government determined to reduce their financial responsibilities to the lowest point compatible with the discharge of the political obligations from which they could not well escape. The measures by which it was sought to give effect to this "non-intervention" policy were these: The independence of the Boer republics was recognized; a native territory, named British Kaffraria, was formed to act as a "buffer state" between the colony and the military Bantu; and, outside these territories and Natal, the Boers, the missionaries, and the natives were told that they must settle their differences in their own way. As a complementary measure, a more liberal constitution was to be granted to the colony, and it was hoped that with the privileges of self-government the colonists would assume its responsibilities, notably the protection of their eastern frontier. Although a legislative council, with (nominated) unofficial members, had been added to the executive council in 1834, the system of representative government thus set up, gave the people of the colony for the first time in its two centuries of existence an appreciable part in the management of its affairs. The executive officials were still appointed by the governor, as representing the Crown, instead of being chosen by the electors, and they were, therefore, responsible to him for their conduct of affairs, and not to the people of the colony. But while the executive power was thus retained, the legislative power was vested, subject to the customary reservations in favour of the Crown, in a parliament of which both chambers, the legislative council and the house of assembly, were elected by all British subjects, irrespective of nationality or race, possessed of certain minimum qualifications of property or income. This parliament met for the first time on June 30, 1854. In spite of war and drought, arbitrary governors and ill-informed secretaries of state, from the beginning of British rule onwards, the internal administration had been honest, impartial, and efficient, and the colony had at length begun to prosper. The Dutch colonists lost by the great trek had been replaced by some 5,000 new British settlers of whom the great majority were brought out under a state-aided scheme of the colonial government in 1846–48. The population had risen to 350,000, of whom 140,000 were European and 210,000 non-European. The revenue approached £400,000, and the annual value of the external trade £3,000,000. Of the exports, £800,000 in annual value, two-thirds were wool. In 1844 the system of roads, which Sir Harry Smith (Gov. 1847–52) declared "would do honour to a great nation instead of a mere dependency of the Crown," was projected by the colonial secretary, John Montagu, and executed by Col. Mitchell and Andrew Bain; and in this and other respects the colony was being equipped with national plant. In 1852 the first-fruits of the hidden mineral wealth of the sub-continent were reaped in the copper mines of Ookiep. At the same time, changes were made in England. Under the colonial policy of Lord Grey the largest practicable measure of self-government was granted to the rapidly developing Pacific colonies, and on the outbreak

of the Crimean War the colonial department was transferred from the war office in 1854, and, reorganized as the colonial office, was placed under a separate secretary of state.

**Under Representative Government.**—With the grant of representative institutions the long tradition of military governors was broken by the appointment of Sir George Grey (1854-61) (*q.v.*). After four years in the colony, Grey realized that the non-intervention policy, being based upon imperfect information, was calculated not to remove but to aggravate the inherent difficulties of South African administration. His conclusions, accompanied by remedial proposals, were communicated to the colonial secretary in a luminous despatch (Nov. 19, 1858); but his advice was rejected and he himself recalled and subsequently reinstated on condition of his strict observance of the policy which had been laid down. Though thwarted and censured, he did good service to England and to the colony. The wheels of the new constitution ran smoothly under his guidance. That was to be expected. A greater and more original service was the institution of the humane and efficient methods of treating the Bantu, which were to make the native policy of the mother colony a model and inspiration for the newer states of South and South-Central Africa. Grey's plans went beyond the mere military defence of the frontier. He realized that sooner or later European supervision must be established over the whole of the Bantu population; and he feared that if this necessary task was postponed too long, the Bantu peoples might unite in a common, and much more serious, effort to challenge the European occupation of South Africa. His wider proposals for averting this danger—the union of the Boer republics with the British colonies by a federal tie, and the placing of British residents among the Zulus—were rejected, but he could, and did, act in this sense within the sphere of his governorship. Before his arrival a British officer had exercised control in British Kaffraria through the chiefs. Grey broke down the power of the chiefs by purchasing from them by monthly stipends the right to inflict fines and punishments, and then introduced European magistrates to administer justice. To raise the natives in the scale of civilization, he established schools and encouraged the substitution of individual ownership for the tribal tenure of land. And by introducing a knowledge of medicine through the hospitals he set up he caused the witch-doctors, who were the instruments of the chiefs' cruelty and cupidity, to become discredited.

To the depreciatory estimate of the country formed in England he replied: "Her Majesty's possessions in South Africa are of great and increasing value." His assurance was quickly justified. In 1870, little more than ten years later, in the desert plains beyond the northern boundary of the colony were found the craters and pipes of the extinct volcanoes which hold the diamonds of Kimberley.

**Responsible Government.**—The establishment of the diamond industry materially altered the attitude of England to South Africa. The non-intervention policy was abandoned. In 1871 British authority, in disregard of the conventions with the Boers, was proclaimed over the diamond fields; and the new territory, Griqualand West, was subsequently (1880) incorporated into Cape Colony. In the meantime the sudden creation of an energetic and wealthy community at Kimberley had quickened the industrial and political progress of the colony. Within five years the revenue was more than doubled. By the time Cecil Rhodes (who had twice rescued the diamond industry from overwhelming disaster) was prime minister of the Cape (1890), the annual value of the exports of the colony had risen to £7,000,000, and of this total the diamond export provided more than half. The change from representative to responsible government was effected in 1869-72; and on the strength of the increasing revenue the first premier, Mr. (afterwards Sir John) Molteno, was able to begin an extensive programme of railway construction by which the two chief towns, Cape Town and Port Elizabeth, were connected, and the inland districts brought into direct railway communication with the ports. The change in the constitution was not advocated by the Dutch, but by the more progressive of the British colonists. None the less, the Dutch majority in Cape

Colony, when once conscious of their power, became a factor of increasing influence in the policies and events by which the subsequent history not merely of the colony itself, but of South Africa as a whole, was determined.

**European Supremacy.**—In 1876, Grey's anticipation of a common effort by the Bantu to contest possession of the country with the Europeans was realized. There were then in South Africa some 320,000 Europeans (of whom 220,000 were in Cape Colony) scattered over an area larger than France and Germany combined, with 1,200,000 natives within, and 2,000,000 without, the two Boer republics and the British territories. A rapid succession of events showed (in words used by a deputation of Cape merchants to Lord Carnarvon, the colonial secretary, on Oct. 26) "how very slender was the plank between the colonists and the great deep of savagery and barbarism in South Africa." To meet this danger, Lord Carnarvon sought to apply Grey's rejected remedy of 20 years before, the re-union of the Europeans by confederation. His first proposals (1875) were received coldly by the Molteno ministry, but in the autumn of 1876 he decided to annex the Transvaal, and to appoint an administrator of the highest capacity to the governorship of the Cape, Sir Bartle Frere (*q.v.*). Frere (1877-80) established the supremacy of the Europeans by the subjugation of the Zulus, the flower of the military Bantu, in 1879, but he failed to carry through confederation. The causes of his failure are significant. Frere, like Durban, was censured and (partially) superseded (1879); and, as happened to Durban, the man by whom he was superseded—Lord Wolseley (*q.v.*)—subsequently gave generous testimony to the correctness of his policy in South Africa.<sup>1</sup> The displeasure of the home government materially increased the difficulty of Frere's task, but the immediate cause of his failure was the action of the Dutch majority in Cape Colony. The necessary first step towards confederation was a conference of the South African governments concerned. Frere had been so far successful in promoting Lord Carnarvon's policy, that in the Cape general election of 1878 a ministry pledged to support confederation was placed in office; and in the following year the ministry framed definite proposals for holding the conference, to be laid before parliament at its next session. When the Cape parliament assembled in 1880, in England, Mr. Gladstone's government had succeeded that of Lord Beaconsfield; but contrary to the expectation of the Boers it had decided on May 12 that the Transvaal was to remain under British rule. On the announcement of this decision, Mr. (afterwards President) Paul Kruger secured a pledge from all, or nearly all, of the Dutch supporters of Mr. (afterwards Sir Gordon) Sprigg in the house of representatives to vote against the conference proposals on the ground that confederation ought to be postponed until the republic was restored. The ministry, to avoid certain defeat, withdrew their proposals; and directly their action was known (officially) in London, Frere was recalled (July 29). As Grey had foreseen, the isolation of the Boer states had not prevented the Dutch subjects of the Crown from "acting in unison . . . in a great national question" with their republican kinsmen.

**The Retrocession of the Transvaal.**—On Dec. 16, 1880, the Transvaal Boers rose in arms. The British were heavily defeated at Majuba Hill (Feb. 26, 1881), and on March 26 peace was made on the assurance that the republic, under British suzerainty, would be restored within six months. President Brand had informed the Cabinet that he could no longer hold back the Free State burghers from joining the Transvaal insurgents, and the Dutch in Cape Colony had declared openly their sympathy with their kinsmen. The retrocession was in direct conflict with the advice which Frere had given to the British government up to June 1879, when the Transvaal was removed from his jurisdiction and placed under Lord Wolseley, and subsequently in connection with affairs in Cape Colony. Frere held, and advised the colonial secretary, that although the expediency of the annexation was questionable, British authority, once established, must be maintained. Apart from the obligations incurred to the natives, and to

<sup>1</sup>In a letter of June, 1902, to Sir George Arthur. "Life of Lord Wolseley," by Gen. Sir F. Maurice and Sir George Arthur, p. 131.

the non-Boer European population which had settled in the country since the annexation *because* British rule had been established, and in the belief that it would continue, the problem of the Transvaal was part of the larger problem of South Africa. Reliance on mere force, he wrote, would be useless; the Boers must be won by a prompt and generous measure of self-government, such as he had proposed when visiting the Transvaal (March 15–May 6, 1879). Either reliance on mere force, or the withdrawal of British authority, would strain to the breaking point the loyalty of the Dutch in Cape Colony.

**The Afrikaner Bond.**—The period of 18 years between the retrocession and the South African War (Oct. 11, 1899–May 31, 1902) was marked by the occupation by Germany of South-west Africa; by the establishment of direct British authority (exercised through the high commission) over the Bantu peoples outside the European states; by the acquisition and settlement of large territories in South-central Africa by the chartered company founded by Rhodes in 1889; by the expansion of Cape Colony eastward to Natal and northwards to the Bechuanaland protectorate; by the establishment of the gold industry in the Transvaal, and the foundation of Johannesburg in 1886; and by the rapid development of the industries, railways, and material equipment of the sub-continent, under the stimulus of gold discovery, accompanied by an appreciable increase of the mainly urban British population. In the political events of this period the soundness of the advice tendered by Frere in respect of the Transvaal, and on other South African questions, was amply demonstrated. On April 7, barely a fortnight after Gen. Joubert had accepted the British promise to restore the republic, Carl Borckenhausen, a German republican and editor of *The Bloemfontein Express*, published in that paper the manifesto of a political organization, styled the "Bond" and originally founded in Cape Colony in 1879. The first paragraph ran:

"The Afrikaner Bond has as final object what is summed up in its motto, 'Africa voor de Afrikaners.' The whole of South Africa belongs by just right to the Afrikaner nation. It is the privilege and duty of every Afrikaner to contribute all in his power towards the expulsion of the English usurper. The States of South Africa to be federated in one independent republic. The Afrikaner Bond prepares for this consummation."

Then followed the "argument in justification." While the creed of the Dutch nationalists was advocated in this form in the republics, in Cape Colony the programme was modified in 1883, under the guidance of Mr. J. H. Hofmeyr, by the omission of all expressions inconsistent with allegiance to the British Crown from the official constitution. In 1884 the Bond secured the return of 25 members of the Cape parliament. From that date onwards to the outbreak of the South African war in 1899, Hofmeyr, although he refrained from putting a Bond ministry in office, by making it impossible for any ministry to be formed without Bond support exercised a general control over the policy of the colonial executives. In 1886 the Bond met for the first (and only) time as an inter-state organization at Bloemfontein; and, as the result of disagreements then manifested between the respective representatives of the Transvaal, the Free State, and the Cape, from 1887 onwards the Afrikaner Bond was developed in Cape Colony as a colonial rather than an inter-state organization.

There was a side of the Bond which appealed to Rhodes, who, born of a land-owning and farming stock, in all his large industrial and financial enterprises never neglected the interests of the country population. In 1883 the Farmers' Protection Association had been amalgamated to the Bond, for Hofmeyr, who was also interested in the development of the country districts, sought the co-operation of the more progressive British farmers in his plans for the improvement of the agriculture of the colony. Apart from this, Rhodes and Hofmeyr found common ground in the desire that South African ideas should prevail in the administration of South Africa. Rhodes never wavered in his loyalty to the British connection; but he recognized the faultiness of a system under which the cardinal questions of South African administration were left to be decided by the House of Commons, a body unfamiliar

with the country and its peoples, whose judgment was often warped by irrelevant considerations of English party politics. In this sense he advocated "the elimination of the Imperial factor." Hofmeyr probably never ceased to desire Dutch supremacy in South Africa, whether under the British or a republican flag. But there was much useful work which each desired to accomplish, that could be accomplished in common, and yet leave each of them free to choose the path—republican or imperial—by which the final goal of South African unity was to be attained. In 1890 Rhodes, with Bond support, became prime minister of the colony; and the Rhodes-Hofmeyr alliance, tending materially to draw together the Dutch and British colonists, worked well until Rhodes's complicity in the Jameson raid (Dec. 29, 1895–Jan. 2, 1896) brought about its violent disruption in 1896. At the time Joseph Chamberlain (*q.v.*), who a few months before had become colonial secretary, was preparing to press President Kruger to grant the franchise to the British population whom the gold industry had brought into the Transvaal. The reaction in Cape Colony against Rhodes, and in favour of Kruger, which followed the raid, materially increased the difficulty of his task. In spite of the prompt and full reparation made by the British Government to the Transvaal, the Bond went back to the policy of 1881; and in view of the increasing seriousness of the situation a man of exceptional ability, Alfred (afterwards Lord) Milner (*q.v.*), was appointed governor of the Cape and high commissioner in 1897. In the year following the Sprigg ministry, which in 1896 had succeeded the Rhodes ministry, came into conflict with the Bond. It was replaced (Oct. 17) by a ministry, pledged at the hustings to prevent British intervention in the Transvaal, in which Mr. Philip Schreiner was prime minister.

**The Boer War and After.**—As high commissioner, Milner was the agent and adviser of the British Government. As governor of the colony, he acted only by, and with, the advice of his ministers. The aim of the Schreiner ministry, with whom rested the disposal of the colonial forces, was to oppose British intervention in the Transvaal, and in the event of war to keep the colony "neutral." As high commissioner, Milner advised the

FROM W. B. WORSFOLD, "HISTORY OF SOUTH AFRICA"

**MAP SHOWING THE EXTENSION OF THE EASTERN BORDER OF CAPE COLONY**

The Great Fish river formed the eastern border at the outset of British colonization, 1806, but successive conflicts with the Bantu peoples extended it first to Keiskamma river and then to the Kei river. In 1871, after the discovery of the Kimberley diamond fields, it was extended to Natal

British Government (May 4, 1899) that "the case for intervention was overwhelming." As governor of the colony, he was unable (Aug. 5) to call out the volunteers and take other measures for the protection of the north-eastern frontier; while a consignment of 500 Mauser rifles and 1,000,000 cartridges passed without his knowledge (July 15) through the colony to the Free State. In these circumstances it needed not only a clear intellect and high resolution but a sympathetic imagination to maintain tolerable relations between himself and the ministry during the four months of abortive negotiations which preceded the war.

As it was, on the outbreak of hostilities (Oct. 11) between the Boer Republic and Great Britain, five districts in the north-west of the colony went over to the Free State, and nine-tenths of the Dutch farmers in Bechuanaland joined the Transvaal. Four months later Milner wrote to the secretary of state (Jan. 16, 1900): "Not less than 10,000 of those now fighting against us in South Africa, and probably somewhat more, either are, or till quite recently were, subjects of the Queen." (For the history of this contest, in which the presages of Grey and Frere were lamentably fulfilled, see SOUTH AFRICAN WAR and SOUTH AFRICA, UNION OF.)

In the course of the war the members of the Schreiner cabinet were divided on the question of the treatment of the Cape rebels; and on Schreiner's resignation, a new ministry, under Sir G. Sprigg, took office (June 19, 1900). On Feb. 28, 1901, Lord Milner left Cape Town to take up his appointment as governor of the Transvaal and Orange River colonies. He was succeeded by Sir W. Hely-Hutchinson as governor of Cape Colony, but retained the high commission, which was thus separated for the first time from the governorship of the Cape. In the same year a new party, styled the "Progressive," was formed in the colony, of which, on the death of Rhodes (March 26, 1902), Dr. (afterwards Sir Starr) Jameson became leader. After the war was ended (May 31, 1902) a Progressive ministry, with Jameson as prime minister, was placed in power by the general election of Feb. 1904; and this ministry was succeeded, on the defeat of the Progressives at the polls by the South African party, by the ministry of Mr. J. X. Merriman in 1908. In the meantime, the four colonies, which had barely emerged from a ruinous conflict in arms, were confronted by the prospect of an economic war scarcely less injurious. In 1906 the Customs Union, instituted in 1903, failed to adjust the financial and industrial interests of the four separate governments, and it seemed that a disastrous competition in tariffs and railway rates for the trade of the Rand could be averted only by a common administration. The first step towards this long-sought goal of South African statesmanship was taken by Jameson, as prime minister of Cape Colony, when on Nov. 28, 1906, he formally requested Lord Selborne (by whom Lord Milner had been succeeded in 1905) to "review the situation." The response was the federation memorandum of 1907, in which the high commissioner, availing himself of the work of Mr. Lionel Curtis and other advocates of "closer union," trenchantly demonstrated the impossibility of settling the outstanding disputes on fiscal and railway questions by any other method than the administrative union of the four colonies concerned in them. The Merriman ministry was equally in favour of closer union, and in 1908 the national convention met at Durban. On Sept. 20, 1909, the South Africa Act, of which the draft had been completed at Bloemfontein on May 11, received the royal assent; and on May 31, 1910, Cape Colony became Cape Province in the Union of South Africa. At that date the colony had a population of 2,563,024, of whom 583,177 were European and 1,545,308 non-European; and it thus contributed nearly one-half of both the European (1,278,025), and the total (4,061,082) population of the union. (See SOUTH AFRICA, UNION OF, AFRICA, AND RHODESIA.)

**BIBLIOGRAPHY.**—Place of publication is London, unless otherwise stated. The British official publications are voluminous, and, in the absence of a *catalogue raisonné*, involve lengthy research, since important historical material is contained under unrelated headings. E.g. the circumstances of Hendrik Potgieter's conflict with the Matabele Zulus in 1836-37 are to be found in the record of the negotiations for the Convention of London in 1883-84. For the general scope of these publications see the annual *Dominions and Colonial Office List*. The Cape government publications are also valuable and are to be found in the library of the D. and C. office. For accounts of contemporary writers, special subjects, and all purposes, see Mendelssohn (S), *South African Bibliography*, illus. (1910).

H. C. V. Leibbrandt, *Archives of the Cape of Good Hope* (Cape Town, 1896-1902); *The Rebellion of 1815 . . . Slachter's Nek* (Cape Town, 1902). Annexure D., extracts from *Court Calendar* (1815) gives names, etc., of central and local officials—almost entirely Dutch—throughout the colony. G. M. Theal, *History and Ethnography of Africa South of the Zambezi, 1505-1795*; *History of South Africa since 1795* (1908). As corrective of Theal's anti-British tendencies,

J. Cappon, *Britain's Title in South Africa* (1901). The author, a Canadian professor, points out that Theal had the assistance of F. W. Reitz, afterwards president of the Free State and state-secretary of the South African Republic in 1899. Sir G. E. Cory, *The Rise of South Africa from the earliest times to 1857*, 6 vols., 4 published up to 1926. W. B. Worsfold, *Lord Milner's Work in South Africa, 1897-1902* (1906) gives full account of Milner's relations with the Schreiner ministry and the home government. *The Reconstruction of the New Colonies under Lord Milner, 1902-1905* (1913) gives account of part played by Cape Colony in the events leading to the constitution of the Union of South Africa. Both books were written in close collaboration with Lord Milner. *Biographical*.—G. C. Henderson, *Sir George Grey* (1907); J. Martineau, *Sir Bartle Frere* (1895); W. B. Worsfold, *Sir Bartle Frere* (1923) contains private correspondence between Frere and Sir M. Hicks Beach (Lord St. Aldwyn); Sir A. Hardinge, *Lord Carnarvon* (4th earl of) (1925); P. A. Molteno, *Sir John Molteno* (1900); B. Williams, *Cecil Rhodes* (1921); Ian Colvin, *Sir L. S. Jameson* (1922); Eric Walker, *Lord de Villiers* (1925). (W. B. W.)

**CAPEFIGUE, JEAN-BAPTISTE HONORÉ RAYMOND** (1801-1872), French historian and biographer, was born at Marseilles. The general catalogue of printed books for the Bibliothèque Nationale contains no fewer than 77 works (145 volumes) published by him during 40 years. Of these the most important are the *Histoire de Philippe-Auguste* (4 vols. 1829), and the *Histoire de la réforme, de la ligue et du règne de Henri IV.* (8 vols. 1834-35).

**CAPE GIRARDEAU**, a city of Cape Girardeau county, Missouri, U.S.A., on the bluffs of the Mississippi river, 131m. S.S.E. of St. Louis. It is on Federal highway 61, and is served by the Frisco railway, river steamboats and barges and a ferry to Thebes, Illinois. In 1900 the population was 4,815; in 1920, 10,252 (90% native white); and in 1930 was 16,227 by the Federal census. There are extensive hardwood forests in the neighbourhood, and deposits of marble, lime, sandstone, iron, silica and pure white clay. The leading manufactures are shoes, cement and lumber products, and the total factory output in 1925 was valued at \$15,526,626. The Southeast Missouri State Teachers' college, established as a normal school in 1873, occupies massive buildings of native limestone in a picturesque setting high above the river. It has a fine collection of local Indian relics, assembled and presented by Thomas Beckwith (d. 1913) of Charleston, Missouri. Cape Girardeau was founded in 1793 by Louis Lorimier, a French Canadian, and was named after another early trader. Under Spanish dominion it was an important military and trading post, and it was the site of a fort in the Civil War. The city was incorporated in 1843. It has a commission form of government.

**CAPEK, KAREL** (1890- ), Czech dramatist and novelist, born at Malé Svatonovice, in Bohemia (Czechoslovakia), is perhaps best known as the author of the successful play *R.U.R.* (1920; Eng. trans. 1923), in which he satirizes the mechanical tendencies of modern civilization, and *The Life of the Insects* (1921; Eng. trans. 1923), a spectacular play written in collaboration with his brother Josef, and satirizing various phases of modern society. He also attracted much attention with the *Makropulos Affair* (1922), a play dealing with longevity. Of his fiction the best is contained in *Painful Tales*, a collection of short stories which deserve comparison with Maupassant, and in his two novels, *The Manufacture of the Absolute* (1923), and *Krakatit* (1924, Eng. trans. 1925). He wrote a brilliant series of feuilletons, *Letters from England* (1924; Eng. trans. 1925), *Letters from Italy* and *Concerning the Nearest Things* (1926).

**CAPEL (of HADHAM), ARTHUR CAPEL, BARON** (fl. 1640-1649), English royalist, son of Sir Henry Capel of Rayne Hall, Essex, was elected a member of the Short and Long Parliaments in 1640 for Hertfordshire. He at first supported the opposition, but went over to the king's party and was raised to the peerage on Aug. 6, 1641. On the outbreak of the civil war, he was appointed lieutenant-general of Shropshire, Cheshire and North Wales, and was a commissioner at the negotiations at Uxbridge in 1645. He attended the queen in her flight to France in 1646, but disapproved of the prince's journey thither, and retired to Jersey, subsequently aiding in the king's escape to the Isle of Wight. He was one of the chief leaders in the second Civil War. On Aug. 27, together with Lord Norwich, he surrendered to Fairfax

at Colchester on promise of quarter for life, an assurance which the civil authorities declared not to be binding on themselves. He succeeded in escaping from the Tower, but was again captured, was condemned to death by the new "high court of justice" on March 8, 1649, and was beheaded, together with the duke of Hamilton and Lord Holland, the next day.

Lord Capel's *Daily Observations or Meditations: Divine, Morall*, published with some of his letters in 1654, was reprinted, with a short life of the author, under the title *Excellent Contemplations*, in 1683.

**CAPEL CURIG** (kăp'əl kŭ'rīg or kŭ'rēch), a small tourist centre in Carnarvonshire, North Wales. Population of parish (1921) 359. It lies 6m. W. of Bettws-y-Coed, near the confluence of the Gwryd and the Llugwy, in some of the wildest mountain scenery of North Wales, and forms a convenient centre for ascending Snowdon, the Glydyrs and the Carnedd. Moel Siabod rises immediately to the south.

**CAPELL, EDWARD** (1713-1781), English Shakespearian critic, was born at Troston Hall in Suffolk, and became deputy-inspector of plays in 1737. In 1760 appeared his *Prolusions, or Select Pieces of Ancient Poetry*, a collection which included *Edward III.*, placed by Capell among the doubtful plays of Shakespeare. Shocked at the inaccuracies which had crept into Sir Thomas Hanmer's edition of Shakespeare, he projected an entirely new edition to be carefully collated with the original copies. After spending three years in collecting and comparing scarce folio and quarto editions, he published his own edition in 10 vols. 8vo (1768), with an introduction written in a style of extraordinary quaintness, which was afterwards appended to Johnson's and Steevens's editions. Capell published the first part of his commentary, which included notes on nine plays with a glossary, in 1774. This he afterwards recalled, and the publication of the complete work, *Notes and Various Readings of Shakespeare* (1779-83), the third volume of which bears the title of *The School of Shakespeare*, was completed in 1783, two years after the author's death. Besides the works already specified, he published an edition of *Antony and Cleopatra*, adapted for the stage with the help of David Garrick in 1758.

**CAPELLA, MARTIANUS MINNEUS FELIX**, Latin writer, according to Cassiodorus a native of Madaura, in Africa, flourished during the 5th century, certainly before the year 439. He appears to have practised as a lawyer at Carthage. His curious work, entitled *Satyricon*, or *De Nuptiis Philologiae et Mercurii et de septem Artibus liberalibus libri novem*, is an allegory written in a mixture of prose and verse. The style is involved, loaded with metaphor and verbose. The first two books contain the allegory proper—the marriage of Mercury to a nymph named Philologia. The remaining seven contain expositions of the seven liberal arts, represented as courtiers of Mercury and Philologia. The work was an encyclopaedia of the culture of the time, and was in high repute during the middle ages. The author's chief sources were Varro, Pliny, Solinus, Aquila Romanus, and Aristides Quintilianus. His prose resembles that of Apuleius, but is even more difficult. The verse portions are in imitation of Varro and are less tiresome. A passage in book viii. contains a clear statement of the heliocentric system of astronomy. It has been supposed that Copernicus, who quotes Capella, may have received from this work some hints towards his own new system.

Editio princeps, by F. Vitalis Bodianus (1499); the best modern edition is that of F. Eyssenhardt (1866); for the relation of Martianus Capella to Aristides Quintilianus see H. Deiters, *Studien zu den griechischen Musikern* (1881). In the 11th century the German monk, Notker Labeo, translated the first two books into Old High German.

**CAPELLA**, the fifth or sixth brightest star in the sky, and the brightest star in the constellation Auriga (*q.v.*) hence its alternative name  $\alpha$  Aurigae. It was found to be a spectroscopic binary by Newall and Campbell (*see* STAR), and the separation of its two components (*q.v.*) was first directly measured in 1919 with Michelson's interferometer (*q.v.*) in conjunction with the 100-in. telescope on Mt. Wilson. The spectrum (*see* SPECTROSCOPY) of Capella closely resembles that of the sun.

**CAPELLO, LUIGI** (1859- ), Italian soldier, was born on April 14, 1859. His career until he became a general officer was passed in the infantry. During the World War he conducted

in Aug. 1916 the attack which led to the capture of Gorizia. As commander of the Gorizia zone II. (VIII., VI. and II. Corps) he conducted the first phase of the Italian offensive in May 1917. In June he was given command of the II. Army and in August he directed the attack on the Bainsizza plateau, but his desire to continue the attack led to differences with Cadorna, his commander-in-chief, who favoured a defensive disposition. It is probable that Capello's faith in his own method of meeting the enemy counter-attack prevented his whole-hearted co-operation with Cadorna. After his retirement in July 1918 he took some part in politics and supported Fascism but later joined the Opposition and, in Nov. 1925, was arrested on a charge of complicity with Zaniboni in the plot against the life of Mussolini. He was tried and condemned to 30 years' penal servitude.

**CAPE MAY**, a city of Cape May county, New Jersey, U.S.A., a popular summer resort on the Atlantic coast, 2m. E.N.E. of the southern tip of the State. It is served by the Pennsylvania and the Reading railways. The permanent population in 1930 was 2,637. The principal part of the city occupies a peninsula between the ocean and Cold Spring inlet, which has been dredged and protected to make a harbour 25ft. deep. On the sea side, along a hard sand beach 5m. long, is the esplanade, bordered by hotels and cottages. The lighthouse on the cape, built in 1800 and rebuilt in 1859, is 145ft. high. There is a landing field for both hydroplanes and aeroplanes at the Coast Guard station on the inlet. The commerce of the harbour in 1925 amounted to 52,240 tons, largely fish, coal and ice. The city has sand plants, a vegetable cannery, a cement-block factory and gold-beating works. The fish, clam and oyster industry is important.

The cape was named after Cornelis Jacobus Mey, director of the Prince Hendrick (Delaware) river for the West India Company of Holland, who took possession of the river in 1623, and planted a short-lived colony (Ft. Nassau) 4m. below Philadelphia. The first permanent settlement here was made about 1699. It was an important whaling port early in the 18th century, and became prominent as a summer resort before 1800. Under the name of Cape Island it was incorporated as a borough in 1848 and chartered as a city in 1851. The name was changed in 1869. In 1924 a city-manager form of government was adopted.

**CAPENA**, an ancient city of southern Etruria, frequently mentioned with Veii and Falerii. According to Cato it was a colony of the former, and in the wars between Veii and Rome it appears as dependent upon Veii, after the fall of which town, however, it became subject to Rome. Out of its territory the *tribus Stellatina* was formed in 367 B.C. It stood on the lonely hill known as Civitucola, about 4m. N.E. of the post station of *ad Vicesimum* on the ancient Via Flaminia, on the north side of a dried-up lake, once a volcanic crater. Remains of buildings of the Roman period exist, while many tombs, especially of the 8th to 7th centuries B.C., have been found in the neighbouring hills.

See T. Ashby, *Memorie dell' Accademia Pontificia* ser. 3, vol. i. part ii, p. 153 sqq. (1924), for a full account of the site, with ref.

**CAPE OF GOOD HOPE**, the full name of the southernmost province of the Union of South Africa, formerly Cape Colony, now Cape Province; also the cape of the same name, forming the peninsula between Table Bay and False Bay, which eventually gave its name to the whole territory. *See* CAPE COLONY.

**CAPE PROVINCE**, formerly CAPE COLONY, the most southern part of Africa. As a British colony its official title was the Colony of the Cape of Good Hope, but it was known as Cape Colony. In 1910 it became a province of the Union of South Africa (*see* CAPE COLONY, and SOUTH AFRICA, UNION OF).

**CAPER, FLAVIUS**, Latin grammarian, flourished during the 2nd century. He devoted special attention to the early Latin writers, and is highly spoken of by Priscian. Caper was the author of two works, *De Lingua Latina* and *De Dubiis Generibus*, now lost; but two short treatises, *De Orthographia* and *De Verbis Dubiis*, have come down to us under his name, probably excerpts from the original works, with later additions by an unknown writer.

See F. Osann, *De Flavio Capro* (1849), and review by W. Christ in *Philologus*, xviii. 165-170 (1862), where several editions of other im-

portant grammarians are noticed; C. Keil, "De Flavio Grammatico," in *Dissertationes Halenses*, x. (1889); text in H. Keil's *Grammatici Latini*, vii.

**CAPERCAILLIE** (CAPERCAILLIE or CAPERCALLY), a bird's name derived from the Gaelic. The bird (*Tetrao urogallus*) became extinct in the British Isles about 1750, but was re-introduced in Scotland at the beginning of the 19th century and is now tolerably abundant. This species is widely, though intermittently, distributed on the Continent of Europe, from Lapland to the northern parts of Spain, Italy and Greece, but is always restricted to pine forests, which alone afford it food in winter. Its bones have been found in the kitchen middens of Denmark and the caves of Aquitaine. It inhabits the forests of a great part of Siberia. On the Stannovoi mountains, however, it is replaced by a nearly allied species (*T. urogalloides*), which is smaller with a slenderer bill, but longer tail.

The male, known as the mountain cock or cock of the woods, is remarkable for his large size and dark plumage, with the breast metallic green. He is polygamous, and in spring mounts to the topmost bough of a tall tree, whence he challenges all comers by extraordinary sounds and gestures; while the hens, which are much smaller and mottled in colour, abide below the result of the duels. The hen nests on the ground, and lays from seven to nine or even more eggs. The young are able to fly soon after they are hatched, and towards the end of summer, from feeding on the fruit and leaves of the bilberries and other plants, get into excellent condition and become good eating. With the first heavy falls of snow they betake themselves to the trees, and then, feeding on the pine-leaves, their flesh speedily acquires a distasteful flavour of turpentine. Hybrids are frequently produced between the capercaillie and the black grouse (*T. tetrix*).

**CAPERN, EDWARD** (1819-1894), English poet, was born at Tiverton, Devonshire, on Jan. 21, 1819, and died on June 5, 1894. From an early age he worked in a lace factory, and then became "the Rural Postman of Bideford," by which name he is usually known. He published *Poems*, by Edward Capern, (1856); *Ballads and Songs* (1858); *The Devonshire Melodist* (a collection of the author's songs, some of them to his own music) and *Wayside Warbles* (1865). He received a civil list pension from Lord Palmerston.

**CAPERNAUM**, on the northern shore of the sea of Galilee, Jesus' second home, a garrison town (Matt. viii. 5), a centre of administration (John iv. 46), and a customs station (Matt. ix. 9). Out of it Jesus called Peter, Andrew and Matthew (or Levi). It was the witness of many of his miracles and in its synagogue he delivered many of his discourses. It is of special interest that its name disappeared and its very site became a matter of debate (cf. Matt. xi. 23). Two possible identifications have long divided the interest and allegiance of investigators—*Tell Hüm* about 2½ m. W. of the Jordan's entry into the lake and *Khirbet el-Minyeh*, 2 m. W. of *Tell Hüm*. Excavations began at *Tell Hüm* in 1905 and conducted by the Franciscans have cleared the site of debris and made its identification with Capernaum certain.

**The Centurion's Synagogue.**—The remains of a synagogue have been disclosed and its plan established. It was a rectangular building (75 ft.×57 ft.) and was apparently oriented north at the first. It was entered by three doors from a platform on its south side. Built of coarse marble, its walls were ornamented externally with pilasters. An open court with covered porticoes on three sides and extending the entire length of the east side, had been added at a later date (prob. 4th century A.D.). In the interior a stylobate, a yard broad, raised 2½ in. from the floor and based on the south wall ran parallel to the walls and divided the synagogue into a nave, two aisles and a transept. It supported seven columns (Corinthian capitals) on each of its long sides with two additional between nave and transept, 16 in all. Above the aisles and transept was added at a later date (2nd or 3rd century A.D.) a gallery with Doric columns. Above each set of columns was a richly ornamented entablature. The lintels of the doors had been surmounted by a frieze from which the figures forming part of the design had been obliterated—probably through Pharisaic zeal about 66 A.D. *The Tebah* (chest) in which were kept the Books of the Law, was erected originally at the north end of the nave but

later, to meet the injunction to congregations to pray facing Jerusalem (2nd century A.D.) it was removed to the other end, close to the main door and across it. The platform fronting the façade was approached on its western side by three, and on its eastern by fourteen, steps. Their discovery has proved vital for identification. In the year 385 A.D., when Capernaum still bore its name, it was visited by Sylvia of Aquitania who mentions as a matter of interest that its synagogue is reached by many steps (*per gradus multos ascenditur* cf. Migne, *Patrol. Lat.* 173 p. 1,128). As this is the only synagogue discovered in Galilee of which that could be said, the existence of the steps proves indisputably that the synagogue of *Tell Hüm* was indeed that built by the Roman centurion who loved the Jewish nation (Luke vii. 5). As the synagogue was evidently destroyed by an earthquake and the stones lie mostly where they fell, its re-erection, which is purposed, should not be difficult.

**The Church of St. Peter.**—Sylvia and Antoninus Martyr (570) amongst others make mention of a church built on the site of Peter's house at Capernaum. Between the synagogue and the lake the ruins of an octagonal building covering a tessellated pavement have been exposed. By some this has been taken to be a forecourt of the synagogue, but it is much more likely that we have here the church built by Joseph of Tiberias in 330 A.D. (Epiphanius, *Adv. Haeres.* xxx. 4).

**BIBLIOGRAPHY.**—E. W. G. Masterman, "The Site of Capernaum," *Quart. Stat. Pal. Expl. Fund* (1907) 220 ff.; W. M. Christie, "Tell Hüm the Site of Capernaum" in *Glasgow Univ. Orient. Soc. Studia Semitica et Orientalia* (1920); B. Meisemann, *Capernaum et Bethsaida et l'âge de la synagogue de Tell Houm* (1921); G. Orfali, *Capernaum et ses ruines d'après les fouilles accomplies à Tell-Houm par la Custodie Franciscaine de Terre Sainte, 1905-1921* (1922).

**CAPERS**, the unexpanded flower-buds of *Capparis spinosa*, (family Capparidaceae) prepared with vinegar for use as a pickle. The caper plant is a trailing shrub, belonging to the Mediterranean region, resembling in habit the common bramble, and having handsome flowers of a pinkish white, with four petals, and numerous long tassel-like stamens. The leaves are simple and ovate, with spiny stipules. The plant is cultivated in Sicily and the south of France; and in commerce capers are valued according to the period at which the buds are gathered and preserved. The finest are the young tender buds called "nonpareil." Other species of *Capparis* are similarly employed in various localities.

**CAPET**, the name of a family to which, for nearly nine centuries, the kings of France, and many of the rulers of the most powerful fiefs in that country, belonged. The first of the family to whom the name was applied was Hugh, who was elected king of the Franks in 987. The real founder of the house, however, was Robert the Strong (*q.v.*), who received from Charles the Bald, king of the Franks, the countships of Anjou and Blois, and who is sometimes called duke, as he exercised some military authority in the district between the Seine and the Loire. According to Aimoin of Saint-Germain-des-Prés, and the chronicler, Richer, he was a Saxon, but historians question this statement. Robert's two sons, Odo or Eudes, and Robert II., succeeded their father successively as dukes, and, in 887, some of the Franks chose Odo as their king. A similar step was taken, in 922, in the case of Robert II., this, too, marking the increasing irritation felt at the weakness of the Carolingian kings. When Robert died in 923, he was succeeded by his brother-in-law, Rudolph, duke of Burgundy, and not by his son Hugh, who is known in history as Hugh the Great, duke of France and Burgundy, and whose domain extended from the Loire to the frontiers of Picardy. When Louis V., king of the Franks, died in 987, the Franks, setting aside the Carolingians, passed over his brother Charles, and elected Hugh Capet, son of Hugh the Great, as their king, and crowned him at Reims. Avoiding the pretensions which had been made by the Carolingian kings, the Capetian kings were content, for a time, with a more modest position, and the story of the growth of their power belongs to the history of France. They had to combat the feudal nobility, and later, the younger branches of the royal house established in the great duchies. The direct line ruled in France from 987 to 1328, when, at the death of King Charles IV., it was succeeded by the younger, or Valois, branch of the

family. Philip VI., the first of the Valois kings was a son of Charles I., count of Valois and grandson of King Philip III. (*See VALOIS.*) The Capetian-Valois dynasty lasted until 1498, when Louis, duke of Orleans, became king as Louis XII., on the death of King Charles VIII. (*See ORLEANS.*) Louis XII. dying childless, the house of Valois-Angoulême followed from Francis I. to the death of Henry III. in 1589 (*see ANGOULÊME*), when the last great Capetian family, the Bourbons (*q.v.*) mounted the throne.

Scarcely second to the royal house is the branch to which belonged the dukes of Burgundy. In the 10th century the duchy of Burgundy fell into the hands of Hugh the Great, father of Hugh Capet, on whose death in 956 it passed to his son Otto, and in 965, to his son Henry. In 1032 Robert, the second son of Robert the Pious, king of the Franks, and grandson of Hugh Capet, founded the first ducal house, which ruled until 1361. For two years the duchy was in the hands of the crown, but in 1363, the second ducal house, also Capetian, was founded by Philip the Bold, son of John II., king of France. This branch of the Capetians became connected with the Habsburgs, through the marriage of Mary, daughter of Charles the Bold, duke of Burgundy, with Maximilian, afterwards the emperor Maximilian I. Of great importance also was the house of the counts of Anjou, which was founded in 1246, by Charles, son of the French king Louis VIII., and which in 1360 was raised to the dignity of a dukedom. (*See ANJOU.*) Members of this family sat upon the thrones of two kingdoms. The counts and dukes of Anjou were kings of Naples from 1265 to 1442. In 1308 Charles Robert of Anjou was elected king of Hungary, his claim being based on the marriage of his grandfather Charles II., king of Naples and count of Anjou, with Maria, daughter of Stephen V., king of Hungary. A third branch formed the house of the counts of Artois, which was founded in 1238 by Robert, son of King Louis VIII. This house merged in that of Valois in 1383, by the marriage of Margaret, daughter of Louis, count of Artois, with Philip the Bold, duke of Burgundy. The throne of Navarre was also filled by the Capetians. In 1284 Jeanne, daughter and heiress of Henry I., king of Navarre, married Philip IV., king of France, and the two kingdoms were united until Philip of Valois became king of France as Philip VI. in 1328, when Jeanne, daughter of King Louis X., and heiress of Navarre, married Philip, count of Evreux. (*See NAVARRE.*)

In the 13th century the throne of Constantinople was occupied by a branch of the Capetians. Peter, grandson of King Louis VI., obtained that dignity in 1217 as brother-in-law of the two previous emperors, Baldwin, count of Flanders, and his brother Henry. Peter was succeeded successively by his two sons, Robert and Baldwin, from whom in 1261 the empire was recovered by the Greeks.

The counts of Dreux, for two centuries and a half (1132-1377), and the counts of Evreux, from 1307 to 1425, also belonged to the family of the Capets,—other members of which worthy of mention are the Dunois and the Longuevilles, illegitimate branches of the house of Valois.

**CAPE TOWN**, the oldest town of South Africa, 33° 56' S., 18° 25' E. Cape Town was built on a strip of low ground on the south-western shores of Table bay. To the south, immediately behind the town, rises Table mountain in a precipitous wall, 2 m. long, and over 3,500 ft. high at its highest point. Its eastern corner, Devil's peak, is 3,300 ft. high. (*See TABLE MOUNTAIN.*) An outlying arm of this barrier extends round on the north-west side of the city in Lion's head, over 2,000 ft., and Lion's rump (or Signal hill). Between Lion's head and Table mountain is a *col*, known as the Kloof, through which pass a road and a tramway, connecting Cape Town with the suburb of Camps bay. From its original nucleus, the city has spread for about 3 m. in a more or less continuous line around the lower slopes of Signal hill to Sea point, with an outlying cluster of houses and hotels at Camps Bay (5 miles). Up the lower slopes of Table mountain it has climbed as far as the gradients will allow. A series of suburbs and independent municipalities has also developed, especially since 1910, to the east of Cape Town, and then, turning the flank of Devil's peak, has become aligned in a north to south direction

along the fall line between the Cape Peninsula hills, and the Cape flats, which connect the former with the mainland. Included in this series are Woodstock, Mowbray, Rosebank, Rondebosch, Newlands, Claremont, Kenilworth and Wynberg, with Muizenberg, 15½ m. from Cape Town, and Kalk Bay on the shores of False bay. In 1913 most of these centres, with the exception of Wynberg, were united to Cape Town, which now includes an area of 37,871 acres.

Several very distinct ethnic elements go to make up the population (*see SOUTH AFRICA*). In 1926 the inhabitants of Cape Town and its suburbs included 129,749 Europeans, and 93,807 coloured.

**Streets and Parks.**—Cape Town is laid out in rectangular plan. The main street is Adderley street, running inland from the shore. Seaward it is continued by a promenade pier, which, with its approach and circus, is 600 yd. long. At the other end Adderley street is continued by Government avenue, about five-eighths of a mile long, and lined on both sides by oak trees. Just to the west of Adderley street is Greenmarket square, the original centre of the old Dutch town, and still further is Riebeeck square, on the site of the old slave market. From the pier the sea front for about 1,000 yd. to the south-east, has been laid out as an esplanade, and planted with palms and shrubs. Behind this is the castle, which was completed about 1680, much of its brick having been brought out from Holland. About ¾ m. from the pier, in a north-westerly direction, are the docks. To the west of the castle is a large, rectangular space, known as the parade ground, which is occupied on Wednesdays and Saturdays by numerous stalls and auctioneers.

Among the chief open spaces are the Greenpoint common, lying to the north-west of the city, and including the golf links and the athletic ground, Trafalgar park to the south-east, and the Botanical gardens, which are situated along the western side of Government avenue, and cover an extent of 14 acres. On the eastern slopes of Table mountain, at Kirstenbosch, and covering about 400 ac., are the National Botanical gardens, originally part of the Groot-Schuur estate. Much of this area is a reserve for the indigenous botanical associations.

**Public Buildings.**—Most of the public buildings and monuments are to be found along Adderley street and Government avenue. Near the entrance to the pier is a bronze statue of van Riebeeck, presented to the city by Cecil Rhodes. A short distance away is the war memorial, unveiled in 1924. Then, along the main street, are the custom house, the railway station, the Standard Bank, the general post office, and the Dutch Reformed church, which is the oldest church in South Africa. It was commenced in 1699, but of the original building only the bell tower remains. In the church eight of the old Dutch governors of the Cape are buried. On the eastern side of Government avenue are the houses of parliament, and Government house, the residence of the governor-general. On the opposite side is the Anglican cathedral, which promises, when completed, to be a fine example of modern architecture. The public library, near by, contains about 150,000 volumes, including first and second editions of Shakespeare's plays. It greatly benefited by a generous gift by Sir George Grey, who was governor of the Cape from 1854 to 1861, and whose statue stands in front of the library. The South African museum occupies a site at the top of the Botanical gardens, and contains much that is of interest to the anthropologist, archaeologist, etc. The opera house in Darling street is capable of seating a thousand people. In front of it is a memorial by Sir Goscombe John to the Cape volunteers who died in the war of 1899-1902.

The new municipal buildings are also in Darling street; the city hall has seating accommodation for 2,000 persons. Opposite to its main entrance is a statue, also by Sir Goscombe John, of King Edward VII. The Michaelis collection of old Flemish and Dutch paintings is housed in the "Old Town house" in Greenmarket square, a fine example of 18th century colonial Dutch architecture. The buildings of the University of Cape Town, which stood on the western side of the Botanical gardens, are gradually being evacuated as the various departments move out to the magnificent new site at Groot Schuur. The Koopman—

de Wet house in Strand street contains old Dutch furniture, and illustrates the life of the early Dutch settlers. Outside of Cape Town, about half a mile from Rondebosch station, is Groot Schuur, which was left by Rhodes as the official residence in Cape Town of the premier of the Union of South Africa. It is built in the Dutch colonial style, and contains some fine specimens of old Dutch furniture. Some distance away is the Rhodes Memorial. In the grounds of Groot Schuur are being constructed the new buildings of the University of Cape Town.

**Harbour.**—The harbour of Cape Town consists of the Victoria basin, a rectangular area of 67 ac. enclosed within walls. The north-western wall is prolonged and slightly curved to form a breakwater. An inner area, the Alfred basin, covers  $8\frac{1}{2}$  acres. Additional wharfage for fishing boats, etc., is provided along the shore to the south-east of the main harbour. The depth of water at the entrance to the harbour is 40 ft. at L.W.O.S.T., and vessels of any draught can anchor in the roadstead under the shelter of the breakwater. In the Victoria basin the average depth at L.W.O.S.T. ranges from 10 to 35 feet. The harbour is well equipped with electric cranes and transporters. Trains of the South African railway system can run alongside the main wharves. There are considerable facilities for fruit cooling and storing. A grain elevator, capable of holding 30,000 tons of grain, has recently been completed. There is also a graving dock, 5,000 ft. long, on the keel blocks, with a maximum width of  $56\frac{1}{2}$  ft., and a depth at H.W.O.S.T. of 25 feet.

**Trade.**—Cape Town is the principal passenger and mail port of South Africa, and deals with over 50% of the combined passenger traffic of the four chief ports of the Union. It is 5,978 m. from Southampton, a distance travelled by the mail boats in 17 days. Passengers may disembark, and find trains waiting alongside, which will take them to Johannesburg (956 m.), Rhodesia, or Durban (1,253 miles). Cape Town is also an important port of call for vessels trading between Europe and Australia or the East. There is also a certain amount of traffic with South American ports. For goods traffic, Cape Town is less favourably situated than its rival, Durban. The handicaps of a large, arid hinterland, and the distance from the centres of population and industry on the Witwatersrand, are only partially compensated by preferential railway rates. It is, however, the chief port of exit for South African gold and diamonds. Of recent years Cape Town has had an increasing export of fresh and dried fruits, flowers and wines, which are being produced in the neighbouring districts. There is also a considerable trade in wool, mohair, skins and maize. Local industries are largely concerned with the preparation of foods. Owing to the distance from the coalfields, and the scarcity of water, power is apt to be expensive, but coloured labour for unskilled and semi-skilled work is comparatively cheap.

As a pleasure resort, Cape Town attracts many visitors from South Africa, and from other countries. Many people from the inland provinces, on retiring, take up permanent residence here. The city owes much to its picturesque situation at the foot of Table mountain and its satellite hills, the slopes of which are in many places covered by plantations of coniferous and other trees, or by the indigenous macchia of heaths, proteas and bulbous plants, which make a wonderful blaze of colour in the spring months. The houses of the suburbs are embowered among trees and gardens. Every Wednesday and Saturday morning, in the season, Adderley street is enlivened by masses of flowers, which are offered for sale by the coloured people. The country in the neighbourhood offers a wide choice of walks and drives, including the justly famed 96 m. drive around the peninsula, passing by Camps Bay, Hout bay, Chapman's peak, the Cape of Good Hope, Simonstown, Muizenberg and Rondebosch. This, for its blending of mountain and sea, heathlands and woodlands, is probably unsurpassed in the world. Table mountain offers climbing to suit the most adventurous spirits. The most popular bathing place is Muizenberg,  $15\frac{1}{2}$  m. from Cape Town. Here, in the warm waters of False bay, surfing is much practised. The shore shelves very gradually, and sharks do not molest the bathers. At Cape Town, and along the western coast of the peninsula, the cold waters of the Benguela current offer less encouragement to bathing.

**Climate, Health.**—The average amount of sunshine throughout the year is 7.5 hours a day, ranging from 4.8 hours in June to over 10 in December. Most of the rains fall between April and October. In the bright, dry summers, high temperatures may occur, especially in the city, but along the western side of the peninsula the shade temperatures in the afternoons are kept quite low by the sea breezes, which blow off the cold current.

The health of Cape Town is satisfactory. The city is equipped with a good sewage scheme. It also has a good water supply, obtained partly from Table mountain, and partly from a reservoir about 40 m. away, in the Caledon district.

The city is lighted by electricity, and there is an efficient tram service. At the Union of South Africa in 1910 Cape Town was made the legislative capital, with Pretoria as the administrative capital. It is also the seat of an archbishop of the English Church, and of a bishop of the Roman Catholic Church. (R. U. S.)

**University of Cape Town.**—The university foundation dates from April 2, 1918, when the council, created by Act 14 of 1916, received a bequest from Sir Julius Wernher of £250,000 and a donation of £250,000 from Otto Beit, who added £50,000 to a lapsed bequest by Alfred Beit. By 1921 a special appeal for funds had raised about £280,000, inclusive of £50,000 for the Jameson Memorial Hall. Pending the erection of buildings on the site provided by the Government at Groote Schuur, the university carries on its work in the buildings formerly occupied by the University of the Cape of Good Hope. The university created in 1925 chairs in commerce, fine art and accounting, while the faculty of law was strengthened by a third professorship. In 1928 the first part of the new buildings at Groote Schuur was opened to students.

**CAPE VERDE ISLANDS** (*Ilhas do Cabo Verde*), an archipelago belonging to Portugal; off the West African coast, between  $17^{\circ} 13'$  and  $14^{\circ} 47' N$ , and  $22^{\circ} 40'$  and  $25^{\circ} 22' W$ . Pop. (1926) 131,147; area, 1,475 sq.m. The archipelago consists of fourteen islands in all, including Santo Antão (commonly miswritten St. Antonio), São Vicente, Santa Luzia, São Nicolao, Sal, Boa Vista, Maio, São Thiago (St. Jago), Fogo and Brava. The distance between the coast of Africa and the nearest island (Boa Vista), is about 300m. The islands derive their name, frequently but erroneously written "Cape Verd," or "Cape de Verd" Islands, from the African promontory off which they lie, known as Cape Verde, or the Green cape. The entire archipelago is of volcanic origin.

**Climate.**—The atmosphere is generally hazy, especially in the direction of Africa. With occasional exceptions during summer and autumn, the north-east trade is the prevailing wind, blowing most strongly from Nov. to May. The rainy season is during Aug., Sept. and Oct. The Harmattan, a very dry east wind from the African continent, occasionally makes itself felt. The heat of summer is high, the thermometer ranging from  $80^{\circ}$  to  $90^{\circ} F$  near the sea. The unhealthy season is during and following the rains.

**Flora.**—The flora is markedly tropical in character; and although some 70 wild-flowers, grasses, ferns, etc., are peculiar to the archipelago, the majority of plants are those found on the neighbouring African littoral. The Portuguese have introduced a few trees, such as the baobab, eucalyptus and dragon-tree, besides many plants of economic value. Coffee-growing, an industry dating from 1790, is the chief resource of the people of Santo Antão, Fogo and São Thiago; maize, millet, sugar-cane, manioc, excellent oranges, pumpkins, sweet potatoes, and, to a less extent, tobacco and cotton are produced. On most of the islands coco-nuts, dates, tamarinds and bananas are to be found; orchil is gathered; and indigo and castor oil are produced. Of considerable importance is the physic-nut (*Jatropha curcas*), which is exported.

**Fauna.**—Quails are found in all the islands; rabbits in Boa Vista, São Thiago and Fogo; wild boars in São Thiago. Both black and grey rats are common. Goats, horses and asses are reared, and goatskins are exported. The neighbouring sea abounds with fish, and coral fisheries are carried on by a colony of Neapolitans in São Thiago. Turtles come from the African coast to lay their eggs on the sandy shores. The Ilheu Branco, or White Islet, between São Nicolao and Santa Luzia, is remarkable as containing a variety of puffin unknown elsewhere, and a species of large lizard (*Macrosclincus coctei*) which feeds on plants.

**Inhabitants.**—The first settlers on the islands imported negro slaves from the African coast. Slavery continued in full force until 1854, when the Portuguese government freed the public slaves, and ameliorated the conditions of private ownership. In 1857 arrangements were made for the gradual abolition of slavery, and by 1876 the last slave had been liberated. The blacks and mulattoes far outnumber the white inhabitants. They are, as a rule, taller than the Portuguese, and are of fine physique, with regular features but woolly hair. Their language is a bastard Portuguese, known as the *língua creoula*.

**Industries.**—The principal industries, apart from agriculture, are the manufacture of sugar, spirits, salt, cottons and straw hats and fish-curing. The most important of the exports are coffee, physic-nuts, millet, sugar, spirits, salt, live animals, skins and fish. The imports consist principally of coal, textiles, food-stuffs, wine, metals, tobacco, machinery, pottery and vegetables. Over 3,000 vessels, with a total tonnage exceeding 3,500,000 annually enter the ports of the archipelago; the majority call at Mindello, on São Vicente, for coal, and do not receive or discharge any large quantities of cargo.

**Santo Antão** (pop. 25,000) at the extreme N.W. of the archipelago, has an area of 265 sq.m. Its surface is very rugged and mountainous, abounding in volcanic craters, of which the chief is the Topoda Coroa (7,300ft.), also known as the Sugar-loaf. Mineral springs exist in many places. Santo Antão produces large quantities of excellent coffee, besides sugar and fruit. It has several small ports, of which the chief are the sheltered and spacious Tarrafal Bay, on the S.W. coast, and the more frequented Ponta do Sol, on the N.E., 8m. from the capital, Ribeira Grande, a town of 4,500 inhabitants. Cinchona is cultivated in the neighbourhood.

**São Vicente** (pop. 8,000), lies near Santo Antão, on the S.E., and has an area of 75 sq.m. Its highest point is Monte Verde (2,400ft.). An English speculator founded a coaling station here in 1851, and the town of Mindello, also known as Porto Grande or St. Vincent, grew up rapidly, and became the commercial centre of the archipelago. São Vicente has a station for the submarine cable from Lisbon to Pernambuco in Brazil.

**Santa Luzia**, about 5m. S.E., has an area of 18 sq.m. Its highest point is 885ft. above sea-level. On the S.W. it has a good harbour, visited by whaling and fishing boats.

**São Nicolau** or **Nicolau** (pop. 12,000), a long, narrow, crescent-shaped island with an area of 126 sq.m., lies farther E. Maize, kidney-beans, manioc, sugar-cane and vines are cultivated. The interior is mountainous, and culminates in two peaks one of which, Monte Gordo, has a height of 4,280 feet. The island was one of the first colonized; in 1774 its inhabitants numbered 13,500, but famine subsequently caused a great decrease.

**Sal** (pop. 750), in the N.E. of the archipelago, has an area of 75 square miles. Towards the close of the 17th century it was inhabited only by a few shepherds, and by slaves employed in the salt-works. In 1705 it was entirely abandoned, owing to drought and consequent famine; and only in 1808 was the manufacture of salt resumed. A railway, the first built in Portuguese territory, was opened in 1835.

**Boa Vista** (pop. 2,600), the most easterly island of the archipelago, has an area of 235 square miles. It was named São Christovão by its discoverers in the 15th century. A chain of heights, flanked by inferior ranges, traverses the middle of the island, culminating in Monte Gallego (1,250ft.), towards the E.

**Maio** (pop. 1,000) has an area of 70 sq.m., and resembles Sal and Boa Vista in climate and configuration. Its best harbour is Nossa Senhora da Luz, on the S.W. coast, and is commonly known as Porto Inglês or English Road, from the fact that it was occupied until the end of the 18th century by the British.

**São Thiago** (pop. 63,000) is the most populous and the largest of the Cape Verde Islands, having an area of 350 square miles. It is also one of the most unhealthy, except among the mountains over 2,000ft. high. The interior is a mass of volcanic heights, formed of basalt covered with chalk and clay, and culminating in the central Pico da Antonia (4,500ft.), a sharply pointed cone. There are numerous ravines, furrowed by perennial streams, and in these ravines are grown large quantities of coffee,

oranges, sugar-cane and physic-nuts, besides a variety of tropical fruits and cereals.

**Fogo** (pop. 17,600) is a mass of volcanic rock, almost circular and measuring about 190 square miles. In the centre a still active volcano, the Pico do Cano, rises to a height of about 10,000 feet. Its crater, which stands within an older crater, measures 3m. in circumference and is visible at sea for nearly 100 miles. It emits smoke and ashes at intervals; and in 1680, 1785, 1799, 1816, 1846, 1852 and 1857 it was in eruption. After the first mentioned and most serious outbreak, the island, which had previously been called São Felipe, was renamed Fogo, i.e., "Fire."

**Brava** (pop. 9,013), the most southerly of the islands, has an area of 23 square miles. Though mountainous, and in some parts sterile, it is very closely cultivated, and, unlike the other islands, is divided into a multitude of small holdings. The women, who are locally celebrated for their beauty, far outnumber the men, who emigrate at an early age to America.

**History.**—The earliest known discovery of the islands was made in 1456 by the Venetian captain Cadamosto (q.v.), who had entered the service of Prince Henry the Navigator. The archipelago was granted by Alphonso V. of Portugal to his brother, Prince Ferdinand, whose agents completed the work of discovery. On his death in 1470 his privileges reverted to the crown, and were bestowed by John II. on Prince Emanuel, by whose accession to the throne in 1495 the archipelago finally became part of the royal dominions. Its population and importance rapidly increased; its first bishop was consecrated in 1532, its first governor-general appointed about the end of the century.

**BIBLIOGRAPHY.**—The best general account of the islands is given in vols. xxiii. and xxvii. of the *Boletim* of the Lisbon Geographical Society (1905, 1908), and in *Madeira, Cabo Verde, e Guiné*, by J. A. Martins (Lisbon, 1891).

See also *Über die Capverden* (Leipzig, 1884) and *Die Vulcane der Capverden* (Graz, 1882), both by C. Dölter. A useful map, entitled *Ocean Atlantico Norte, Archipelago do Cabo Verde*, was issued in 1900 by the *Comissão de Cartographia*, Lisbon.

**CAPGRAVE, JOHN** (1393–1464), English chronicler and hagiologist, was born at Lynn, in Norfolk, on April 21 1393. He became a priest, took the degree of D.D. at Oxford, where he lectured on theology, and subsequently joined the order of Augustinian Hermits. Most of his life he spent in the house of the order at Lynn, of which he probably became prior; he was certainly provincial of his order in England, which involved visits to other friaries, and he made at least one journey to Rome. He died on Aug. 12, 1464.

Capgrave was an indefatigable student, and was reputed one of the most learned men of his age. The bulk of his works are theological: sermons, commentaries and lives of saints. His reputation as a hagiologist rests on his *Nova legenda Angliæ*, or *Catalogus* of the English saints, but this was no more than a recension of the *Sanctilogium* which the chronicler John of Tinmouth, a monk of St. Albans, had completed in 1366, which in its turn was largely borrowed from the *Sanctilogium* of Guido, abbot of St. Denis. The *Nova legenda* was printed by Wynkyn de Worde in 1516 and again in 1527. Capgrave's historical works are *The Chronicle of England* (from the Creation to 1417), written in English and unfinished at his death, and the *Liber de illustribus Henricis*, completed between 1446 and 1453. The latter is a collection of lives of German emperors (918–1198), English kings (1100–1446) and other famous Henries in various parts of the world (1031–1406). The portion devoted to Henry VI. of England is a contemporary record, but consists mainly of ejaculations in praise of the pious king. The accounts of the other English Henries are transferred from various well-known chroniclers.

The *Chronicle* was edited for the "Rolls" Series by Francis Charles Hingeston (London, 1858); the *Liber de illustribus Henricis* was edited (London, 1858) for the same series by F. C. Hingeston, who published an English translation the same year. See Potthast, *Bibliotheka Med. Aev.*; and U. Chevalier, *Répertoire des sources hist. Bio-bibliographie*, s.v.

**CAP HAITIEN**, a seaport of Haiti, West Indies. Pop. about 20,000. It is situated on the north coast 90m. north of Port au Prince, in 19° 46' N. and 72° 14' W. Its original Indian name was Guarico, and it has been known, at various times, as Cabo

Santo, Cap Français and Cape Henri, while throughout Haiti it is always called Le Cap. It is the most picturesque town in the republic, and the second in importance. On three sides it is hemmed in by lofty mountains, while on the fourth it overlooks a safe and commodious harbour. Under the French rule it was the capital of the colony, and its splendour, wealth and luxury earned for it the title of the "Paris of Haiti." It was then the see of an archbishop and possessed a large and flourishing university. The last remains of its former glory were destroyed by the earthquake of 1842 and the British bombardment of 1865. It is the centre of a thriving district and does a large export trade. It was founded by the Spaniards about the middle of the 17th century, and in 1687 received a large French colony. In 1695 it was taken and burned by the British, and in 1791 it suffered the same fate at the hands of Toussaint L'Ouverture. It then became the capital of King Henri Christophe's dominions, but since his fall has suffered severely in numerous revolutions.

**CAPILLARY ACTION:** *see* SURFACE TENSION.

**CAPILLARY TUBE**, a tube of small diameter in which a liquid will ascend on account of the action of surface tension (*q.v.*) being greater than that of gravity. *Capillaries*, in physiology, are the channels connecting arteries with veins, and are so called on account of their minute diameters (*see* VASCULAR SYSTEM).

**CAPILLARY WAVES**, small waves (*see* WAVE), in a liquid, in which, owing to their short wave-length, the force due to surface tension (*q.v.*) has more effect in controlling their velocity than has that due to gravity.

**CAPISTRANO, SAINT JOHN OF** (1386–1456), Italian theologian and inquisitor, was born in Capistrano in the Abruzzi. He became a magistrate, but on the death of his wife (1416), joined the Franciscans where, under the direction of Bernardino of Sienna, he defended the ideal of strict observance. He was charged with various missions by Eugenius IV. and Nicholas V.; as legate or inquisitor, he persecuted the last Fraticelli of Ferrara, the Jesuati of Venice, the Jews of Sicily, Moldavia and Poland, and, above all, the Hussites of Germany, Hungary and Bohemia; his aim in the last case was to prohibit conferences between the representatives of Rome and the Bohemians, for every attempt at conciliation seemed to him to be conniving at heresy. After the taking of Constantinople, he gathered troops for a crusade against the Turks (1455), which at least helped to raise the siege of Belgrade, then blockaded by Mohammed II. He died on Oct. 23, 1456, and was canonized in 1690.

**CAPITAL**, in architecture, the top number of a column, pier or pilaster, usually larger on the upper surface than the diameter of the shaft supporting it, thus not only furnishing a better bearing for the superstructure, but also forming a decorative accent to cap the vertical line of the shaft. The capital had three parts: First, the abacus (*q.v.*) at the top, a block acting as the supporting surface; second, a bell, or echinus (*q.v.*) carrying the abacus and furnishing the richest portion of the decoration; and third, some feature to mark the transition between shaft and capital. Bracketed capitals are also found, in which projecting brackets at the top of the column furnish a long support for beams or arches.

Primitive capitals, as shown in rock cut tombs of the 12th dynasty, at Beni Hassan, Egypt, consisted merely of a thin, square abacus block supported directly on the shaft. Other types were developed in Egypt, probably first in wood, as early as the 4th dynasty; they appeared in highly organized forms from c. 2000 B.C. on. These are: First, the lotus bud type; second, the campaniform or bell type, painted with papyrus; third, palm leaf forms, in which the bell is ornamented with lobes and palm leaves. From c. 500 B.C. on, convex types based upon the open lotus flower, complicated lobed types, decorated with water plants, and a square form, whose four sides carry the face of the goddess Hathor, are found. (*See* EGYPTIAN ARCHITECTURE.) Ancient capitals in western Asia are principally of the bracketed type. Contemporary reliefs show that Mesopotamian buildings had small

columns with voluted capitals resembling the later Ionic. The capitals used by the Persians in the 5th and 6th centuries B.C. consist of a long, narrow block, either directly above the shaft, or supported by a scrolled and bell-shaped member. This block is carved with a bull or horse at each end, carrying the main beams; a hollow between them gave space for a cross beam.

The Aegean civilization used a capital having a square abacus, with a heavy, simple convex echinus below. Examples are found in the palace at Cnossus, c. 1500 B.C., and the so-called treasury of Atreus in Mycenae, c. 1200 B.C. in which the echinus is richly carved. The later Hellenic Greeks developed capitals that have been an inspiration to all subsequent Western art. The Aegean type grew into the Doric order, where the echinus curve was studied with great refinement. The scrolled, bracketed type, taken from earlier builders of western Asia, became the Ionic order, and the effort to decorate appropriately a simple bell produced the Corinthian order, with its scrolls and acanthus leaves. These types were developed by the Romans and the Renaissance architects in various ways. (*See* ORDER.)

Three trends distinguish the evolution of the capital in Europe during the middle ages. One is of Byzantine origin. The capital surface is ornamented with small scale, deeply cut leafage. In early examples, classic forms persist, but a tendency toward simplification led to the type called the basket capital. The second family results from the effort to make a simple geometrical transition from round shaft to square abacus, and is known as the cushion capital. It is common in Lombard, German and Norman Romanesque. The third kind is a mediaeval development of the Roman Corinthian. In addition, during the Romanesque period, many grotesque capitals are found, decorated with birds, beasts and human figures, especially in Spain and France. Growing naturalism, and the use of the bud form known as the crocket (*q.v.*), produced the varied Gothic capitals. In France, early conventional treatment gave place to vivid naturalism and a loss of structural significance in the late 13th century, but in the 15th a new period of extreme conventionalism occurred. In England, moulded capitals, in which strong projections and deep hollows give the effect, were popular throughout the 13th century. Foliated capitals are more free than French examples. Frequently they display naturalism of an extremely vital and pictorial perfection. In late English Gothic, as in French, the capital is comparatively unimportant.

Renaissance capitals usually follow classic prototypes, although many exceptions are found in the early Renaissance and the Baroque. In "modernistic" work, on account of the theory that the capital is decoratively false, because often structurally unnecessary, it has largely disappeared. Occasional forms, with classic influence, occur in Germany and Scandinavia.

The earliest Mohammedan capitals are based on Roman types, but the general objection of the Muslims to the representation of any objects soon led to the development of abstract forms. These consist either of a succession of geometrical faces or else of the little bracketed niches called stalactite ornament. In China and Japan, where beams usually run through columns, instead of being supported upon them, there is no real capital, although occasionally the projecting beam ends give a similar decorative effect. Indian capitals, on the other hand, are varied and complex. At times they seem almost classic, at times, in their elaborately intersecting planes, they resemble Mohammedan types, and at times they consist merely of an intricate set of small mouldings.

The word capital is also applied to forms resembling any of those above, when used as the crowning feature of any vertical shaft, as of a stele (*q.v.*) or pinnacle.

**CAPITAL.** In economics, capital may be defined as produced wealth used productively for gain. It is thus distinguished from land and other natural resources, which are not "produced," and from consumers' goods, which are not used productively for gain. The economist's conception of capital is unlike the conceptions

which govern the practice of accountants. The reason is that many things which are properly counted as part of the capital of a person or a firm make no part of the aggregate capital of society. A house occupied by a tenant is part of its owner's capital, but it is not for that reason any more a part of the productive apparatus of the community than it would be if it were owned by its occupant. A may include what B owes him in an inventory of his capital, but in the aggregate view A's claim and B's liability cancel. Patents, copyrights, the franchises of public service companies, and other exclusive privileges, or the goodwill of a business undertaking, its established claim upon the preferences of buyers, have similar status. Such things are sometimes called "acquisitive capital," to distinguish them from the things which constitute the true capital of the community.

There is a sense in which a community's whole stock of accumulated wealth, including durable goods in the possession of consumers, may be said to be its capital. A consumer who buys durable goods—a house, a piano, a piece of furniture—from which he expects to get a long series of uses, is thereby providing for the future, and so far as a community is supplied with such goods its future wants are in that measure provided for. Whether such accumulations should be called capital is a question of convenience, not of principle. The distinction between goods which provide for future wants and the goods and services which merely provide for the present is doubtless important, but the distinction between using goods in production for the market, *i.e.*, in production for gain, and using them as part of one's own equipment for living is also important, and most economists have preferred to emphasize this last distinction by drawing a line between capital and consumers' goods. The line cannot be drawn with perfect precision, however. It is impracticable to make a sharp distinction either between the capital which a farmer uses in producing food for the market and the equipment which he uses in producing food for his own household, or between the latter and the equipment which a housewife uses in preparing food for the table. But these are small matters and do not affect the practical utility of the conception of a special category of produced wealth which is used productively for gain.

There is also a sense in which personal qualities, as well as goods, may be said to be capital. Expenditure for education or for any training which makes a man a more efficient producer may properly be regarded as an "investment of capital." The personal earnings which are attributable to acquired qualities of skill and efficiency might easily be treated as interest or profits upon "personal capital." Economists have found it more convenient, however, to adhere in this particular to the practice of the business world, and to treat such earnings as elements in wages. Similarly, while it is important to take account of the motives which lead men to employ capital in improving land (*e.g.*, in fertilizing or draining it), no useful purpose is served by attempting always to distinguish between the return attributable to the capital which has been incorporated in land and the rent of the land itself.

**The Varieties of Capital.**—Historically, the distinction between commercial capital and industrial capital is of prime importance, for capital was employed on a large scale in trade and transport long before any considerable use was found for it in industry. What date should be assigned to the beginnings of "modern capitalism" or of "capitalistic institutions" depends upon what is meant. Most of the history of industrial capitalism falls within the last 200 years, while many of the characteristic institutions of commercial capitalism can be traced back to the towns of the later middle ages, or even to the ancient civilizations of the eastern Mediterranean. The distinction between commercial and industrial capital remains important for an understanding of the part which capital plays in modern economic life, but it is better to draw the line, not between the capital used by traders and the capital used by manufacturers, but between stocks (raw materials, auxiliary materials, goods in process, finished goods) and instruments (machines, tools, railways, factory buildings, etc.). Much the same distinction is conveyed by the terms circulating capital and fixed capital. The characteristic which gives

circulating capital the quality of capital, however, is not that it "circulates" (whether in the way in which raw materials reappear in the finished product or in the way in which goods pass from manufacturer to merchant and from merchant to consumer) but that the processes of production and distribution require that large stocks of it shall be maintained.

Next in importance to the distinction between instruments and stocks is the distinction between specialized capital and unspecialized capital. A railway track or a complicated machine is serviceable only within the narrow range of uses for which it was constructed. Its value depends upon the demand for the special services which it is capable of rendering. Raw materials that enter into different sorts of finished products, tools and machines of standard types, are examples of less highly specialized capital. The difference is one of degree. Most capital is partly specialized, in the sense that it has only a certain range of uses and that it is better adapted to some uses than to others. Money, because it can be used in acquiring goods and services of whatever sort, is sometimes held to be a wholly free and unspecialized form of capital. But is money capital? It is true that stocks of ready money as well as stocks of goods are required for the operations of industry and trade, and that these stocks are not maintained without expense. But it is also true of some of the most important forms of money (including the notes of banks and of governments and bank deposits subject to cheque) that the holder's capital is offset by the issuer's debit or liability. Furthermore, the supply of money may be increased without there being any attendant increase of the real wealth of the community or even of the aggregate serviceability of its stocks of money. In short, money may properly be counted as capital if it is recognized clearly that it constitutes a separate category, with special characteristics of its own.

**The Earnings of Capital.**—That capital contributes nothing to the production of wealth beyond the labour which it embodies, that it merely enables its owners to appropriate an unearned share of the total product, is a tenet held by disciples of Karl Marx and by other critics of the existing economic order. This tenet appears to rest upon a misconception of the services which both labour and capital render. Neither labour nor capital is inherently productive. Just as land will grow thistles as well as figs, so labour and capital alike may be wasted in making things which no one wants and which therefore have no value. Labour and capital are without value except as their products are valuable. In one sense, therefore, labour and capital may be said to derive their value from the value of their products. Taken by itself, however, this is a misleading statement. No product will have value if it can be reproduced without diverting any part of the supply of scarce and valuable productive agents (labour, capital, and natural resources) from other possible uses. When we say that capital is productive we imply not only that capital can be used so as to increase the supply of valuable goods but also that the supply of capital itself is in some degree limited or inelastic.

Nature furnishes free productive agents which, merely because no economy need be practised in our use of them, are not productive in an economic as distinguished from a purely physical sense. Thus in the economic sense the wind is not productive but windmills are. We harness natural forces so as to use them in production, but we attribute the product wholly to the harness. This is inevitable, for the harness is the only factor in the situation which we can add or take away or which we can vary as we please, so that the product depends upon it. Capital would not be deemed productive if its supply were not limited, nor would it be deemed scarce if it were not productive. Whether the earnings of capital are attributable to its productivity or to its scarcity is therefore a meaningless question. That a larger (physical) product can be got by using capital does not explain why a specific part of the product has to be attributed to capital and assigned to it as its earnings. The economic productivity of capital, its scarcity, and its earning power are merely different aspects of the way in which the amount of the product depends upon the supply of capital. For an understanding of this relation of dependency between product and capital it is necessary to take account both of

the productive uses of capital and of the circumstances which limit its supply.

**The Uses of Capital.**—Consider first the uses of instruments—tools, machines, prime movers, and auxiliary apparatus. Inert and passive in themselves, from the point of view of economics, instruments are goods which are produced and used in the producing of other goods for the reason that such procedure is economical. A conspicuous characteristic of the procedure is that it is indirect or roundabout. There is nothing inherently economical in roundabout methods, but the most economical methods often happen to be roundabout. The degree of roundaboutness which is most economical generally depends upon the amount of a particular kind of work which is to be done. And also the making and use of instruments involves an extension of the principle of the division of labour, and the division of labour, as Adam Smith observed, depends upon the extent of the market. The use of capital on a large scale in industry came later than its use in commerce, for the reason that not until there were markets which were able to absorb large outputs of standard types of goods was it profitable to make any extensive use of roundabout methods of production. Once established, however, industrial capitalism showed that it had within itself the seeds of its own growth. Cheaper goods, improved means of transport, and the increased advantages of specialization led to larger markets, so that the economies of industrial capitalism grew in a cumulative way. The increasing division of labour, by breaking up complex industrial processes into simpler parts, not only invited a larger use of instruments, but also prompted the invention of new types of instruments. Along with these changes and holding with respect to them the dual relation of cause and effect, the exploitation of the world's stores of mechanical energy extended enormously the effective range of the use of instruments. Improvements in industry and in transport made the world capable of sustaining a larger population, while the growth of population, in turn, by creating larger markets, made it profitable for industry to use methods of a higher degree of roundaboutness.

The uses of stocks are various. (1) Stocks are held in order to give time for spontaneous or induced changes of a desirable kind to occur. The maturing of wine or tobacco, the fructifying of the seed in the soil, the drying and seasoning of the wood used in cabinet work, are examples of a very large number of processes which either cannot be hastened or cannot advantageously be hastened beyond a certain point. (2) Stocks have to be held in order that the products of agriculture and of other seasonal industries may be spread throughout the year in accordance with the requirements of consumers. (3) The technical requirements of production make it necessary that stocks of "goods in process" be held. (4) At various points in the linked chains of agencies through which goods pass on their way from the producer of raw materials to the ultimate buyer of the finished product stocks are accumulated. This helps to safeguard buyers, at whatever point in the chain, against the inconvenience and losses of delays, and it makes for economy in transport and handling. Furthermore, even if production and trade were always managed with complete efficiency and if producers and traders always had complete knowledge of the market, it would be impracticable and uneconomical to keep all of the various processes of production and distribution moving together so as to maintain a smooth and even flow of goods from the first producers to the final buyers. Stocks are like the reservoirs in which the waters from variable and intermittent streams are impounded so as to guard against both floods and drought.

**The Supply of Capital.**—The use of capital saves time, in the sense that a larger product can be had with a given amount of labour. But it increases the average interval of time which elapses before the products of a given day's labour reach their final form and pass into the hands of consumers. Present work, however far away its final fruition in a finished product may be, has to be paid for in the present, and so do the present uses of land and capital—unless, indeed, the owners of land and capital can be induced to defer their claims. These present payments are advanced in anticipation of the payments which consumers will

make later for finished products. This is the central fact of the capitalistic system of production.

Interest is the premium which is paid for advances. The money incomes which employers, labourers, capitalists, and landowners receive are used in part to pay for immediate personal services and for the finished goods that have been produced in the past, and in part to pay (as advances) for the present expenses of forwarding the production of goods for future markets. In those future markets, it is expected, the goods will sell for enough to cover the advances, with interest added. If the returns finally secured prove on the whole to be inadequate, or even promise to be inadequate, the demand for advances will fall off and the rate of interest will decline. But if industry is prosperous, if the prospect is that in general some net profit will be left after the cost of advances has been met, the demand for advances will increase and the rate of interest will rise, so that a smaller part of the current stream of money incomes will be expended for finished goods and personal services and a larger part will be used in producing instruments and in increasing stocks. There is thus an effective tendency towards an unstable sort of equilibrium, in which the most important variable factors (human nature being taken as constant) are, first, the economies of capitalistic methods of production, and, second, the rate of interest. In the long run, however, what part of the product is imputed or attributed to capital rather than to labour or to natural resources will be determined by the rate of interest. How much larger the total product is than it would be if no capital were used is mostly a matter of technology. How much of the product is, in the economic sense, attributed to capital as its product, is largely a matter of the price which has to be paid for advances.

The operations of banks have an important effect upon the way in which advances are made. Banks are more than mere intermediaries between lenders (depositors) and borrowers. So far as their own obligations (notes and deposits) will serve as money, and within the limits set by the necessity of maintaining their own solvency, they can make advances to industry and trade without there being any prior saving. In fact, because consumers' incomes will be increased as the funds advanced by the banks are paid out to cover the expenses of producing goods, the demand (in terms of money offered) for goods and services will be larger than before. If stocks cannot be increased as rapidly as the demand for finished goods increases, prices will rise, and a disguised form of involuntary saving will thus be imposed upon all consumers whose incomes have not increased proportionately. Furthermore, if manufacturers and traders gain by reason of the rise of prices (their expenses not having increased proportionately), they are fairly sure to reinvest some of their profits. The real burden of the saving which makes these new advances possible falls more heavily upon the persons who lose (in purchasing power) because of the rise of prices than upon the manufacturers and traders who gain. But profits, of course, do not depend upon price fluctuations alone. A high general level of profits, brought about as the result of whatever causes, will increase both the demand for and the supply of advances. In consequence there may be an unduly rapid increase of instruments and stocks—a circumstance which probably plays a part in the recurring industrial fluctuations which have come to be known as trade cycles. Business profits are probably the largest single source of investment funds. Estimates made by A. L. Bowley, Sir Josiah Stamp and W. I. King indicate that in Great Britain and the United States fully half of the current supply of advances comes from that source.

**Non-Productive Uses and Forms of Capital.**—No simple and consistent view of the nature and uses of capital can be altogether true to the complicated facts of economic life. The conception of capital as a productive agent is justified because it emphasizes what are, in fact, the most important uses of capital. Advances are made mostly so that capital may be used in furthering the production of goods. In some important fields of business enterprise, however, large amounts of money are invested, not in producing goods which consumers already want, but in inducing them to buy certain particular things. The purpose of a consider-

able part of what are commonly called selling expenses is not to supply goods to satisfy an existing demand, but to shift demand from other channels. Such expenditures are not always wholly unproductive. Scrupulously truthful advertising may be of real service to the consumer, perplexed by the wide range of alternative choices and without firsthand knowledge of the qualities of competing goods. Advertising, furthermore, by helping to create larger markets for particular types of goods which can be produced much more economically if produced on a large scale, may itself be a factor in the economizing of the productive resources of the community. But these are incidental and by no means necessary results of what are primarily competitive or acquisitive uses of capital. Advertising may lead sometimes to the education of the consumer, but it may also lead to the exploitation of weakness and ignorance. While it may sometimes open the way to real economies in production, it may at other times involve a pure waste of resources which might otherwise have been used productively. Its importance has been fully recognized in all forms of productive business.

One other qualification of what has been said about the nature of capital remains to be noted. A nation's capital may be taken to be either (1) the capital within the nation's boundaries, irrespective of its ownership, or (2) the capital owned within the nation, irrespective of its situation. In the second sense a nation's capital includes the net excess of its external or foreign assets (property and credits) over its external liabilities (domestic property owned abroad plus foreign debts). In two respects this view is inconsistent with the definition of capital as "produced wealth used productively for gain." In the first place, credits are included, which, in an international stock-taking, would cancel against debts. In the second place, foreign holdings of land, of mineral rights, of concessions, and of other valuable privileges, as well as of instruments and stocks, are included. There is nothing unreasonable in this. Investments in landed property or in mineral rights outside of a nation's own boundaries make part of its national savings and affect the amount of its annual national income. In short, in determining the amount of a nation's capital, it is necessary, for some purposes, to abandon at the national frontiers the communal conception of capital, and to adopt a private or acquisitive conception, such as is employed in accountancy. Similarly, while the phrase, "the export of capital," might conceivably be taken to refer to the movement of instruments and stocks from one country to another, it is more generally taken to denote the increase of the net foreign investments of the people of a given country.

**BIBLIOGRAPHY.**—E. von Böhm-Bawerk, in *Kapital und Kapitalzins* (4th ed., 1921), provides an acute critical analysis of the principal theories of capital and interest. An English translation of an earlier edition of this important work is available in two separate volumes, *Capital and Interest* (1890) and *Positive Theory of Capital* (1891). Standard modern treatments will be found in A. Marshall, *Principles of Economics*, 8th ed. (1920); G. Cassel, *The Nature and Necessity of Interest* (1903) and *Theory of Social Economy* (trans. J. McCabe, 1923); R. T. Ely and others, *Outlines of Economics*, 4th ed. (1920); F. W. Taussig, *Principles of Economics*, 3rd ed. (1921); A. Landry, *L'intérêt du capital* (1904); J. B. Clark, *The Distribution of Wealth* (1899), distinguishes between capital, viewed as a "fund," and the specific capital goods, including land, in which at any given time the fund is embodied. Irving Fisher, *Nature of Capital and Income and The Rate of Interest* (1906), identifies capital with wealth, measured in terms of its money value. J. Schumpeter, *Theorie der wirtschaftlichen Entwicklung* (1912), emphasizes the parts which progress and enterprise play in making capital productive. H. J. Davenport, *The Economics of Enterprise* (1913), holds that in a competitive society capital must be defined as an instrument of acquisition rather than of production. The most influential statement of the view that income from capital is unearned and is based on exploitation is Karl Marx's *Capital*. For older views of the nature and services of capital see especially Adam Smith, *The Wealth of Nations* (1776), Book II. and J. S. Mill, *Principles of Political Economy* (1848), Book I. Some of the differences in the views of modern economists, it may be observed, are more apparent than real, and come from differences in definitions, in emphasis, or in the particular problems which the different writers have attacked. (A. Yo.)

**CAPITAL, EXPORT OF.** This expression denotes investment of capital abroad by a country or its inhabitants. The term may be applied either broadly to the gross amount of capital so invested during a given period, or more narrowly to the net amount, represented by an excess of capital invested externally over capital concurrently invested in the country from outside.

Export of capital presupposes the existence of a supply of capital available for investment abroad, of an effective demand and of arrangements for bringing the supply and the demand into relation with one another.

The supply of capital available to a country for investment abroad in any period forms an indefinite part of its total supply of capital available for investment at home or abroad in that period. This total includes capital which is the fruit of current savings, as well as some capital, accumulated in earlier periods, which becomes re-available for investment as a result, e.g., of liquidation of stocks in which it had been temporarily invested. In the long run current savings are all important, and the supply of capital available for investment abroad forms part of the savings of the country. Not all the capital which is accumulated is equally available for investment at home or abroad. Many investors undoubtedly prefer to invest their money at home in undertakings with which they are familiar, even if the rate of interest obtainable is relatively low; or if they control trust funds they may be restricted as regards the choice of investments. In this connection it may be noted that under English law prior to 1900 trustees could only invest in certain British securities, but the Colonial Stock Act of that year extended the classes of securities open to them to include certain Colonial Government Stocks.

**Competition of Home and Foreign Investments.**—Home investment generally tends to exert the first pull upon the available supplies of capital, but reluctance to invest abroad may be largely overcome (where good opportunities for investment exist) by widely increased knowledge of foreign investments. As the habit of foreign investment increases, the special financial inducement (in the form of high rates of interest) which is necessary to overcome the distaste for foreign investments tends to diminish, and capital flows more freely over the world in response to demand. But where there is a strong internal demand for capital, as in a country which is developing rapidly, capitalists will have no strong motive to acquire experience of foreign investments, and the great bulk of their capital will be invested at home. For this reason the export of capital in large volume normally implies that the capital exporting country has reached a certain stage of economic maturity, at which not only is the rate of saving high, but the internal demand for capital is no longer so insistent as to offer a pre-emptive rate of return to the investor. In fact it may be possible to distinguish three successive stages of development:—(1) the stage in which the rate of accumulation does not suffice to meet the home demand for capital, and there is a tendency to import capital; (2) the stage in which the rate of accumulation exceeds the home demand, and the ownership of the physical capital invested in the country by foreigners is purchased from them; and (3) the stage at which capital is exported for investment abroad. These stages no doubt in practice overlap, but they are definitely traceable, and they are prominently exemplified by the history of the United States in recent decades (see p. 799).

Demand for capital expresses itself effectively by the offer to lenders of what appears to them an adequate prospect of an attractive return on their capital. It may happen that a particular form of capital expenditure (e.g., on working class houses or public education) would be advantageous and highly remunerative from the point of view of the community as a whole, and yet does not offer the prospect of a financial return to the individual capitalist. In that case the demand for capital is not effective unless the expenditure is undertaken by some public body, capable if necessary of borrowing the money from the individual capitalist. When it is said that the distribution of newly accumulated capital between home investment and foreign investment is affected by the relative strength of the home and the

foreign demand, this important qualification should be borne in mind. The demand for capital for investment abroad arises mainly in connection with the opening up and economic development of the country in which the capital is to be invested, although borrowing in connection with war expenditure (especially during the World War) or for the purpose of meeting budget deficits in peace time has been important on many occasions. Investment for purposes of development has the advantage of being reproductive, that is to say it enables further wealth to be created out of which the capitalist may hope to draw his interest. The economic development of new and backward countries may be enormously accelerated by the investment of capital from abroad, though abuses may arise where the interests of the country or its inhabitants are subordinated to the interests of foreign capitalists. The capital is used largely for the construction of means of communication, such as railways; for public utility undertakings, such as gas, water and electric supply; for banks and land mortgage companies; and for mining or agricultural work, including such enterprises as tea and rubber plantations or sheep farms. It is on the whole exceptional for the imported capital to be invested in manufacturing industries, largely no doubt because the development of these industries represents a late stage in normal economic growth, a stage reached by the capital exporting countries, and partly perhaps also from a disinclination on the part of capitalists in capital exporting countries to promote competition with the industries in their own countries. Nevertheless, there has been some tendency in recent years for large industrial undertakings in capital exporting countries to establish branch factories abroad, especially in countries to which direct shipment of goods is uneconomic on account of a protective tariff or other circumstances.

**Organization of Foreign Investment.**—Regarding the arrangements for bringing the supply of capital available for investment abroad into relation with the demand, it may be said that an elaborate organization is required and tends to grow up where capital is exported on a large scale. The market is concentrated largely in the hands of a group of financial houses, banks and merchant firms, with the Stock Exchange as an essential adjunct. In the relatively simple case where a foreign government seeks a loan, the financial house or bank with whom negotiations are conducted has to make the necessary arrangements for getting the loan underwritten (so as to ensure that the money is forthcoming even if the public do not subscribe all that is required) and for issuing the loan to individual investors. In many cases, however, financial houses have to seek out opportunities for investment abroad, to obtain "concessions," and to "nurse" projects until they are ready to be launched upon the market in the form of a public issue by a company formed to carry on the undertaking. Again, securities already issued in a foreign country may be purchased and distributed to investors in the capital exporting country by a publicly advertised offer for sale, by introduction and sale on the Stock Exchange or by placing through other channels.

**Relation of Foreign Investment to Foreign Trade.**—It may be asked what is the relation of the export of capital to the foreign trade of the capital exporting country and of the capital importing country. When a country begins to export capital it furnishes to foreign countries commercially a greater value of goods or services than it obtains in current exchange, the difference representing the amount of capital lent. Not that the difference in value between the outward and the inward flow of goods and services is necessarily caused by the capital transaction. It may be rather that the capital transaction is caused by the existence of the difference in value between the outward and the inward flow of goods and services. From a secular point of view the latter is probably the truer explanation. The British export of capital during the 19th century was rather a consequence than a cause of the development of a number of great industries looking to the export markets for the disposal of their products; and the development of the American export of capital in the 20th century is similarly rather a consequence than a cause of expanded exports and restricted imports. On the other hand, the export of capital is a condition of the outward flow of goods and

services exceeding the inward flow. Moreover, at any particular time the conclusion of foreign loans may be an important factor in stimulating the outward flow of goods and services from the capital exporting country or in reducing the inward flow.

In some cases it is possible to trace a close connection between a particular investment of capital abroad and a particular outflow of goods or services. Thus it can be shown that export of British capital for investment in railways in Argentina is frequently related to the export of British railway material to Argentina, and it may be reasonable to regard the export of this material as attributable to the investment of the capital. It is, however, comparatively seldom that a connection can be traced between a particular export of goods and a particular investment of capital. Even in the case of an Argentine railway which purchases its equipment in Great Britain, part of the money invested must be remitted to Argentina to pay wages of the workpeople engaged in building the line and to meet other local expenditure. Where no condition is attached to a loan requiring a portion of the proceeds to be expended in the lending country (as is frequently the practice in France and other Continental countries), the whole may possibly be remitted abroad by the purchase of "exchange," no part being spent directly on buying goods in the lending country.

In saying that the export of capital is related to an excess in the value of goods and services furnished by the capital exporting country over the goods and services received, it was assumed for the sake of simplicity that the country was just beginning to export capital so that the question of interest payments upon capital already invested abroad did not arise. The position, however, is not essentially different in the case of an old capital exporting country. If the interest be regarded as payment for a service concurrently rendered by the capital exporting country—the service of allowing capital to be used—the statement still holds that the amount of capital exported in any year is equivalent to the excess in value of goods and services furnished commercially by the capital exporting country over those received commercially. The export of capital during any year may or may not exceed the value of current interest payments on capital previously invested abroad, and, in so far as it is balanced by interest payments, the export of capital is sometimes regarded as a re-investment of the interest. This does not of course mean that the money intended for interest payments is retained abroad and directly re-invested. Nor does it mean strictly that the same money that is paid as interest is used in subscribing to new issues of capital for investment abroad. The phrase, however, implies the existence of a special, though somewhat indefinite connection between the two items in the international trading account. It is no doubt true to a certain extent that the capital exported in any year is derived from the income obtained from earlier investments abroad, and to that extent anything which affects the flow of income affects also the accumulation and outflow of capital. Further, nothing is more calculated to stimulate the export of capital than a high yield on capital already invested abroad, or to discourage it than a low yield.

**Economic Effects of Capital Exports.**—There is a certain presumption that an unrestricted flow of capital tends to maximize wealth. The export of capital from countries where it was relatively plentiful to countries where it was relatively scarce, in response to the prospect of a higher yield, has on the whole enormously added to the wealth of the world. The rate of development of new countries such as the United States has been very greatly accelerated by the investment of capital from European countries, and the annual interest represents but a small part of the wealth which was produced with the aid of the capital. Further, the prosperity of the capital exporting countries themselves was increased not merely by the relatively high rates of interest on capital invested abroad, but far more by the fact that the development of production and of transport led to a vast expansion of international trade. As already stated, the export of capital in large volume normally implies that the capital exporting country has reached a certain stage of economic maturity at which the demand for capital for internal use is less strong

than formerly. This means as a rule that a tendency to diminishing returns is making itself felt particularly in the agricultural industries. In so far as plentiful supplies of food and raw materials can be purchased cheaply from abroad, the effects of the tendency to diminishing returns can be postponed. The country can support an increasing population by concentrating its activities in those directions in which there is a tendency to increasing or constant returns, *i.e.*, particularly in manufacturing industries, and by obtaining from abroad those foodstuffs and raw materials which it could only produce itself at increasing cost, if at all. From this point of view the economic advantages of the export of capital to a country such as Great Britain must be regarded as immense. Had it not been for the development of agricultural industries abroad with the assistance of British and other capital, there would have been no question of Great Britain being able to support anything like the population which it supports to-day. It is no doubt true that as new countries become developed they may no longer be content to be suppliers of food and raw material and may establish manufacturing industries of their own. Their internal requirements of food and raw materials may increase to such an extent that they have less to spare for export, and this is more likely to be the case as they become more thickly populated and as a tendency to diminishing return makes itself felt. But there are still many undeveloped parts of the world, and it is in those parts that the capital exporting countries increasingly seek opportunities for investment as the older fields become less attractive.

**British Investments Abroad.**—British investments abroad were built up by an almost unintermittent export of capital between the end of the Napoleonic wars and the outbreak of the World War. Sir George Paish estimated that at the end of 1913 the amount of capital publicly invested by British citizens in the colonies and foreign countries amounted to over £3,700,000,000, to which should be added a large amount invested privately, bringing the total to about £4,000,000,000. Of the amount publicly invested, Sir George Paish found that some £1,780,000,000 was invested in British Dominions and possessions, some £754,000,000 in the United States, and some £764,000,000 in other foreign countries on the American continent. A comparatively small amount (less than £200,000,000) was invested in European countries—mainly Russia, Spain and Turkey. Sir George Paish estimated that no less than £1,521,000,000 was invested in railways; £959,000,000 in Government securities; £273,000,000 in mines; £244,000,000 in land, investment and finance companies; £147,000,000 in municipal loans; and £145,000,000 in commercial and industrial securities.

**Other European Countries.**—Several other European countries emerged as exporters of capital during the 19th century. Apart from Holland, which had established her position earlier as an investing country, these included France, Germany, Belgium and Switzerland. The amount of French capital invested externally was estimated in 1912 at some fr. 40,000,000,000 to fr. 42,000,000,000. French investors tended to concentrate their investments in Europe, Egypt and the French African colonies; and showed a marked preference for Government bonds, including Russian Government issues which were held very extensively. They also held considerable investments in South America, Mexico and the Transvaal.

The amount of German investments was variously estimated at £1,000,000,000 to £1,250,000,000 before the World War. A large part was represented by Russian bonds, railway and industrial securities; and German investors had large interests in Austria-Hungary, Italy, Rumania and the Balkans. They also had substantial interests farther afield, in the United States and Canada, South America and the Far East.

The position then before the World War was that Great Britain, and to a smaller extent France, Germany and some other European countries, had built up substantial external investments, and were in the habit of adding to them year by year through the export of capital. Apart from these, no other countries exported capital on balance, though some capital importing countries also invested capital abroad.

**United States.**—Among these countries was the United States, which, during the two decades before the war, had invested considerable sums in the development of industries in Canada, in Mexico and Cuba; and had also repurchased from Europe considerable amounts of American railway securities. The flow of capital, however, continued, on balance, to be into the United States. At the outbreak of the war in 1914 European holdings of American securities were probably between \$4,500,000,000 and \$5,000,000,000. American external investments probably did not exceed one-third of this amount.

**Changes Due to the War.**—The World War brought enormous changes in the sphere of international indebtedness, the extent of which cannot even now be precisely gauged. The initial shock to the credit system at the outbreak of war caused an immediate stoppage in the normal flow of capital from lending to borrowing countries and gave rise to demands on the part of the former for the repayment of maturing obligations. The borrowing countries experienced at first great difficulty in making remittances, as was indicated by the position of and the fluctuations in the exchanges.

Later, as purchases of war supplies by the belligerents increased, this difficulty disappeared and the exchanges turned in favour of the borrowing countries. From that time the European belligerent countries were confronted with an increasingly serious problem of financing their purchases abroad. It was a problem much more serious for the Allies than for the Central Powers, because the latter were largely cut off from the possibility of importing from countries out of Europe; but it applied to the Central Powers in connection with their purchases from European neutrals.

Great Britain bore a large part of the burden of financing the external purchases of the Allies prior to the entry of the United States into the war, and an account of the arrangements made forms part of the history of British war finance (*see* GREAT BRITAIN). So far as purchases could not be paid for out of ordinary credit items in the trade account they were met out of money obtained (a) by selling abroad holdings of foreign securities, (b) by borrowing abroad on the market, or (c) by borrowing from foreign or Dominion Governments. Each method was adopted so far as practicable, the last becoming commoner as more countries joined the Allies.

In view of the magnitude of British investments overseas it might have appeared that vast sums could be raised abroad by the sale of securities if not by borrowing. The extent to which investments could be realized was, however, in fact comparatively small. Only exceptionally did it prove possible to sell any of the sterling securities which represented the bulk of British holdings, and sales were for the most part limited to securities expressed in (or convertible into) foreign currencies—particularly American dollar securities. The sale of these securities proceeded to some extent in response to ordinary economic motives, and subsequently the British Government itself organized the acquisition, by purchase or on loan, of suitable dollar and other securities which could either be sold abroad or used as collateral for advances. To encourage holders to lend securities which the Government wished to borrow, an inducement was offered in the form of an additional  $\frac{1}{2}\%$  interest; while holders of certain specified securities were pressed to sell or lend them to the Treasury by means of a penal additional income tax of 2s. in the £.

In the course of its operations the so-called American Dollar Securities Committee purchased American and Canadian dollar securities to the value of £184,266,540, and obtained the deposit on loan of others valued at £100,290,052. More important in amount than the sale of American and other securities was the direct borrowing by the floating of loans abroad and by arrangements with foreign bankers or with governments. The aggregate external debt of the British Government amounted on March 31, 1919, to £1,364,850,000 at par of exchange. Of this £840,822,000 represented debt owing to the United States Government, £91,808,000 was owing to the Canadian Government and £113,500,000 represented loans from certain Allied Governments, which could be regarded as available to be set off against debts owed by the same Governments to Great Britain.

### Britain, France and Germany as Creditor Nations.—

While dollar securities were being sold abroad and money was being borrowed, advances were being made to European Allies and to certain of the Dominions, the aggregate nominal amount of these advances being undoubtedly in excess of the amount raised abroad by selling securities and by borrowing. Regarded as a commercial asset, however, these advances are by no means equivalent in value to the amount realized by the sales of dollar securities and by external borrowings. In 1926 the payment made by Great Britain to the United States Government on account of principal and interest of the debt alone exceeded by over £6,500,000 the amount received by Great Britain in respect of war debts and reparations. On the whole, it is clear that the creditor position of Great Britain at the end of the war was considerably, though certainly not fundamentally, impaired.

The effects of the war upon the creditor position of France were more disastrous owing to the extent to which French capital had been invested in Russia and other countries affected by the war. In addition to incurring considerable debts to private interests, abroad, the French Government borrowed very heavily from the British and United States Governments. Settlements of these debts have been negotiated though not ratified by France, but payments on account are being made.

Germany, like France, had large investments in Russia which were lost. She also suffered from the sequestration of German property and enterprises in the territory of hostile countries, though to some extent this was set off against property of those

governments associated with it in the war exceeded \$7,300,000,000 at the end of 1918. Since that time agreements have been reached with nearly all the foreign governments to which money was lent by the United States Treasury, for the settlement of the debts, and in 1926 there was paid to the United States \$35,119,000 on account of the principal of these debts, and \$160,170,000 on account of interest. At the end of the war the United States was no longer on balance a debtor. During the following years she rapidly established her position as a great creditor. After the Armistice, Europe needed large quantities of foodstuffs and other supplies for which payment could not be made in cash. The United States was able and willing to furnish the goods and did so to a large extent on open credits from the banks. These advances were subsequently in large part funded in various ways. To some extent they were liquidated by further sales of European owned dollar securities, of which it is estimated that \$500,000,000 were repurchased in 1919 and 1920. A certain quantity of South American, Canadian and other sterling securities were also purchased in America.

**Flotations of Capital.**—Flotations of capital were effected in the United States to a vast aggregate amount on behalf of foreign governments and municipalities whether Canadian, South American, European or other; and large sums were invested in industrial undertakings, especially in Canada and South America. The amount of new flotations of capital in each year from 1920 to 1926 is computed by *The Financial and Commercial Chronicle* to have been as follows:—

*Foreign Issues Placed in U. S. A. Excluding Refunding Loans (In thousands of dollars)*

|  | 1921.   | 1922.   | 1923.   | 1924.   | 1925.     | 1926.     | 1927.         |

countries in Germany sequestered by the German Government. Like the Allies, Germany incurred heavy debts in certain foreign countries, notably Holland, Sweden and Switzerland; and she mobilized saleable foreign securities with a view to effecting payments abroad. On the other hand, she advanced large sums to her Allies, but had to forego her claims to repayment as one of the conditions of peace. Her defeat in the war resulted in the loss of her position as a capital exporting country.

**Position of Neutrals.**—The urgent demands of the European belligerents for supplies of many kinds provided an exceptional opportunity for countries which were in a position to take advantage of it. This applied to a considerable extent to some of the neutral countries of Europe, especially Holland, Sweden and Switzerland; but their capacity to furnish supplies on loan or otherwise was restricted by economic difficulties resulting from their position in the war area. It was estimated nevertheless with regard to Switzerland that by the end of 1918 she had lent the Allies fr. 400,000,000 and the Central Powers fr. 200,000,000, and that she had at the same time repurchased securities in French, German, English and Austrian hands to the value of at least 800,000,000 francs. The experience of Holland and Sweden was not dissimilar.

**The United States as a Creditor Country.**—It has already been indicated that for some years before the war, America had been investing capital abroad, although she was not on balance a capital exporting country. Clearly, however, her financial strength was increasing, and it was only the great demand for capital for internal development which kept her from becoming a capital exporting country. The war greatly hastened her progress in that direction. She was able to repurchase with ease from Europe large amounts of American securities, the aggregate being estimated at \$2,000,000,000 up to the end of 1918. Private loans were also floated in the United States to the amount of \$1,500,000,000, while advances by the United States Government to the

The flotation of new foreign capital issues fell off markedly in 1923, owing largely to distrust arising out of the French occupation of the Ruhr. Following the settlement on the lines of the Dawes Report, which increased confidence in the stability of Europe, the amount of new issues rose to unprecedented figures in 1924, 1925 and 1926, when very large sums were lent to European governments and municipalities as well as to industrial enterprises. Parts of these new issues were, however, subsequently sold back to Europe.

A large part of the gross export of capital from the United States (as also from the United Kingdom) is ordinarily represented by money subscribed to new flotations of capital for investment abroad. Nevertheless the gross export of capital is not to be identified with the amount of such flotations, even assuming them to be fully subscribed. Capital may be invested abroad privately, either in permanent investments or on short loan in foreign money markets. On the other hand, a new flotation may represent merely a sale of an undertaking which is already owned in the investing country, or part of the money may be subscribed by foreigners, or the subscription may be made out of funds already invested abroad. Still less is the amount subscribed to new flotations for investment abroad to be identified with the net export of capital, since there may, during any period, be a considerable import of capital. The amount of the net export of capital from the United States was estimated by the Department of Commerce, on the basis of an analysis of the international payments of the United States, to be \$2,017,000,000 in 1920, \$561,000,000 in 1921 and \$130,000,000 in 1922. In 1923 there was a net import of capital amounting to \$228,000,000 followed by a net export of \$310,000,000 in 1924, \$429,000,000 in 1925 and \$13,000,000 in 1926. It is clear that the amount of new flotations bears little relation to the net export of capital, which since 1922 has been much smaller.

American foreign investments (exclusive of debts owing by

foreign governments to the United States Government) are estimated to have been made up as follows, at the end of 1926:—

|   | \$                   |
|---|----------------------|
| Europe . . . . .  | 3,010,000,000        |
| Latin America . . . . .                                 | 4,500,000,000        |
| Canada and Newfoundland . . . . .                       | 2,801,000,000        |
| Asia, Australia, Africa and rest of the world . . . . . | 904,000,000          |
|   | <hr/> 11,215,000,000 |

By far the greater part of these investments has been made since 1914, and when account is taken of the fact that foreign holdings of investments in America have been reduced to comparatively small proportions by the repurchase of some \$2,500,000,000 of securities, and further of the debts owing by European Governments, the magnitude of the change which has occurred in the financial position of the United States is clearly apparent. Whether America will continue to export capital at the same rate or whether a rising standard of consumption and the demand for capital for internal purposes will restrict the amount invested abroad is by no means certain.

**France and Germany in Post-war Finance.**—For the time being at any rate Europe has ceased to be able to provide large amounts of capital for other parts of the world, and on the whole the flow is at present rather into than away from Europe. The resources of France have been fully taken up with the restoration of the devastated areas. Germany has been borrowing heavily for reconstruction, and having regard to reparation payments is not likely to be in a position to invest capital abroad for many years.

**Recovery of the London Market.**—On the other hand, Great Britain was able to resume the export of capital, though on a reduced scale. The external debt incurred during the war was reduced by over £200,000,000 between March 1919 and March 1921, since when further substantial reductions have been made. During 1920 considerable blocks of South American, Chinese and other foreign securities were purchased at low prices from the Continent, although at the same time other securities were being sold to the United States and also to Canada until the imposition by the latter country in the autumn of 1920 of an embargo on importation of securities. Considerable flotations of capital were also made for British possessions and foreign countries, as indicated by figures compiled by *The Economist*, shown in tabular form: "New Capital Issues in London."

For reasons explained above the amount of new issues of capital for investment abroad is not to be identified with the total export of capital, and still less with the net export of capital obtained after deducting any import of capital. There is reason to believe that during the past two or three years a considerable import of capital has taken place (in the form of a transfer to London of bankers' and other balances for investment in the money market) tending to offset the total export of capital represented by capital subscribed to new issues and other investments.

*New Capital Issues in London*

|                | For British possessions. | For foreign countries. | Total.      |
|----------------|--------------------------|------------------------|-------------|
|                | £                        | £                      | £           |
| 1920 . . . . . | 31,639,800               | 7,888,400              | 39,528,200  |
| 1921 . . . . . | 90,577,800               | 22,223,900             | 112,801,700 |
| 1922 . . . . . | 74,924,200               | 55,233,100             | 130,157,300 |
| 1923 . . . . . | 92,722,900               | 44,754,700             | 137,477,600 |
| 1924 . . . . . | 72,276,900               | 52,436,800             | 124,713,700 |
| 1925 . . . . . | 60,919,700               | 16,276,500             | 77,196,200  |
| 1926 . . . . . | 53,174,300               | 48,432,600             | 101,606,900 |
| 1927 . . . . . | 99,812,400               | 48,470,000             | 148,282,400 |

Estimates of the export of capital based upon an analysis of the balance of trade indicate that in 1920 the nominal amount was probably higher than in the years immediately preceding the war, when it approached £200,000,000 per annum. In 1922 the amount was probably about the later figure and in 1923 about £170,000,000. It fell to £86,000,000 in 1924 and £54,000,000 in 1925, according to estimates of the Board of Trade. In 1926,

when the trade of the country was disorganized by a prolonged coal stoppage, it is estimated by the same authority that there was a net import of capital amounting to approximately £7,000,000. The general depression of trade has affected British industry severely, and while the aggregate accumulation of capital has certainly been much reduced in real amount (though in nominal value it is probably as great as before the war) a much larger proportion has been invested in Great Britain. In 1927 the net export of capital is estimated to have been £96,000,000.

**CAPITAL, NATIONAL:** see WEALTH, NATIONAL.

**CAPITALISM.** "Capital" may be most briefly described as wealth used in producing more wealth; and "capitalism" as the system directing that process. This latter term came into general use during the second half of the 19th century as a word chiefly signifying the world-wide modern system of organizing production and trade by private enterprise free to seek profit and fortune by employing for wages the mass of human labour. There is no satisfactory definition of the term, though nothing is more evident than the thing. Arthur Young (1792) calls capitalists "moneyed men." Coleridge as early as 1823 distinguishes them as having "labour at command." This latter aspect, seized upon by Karl Marx, is emphasized by economists whether favourable or hostile to the individualist method. The expression "capitalism" is of Socialist origin and was used at first with an implication of reproach. It has been accepted by those whom it meant to stigmatize; and is now the name—as opposed to Socialism—of the prevailing economic system. As the ruling alternative to Socialism it claims to be more modern in thought, more creative in result, surer of the future because more capable of raising the average level of material prosperity and happiness, while enhancing the vigour, variety and zest of life by a richer play of personal initiative. Its undeniable defects and the proposals for its improvement will be examined towards the end of this article.

The economics of capitalism are so deeply involved with politics and all sociology that it was regarded until lately as a subject unfitted for scientific treatment. While Socialist indictments were elaborate, the positive case for capitalism was hardly stated. Only in recent years has it found a separate heading in works of reference. It is still excluded from the latest re-issue of the *English Dictionary of Political Economy*. After some hesitation it has been rightly included and treated at length in the new post-war edition of that massive German compilation, *Handwörterbuch der Staatswissenschaften*.

**1. Capitalism in Action.**—Strange to say the growth and working of capitalism have received not a tithe of the attention devoted in our time to Socialist theory. Science has been defined as accurate description of observed results. Modern capitalism offers to accurate description a subject to be studied like physiology. It is more nearly a universal force than any other, spiritual or material, yet known. It operates and extends amidst all races, colours and sects. It is active more or less in all nations. Even Soviet Russia, it appears, has been compelled, in effect, to recognize private ownership of the land—including the superiority of richer peasants over poorer—and to restore private trade to a certain extent in towns. The only anti-capitalist Government craves loans from capitalist nations. In consequence of these lessons, the Socialist and Communist pleas for the overthrow of the existing system of private property and free enterprise are more decisively rejected by a large majority of the world. Capitalism

prevails more strongly than ever, in at least six-sevenths of the world. In the remaining part—the immense Eurasian territories of the Soviet republics, more truly called the Soviet empire—a general reversion to private ownership and trade seems likely to take place in the long run, though the residue of State control may remain larger in the Russian system than in Western societies. Elsewhere private enterprise animates economic life in all the continents and impels their interlinking traffic. It is the strongest pervading influence in the daily affairs of all civilized peoples.

Everywhere the soil which feeds all other human activities is in the hands of private owners whose numbers have largely increased, especially in eastern Europe and Russia, since the World War. Mines everywhere—outside the Soviet territories—are worked by capitalist enterprise. Transport by land, sea, inland waterways and air is conducted generally by private direction utilizing the funds supplied by hosts of individual investors. The towns and cities with their factories and workshops; with their dense populations sustained by work for wages; with their myriad agencies of distribution by middlemen; with their conditions of housing, supply and conveyance—all these are creations of modern capitalism. It is the agency whereby the intellectual achievements of thought and invention enter into the practical service of human life in all its forms at all its moments. And this by means of an innumerable variety of mechanisms ranging from engines of giant mass and power to devices the most minute and delicate. The tall chimney appears as a symbol at Rome and Athens, at Jerusalem and Benares, and Peking and Tokyo. An enormous enhancement of the productivity of human hands has brought into being some hundreds of millions of civilized populations who could not have existed and subsisted without it. As it has enlarged and altered the white societies out of recognition, capitalism reaches into the depths of the newer continents and is stirring anew the ancient Asiatic peoples; while in a single half-century it has penetrated the Dark Continent from end to end and transformed all African conditions.

**2. Freedom of Enterprise.**—Freedom to undertake affairs in the hope of gain and at the risk of loss is the breath and the life-blood of this system. It has its edifices, its productive plant, its inter-connecting chains of traffic and networks of communication by which goods and services are exchanged, different needs in all their multiplicity mutually supplied. Extremely complex organizations of human intelligence and labour are required to work this system: they function under private ownership and control. Governments may facilitate and assist—as they may hamper and impede—the exertions of free enterprise. But Governments derive their own funds from taxes levied directly or indirectly on individual effort; nowhere has the State itself become a separate wealth-making power; nowhere has Socialism been able to make itself in the least degree a working substitute for modern capitalism. The Bolshevik experiment—rejected in agriculture by that 90% of the Russian people whose preference for private ownership is invincible—is especially inferior in industrial efficiency. Hence, the Russian Communists by paradox seek loans from foreign capital to postpone the collapse of anti-capitalism.

**3. Rise of Machine Industry.**—The impartial history of capitalism, not yet written, deserves many volumes by a Gibbon of economics. Only recent phases can be dealt with in this place. A golden age of equality and harmony is a dream of the future; it never has been a reality of the past. In dimmest prehistoric times the exceptionally competent individual must have been relatively more powerful than now; useful enough to be deified by his fellows. The superior craftsman and artist, possibly the superior director of average labour, emerged in the making of flint weapons and tools. Acquisition like leadership went with strength and skill. From the beginnings of recorded history, rich and poor appear. Kings and chiefs, able warriors and civil administrators, priests, merchants, commanded the labour and services of the mass of men. In that sense, Egypt and Babylonia, Greece and Rome were full of capitalism and of every kind of private ownership including its extreme form, slavery. If Carthage was a thoroughly capitalistic State, so was Athens, at its zenith and later. In the time of the orators, the common rate of interest on loans ranged from 12

to 18%. The middle ages passed through feudalism and serfage. The Renaissance and the Reformation alike carried capitalism and the wages-system into wider development and more detailed activities. On the one hand the Renaissance enriched creative ideas and multiplied desires; while the voyages of discovery opened the epoch of world-trade with its new classes of merchants and makers and its necessary retinue of middlemen superseding more and more the direct contact of producer and consumer usual in the more local intercourse of mediaeval times. On the other hand, acute economists have insisted that after the Reformation the spirit of Calvinism and Puritanism developed thrift, exertion, method, diligence, and all the other efficient qualities of what we call acquisitive individualism. And this to a degree which prepared the ground for modern capitalism.

Then in the latter half of the 18th century came the industrial revolution. It has worked and spread with cumulative effect through five generations of invention and social change. Fixed and mobile machines, steam-power, oil-power and electric energy with its long-distance transmission of signs, sounds, light, heat and propulsion—these, purchased and directed by free enterprise in the economic sphere, are the present instruments of capitalist organization in the 20th century as already very generally described. There is as much difference between the contemporary world and the world of a little more than a century ago as between the 18th century and the higher stone age of 10,000 years before. The strong characteristics of the present phase are threefold: (1) the magnitude of capitalist operations far exceeds former example: the vigilance of their intelligence-departments must reach to the ends of the earth; trade and investment are international; every manufacturing nation, even the United States with all its self-supplying resources, seeks to derive raw material or choice commodities from every region of the globe and to find in every one of them a market for goods or money. (2) Larger aggregates of labour are directed by larger corporations and companies, amalgamated or federated. With its trusts and syndicates and other forms of consolidation, capitalist management is forming into fewer but more massive units. The relations between employers and employed depend more and more upon impersonal system, less and less upon individual attachments or dislikes. Yet exceptional personality, as in the case of Henry Ford, is more important than ever for progressive efficiency of production on the capitalist side while promoting wages, welfare-work and other encouragements in the way most likely to induce labour to give its best effort. (3) Though capitalism concentrates the control while extending the scope of its operations, as Karl Marx foresaw, the company-system confounds his chief expectation by immensely increasing the number of participating investors—multiplying small shareholders and widening the social basis of the system.

**4. Early Abuses and Resulting Prejudice.**—The sharpest points of Socialist criticism were originally urged against admitted and gross abuses in a period which has passed away. The worst of these evils have been remedied in most countries and remaining defects are as remediable. The positive case claims that capitalism to-day in its altered working is not only the most productive economic system possible in the present state of society, but that it is the most conducive to social welfare and progress.

During the last few decades and especially since the World War, the improvement in the character of the system has been in fact sweeping. When the Marxist creed was framed much of his terrible indictment was true. This must be confessed by those who reject his constructive fantasies. Machine-industry, still in the crude beginnings of its evolution, was like Milton's animals emerging at creation, half in the earth and half out of it. Many of its aspects were deformed and its effects vile. Swarming populations were huddled into mazes of mean streets, alleys and courts, put up and linked on without civic plan and regardless of health and decency. Throughout Great Britain the foul slums already presented a scene of ugliness and squalor such as civilization had never beheld. The large majority of the adult workers, and more than half their children were totally uneducated. The Factory Acts were only just beginning to build up what became one of the finest codes of humanitarian legislation in the world. Before the

first act was passed, parliamentary committees had exposed the horrors of child-slavery in the mills; women stood at the loom from morning to night sometimes for 15 and 16 hours.

As the common soldiers had been called "cannon-fodder" in war, the common people at this time were "factory-fodder" in peace. The defensive efforts of trades unionism were still scattered and feeble. The employer was in an absolute sense the "master." As profits rose and fell hands were thrown on the streets or taken on again. The hours of all labour were cruelly long and wages wretchedly low. Capitalism at that phase was in fact a wrongful exploitation of flesh and blood. We must not lay all the blame on the capitalists. Narrow lights usually were all they had. The prevailing classical economists taught that unrestrained competition was the spring of effort and the key of progress; that the poor in the lump must always be cheap; that labour by fatalism would always breed fast enough to keep wages at the lowest level required for human subsistence. In the leading industrial nations these conditions and ideas have been swept away long since in a manner that Karl Heinrich Marx could not foresee; but the memory of former wrongs and evils still prejudices the name of capitalism.

**5. The Creativeness of Capitalism.**—Now—though much remains to be done—the working of the system as a whole is incomparably more satisfactory and enlightened. It maintains the industrial masses of most white communities, but above all in America, at a higher level of prosperity than ever was reached before. Temporary post-war conditions shadow the European picture; but it is true even in Europe that the workers generally are somewhat better paid for shorter hours than in any previous period; that they are better fed and educated, housed and clothed; that they are better secured against all the preventable ills of human life; and that their opportunities for advancement and enjoyment have largely increased. Take first the question of creative success. Capitalism claims that however great may be the rewards it acquires for itself, it results in higher earnings, cheaper consumption and more various advantages than labour could have obtained otherwise. And how is this brought about? By ceaselessly seeking extension, improvement, novelty, by seizing on every idea likely to cheapen costs and enlarge turnover, by looking vigilantly for the ablest persons, free enterprise is dynamic and progressive through the rule of its nature.

More surely and quickly than ever before, the backward or stationary methods in business are eliminated by energetic and resourceful rivalry. Freedom of enterprise works in many ways as a creative force in economic life. It stimulates originality of ideas, ingenuity of method, boldness of attempt; qualities that the routine of public administration tends to fetter or stifle. The capitalist in this way shares the spirit of the adventurer, to whom pursuit of the personal idea is the breath of his being, and of the artist for whom freedom of individual expression is the vital condition of creativeness. Capitalism swarms with imagination in action. Every day thousands of heads in business, relying on their own perception and courage, are taking decisions and risks from which any public official or committee would shrink. Fresh initiative and invention never can be the characteristics of Government departments, least of all under democratic conditions where the dread of hostile criticism is a continual deterrent from any attempt, however successful in the long run, which at first only appeals to a few—or to one. Again the swift use of time is part of the essence of success in private enterprise. Public officials and offices have to wait until "opinion is ripe"—until they can count upon the approval of the many, and that commonly takes a long while. For these reasons, capitalism gives to economic life a vigour of impulse and creative fertility which no other method yet suggested seems likely to supply in anything like the same degree. By comparison—argue the modern advocates of individual ownership and direction—Socialism would mean at least arrested development, and probably an actual decline in general prosperity and welfare. Many a great undertaking employing thousands of workers has sprung from the idea of a single mind or from the intrepid judgment of a single character finding beforehand amongst other men little support or none.

**6. Vital Elasticity of Capitalist Organization.**—Capitalist enterprise large and small concentrates in millions of ways particular minds on particular problems. The needs, desires of every day in a civilized society, the new wishes always being awakened by new things offered, these are as the sands for number and the sea for endless changes of shade and motion. Consider the numbers of capitalist persons who are engaged in making in gross and detail the countless adjustments between supply and demand in their infinite variety. Conceive all the different processes of specialized intelligence that are involved. It becomes impossible to imagine in the present state of science how this living maze of private activities, each bent upon some one part of supply and demand, could be replaced under any form of Socialism by officials and committees without the same scope for personal initiative and contrivance—thus lacking the acute attention and supple adaptability that the present system on the whole compels. This is a chief ground for the conviction of thoughtful interpreters of capitalism in every great industrialized nation that private enterprise is not only the most powerful force of economic creativeness, but also the most elastic means of economic organization for adjusting supply and demand.

Private capitalism makes overseas investments. In any country it may provide funds for developing the productiveness of other countries; of regions thousands of miles away; building railways, opening mines and oil-fields, financing plantations—as for rubber—founding banks. British investments, for instance, in North and South America, in Asia, Africa and Australia—above all in United States railways during the generation after the Civil War—have done more than anything else to provide British labour with an abundance of cheap and varied food on the one hand, and on the other with cheap raw material to the benefit of employment and wages. Once more, we find it not easy to see how any kind of Socialist State could make overseas investments in this way, or conduct inter-connected banking, or maintain the present complex and sensitive mechanism of credit—that most wonderful achievement of creative capitalism—or provide and allocate the fresh capital required for the advance of industry, employment and wages. Under the present system, this fresh capital is furnished by the private accumulations made possible by freedom of private action.

**7. Progress of Labour-enhancing Equipment.**—Turn to another aspect—progressiveness in equipment. Modern capitalism depends chiefly on steam-driven or electric mechanism energized by coal, oil or water-fall. The rapid increase in our own time of the part played by mechanism in comparison with hand-labour is not less marvellous than were the beginnings of industrial invention. It is stated, for example, that in the most modern engineering shops 80% of the work is done by the machines and only 20% by the attendants. One attendant may now keep in play several machines doing the former work of scores of men. The eagerness of private capital to perfect equipment has given increasing stimulus to invention. In any Socialist State political pressure arising from fear of unemployment would have prevented that State, were its democratic opinion genuinely free, from pushing technical progress to the utmost as capitalism largely does. By the astonishing increase of miracles in metal, performing their intricate processes as though actuated by a mysterious intelligence of their own, the present productiveness of manual effort is enormously raised by contrast even with the latter part of the 19th century. Supply is cheapened, demand widened, the conveniences of life made more numerous and accessible, while employment is steadily enlarged in civilization as a whole. Human well-being is vigorously advanced in all material respects.

Other characteristics of capitalism, especially in the United States, where it shows its highest powers of technical progressiveness, are the standardization of models and parts, the speeding-up of processes, and the elimination of waste whether of material or time. These things are now made the subject of close and even subtle study. Nothing human we know ever can be finally perfect; ideas always are in advance of achievement. But when we look at such large effects of Capitalism as are unquestionably good, every dispassionate thinker must admit that the system is as prodigious

in ingenuity as tremendous in power. The present writer holds it to be altogether unthinkable that production and exchange in the modern world could have been developed by any other means to anything like the present extent.

**8. The Human Factor and the American Example.**—We pass here to another and deeper part of the examination. We have studied the working of modern capitalism as a means of animating production and facilitating exchange, stimulating demand and adapting supply; and we have seen reason to think that any extensive attempt to replace it by public ownership and management would mean something far less plastic and fertile, incapable of the same degree of wealth-making power and distributed prosperity. But what is the effect of capitalism on the labour it employs—that is upon the large majority of human beings where the system prevails? How far does it serve the greatest good of the greatest number? Again—though ideals must always move ahead however far practical improvement marches—we must note that since the time when Socialism formulated its charges and framed its dogmas, there has been a surprising change for the better in the principal matters of wages, hours and provisions, for personal health and physical security. A steady general movement has reduced working time and raised money-earnings; and also real earnings as measured by purchasing-power. That any system of public ownership and official control could enable a less amount of labour to enjoy an equal buying-power is an assertion out of the region of proof and any man is free to think it as far beyond credibility. This is, of course, a central point in the discussion.

It cannot be said any longer that capital habitually and necessarily extracts from labour an undue effort for an unjust reward; that manual workers are, demonstrably and usually, paid less than that part of the value which they contribute to the selling-price of the common product; or that average labour could hope to earn more or as much per hour if the creative aid of free enterprise were abolished. "Exploitation," in the sense of the old-fashioned Socialistic phrase, when the evil fact prevailed, is no longer a typical accompaniment of the economic system in the leading capitalist nations. No doubt, the success of labour in securing the utmost proportion of the selling price compatible with production at a profit differs much in different countries. On the European continent, as in Germany, wages on the whole bear a lower ratio to profit than in Great Britain where various convergent influences—trade unionist pressure reinforced by political power on the one hand, and on the other, a unique degree of freedom from indirect taxation coupled with large contributions by the minority of direct taxpayers to popular benefits—enable the working-classes to exact as full a payment in proportion to output as can be given without threatening the disappearance of profit and the debility of enterprise.

In America, however, where what we might call the new or reformed capitalism is in operation on the largest scale, high wages are accepted and welcomed as a vital principle of creative capacity in a way that Europe is only just beginning to comprehend. But what is the inference? Obviously that capitalism everywhere can follow where America leads—that capitalism as a system is by way of becoming a more willing and vigorous instrument for the greatest good of the greatest number than original Socialism could imagine. In the United States over a hundred millions of people have reached common standards of comfort and enjoyment far above the best known in Europe and immeasurably above any social achievement in the world's history. As has been said this gigantic example in the United States of wealth-making, with a large-minded distribution of the proceeds, is the result of equipping man-power with all the mightiest and nicest aids of machine power. Models and parts of the things to be made are standardized to cheapen repetition and replacement; all unserviceable complications are cut out; the processes of production are speeded up while more and more waste is eliminated. Far as that remarkable process has already gone, its further possibilities are seen to be very wide. Profits are sought not by making high prices an object in themselves but by reducing prices in order to enlarge demand and quicken turnover. In America individual abilities find the freest scope, the promptest recognition and the amplest reward.

The welfare of the workers is promoted by bringing into the factory system more safety and health, more lightness and brightness. Expert research into the possibility of improving mechanism, processes and use of materials is more widely and liberally encouraged than anywhere else. The spectacle of hosts of American workmen with their own motor-cars is a thing that would have staggered Karl Marx. Most of his generalizations drawn from the temporary conditions of mid-Victorian England are confounded by 20th-century America in general and particularly by the methods of Henry Ford. As an instance of the extent to which material progress may increase moral resources it may be noted that more money is spent in America on education than in all the other nations together. It need hardly be said that we must not conceive a perfect picture even of the United States. Not all the fields of American industry are Elysian fields. American thinkers assert that in some coal-areas in America relations between capitalism and labour are harsher than in western Europe; and that in other industries the example of the most progressive employers is far from being sufficiently followed. Some European experts protest that superabundance of wealth and material is still causing more wastefulness in certain directions than the scientific anti-waste movement is removing in other ways. But on the whole the American scene is magnificent in economic achievement and full of human promise. As against the culmination of the success of private enterprise in the United States, the only example of thorough Socialist attempt on a large scale is Russia as we see it.

**9. The Widening Social Basis of Capitalism.**—Modern facts refute the prediction that wealth would be concentrated in fewer and fewer hands until capitalism, more and more isolated, was either terminated by helpless surrender or overthrown by the insurgent violence of the exploited masses. Taking civilization as a whole the relative numbers of those personally interested in the maintenance of private enterprise grow every day. Under the company system we have seen continual and accelerating reinforcements of the ranks of small investors and owners of every kind. Hosts of people who work for salaries and fees prefer the private system and decisively reject the other, many of them no doubt as much desiring the further reform of capitalism as opposed to its abolition. This movement has begun to act on labour proper in a manner that is one of the more suggestive revelations of our time. The United States is far ahead on this line also but it only leads the progressive ideas of capitalism elsewhere. It is estimated that the number of small stockholders in the United States is (1928) over 10,000,000. Large numbers of workers have holdings in the concerns which employ them. In some cases, thousands of workers contribute their savings to nourish capitalist enterprises and are members of the corporations they serve. In one large motor concern over 90% of the employees are buying stock on the instalment plan. In another business the investments of the workers give controlling power. Yet another company's employees doubled in one year their holdings of its stock. It would seem difficult to overestimate the importance of several influences belonging to this novel development.

With bigger wages for bigger output there is incentive to thrift; a spur to energy and aspiration; a discipline of character; an interest in the business as a whole and in the wider fields which it serves; a stimulus of economic intelligence; an added sense of responsibility; and a gain to the spirit of life. It must be remembered that the actual majority of the population in France are small capitalists whether as property owners or *rentiers*. In Great Britain, on the one hand, individual investors in company shares are a big aggregate; while, on the other hand, many millions of the working-class population, probably a third of the whole, are interested in the public funds through the war certificates and savings banks deposits. Lively interest is aroused by plans for profit-sharing and co-partnership. The familiar instalment system in the United States and building societies in Great Britain have induced some millions of persons in the last half-decade to become private owners by buying the houses they live in. In Great Britain as in Germany the schemes for associating labour by consultative committees with the management of industry are more or less officially encouraged. In the United States the voluntary action of capital

has made a beginning with the same method. This movement as yet is rather an experiment than a power. Later, in connection with stockholding by labour and schemes of profit-sharing, the method of joint councils may well arrive at epoch-making results.

10. **Summary of the Present Position, 1928.**—We may now state the salient features of a full view. Capitalism generally in its world-wide undertakings has risen to this height and breadth of productive and distributive success. Where capitalism is most powerful, as in the United States, labour is more prosperous than at any previous phase of history and asserts a better individual status. On the other side of the Atlantic, Great Britain possesses most capital in proportion to population; and there, accordingly, wages are much higher on the whole than in any country of the European continent. Where wealth thus created is most abundant, the provision for education is more liberal, as in the United States; or as in Britain the evils belonging, amongst the workers, to sickness, accident, disablement, widowhood, orphanage and old age are mitigated by State-aid maintained by increased taxation chiefly levied on the capitalist classes. While capitalism does in fact tend to concentrate into fewer and larger organizations the total number of investors has grown rapidly. The capitalist system is indeed built pyramidwise, but instead of coming to a last hopeless attempt to stand upon its apex, according to the Marxist vision, it broadens its basis more than it raises its altitude. The original Socialist predictions have been falsified, with the usual irony of human anticipation.

11. **Capitalism and Unemployment.**—None the less we must take account of revised Socialist criticism and enquire into its validity. Charges to some extent contradictory have been partly answered in passing. Capitalism is still accused of responsibility for avoidable unemployment, arising from the periodic alternations of climaxes and depressions in trade activity, of "booms" and "slumps," to use the coarse but telling jargon. It is certain, however, that though there must always be some tidal movement of rise and fall, the former violence of these rhythms is now much abated in times of peace owing to longer experience and fuller knowledge; to swifter information in every part of the globe of what is happening in every other; to quicker transport, the better-calculated control exercised by the great trusts and syndicates as indirectly by the great banking combinations; and to the better adjustment altogether of the world-forces of supply and demand. These improving tendencies, we must note, belong in their nature to a condition of peace. General war in the modern world is a catastrophe followed by an exceptional mass of unemployment in the countries where trade and finance have been most severely dislocated by hostilities. Extreme Socialists blame capitalism for war as for every evil. They are deluded. Racial passion, fears and claims are main causes of war far older than capitalism, which though in some of its forms sharing and even stimulating the bad or mad feelings existing without it, is on the whole amongst the more pacific influences, especially in its form of international finance. Before the World War chronic unemployment in a country like Germany had been reduced to about 2% of a volume of labour continually expanding. This shows that the higher figure in Great Britain was not due to any defect necessarily inherent in capitalism.

The United States at the same time was subject as it were to larger and looser forces which have since been restrained. Unemployment is far from being only a question of economics. It is profoundly affected by biology in the shape of a lower or higher birth-rate and by policy in the shape of tariffs or of more or less restricted emigration. Psychology plays its part, as in the changes of taste and fashion, which throw out particular bodies of workers from time to time. As nothing suggests that official management of industry could have created the extent of employment now existing in the world, so there is no reason to believe that the most complete State control could make the movements of rise and fall in trade milder than they have become. No human system, let us repeat, can hope to be perfect. Before modern capitalism existed—for instance, in mediaeval times, often absurdly regarded as a golden age—the chronic unemployed abounded as beggars and vagabonds; while every bad harvest diminished work in the towns;

and recurrent famine meant disaster for urban labour as well as rural.

12. **The Questions of Speeding-up, Subdivision and Monotony.**—Frequently, still, capitalism is accused of lowering the physique of the worker by the modern intensity of speeding-up in machine production; and of injuring the mind and moral being of the worker by a remorseless monotony. The first indictment generally seems untrue, and the second very exaggerated. As regards human health the statistics for many manufacturing centres are favourable beyond any known example in previous history. For instance, the industrialization of Germany after 1871 was followed by an increase of longevity. The average duration of individual life was raised from about 37 years in the decade 1871–80 to about 47 years in 1900–10. Though sanitation plays its part here, capitalism is evidently no obstacle to sanitation any more than to education or to any other good human purpose. The wealth it makes supports these things. But then it is repeated that machine-industry at least injures the mind and spirit of the worker by extreme subdivision of effort, involving an eternal repetition of work on small parts and thereby a soul-killing monotony. We come to a very interesting discussion where the worst conclusion of the argument would cut both ways. In fact this general injury to the cheerfulness of the workers is not to be observed. Their demeanour at football or baseball matches and at the cinema or on any of their holiday occasions does not confirm the theory of their psychic depression. On the one hand, those workers who execute with their own hands and repeat endlessly only one small part of a process of manufacture are in sight of the manifold and stirring organization of the whole. More and more, as in America, the miracles of the machine quicken their intelligence, especially as their education advances. Again, millions of the more expert artisans work in teams, as it were, on mechanisms of colossal power and intricate cunning which are always dramatic. The linotype operator, yet again, repudiates the suggestion that he is a more soulless being than the old compositor who set type by hand, while no chauffeur will admit that he is less intelligent than the old coachman.

13. **"Socialism No Solution"—Capitalism or "Erewhon."**—In any case this particular argument against capitalism is a tool which turns its other edge against the user. So far as the modern subdivision of machine industry is disadvantageous, that is evidently the result of the whole modern movement of technical science and not of the capitalist application. Under Socialism a factory would be still a factory. Public ownership would have to take over the buildings and plant, and pursue the same methods of mechanical efficiency, with all such monotonies of minute repetition as are now denounced. Without destroying the basis of industrial employment and of the manufacturing towns Socialism could not do otherwise; and therefore by no possibility could it make such large changes for the better in the average conditions of human life as it is accustomed to assume.

Some anti-capitalist thinkers say, indeed, that the whole system of industrial civilization is a mistake; that it has brought into being excessive masses of people who are only higher kinds of automatic machines; that man loses his true happiness and deepest faculties and strongest character when divorced from nature and the soil; that the country originates the abilities which the town devours; and that the true solution, as in that profound satire "Erewhon," is to destroy the machines, prohibit their revival, and to return to agriculture and handicraft. This is a fascinating vision of ideal romance, and it sounds a moving chord to the ear of imagination; but as a practical argument it offers no escape. It comes too late. The industrial revolution is there, far advanced, and irreversible except by some catastrophe which would engulf all white civilization. Labour on the soil means monotony and repetition of another kind with a harder life. Variety and leisure are far from the traits of the French peasant's existence. No average town-worker afflicted by the evils imputed to capitalism is willing to go back to the spade and the plough. On the contrary, agricultural labour is more attracted by the towns; while, further, the prosperity of farming and pasture depend on supplying the swarming populations called into being by capitalist industry. And yet, as Ameri-

can practice shows, the machine is becoming as indispensable to the farm as to the factory. It makes man's life on the soil less hard yet more fertile. These inter-relations of machine civilization must be accepted. The real problem is to make the best of them.

**14. Reformed Capitalism Likely to Prevail.**—The Russian example and the failure of Socialism everywhere to reach any kind of constructive success have resulted in a ruling and strengthening conviction that the suppression of private enterprise and its replacement by official control would be a leap in the dark with the presumption of coming to grief. The old-fashioned centralizing Socialism with its army of bureaucratic agents would mean a slow sterilizing régime fatally influenced by political patronage, discouraging initiative and repressing independent personality. That this plan would be unendurable is felt by the younger Socialists. Their guild system, however, with self-rule for each industry, raises many more difficulties than it solves. How could the same work in the same factory become more pleasurable than now because the State or a guild owned it? Human nature is not so constructed. How could the big guilds adjust their exchanges, their relative claims to importance and reward, without formidable disputes? What would happen to the smaller miscellaneous industries? To picture this theory as a key to natural harmony is a myth. Who would entrust savings, did they continue practicable, to Socialist banks, and who would invest by preference in a Socialist country?

Private accumulation being impeded or prevented, how could democratic ownership and control keep in flow the supplies of fresh capital always needed for progressive industry and enlarging employment? If any national total of such fresh capital were available at all, how could it be allocated to meet the competing claims of different publicly owned industries? If the present possessing classes were abolished, so that annual revenue could not be raised from them as now, and direct taxation consequently were applied to the multitude, how would the people like that change? Would not hope be frustrated and subversive discontent aroused when it was found immediately that the part of the social dividend distributed to the average worker was disappointingly limited, low indeed, by comparison with the dream, and lower than the highest rates of wages now paid? The large majority of thoughtful men acquainted with the creation and management of business are utterly persuaded that every imaginative alternative to capitalism yet proposed for advanced societies, would either be a practical recipe for chaos or for a cruder order amounting to a throwback in civilized organization. It is thus probable that for a long time to come social progress will seek its goal not in Socialist proposals inspired by obsolete criticism of former conditions now so largely removed or remedied or shown to be remediable under the system of private enterprise; but rather in the development of the present tendencies of what we have called the new or reformed capitalism.

**15. Remaining Defects and Problems.**—Some of the strongest defenders of capitalism as the best system are yet amongst the frankest analysts of its remaining defects and abuses. These defects and abuses are in the way of correction by the convergent power of several growing forces—scientific thought, public criticism, the political power of democracy, the consequent pressure of legislation and the enlightened self-interest of capitalism itself. More and more subject in society to the conscious sovereignty of the greatest number seeking their greater good, intelligent capitalism sees that it must set itself in every way to serve the common interest. It must work so that its preservation shall be recognized as a vital part of the common interest. One broad remaining defect is that very many employers everywhere, especially of the older school, still fail to recognize that where capitalism stakes money, labour stakes life. Labour on the initiative of wise capitalism must be taken more and more into partnership by profit-sharing schemes, by extending stockholding amongst employees, by joint councils not impeding the executive but discussing general questions of policy or management and in possession of details of costs and profits. Evasion of publicity with regard to costs of production and real profits is the mother of suspicion. Hardy frankness must come.

In some countries, certainly in Great Britain, the chief complaint against excessive profits comes rather from the consumers. They complain of middlemen even more than of "rings"; and political action in Great Britain distinctly tends toward restraining prices thought unfair. The threat of interference is in itself some deterrent; but the consumers have no belief that labour control would mean cheaper supply. Yet public opinion insists strongly that trusts and syndicates shall not exploit the consumer in the temper of the old monopolies. Capitalist concentration may safely result in any extent of profit to the promoters so long as, by lower not higher prices, and by more assiduous services, it conduces to the plain advantage of the general community. Other problems raised everywhere by progressive, non-Socialist programmes are inherited wealth, the "idle rich"; pretentious and wasteful ostentation or what is called "prurient luxury"; efforts to acquire by the influences of money oligarchical or even pro-consular power over the nominal forms of political democracy.

It seems tolerably certain that democracy in the end will prevent or limit the enjoyment of the advantages of wealth by those not contributing to its creation by personal effort. Even on this question, which affords a facile means of appealing to popular indignation, we must discriminate. We must remember that as a rule the "idle rich" do not represent idle riches. Their money is for the most part invested in productive enterprise, and their personal waste is by comparison an inconsiderable mischief. Nevertheless wealth without work, however its actual evil may be magnified in popular imagination, is seriously obnoxious to democratic susceptibility. The case for active capitalism is fortified by every measure public and private tending to restrain the power of money in the hands of indolence. That excess of personal indulgence described as "prurient luxury" has been known in all ages under all systems. It occurs in the present day under capitalism, Bolshevism, Fascism, Kemalism, as an abuse not only of the corrupting possibilities of private wealth but of the equally corrupting possibilities of every kind of political and social influence wherever those who possess it seek to gratify a vicious habit. This immemorial disease has no moral relevance to modern capitalism as a system, and could not be cured by the abolition of private wealth. It is a problem of personal morals which has recurred under every social system, and can only be grappled with by methods not inspired by economic considerations.

Lastly, it must be recognized that a different kind of abuse is the broadest blot on the capitalist system. In cases no longer so common but still not infrequent, providers of capital, taking no part whatever in the active management of business, are content to receive big dividends without extending any kind of profit-sharing or co-partnership to the salaried experts and workers for wages who in combination produce the dividends. The principle promising to spread in the future is that the interest on passive capital should be limited to some definite though not grudging figure; that the rewards of creative management should be in full proportion to the results achieved by ability or genius; that all workers in a business should have some definite personal inducement to work for its increasing success.

**16. The Future of Capitalism.**—While prophecy is vain, "probability is the guide of life." We must frame our estimate of what is probable, as well as of what is attainable and ought to be attained. As Socialism inspires vivid dreams, capitalism for its moral vindication must have ideals as definite and more practicable. There is a rising supremacy of liberalizing public influence. Advanced social thinkers who are yet deeply opposed to Socialism, believe that private enterprise which they hold to be the best wealth-creating force is in gradual process of becoming also the best wealth-distributing system in a way that will raise the average of human prosperity to still higher levels. They anticipate, therefore, that the interest on "passive capital" will be limited by maximum rates never so low as to discourage saving and investment; that the directing ability of active capital must remain entitled as now to large rewards in proportion to success in enterprise; but that as the education of democracy progresses labour will not only receive wages steadily increasing relatively to profits, but will everywhere share in the division of profits, while

becoming more and more associated in consultative councils with the management of industry, and enjoying every possible opportunity to rise from the ranks.

In this fashion, therefore, capitalism would realize in the end all that is really sound in the practical ideals of Socialism while preserving that creative play of free ambition and adventure which is most surely stimulated by the chances and prizes of personal success expressed in terms of high income and acquired fortune whether large or small. To consider private profit in itself as sordid or immoral is superficial. Artists as usually as capitalists dream of large gains and splendid habits. Poets, dramatists and novelists, painters and architects, musicians, actors, still seek, or at least readily receive, as in fact they always have done, the largest personal gains that the demand for their achievements can bring. On the basis of more and more intimate partnership between capital and labour as here contemplated, methods of arbitration and conciliation would prevail and the lingering barbarism of strikes and lock-outs would disappear. The total yield of industry would be so largely enhanced by the fullest energy and harmony of common effort, that the earnings of the average might be far higher than now but the rewards of exceptional success not less ample nor even less dazzling. That freedom which maintains inequality does in fact lift the general level of existence, which forced equality would depress. Nevertheless, there is an ardent tendency throughout civilization to insist that the privileges of society shall only be enjoyed by those who sufficiently participate in its activities and duties; that up to a reasonable age personal work must go with wealth.

Nor is this all. As capitalism for its own sake must be an instrument for applying the results of science to the general advantage, its function in that respect is becoming ever more effectual and hopeful. From the dirt and crudity, the utilitarian ugliness and social miseries of the generations immediately following the beginning of the machine-age, we are moving towards a smokeless civilization commanding more sovereign and more subtle powers than we yet possess. The disappearing smoke is a physical symbol of the disappearance of moral evils in human relations and conditions. The machine which in some industries already does four-fifths of the work must come to perform nine-tenths of it in most industries. It is bound to eliminate the coarser kinds of heavy manual toil. We may reasonably expect that amongst the advanced industrial nations whom America is leading, every worker will become on the one hand a skilled man using fine touch with understanding, and on the other hand an associate of capital, taken into counsel on the general conduct of business, sharing profit and responsibility. Evolution in this manner seems more likely to be the general way of the world instead of revolution whether by legislation or violence. While maintaining all the energy and nimbleness of free private enterprise, enlightened capitalism, consciously working everywhere towards the ideals here described, can bring about so large an improvement upon the best social conditions at present existing that Socialism, no longer able to promise a new heaven and a new earth by comparison, will cease to think it worth while to seek a change. Not conflict between capital and labour but their real partnership in counsel and profits is the sure path of social vision between theories leading into the unknown or violence that either plunges into a morass or heads for a precipice. One of the deep problems is not economic. Capitalism in the past has contributed too much to ugliness in the world. The capitalism of the future must seek to enter into the service of art and beauty.

**BIBLIOGRAPHY.**—The classic work on economic freedom is Adam Smith's *Wealth of Nations* (1776). Much of his argument as to the value of private enterprise and initiative remains valid. Alfred Marshall's *Principles of Economics* (8th ed., 1920) and *Industry and Trade* (2nd ed., 1919), contain a masterly analysis of the principles underlying the existing economic system. In a brilliant essay on "The Social Possibilities of Economic Chivalry," published in *Memorials of Alfred Marshall* (1925), he contrasts the sterility and the deadening influence in the long run of governmental management of industry with the elasticity of private enterprise.

An excellent account of economic tendencies and their practical operation is given in a recent work by an American economist, Prof. F. W. Taussig—*Principles of Economics* (1921–22).

Besides these general treatises, other recent works which bear di-

rectly on the form of the economic system, and which are written from a scientific standpoint, include: Edwin Cannan, *The Economic Outlook* (1912); R. G. Hawtrey, *The Economic Problem* (1926); D. H. Robertson, *The Control of Industry* (1923); J. H. Jones, *Social Economics* (1920). M. H. Dobb in *Capitalist Enterprise and Social Progress* (1925) makes an acute critical analysis of the place of the entrepreneurs in the evolution of the present industrial system.

The above-mentioned books are all academic in outlook and treatment. Very few of those who are or have been engaged in industrial or commercial enterprises have utilized their experience and practical knowledge to write in defence of capitalism against the onslaughts of its Socialistic critics. Amongst such works the following are of special importance: *My Life and Work* (1922), by Henry J. Ford and S. Crowther, gives a very valuable first-hand account of the methods by which one of the greatest and most successful modern businesses has been built up.

Both in *Confessions of a Capitalist* (1925), by Sir E. J. Benn, and in *The Case for Capitalism*, by Hartley Withers (1920), a vigorous defence of capitalism is put forward from a practical point of view. A. Shadwell in *The Socialist Movement*, 2 vols. (1921), urges the superiority of private enterprise.

In his remarkable little book, *Concerning Man's Origin* (1927), Prof. Sir Arthur Keith includes a remarkable essay on "Capital as a Factor in Evolution," where he argues that an increasing power of providing for the future has been the key to biological, as well as to economic, development.

A number of important books dealing with the history and theory of capitalism have appeared in German, of which the following may be mentioned here: Fritz Gerlich, *Geschichte und Theorie des Kapitalismus* (Leipzig, 1913); J. Strieder, *Studien zur Geschichte Kapitalistischer Organisationsformen* (Munich, 1914); Werner Sombart, *Der Moderne Kapitalismus* (2nd ed., Leipzig, 1916, completed in 1926); this is a very comprehensive work characterized by much originality of ideas and clearness of exposition, in which is set out the history of modern capitalism down to the end of the 18th century, together with a brilliant analysis of the chief psychological and other factors governing its origin and progress. In the recently published two concluding volumes, the capitalist system of the present day is described and discussed at length, with great impartiality; an acute analysis is made of the nature, structure and functioning of the vast economic processes which constitute the material basis of western civilization. *The Quintessence of Capitalism* (Eng. trans. 1915) by the same author, is a brightly written popular survey of the problem. Richard Passow, *Kapitalismus* (Jena, 1918); Karl Bücher, *Die Entstehung der Volkswirtschaft* (1918–19); Georg von Below, *Probleme der Wirtschaftsgeschichte* (1920); O. Spann, *Der Wahre Staat* (1921); L. Pohle, *Kapitalismus und Sozialismus* (3rd ed. Leipzig, 1923), a good defence by the Professor of Economics at Leipzig of capitalism on economic and general grounds, and a critical account of the theoretical, but especially of the practical errors of Socialism; August Pieper, *Kapitalismus und Sozialismus als seelisches Problem* (1924); J. Walcher, *Ford oder Marx* (Berlin, 1925), a comparison of the consequences to the whole community, and above all to the working classes, that would result from the adoption on the one hand of the principles advocated and applied by Henry Ford, and on the other of the destructive and barren tenets of Karl Marx; Richard Passow, *Kapitalismus* (1927).

Among French and Italian works consult: C. Gide, *Principes d'économie politique* (1910); D. Bellet, *La machine et la main d'œuvre humaine* (1912) and *Crises économiques* (1918); A. Aftalion, *Crises périodiques des surproductions* (1913); Yves-Guyot, *L'industrie et les industriels* (1914); N. Colajanni, *Il progresso economico* (1913); G. Arias, *Principii di economia commerciale* (1917). (J. L. G.)

**CAPITAL LEVY.** During the first year of the World War it was thought in Great Britain that a loan policy should take the first burden of its cost, but as soon as it became obvious that the war would be a long one, it was equally clear that the amount of the war debt would reach figures quite unprecedented in financial history. There was the apparent impossibility of meeting the cost from current resources, either by taxation or by loan, and also a strong desire to avoid the evils of currency inflation.

**Early Suggestions for a Levy.**—The first suggestions for a levy in Great Britain seem to have been made by Mr. W. Watson Rutherford (Nov. 19 1914) in the House of Commons. He proposed a 5% tax on capital, which would produce £500,000,000 and be taken in kind in the case of shares or real estate. He thought that the majority of persons would gladly pay if they understood that the levy was to take the place of a high income tax. It was put forward therefore as a sound business proposition. Sir Thomas P. Whittaker, M.P., in May 1915 proposed a 2½% levy to raise £250,000,000, which was described as an attractive proposal, but very difficult to carry out. Professor A. C. Pigou, one of the earliest academic supporters of the scheme, incorporated a detailed proposal for the special taxation of earned income to balance the special levy on objective wealth.

**Development of the Plan.**—The theory of "commutation," or the "business deal," did not, however, long hold the field. A considerable degree of inflation was taking place, and many were preoccupied with the inevitable fall in prices expected after the war. It was obvious that the repayment of £1,000,000,000 of debt at such a time involved far less real production and effort than the repayment of a similar amount when the price level should be lower in years to come. Moreover, what was a tolerable burden of interest at a high level of prices would become intolerable at some future period at a much lower level. It was said that "where we had borrowed one pair of boots we should really be repaying two," for, the debt being in sterling, sterling would in future have a much greater purchasing power with a lower price level. The proportion of the debt charge to the national income at that time was probably not more than one-eleventh or one-twelfth, whereas if the price level went back to its pre-war position that same sterling debt charge might represent one-sixth or one-seventh of the same real national income. Everything else in the national income might go down with the price level, but the debt charge could not. It was urged, therefore, that the opportunity to make a very substantial reduction in the indebtedness by a special levy on individual fortunes should not be missed.

During the last two years of the war the case for the levy became reinforced by two powerful semi-ethical considerations. In the first place enormous fortunes were being made, despite heavy taxation by income tax, super-tax and excess profits duty, at a time when large numbers of people were impoverished through the war, and it was considered to be wholly unjust that people who were able to avoid the fighting line should in addition secure a much greater personal wealth than they had at the beginning of the war.

Moreover, conscription brought into prominence the so-called contrast between "life" and "wealth," and it was said that conscription of life on the part of the able-bodied should be matched by conscription of wealth on the part of the rich. Simultaneously, the argument arose that the war was one brought about by the old and fought by the young, that the old would chiefly benefit, and that it was unfair for the young to bear first the burden of fighting, and then, for the rest of their lives, by a toll on their effort and production, the burden of interest payments to those who had never borne their physical share of the conflict.

Approval of the principle of the levy was at first not confined to any particular political party. Mr. Bonar Law at one time showed a definite leaning towards the proposal, and a small group of economists were in favour of it on broad grounds. The chief battle-ground of controversy was the question of the practicability of carrying through so gigantic a financial operation without dislocating the delicate financial mechanism of the country, bringing about a wholesale slump in stock exchange prices, robbing industry of credit, and generally undermining the whole foundation of stable values upon which the idea of the levy rested.

### PROPOSED LEVY ON WAR WEALTH

After the war the discussion took a specific direction, viz., it proposed to confine the levy to "war fortunes." It was realised that a capital levy would tax two fortunes of £20,000 identically, although one might have been reduced from £50,000 owing to the war, while the other might have been built up from practically nothing. The capital levy, therefore, was seen to work considerable injustice, judged from purely ethical standpoints. The proposal for the moment thus became limited to the levying of a tax upon fortunes, which by a common public sentiment were regarded as specially fit for such a burden. It was soon, however, agreed to be administratively impracticable to examine every individual circumstance and to decide in which particular cases the increase was actually due to the war, so that a new proposition was put forward that *anybody* who had had an increment in his fortune between 1914 and 1919 would probably be a suitable subject for such a tax.

**Report of a Select Committee.**—Early in 1920 post-war inflation and the great amount of the floating debt, with its continual renewal in cost and competition, created a difficult and

dangerous situation. It was thought that a special levy would raise from £500,000,000 to £750,000,000 and, by reducing the floating indebtedness, would conduce to stability. A select committee of the House of Commons considered the question early in 1920. Its report was not conclusive, but, in any case by May 1920, the financial situation had definitely turned, prices declined, and it was thought to be positively dangerous to adopt such a highly difficult expedient at such an unpropitious time.

**Resumption of the Capital Levy Proposal.**—Under those conditions the financial objections to a general capital levy became stronger and more pronounced on many sides. Apart from a few supporters in academic circles, the programme became almost entirely identified with the Labour Party, and the grounds upon which it was put forward were also gradually shifted. It was no longer specially urged as a composition by the taxpayer for his own future liabilities. The main dynamic argument with the Labour Party was the fact that the heavy interest charges included in the Budget necessitated such high rates of direct taxation and such pressure for reductions in taxation that it became impossible to budget for any substantial new programmes for social reform, and to incur greater expenditure on housing, education, pensions, etc.; it was clear that the burden might delay expansion indefinitely. It was thus desired to relieve the Budget of a large part of its annual interest on the expenditure side, in order to allow room for expenditure on other objects.

On coming into power the Labour Party appointed a special committee to consider questions relating to national debt and taxation (the Colwyn Committee). In their report (Nov. 1926) the majority concluded that "if there were a prospect of a capital levy being well received, the relief from debt which it offers would be insufficient to justify an experiment so large, difficult and full of hazard; this would hold good in any circumstances not differing widely from those of the present time. Further, unless a levy were accepted with more goodwill than it would be possible to anticipate under present conditions, it would be highly injurious to the social and industrial life of the community." The minority said the levy would still be the best method of dealing with the debt, "provided that it were generally approved and were assured fair treatment by the taxpayers. The nation may yet turn to the capital levy as a wise and practicable measure affording the best road out of its difficulties." The proposal disappeared from the Labour programme altogether in 1927.

### SUMMARY

The chief financial and economic contentions on the two sides for and against a levy may now be set out. The ethical considerations that once loomed so large became later less prominent. The chief objections may be classified as follows:—

1. *Repetition.*—A successful levy, although definitely aimed at relieving war debt, can give no guarantee against repetition for other purposes in the future, and possibly even in the near future. No ordinary assurance against this possibility is of any use because no Government can bind its successor. Indeed the more successful the levy, the greater may be the incentive to repeat it. The consequence of this would be that under a fear of repetition the accumulation of capital would be restricted and slow, and, as a consequence, all industrial progress must be retarded.

Against this view it has been contended that repetition is not a thing to be feared, because no one would think of imposing a special charge of this character except in a great emergency. In the event of a great emergency it would be a positive advantage to have the national accounts cleared of such indebtedness, and to be able to enter upon a war without a colossal debt. All war loans have conditions attached to them which are honourably observed by Governments, and there is no reason to suppose that a similar assurance cannot be given to the taxpayer so that any economic effects through fear of repetition could be avoided.

2. *Effects on Prices.*—The second main contention is that the financial operation would be so huge, that the attempts to carry it out on practical simultaneous lines must destroy its own basis by depressing prices. If the treasury were satisfied to take only cash this would involve putting large blocks of shares on the market, for which there would be no ready sale, panic prices would ensue, and confidence would be destroyed. If, in order to avoid forced sales, the Government were to take stocks and shares in payment, they would find themselves with large miscellaneous holdings in industry which they could not realise without disastrous consequences. The mere passive holding of securities is no relief to the Budget.

It has been rejoined that the notion that a large quantity of securities must be put on the market and result in depressing it, is quite mistaken. It is merely a matter of synchronising the supply of securities with the demand, for whenever debt is redeemed an investor will be ready in the market to buy securities that are on sale, either by taxpayers or the Government. It is true that the banks and finance houses could talk the market into a state of panic, but if they were determined to support the scheme with their good-will, depression of prices would be quite unnecessary.

3. *Damage to Individual Businesses.*—The third contention is that the ordinary business in private hands could not pay a large levy without encompassing its own destruction. It could not divide its business, and would be forced to raise mortgages or debentures which, in view of the uncertain financial future, could only be obtained on onerous terms.

A counter contention to this takes the following form: If a business were really valued at a figure necessitating a payment to the Government, it would also have sufficient credit to raise a mortgage and the charge or levy would be evidence of the fact. The money for this would be forthcoming in the market because of the funds set free by the redemption of debt. The utmost difficulty that could arise would be some slight redirection of capital. In all cases of hardship, or where a business was likely to be inconvenienced, the Government would grant payment by instalments. Against this it has been replied that a levy honeycombed with instalments and special cases would be very similar to a special income tax, but levied on an insecure and unfair basis. Such a system, it is urged, would take 10 or 20 years to bring to a definite conclusion.

4. *Valuations Impracticable.*—The next contention is that so much of the wealth of the country is held in contingent titles, such as life interests and reversions, and that the valuation of these would make an insoluble problem. However actually correct the valuation may be at the time, the results would be belied by subsequent events, and wherever duty was being paid by instalments there would be overwhelming demands for adjustments. These would be sufficiently important to reduce the levy to chaos.

5. *Repayment of Part of the Debt Makes the Repayment of the Remainder more Difficult.*—The fifth argument relates to the deflationary effect of the levy itself. It is stated in some financial circles that the sudden cancellation of £3,000,000,000 of debt according to the programme of the Labour party, would remove from businesses a very large amount of collateral security. This would cause credit to be withdrawn and restricted. In other cases credit would be withheld, and prices would fluctuate with disastrous effects on business enterprise and employment.

Against this it is contended that the argument is a gross exaggeration. Only a small proportion of the war loan is used as the actual basis of credit operations, and many people who so use it have other securities which can be used instead. Again, credit is much more largely personal, and does not depend upon collateral of this kind. Moreover, others contend that deflation can only be brought about by operations through the Bank of England, and the inability of an individual borrower to be granted a loan means that, in practice, a loan is given to someone else because the banks have this credit available. The total amount of effective credit, it is said, cannot be affected by the demands of the particular borrowers.

6. *Future Saving Impaired.*—The sixth contention relates to the effects of redistribution of wealth upon future saving. The idea that the wealth-accumulating classes would have not only to give up a part of their existing fortune, but also to suffer rates of tax in future as high, or higher, would, it is said, strike at the root of all thrift and lead to national wastefulness, because the other classes of the community would not themselves save an equivalent sum.

Against this it is stated, however, that the outlook is too serious for any ordinary arguments about the redistribution of wealth to avail. Money must be taken where it is to be found. Whatever the immediate disadvantageous effects of the levy, the dynamic effects in future are by far the more important. Greater good to the community would come about by relieving the worker and the middle classes of some of the burden of taxation or by expending state funds on proper social purposes. This would lead to greater productivity, to lower rates of taxation and to greater general average prosperity.

7. *The Price Level Argument.*—In the next place, the price level contention is disputed. The idea that it will be an advantage to repay a debt before the price level falls must be qualified by the fact that the operation of the levy itself would bring about lower prices and thus make the remaining £4,000,000,000 sterling of the debt charge a much more onerous charge than would otherwise be. In view, however, of the denial that the price level will be necessarily lower in the long run, this contention is not accepted. But in so far as it might prove to be true, it is said that it would be so much to the advantage of the workers to have higher real value in their earnings that the whole country would gain. It is said that there are more factors making for a rise in prices than for a fall in the long run, and therefore future repayment may be easier than present repayment.

8. *The Net Annual Relief.*—In the last place the opponents of the levy say that the whole basis of the programme is fallacious, because it has been assumed that the effect would be to set free the whole of

the interest on £3,000,000,000 of debt, say £150,000,000 a year, and allow of expenditure programme to this amount, or of a reduction of taxation *pro tanto*.

It is stated that this view ignores the progressive features in the existing income tax, supertax and death duty schemes. Taking large sums away from individual fortunes would reduce their taxpaying power in future, and the revenue side of the Budget would also be seriously affected, so that all that could be reckoned upon would be a certain *net* saving. One authority has estimated that, in the long run, out of a saving of expenditure of £140,000,000, something between £90,000,000 and £98,000,000 per annum would have to be set aside to make good the effects of the levy on future revenue, so that the net advantage to the Budget would have to be reduced to some £42,000,000 or £50,000,000 a year. No effective counter statistics have been so far put forward to alter this result.

**The Rate of Levy.**—The proposals of the Labour Party were that persons with less than £5,000 should pay nothing, but that those owning more than that sum should pay on the following scale:

| £      | %  | £               | %  |
|--------|----|-----------------|----|
| 6,000  | 5  | 50,000          | 35 |
| 8,000  | 10 | 100,000         | 40 |
| 10,000 | 15 | 200,000         | 45 |
| 15,000 | 20 | 500,000         | 50 |
| 20,000 | 25 | 1,000,000       | 55 |
| 30,000 | 30 | Above 1,000,000 | 60 |

The Colwyn Committee found that the capital wealth of the country was not sufficient for the operation of this scale to produce the £3,000,000,000 assumed.

#### THE LEVY IN OTHER COUNTRIES

There have been no first-class experiments abroad illustrating all the features of the levy as proposed for the United Kingdom. In 1920 in Czechoslovakia a levy was introduced which was to bring in £63,000,000 or about £5 per head of the population, with a low limit of exemption, *i.e.*, 10,000 crowns free, 1% on the first 25,000 crowns, and then on a progressive scale up to 30% on amounts over 10,000,000 crowns. The actual yield was £17,000,000 in the first two years, and the instalment system which was allowed gave it, as a matter of fact, the character of a heavy income tax. The results have been regarded as disappointing, and the consequent arrears in income tax are heavy.

In Switzerland in 1922 the Socialist Party proposed a levy with the idea of devoting the proceeds mainly to social purposes. On a referendum the proposal was rejected in every canton, but while it was under discussion the effects upon financial conditions were very obvious.

Pigou, *A Capital Levy and a Levy on War Wealth* (1920); Sir Josiah Stamp, *Wealth and Taxable Capacity* (1922); Hugh Dalton, *The Capital Levy Explained* (1923); Sir J. Stamp, *Current Problems in Finance and Government* (1924); Report of the Committee on Taxation and the National Debt (Stationery Office, London, 1927 Cmd. 2,800). (J. S.)

**CAPITAL PUNISHMENT** is the penalty of death, pronounced by a competent tribunal. Its history shows a shifting of the stress from sacrilege and offences against property to murder pure and simple. Treason, which has changed from the sacrilege of attacking the divinity of kingship to the modern crime of attacking the security of the State, has always been punishable by death. The laws of Hammurabi (*see* BABYLONIAN LAW) provide capital punishment somewhat indiscriminately and it is important to realize that the *lex talionis* of the ancient Hebrews represented an advance in civilization, as introducing the idea of degree into the law. The ancient Hebrews punished with death: adultery (Lev. 20, 10); bestiality (Ex. 22, 19; 20, 15-16); blasphemy (Lev. 24, 16); cursing father or mother (Ex. 21, 17; Lev. 20, 9); idolatry (Deut. 13, 6-10); incest (Lev. 20: 17); rape (Deut. 22, 25); sabbath breaking (Num. 15:35, 36); unchastity (Deut. 22:21); and witchcraft (Ex. 22, 18; Lev. 22:27).

In Roman law (*q.v.*) capital punishment meant, besides the *summum supplicium* (death), those punishments that affected the *caput* (=status) of the citizen, *viz.*, banishment (*aqua et igni interdictio*) under the republic or *deportatio* under the empire, condemnation *in opus perpetuum* or to the mines. The following

offences were capital in our sense: treason (*lex Julia majestatis*); adultery and sodomy (*lex Julia de adulteriis*); murder (*lex Cornelia de Sicariis*); forgery by slaves (*lex Cornelia de Falsis*); corruption (*lex Julia Peculatis*); kidnapping under certain circumstances (*lex Fabia de Plagiariis*); seduction (Digest 48, 11, 1, 2), and rape (D. 48, 6, 3, 4).

In Anglo-Saxon times murder was punishable by a fine or *bot* whereof two-thirds (*wer*) went to the relatives and one-third (*wite*) to the king. Some crimes however were *boteless* and the offender must die. In the 13th century death was, by the common law of England, the punishment for all felonies (except mayhem and petty larceny) but under the influence of the church the severity of the law was mitigated, at first for clerks and then for any who could read (*see* BENEFIT OF CLERGY); and from the beginning of the 17th century to the middle of the 19th, by giving condemned felons the option of transportation (*see* DEPORTATION).

In 1766 Goldsmith wrote "Nor can I avoid even questioning the validity of that right which social combinations have assumed of capital punishing offences of a slight nature. In cases of murder their right is obvious, as it is the duty of us all from the laws of self-defence to cut off that man who has shown a disregard for the life of another. Against such all nature rises in arms; but it is not so against him who steals my property." This view was supported by Bentham (*q.v.*) and others with the result that instead of no less than 200 capital crimes at the beginning of the 19th century we now have four, viz., high treason, murder, piracy with violence and (except in Scotland and Ireland) destruction of dockyards, etc. Since 1838 the death penalty has been exacted under the ordinary law in England only for murder, but in 1916 Roger Casement was hanged for high treason (*q.v.*). The Infanticide Act 1922 makes the killing of a newly born child by its mother equivalent to manslaughter, punishable by imprisonment.

Under the Indian Penal Code, waging war against the king (s. 121) and murder (s. 302) are capital offences. The Canadian criminal code of 1892 provides death for treason (ss. 68, 657), murder (231), rape (267), and piracy with violence (127). Roman-Dutch law (*q.v.*) applies in South Africa, where treason (*perduellio* and *laesa majestatis*), murder and rape are capital. In Australia, as elsewhere in the British empire, treason, murder and piracy with violence are capital, and in New South Wales and Victoria, rape also. In Queensland capital punishment was abolished by the Criminal Law Amendment Act of 1922.

Although at the time of the colonization of America, no less than 200 crimes, as we have seen, were punishable by death, the colonists greatly reduced this number, only twelve offences being capital in the New England colonies. Ohio in 1788 and Pennsylvania in 1794 limited capital punishment to wilful and deliberate murder and in 1838 Rhode Island selected murder and arson. In 1892 a Federal law was passed which reduced the number of capital crimes to three, viz., treason, murder and rape; but for the most part the punishment of crime is undertaken by the constituent States, eight of which have abolished capital punishment; and of the 40 which retain it twelve have limited it to wilful and deliberate murder, while in 33 states the court (judge or jury) is vested with discretion to impose a sentence of imprisonment or the death penalty.

#### Countries Which Have Abolished Capital Punishment.—

Capital punishment has been abolished, except as a general rule in war time or under martial law, in the following countries: Austria (3.4., 1914; St.G.B. 223); Colombia (in 1910, by an amendment to the constitution whereby not even Congress may impose the penalty); Latvia (in 1917); Luxemburg (in art. 18 of the Constitution); the Netherlands (in 1870); Panama (in 1922); Portugal (who also refuses extradition [*q.v.*] to a country which enforces capital punishment); Rumania; San Marino (in 1859); San Domingo (in the Constitution of 1924); Sweden (in 1921); Argentine, Brazil, Costa Rica, Ecuador, Honduras, Norway (1905), Peru, Uruguay, Venezuela.

**Countries Which Retain Capital Punishment.**—It is inflicted in the following countries for the offences named:

**Albania.**—Wilful murder with aggravating circumstances and high treason.

**Belgium.**—Though existing theoretically, it has not been inflicted since 1863, as the king constantly grants a reprieve.

**Bolivia.**—Murder and high treason.

**Bulgaria.**—Wilful murder or attempted murder of the king or crown prince (art. 98, par. 1 and art. 100 of the penal code); wilful murder (art. 247); treason and intelligence with the enemy in war time. During the Communist upheaval of 1923 the Sobranje passed a Defence of the State Act providing capital punishment for a limited number of offences having as their object a forcible change of the present political and social order.

**Chili.**—Crimes endangering the security of the country (artt. 106–110 of the penal code); murder under certain circumstances (artt. 390 and 391).

**Czechoslovakia.**—A new penal code is now in preparation (which makes no mention of capital punishment except under national and military law), but meanwhile the Austrian Penal Law of 1852 runs in Bohemia, Moravia and Silesia and the Hungarian Penal Law of 1878 in Slovakia and Carpathian Ruthenia. The former inflicts the penalty in five cases leading to fatal results; murder, robbery with violence, arson, malicious damage to property, malicious act or neglect on railways, etc. Throughout the republic however the death penalty may be inflicted on persons who deliberately use explosives with a fatal result. Under the Austrian law there is no reprieve except where the accused is under twenty, or when 20 years have elapsed since the murder; these last two provisions apply also to Hungary. The death penalty has actually been carried out in Czechoslovakia only thrice since 1919.

**Denmark.**—High treason (artt. 71, 72, 75, 85, 92, penal code 10, 2, 1866); wilful murder with aggravating circumstances; murder with premeditation; wilful murder of an ascendant or spouse. Execution has not been inflicted for 30 years, being commuted by royal decree to imprisonment for life. The new draft penal code before the Rigsdag proposes the abolishment of capital punishment.

**Egypt.**—High treason (mixed penal code, artt. 76–80, 83, 84, 87, 88); arson of public buildings (art. 89); murder with aggravating circumstances (artt. 194, 197).

**Finland.**—High treason and wilful murder. No execution since 1826, except in 1918, under martial law.

**France.**—Attempted murder of magistrates or other public officials (artt. 223, 228 and 230 of the penal code); assassination, parricide, infanticide and poisoning (art. 302); crimes accompanied by torture, etc. (art. 303); murder coupled with another crime (art. 304); unlawful imprisonment with torture (art. 344); perjury and subornation of witnesses resulting in a death sentence (artt. 361 and 365); many cases of arson, etc. (artt. 434 and 435) and wilful derailment, etc., resulting in loss of life (art. 16 of the law of July 1845).

**Germany.**—Murder; certain offences under the dynamite act of 1884, the law against slave traffic, and under military law.

**Greece.**—High treason; murder and poisoning; robbery and arson under certain circumstances (penal code of 1834).

**Guatemala.**—Murder of ascendant, descendant or spouse; and murder under certain other aggravating circumstances; robbery with violence or threats, with fatal result; derailment of trains or wrecking of vessels, etc., with fatal result (penal code 15. 2. 1889).

**Hayti.**—High treason (artt. 57, 58, 63 and 64 of the penal code of Aug. 11, 1835); coining (art. 97); certain cases of rebellion, etc. (art. 170 *et seq.*); assassination, parricide, infanticide, poisoning (artt. 241 to 246); robbery with violence (art. 326).

**Hungary.**—Inflicted under the penal law of 1878 for murder only; defined as the deliberated and premeditated act of killing.

**Iraq.**—Baghdad penal code 1918: high treason, arson of public building (art. 106), murder under aggravating circumstances.

**Italy.**—High treason (art. 1 of the law of Nov. 25, 1926 and artt. 104, 107, 108, 120 and 252 of the penal code of June 30, 1889).

**Japan.**—High treason and murder with aggravating circumstances.

**Latvia.**—By the law of 1923 the Minister of the Interior in connection with the Minister of Justice shall have the right to transfer the punishment of certain crimes from the competence of the civil courts to military courts, acting on the basis of military laws, where the death penalty is inflicted for high treason, murder, theft-murder and armed insurrection against the State.

**Liberia.**—Murder and treason with fatal results.

**Lithuania.**—The Russian Penal Statute of 1903 applies (with certain amendments made in 1919, *Gov. Gaz.* no. 23, 16. 1. 1919), art. 108 of which provides the death penalty for high treason; which is also provided (by amendment of the Penal Statute, *Gov. Gaz.* no. 20, of 4. 3. 1920) for armed insurrection, etc., as also for certain offences under the Military Penal Statute enforced since 1869. Only applied in time of war and under martial law.

**Mexico.**—High treason committed during a foreign war; parricide, murder with aggravating circumstances, arson, abduction, highway robbery and grave military offences (art. 22 s. 3 of the Federal Constitution). In the case of women, and men over 70 and when five years have elapsed since the crime, the punishment is 20 years' imprisonment (art. 239, penal code of 31. 3. 1884). Proscription after 15 years (art. 294).

**Paraguay.**—High treason leading to war (art. 137 penal code of 22. 2. 1910, amended 18. 6. 1914); arson with fatal results (artt. 246 and 247); destruction of bridges, etc. (art. 252); malicious use of explosives with fatal results (art. 253); train wrecking with fatal results (art. 257); murder with aggravating circumstances (art. 338). In practice, however, these articles are seldom applied and the rule is imprisonment for a long term.

**Persia.**—Penal code 1925: treason, rebellion, murder; highway robbery with aggravating circumstances.

**Salvador.**—Penal code, 1920: parricide and murder.

**Siam.**—Penal code, 1908: treason (s. 101, 105, 110, 112) and murder (s. 249, 250).

**Spain.**—The Penal code of 1909 punished with death, rebellion (art. 184, 1); treason (artt. 136–8, 142); murder of a sovereign in Spain (art. 153); piracy under certain conditions (art. 156); parricide (art. 417); murder with aggravating circumstances (artt. 157, 418). Of 138 death sentences by civil tribunals in the last decade only 12 have been carried out; of 37, however, condemned by military tribunals, 23 were executed.

**Switzerland.**—Abolished by the Federal Constitution of 1874 but by art. 65 of the amendment of 1879 the Cantons were empowered to reintroduce capital punishment, though not for political offences. The following cantons have reintroduced the penalty: Lucerne, Uri, Schwyz, Unterwald le Haut, Fribourg, Schaffhouse, Appenzell Rhodes-Interieures, St. Gall, Valais. The Draft Penal Code now before the Federal Houses does not provide for capital punishment. The new Military Penal Code of 13. 6. 1927, provides the death penalty in a number of cases.

**Yugoslavia** (*Kingdom of the Serbs, Croats and Slovenes*).—Murder and treason.

**Methods of Execution.**—Ancient methods requiring no apparatus were drowning (Code of Khammurabi, ss. 109, 129, 133, 143, 155) and precipitation from a height, as from the Tarpeian rock (Twelve Tables). Impaling was practised in Assyria. Stoning (Lev. xxiv.:16, 20:27; Deut. xiii.:6–10, xxi.:18–21; Num. xv.:35, 36) and burning (Lev. xxi.:9, xx.:14) were used by the ancient Hebrews. Crucifixion was used by the Romans for condemned persons who were not Roman citizens. Parricide, regarded with especial abhorrence by the Romans, was punished in the following extraordinary manner: The victim was sewn up in a sack with a dog, a cock, a viper and an ape and cast into the sea or river (*lex Pompeia de Parricidiis*, 55 B.C.). Hanging (*q.v.*) is now practised in many countries, *e.g.*—Albania, the British empire, Egypt, Hungary, Japan, Latvia and some of the United States. In Latvia the victim may be shot or hanged, while in Utah he has the choice. France employs the guillotine (*q.v.*) and Spain the garrotte (*q.v.*). Fifteen of the United States now employ electrocution, Nevada uses the lethal chamber. (F. T. G.)

(1902, 5th ed., 1927); J. L. Gillen, *Criminology and Penology* (1927).

**CAPITO, WOLFGANG** (1478–1541), Lutheran divine, was born of humble parentage at Hagenau and died at Strasbourg. He was educated at Freiburg, and, becoming a priest, went in 1515 to Basle where he met Erasmus and Zwingli and entered into correspondence with Luther. In 1519, however, he was made chaplain to the archbishop of Mainz, an office which he resigned in 1522 to become a Protestant. In 1523 he settled at Strasbourg, where he remained until his death in November, 1541. He wrote with Bucer the *Confessio Tetrapolitana* (1530), and later produced the *Berner Synodus*, treating of church discipline. In 1534 he opposed the Anabaptists and two years afterwards assisted at the Wittenberg Concordia.

See J. W. Baum, *Capito u. Butzer* (Elberfeld, 1860) and A. Baum, *Magistrat u. Reformation in Strassburg bis 1520* (Strasbourg, 1887). Kalkoff, *Wolfgang Capito im Dienste Erzbischof Albrechts von Mainz*.

**CAPITULARY**, a series of legislative or administrative acts emanating from the Merovingian and Carolingian kings, so called as being divided into sections or chapters (*capitula*). At the present day we do not possess a single capitulary in its original form; but very frequently copies of these isolated capitularies were included in various scattered manuscripts, among pieces of a very different nature, ecclesiastical or secular.

These capitularies make provisions of a most varied nature; it was therefore found necessary at quite an early date to classify them into chapters according to the subject. In 827 Ansegisus, abbot of St. Wandrille at Fontenelle, made such a collection, which soon gained an official authority.

After 827 new capitularies were naturally promulgated, and before 858 there appeared a second collection, quite unreliable, in three books, by an author calling himself Benedictus Levita. In 1677 Baluze issued the *Capitularia regum francorum*, in two folio volumes, in which he published first the capitularies of the Merovingian kings, then those of Pippin, of Charles and of Louis the Pious, which he had found complete in various manuscripts. After the date of 840, he published as supplements the unreliable collection of Ansegisus and Benedictus Levita, with the warning that the latter was quite untrustworthy. He then gave the capitularies of Charles the Bald, and of other Carolingian kings, either contemporaries or successors of Charles, which he had discovered in various places.

An edition of the capitularies was made in 1835 by George Pertz, in the *Monumenta Germaniae* (folio edition, vol. i., of the *Leges*). In 1883 Boretius published his first volume, containing all the detached capitularies up to 827, together with various appendices bearing on them, and the collection of Ansegisus. This work was continued by Victor Krause, who collected in vol. ii., the scattered capitularies of a date posterior to 828. Karl Zeumer and Albrecht Werminghoff drew up a detailed index of both volumes, in which all the essential words are noted.

Among the capitularies are to be found documents of a very varied kind. Boretius divided them into several classes:

(a) The *Capitula legibus addenda*.—There are additions made by the king of the Franks to the barbarian laws promulgated under the Merovingians, the Salic law, the Riparian or the Bavarian. Like the laws, they consist chiefly of scales of compensation, rules of procedure and points of civil law. They were solemnly promulgated in the local assemblies where the consent of the people was asked. Charlemagne and Louis the Pious seem to have made efforts to bring the other laws into harmony with the Salic law.

(b) The *Capitula ecclesiastica*.—These capitularies were elaborated in the councils of the bishops; the kings of the Franks sanctioned the canon of the councils, and made them obligatory on all the Christians in the kingdom.

(c) The *Capitula per se scribenda*.—These embodied political decrees which all subjects of the kingdom were bound to observe. They often bore the name of *edictum* or of *constitutio*, and the provisions made in them were permanent.

(d) The *Capitula missorum*, which are the instructions given by Charlemagne and his successors to the *missi* sent into the various parts of the empire. They are sometimes drawn up in

common for all the *missi* of a certain year (*capitula missorum generalia*); sometimes for the *missi* sent only on a given circuit (*capitula missorum specialia*).

(e) With the capitularies have been incorporated various documents; for instance, the rules to be observed in administering the king's private domain (the celebrated capitulary *de villis*, which is doubtless a collection of the instructions sent at various times to the agents of these domains); the partitions of the kingdom among the king's sons, as, the *Divisio regnorum* of 806, or the *Ordinatio imperii* of 817; the oath of peace and brotherhood which was taken on various occasions by the sons of Louis the Pious, etc.

After the reign of Louis the Pious the capitularies became long and diffuse. Soon, from the 10th century onwards, no provision of general application emanates from the kings. Henceforth the kings only regulated private interests by charters; it was not until the reign of Philip Augustus that general provisions again appeared; but when they did so, they bore the name of ordinances (*ordonnances*).

There were also capitularies of the Lombards. These capitularies formed a continuation of the Lombard laws, and are printed as an appendix to these laws by Boretius in the folio edition of the *Monumenta Germaniae, Leges*, vol. iv.

**CAPITULATIONS**, treaties granted by a state and conferring the privilege of extra-territorial jurisdiction within its boundaries on the subjects of another state. In the 9th century the caliph Harun-al-Rashid granted guarantees and commercial facilities to the Franks. Similar concessions were made to certain Italian city states. Thus, in 1098, the prince of Antioch granted a charter of this nature to Genoa; the king of Jerusalem to Venice in 1123 and to Marseilles in 1136. Salah-ud-din (Saladin), sultan of Babylon (Cairo), granted a charter to the town of Pisa in 1173. The Byzantine emperors followed this example, and Genoa, Pisa and Venice all obtained capitulations. The explanation of the practice is to be found in the fact that the sovereignty of the state was held to apply only to its subjects. The privilege of citizenship was too precious to be extended to the alien, who was long practically an outlaw. But when the numbers, wealth and power of foreigners residing within the state became too great, it was found to be politic to subject them to some law, and it was held that this law should be their own. Under the Ottoman sultans the system already in existence was continued. The first capitulations concluded with a foreign state were those of 1536 granted to the French. They amounted to a treaty of commerce and a treaty allowing the establishment of Frenchmen in Turkey and fixing the jurisdiction to be exercised over them; individual and religious liberty was guaranteed to them, the king of France being empowered to appoint consuls in Turkey, the consuls being competent to judge the civil and criminal affairs of French subjects in Turkey according to French law, and to appeal to the officers of the sultan for their aid in the execution of their sentences. All subsequent capitulations followed this model. The capitulations were at first held to be in force only during the lifetime of the sultan by whom they were granted; thus in 1569 Sultan Selim II. renewed the French capitulations granted by his predecessor. In 1583 England obtained her first capitulation, until which time France had been the official protector of all Europeans established in Turkey. Later on, England claimed to protect the subjects of other nations, a claim rejected in the French capitulations of 1507, 1604 and 1607, the last-named of which explicitly laid down that the subjects of all nations not represented at Constantinople by an ambassador should be under French protection. In 1613 Holland obtained her first capitulation. In 1673 the French succeeded in obtaining the renewal of the capitulations which had remained unconfirmed since 1607. Louis XIV. had been anxious to secure the protectorate of all Catholics in Turkey, but was obliged to content himself with the recognition of his right to protect all Latins of non-Turkish na-

tionality; his claim for the restoration to the Catholics of the holy places usurped by the Greeks was also rejected, the sultan only undertaking to promise to restore their churches to the Jesuit Capuchins. Later, France's friendship secured for Turkey a successful negotiation of the peace of Belgrade in 1739, and the result was the capitulation of 1740; this was no longer limited in duration to the sultan's lifetime but was in perpetuity, and could not be modified without the assent of the French. It conferred on the French ambassador precedence over his colleagues. Austria had obtained capitulations in 1718, modified in 1784; Russia secured similar privileges in 1784. In the course of the 18th century nearly every European power obtained capitulations, and such newly-established countries as the United States of America, Belgium and Greece, followed in the 19th century.

The post-War position of capitulations may be briefly stated. Capitulations are still in force in Abyssinia, China, Egypt and Morocco; they may be said to exist in Bulgaria, as Art. 175 of the Treaty of Neuilly provides that the immunities and privileges of foreigners as well as the rights of jurisdiction and of consular protection enjoyed by the Allied and Associated Powers in Bulgaria by virtue of the capitulations, usages and treaties, may form the subject of special conventions between each of the Allied and Associated Powers and Bulgaria; Great Britain possesses extra-territorial jurisdiction in Bahrein, Kuwait and Muscat. The capitulations still in force may be thus summarized according to countries.

**Abyssinia.**—The provisions of the Klobukowski Treaty of 1908 by which France was accorded consular jurisdiction in Abyssinia are applicable to all countries diplomatically represented in Abyssinia.

**China.**—Extra-territorial jurisdiction is enjoyed by Belgium, Brazil, Chile, Denmark, France, Great Britain, Italy, Japan, the Netherlands, Norway, Portugal, Spain, Sweden and the United States.

The Chinese do not recognize Chile's right to extra-territorial privileges and assert that the Japanese treaties, under which Japanese subjects enjoy extra-territorial rights in China have expired, though no steps have actually been taken to assume jurisdiction over Japanese subjects in China.

Belgium has agreed to Belgian subjects being amenable to Chinese jurisdiction as soon as the majority of the Powers now possessing extra-territorial privileges in China have agreed to relinquish them.

Italy, Denmark, Portugal and Spain have, by treaties, Nov. and Dec., 1928 agreed to their nationals being amenable to Chinese jurisdiction when all the Powers signatory to the Washington treaties of 1922 have agreed to abolition of extra-territoriality.

**Egypt.**—Capitulatory rights are possessed by Belgium, Denmark, France, Great Britain, Greece, Italy, and the Netherlands, Norway, Portugal, Russia, Spain, Sweden and the United States. Rumania has limited capitulatory rights.

**Morocco.**—Great Britain and the United States of America retain capitulatory rights in the French zone; and the United States in the Tangier zone. In the Spanish zone Great Britain, Japan and the United States of America retain these rights.

Since 1911 capitulatory rights have been abandoned in very many countries but in one instance alone—Tripolitania—were such rights relinquished prior to the World War. The following summary shows the extent to which capitulations have been abandoned since 1911:—

**Albania.**—By Great Britain, Feb. 6, 1926.

**China.**—By Austria, Germany and the Soviet Union. Extra-territorial rights have also been lost by the subjects or citizens of the Succession States (Poland, Czechoslovakia, etc.) formed from the dissolution of Austro-Hungarian and Russian Empires.

**Mexico** relinquished her extra-territorial rights in China on November 12, 1929.

**Crete.**—By Great Britain, August 25, 1914.

**Egypt.**—By Austria, Germany and Hungary. By Persia in 1928.

**Greece.**—By Great Britain, in territories acquired by Greece after the Balkan Wars 1912-13, as a result of an agreement

embodied in notes of August 25 and September 1, 1914.

**Morocco.**—In the French zone by Belgium, Bolivia, Costa Rica, Denmark, Greece, Italy, Japan, the Netherlands, Norway, Portugal, Russia, Spain, Sweden and Switzerland. In the Spanish zone by Belgium, Denmark, France, Greece, Italy, the Netherlands, Norway, Portugal, Russia, Sweden and Switzerland. Austria, by Articles 96–98 of the Treaty of St. Germain, September 10, 1919; Germany by Articles 141–143 of the Treaty of Versailles, June 28, 1919; Hungary by Articles 80–82 of the Treaty of Trianon, June 4, 1920 have renounced their capitulatory rights.

In the Tangier zone, by Belgium, France, Great Britain, Italy, the Netherlands, Portugal, Spain and Sweden.

**Persia.**—The capitulations, in respect of those Powers still possessing Capitulatory Rights, were abolished as May 10, 1928.

**Siam.**—The protocol relating to jurisdiction annexed to the general treaty with Siam of July 14, 1925, has abolished the system of jurisdiction heretofore established in Siam for British subjects who now become amenable to the Siamese Courts. In the interests of justice, however, cases may be evoked from the Siamese Courts and be dealt with by a British diplomatic or consular officer in accordance with English law. See SIAM.

**Tripolitania.**—By Great Britain in October, 1911.

**Turkey.**—By those signatories of the Treaty of Lausanne, July 24, 1923, who possessed capitulatory rights in Turkey at the outbreak of the World War: and by Germany, Persia, the Soviet Union and the United States of America. See CONCESSIONS.

**BIBLIOGRAPHY.**—For the texts of the treaties mentioned, excepting that with Siam, see H. W. V. Temperley, *The History of the Peace Conference at Paris*, vol. 6. (I. F. D. M.)

**CAPIZ**, a municipality (with administration centre and 34 *barrios* or districts) and capital of the province of Capiz, Panay, Philippine Islands, on the Capiz or Panay river, about 4 m. from its mouth on the north coast. Pop. (1918) 22,022, of whom only 11 were whites. Capiz has railway connection with Iloilo. It has a large and beautiful Roman Catholic church, a Protestant church and hospital, and excellent Government buildings, and is the seat of the provincial high school. The alcohol industry, formerly very important, has been ruined by the increase in the internal revenue tax. Fishing and the weaving of fabrics of cotton, abacá and piña, are important industries. Rice and sugar are raised in considerable quantity, and tobacco, corn and cacao to a limited amount. Sugar, nipa thatch and copra are among the exports. Coasting vessels can ascend the river to the town, which is an important commercial centre having some trade direct with Manila. In 1918, there were 13 manufacturing establishments with output valued at 98,500 pesos, besides 544 household industry establishments with output valued at 90,300 pesos. There were also five rice-mills, with output valued at 759,800 pesos, and five sugar-mills. Of the eight schools, six were public. Capiz lies in the typhoon belt and has often received great damage. The language spoken is a dialect of Bisayan.

**CAPMANY Y MONTPALAU, ANTONIO DE** (1742–1813), Spanish polygraph, was born at Barcelona on Nov. 24, 1742. He retired from the army in 1770, and was subsequently elected secretary of the Royal Academy of History at Madrid. His principal works are: *Memorias históricas sobre la marina, comercio, y artes de la antigua ciudad de Barcelona* (4 vols., 1779–92); *Teatro histórico-crítico de la elocuencia Española* (1786); *Filosofía de la elocuencia* (1776), and *Cuestiones críticas sobre varios puntos de historia económica, política, y militar* (1807). Capmany died at Barcelona on Nov. 14, 1813. His monograph on the history of his birthplace still preserves much of its original value.

**CAPO D'ISTRIA, GIOVANNI ANTONIO (JOAN-NEs)**, COUNT (1776–1831), Russian and Greek statesman, son of Count Antonio Capo d'Istria, the head of an old Corfiot family, was born in Corfu on Feb. 11, 1776, and studied at Padua. In 1800 he became secretary to the legislative council of the septinsular republic (Ionian Islands), and in 1807 he organised the defence of Santa Maura against Ali Pasha. A profound admirer of Russia, he entered her service in 1809 and became attaché at Vienna in 1811. After serving on a mission to the principalities in 1812, Capo

d'Istria was attached to Barclay de Tolly's staff during the campaign in 1813 and, after a mission to Switzerland, was present in Paris and later at the Congress of Vienna. At that Congress he exercised great influence and prepared a memorandum for Alexander on German policy in which he advocated keeping Germany in dependence upon Russia. He also opposed the dismemberment of France, and was largely responsible for the treaty of Nov. 20, 1815, in which year he was made secretary of state, sharing the ministry of foreign affairs with Nesselrode, and assuming control of Bessarabia. After attending the Congress of Aix-la-Chapelle in 1818, Capo d'Istria paid a visit to Corfu where he listened to the complaints of the Corfiots against English rule. On his return to Russia, he visited England to lay their complaints before the British Cabinet by whom he was somewhat coldly received. He was responsible for drafting the protest of the Tsar against the Carlsbad Decrees (see *Alexander I.*) and in October 1820 attended the Congress at Troppau. Metternich did his utmost to detach the Tsar's confidence from Capo d'Istria, and was successful in bringing about his resignation in 1822. Five years later the Greek national assembly elected Capo d'Istria to the presidency of the republic. Nicholas I. had succeeded Alexander upon the Russian throne, and the count hastened to Tsarskoye Selo from Geneva, where he had been living, in order to obtain the Tsar's permission to take up his new post. This was readily granted him, and he set forth as virtually a Russian agent in Greece. After a tour of Europe, during which he endeavoured to secure the support of the Governments for his new work, Capo d'Istria landed at Nauplia on Jan. 19, 1828.

From the outset he had to face immense difficulties in Greece—a land with a bankrupt treasury, a half-barbarian population, and with its soil not yet freed from the presence of Ibrahim Pasha's army in the Morea. His international reputation was appreciated by the Greeks, but his aristocratic outlook and want of human sympathy soon alienated a democratic and turbulent people. Yet he fought against the restrictive policy of the European states in regard to Greece, and it was not until his marked preference for Phanariotes (*q.v.*) and Corfiots together with the promotion of his brothers to high commands had earned him widespread dislike that the incipient fires of revolt blazed up into open rebellion. By calling in Russian aid to suppress the revolt, Capo d'Istria gave it the character of a national and patriotic rising; and his imprisonment of the leader of the Mavromichales clan aroused the fury of the Mainots. The Russian minister sought to make peace, and might have succeeded, but for Capo d'Istria's insolent treatment of the old Mavromichales chief, Petrobey, who gave the signal to his son and a cousin to wipe out the insult. On the following day (Oct. 9, 1831), Capo d'Istria was assassinated by these two men as he went into church.

**BIBLIOGRAPHY.**—Carl W. P. Mendelssohn-Bartholdy's *Graf Johann Kapodistrias* (Berlin, 1864) is based on all the sources, printed and unprinted, available at the time of publication, and contains an excellent guide to these. See also the historical sections of F. de Marten's *Recueil des traités conclus par la Russie*, etc. (1874, etc.), and W. Alison Phillips, *The War of Greek Independence* (1897). Under the Russian title "Zapiska grapha Joanna Capodistrias" is published in the series of the Imperial Russian Historical Society, vol. iii. p. 163 (St. Petersburg, 1868) the *Aperçu de ma carrière publique*, written by Capo d'Istria for presentation to the emperor Alexander, and dated at Geneva Dec. 12 (24 N.S.) 1826. Of unpublished materials may be mentioned the letters of Capo d'Istria to Sir Richard Church, vol. xvi. of the Church Papers in the British Museum (*Add. mss.* 36453–36571). See further, bibliography to chapter vi. of vol. x. of the *Cambridge Modern History* (1907).

**CAPODISTRIA**, a town and seaport of Istria, Italy, in the province of Pola, 15 m. S.W. of Trieste by rail but also reached by steamer. Pop. (1921) 8,192 (town), 12,654 (commune). It is situated on a small island, which occupies the end of a large bay in the Gulf of Trieste, and which is connected with the mainland by a causeway half a mile in length. Capodistria is an old town with small streets, and has preserved remarkably well its Venetian character. There are some good Venetian pictures in the churches. The most noteworthy buildings are the cathedral, the *Palazzo del Podestà* and the *Loggia*, all of them situated in the principal square. There are extensive salt works near the town. Capodistria is usually identified with the town of Aegida, which

received (in the 6th century A.D.) the name of Justinopolis from Justin II. When at the beginning of the 13th century Istria fell into the hands of the patriarchs of Aquileia, they made this town the capital of Istria (whence its name). It was captured by the Venetians in 1278.

**CAPONIER** (from the Fr. *caponnière*, properly a capon-cote or house), in fortification, a work constructed in the ditch of a fort so that fire from it can sweep the bottom of the ditch and prevent an enemy from establishing himself therein. The term is used in a military sense as early as in the late 17th century. In various bastioned systems of fortification a caponier served merely as a covered means of access to outworks, the bastion trace providing for the defence of the ditch by fire from the main parapet.

**CAPORETTO, BATTLE OF.** This is the title given to the disastrous, but not irretrievable defeat of the Italian force in Venezia. Beginning on Oct. 24, 1917, the Austro-German drive was finally thwarted on the general line of the Piave in December. The Italian offensive of Aug.-Sept. 1917 (see WORLD WAR) had reduced Borojević's armies to the limit of resistance, so much so that, as Ludendorff records, "in the middle of September it became necessary to decide for the attack on Italy in order to prevent the collapse of Austria-Hungary."

There was a clear difference of opinion on the Italian side as to the best way of meeting the forthcoming attack. Cadorna felt he must stand on the defensive. Capello, who commanded the II. Army, was anxious to anticipate the enemy's move by an attack north-east from his positions on the Bainsizza plateau. His army was in the main aligned for attack, for a continuation of the offensive which had been broken off in September, and he judged it impossible, given the difficulty of communications and the risk of imminent attack, to take up the positions best adapted for defence. In this idea he had the support of more than one of his corps commanders, but Cadorna did not think that he could throw in the forces necessary for such an attack when he was uncertain as to the direction of the forthcoming blow.

#### I. THE AUSTRO-GERMAN ATTACK

**Disposition of Italian Forces.**—Cadorna had received satisfactory reports concerning the morale of his troops. He had enough men, though a number of his units were below strength; and he had enough guns, in spite of the withdrawal of the Allied batteries, though he would have been glad of more heavy artillery. Between Monte Rombone and Monte San Gabriele, Capello had some 2,200 guns and nearly 800 trench mortars. North of Tolmino the line on the left bank of the Isonzo was held by Cavaciocchi's IV. Corps, whose left wing held the Plezzo basin and was in contact with the Carnia force on Monte Rombone. Next came Badoglio's XXVII. Corps, whose left wing, the 19th Division, raised to the strength of an army corps, held the lines opposite Tolmino. The other three divisions which completed the XXVII. Corps were across the river south of the Lom plateau. Behind Cavaciocchi's right and the 19th Division, on the mountains west of the Isonzo, lay the VII. Corps, newly reconstituted with units from other corps, and commanded by Gen. Buongiovanni. On the right of the XXVII., holding the line as far as Monte Santo, were Cavaglia's XXIV. Corps and Albricci's II. Corps.

The weak point of the Italian line was the Tolmino sector; the weakest part of the sector was at the junction of the XXVII. Corps (19th Division) with the IV. (46th Division), and the weakest position of all was that held by the right of the 46th Division, which was clinging to the slopes of Sleme and Mrzlivrh, completely dominated by the enemy and badly off for communications with its neighbours. The Tolmino sector was chosen for the main enemy attack, and here, owing to a complex of circumstances, the Austro-German forces won a success that led to a great Italian disaster. The Italian preparations were much handicapped by the illness of Capello.

**The Attack Launched.**—The main attack came in the direction anticipated, between Monte Rombone and south of Tolmino, and was conducted by a mixed German and Austrian army under Gen. Otto von Below. The army, which was known as the XIV.

Army, consisted of nine Austrian divisions and seven German, in four groups. The northern group of four divisions (three Austrian and one German Jäger) was commanded by Krauss, who had been called back from the Bukovina. Next came a group of three divisions (one Austrian and two German) under the German, von Stein, and a group of two German divisions under the German, von Berrer. South of these two central groups was a mixed group (one Austrian and two German) under the Austrian, von Scotti. East of Tolmino lay four divisions in reserve. Borojević had 20 divisions in his two Isonzo armies between Auzza and the sea. Below and Henriquez (II. Isonzo Army) had some 2,500 guns and 500 trench mortars.

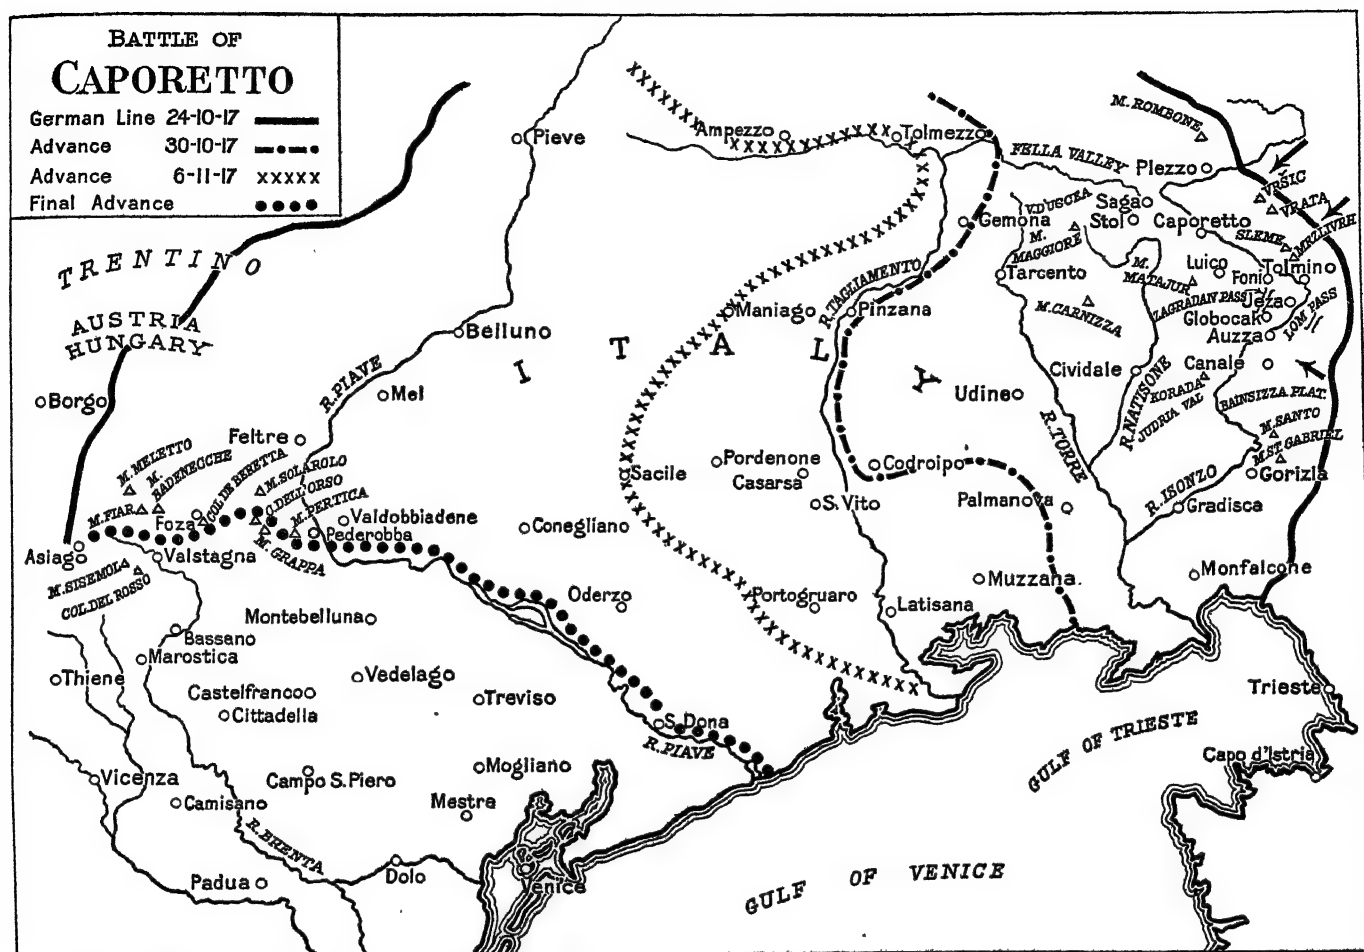

The bombardment began at 2 o'clock on the morning of Oct. 24, in wild autumn weather. There was a drizzle of snow on the high ridges, rain below, and mist everywhere. Towards dawn the fire died down, and it was thought on some parts of the defending front that the bad weather had counselled a delay in the attack. But the attackers were to make skilful use of the weather conditions, and only on Monte Rombone, on Krauss's extreme right, an attack in conjunction with the left wing of Krobatin's X. Army had to be given up owing to the snow.

Krauss's main attack was a straight drive through the Italian lines in the Plezzo basin, his first objective the Saga defile. But he meant to reach without delay the ridge of the Stol (6,467 ft.), which stood athwart a further direct advance. For this attack he detailed the 22nd Schützen Division, followed by a Kaiserjäger and a Kaiserschützen battalion, which were to go straight for the Stol, and by six battalions of the 3rd (Edelweiss) Division, which were to make for the val Fella by way of the val d'Uccea. Krauss's left wing, the 55th (Bosnian) Division, attacked the Vršč-Vrata ridge, with the object of breaking through to the Isonzo and Caporetto.

Krauss's drive, after hard fighting, broke through the three front lines held by the Italian 50th Division, but the attacking troops were checked at the Saga defile. When evening fell this position was still in the hands of the Italians, but the battle had gone badly for the defenders farther south, and a retreat to the Stol became necessary. Krauss's Bosnians had met with no success against the left wing of the Italian 43rd Division, but Stein's group had carried all before it. Stein opened his attack with his right wing, the Austrian 50th Division, at 7.30 A.M., attacking the Italian 46th Division between Monte Nero and Vodil. A little later the Bavarian Alpenkorps, advancing from Tolmino, attacked the ridges east of the Passo di Zogradan, while Berrer and Scotti attacked farther south.

**Success of the Silesians.**—When both Stein's initial attacks were under way the 12th Silesian Division, under Gen. von Lequis, was sent in between them. Lequis attacked in two columns, one on each side of the river, making for Caporetto, where it was hoped he would join with Krauss's Bosnians. Both columns were completely successful. The right-hand column, aided by the strong attacks of the Austrian 50th Division, pierced the extreme right of the Italian 46th Division and pushed north-west with all speed. Across the river, where the Alpenkorps was making good headway on the slopes above the road, Lequis's left-hand column quickly reached the Italian second line, where the valley narrows below the hamlet of Foni. This line had been held until the eve of the battle by a brigade of the IV. Corps, but at the last moment the sector was transferred to the XXVII. Corps, and the Napoli Brigade was given to Badoglio to hold this important point. Only one battalion, however, was placed near the river. The rest of this regiment (the 76th) lay at the Zogradan pass, high on the ridge to the south-west, and the other regiment of the brigade (the 75th), together with the brigade command, was three miles away, on the western slopes below Zogradan. The single battalion, of which only a platoon was on the road, seems to have been taken completely by surprise. It was run over by the Silesians, who proceeded on their way up the valley practically unmolested.

Meanwhile, the Alpenkorps, Berrer's two divisions and Scotti's right wing were breaking up Badoglio's left, while the latter's right, across the river, and Cavaglia's corps were being strongly

MAP SHOWING LINES OF THE AUSTRO-GERMAN ADVANCE, OCT. 24 TO NOV. 6, 1917. THE GERMAN ATTACK WAS LAUNCHED AGAINST THE ITALIAN ISONZO LINE AT ITS WEAKEST PART, THE TOLMINO SECTOR

attacked by Scotti's left and Henriquez's right. The attack from Tolmino had been carried out with skill, speed and resolution, and by a capital error, which has never been satisfactorily explained, the Italian guns remained silent until too late. Definite orders had been given both by Cadorna and by Capello that immediately upon the opening of the enemy's bombardment the Italian artillery should open fire on the enemy's trenches and zones of concentration, and that they should lay down a heavy barrage as soon as there were signs of movement. These orders were not carried out and, owing to great destruction of telephone wires, when the guns finally began their fire was fitful and uncertain. Taken by surprise, puzzled by the comparative silence of their own guns and blinded by mist, the troops of the 19th Division opposed a weak resistance to the Austro-German attack.

Henriquez's attack on the Bainsizza plateau, although it met with some initial success, was readily repulsed. Badoglio had hoped to hold the enemy attack from Tolmino and turn the scale by a counter-attack on the Lom plateau with his three divisions on the left bank of the Isonzo. But he was not afforded the chance of attempting any such manoeuvre. It was long before he received any news of how the day was going on the front of the 19th Division, and from the beginning of the action he was unable to communicate with his divisions across the river. In a message sent to Army Headquarters at 4 P.M. he reported the enemy success south of Jeza, but said that he had no news from the commands of the 19th Division and the IV. Corps, and that he was unable to communicate with anyone.

By 4 P.M. Lequis's Silesians were approaching Caporetto. The left-hand column was unmolested on its march. The right-hand column, which had cut in behind the Italian 43rd Division, was making the task of the Austrian 50th comparatively easy, and brushing aside the spasmodic opposition of such small detach-

ments as came in its way. Cavaciocchi had filled his front lines too full, and sent practically all his reserves across the river, in immediate support of the 43rd and 46th Divisions.

## II. THE ITALIAN RETREAT

By evening Stein was pouring troops through the breach made by the Silesians, and was making good headway with the Austrian 50th Division on their right, while the Alpenkorps, Berrer and Scotti had in several places gained the high ridges dominating the head of the Judrio valley. Krauss was still held up at Saga and Polounik, and his Bosnians had gained no more ground. But the break-through between Tolmino and Caporetto had made the Italian positions untenable.

At Cividale, where Capello had his headquarters, and at the Comando Supremo in Udine, the first news that came from the IV. Corps, and the absence of news from the XXVII., made a grave impression. Capello sent up the army reserves by the valley roads and dispatched Montuori to direct the "left wing" (the IV. and VII. Corps). By evening it was clear that the enemy had won a big success, though it was not yet clear to what an extent the whole Italian left was crumbling. There seemed good reason to hope that the advance might be blocked in the narrow valleys west of the Isonzo. But by nightfall both the IV. Corps and the 19th Division were practically broken in pieces. The VII. Corps was beginning to be attacked at Luico, and its right was uncovered by the destruction of most of the 19th Division. The right wing of the 19th was still holding on Globocak and down to the river, and troops were being brought back from the left bank to strengthen this line. But it was obvious that the positions on the Bainsizza could not be obtained, and orders were given to Cavaglia, who had taken over Badoglio's troops beyond the river, to prepare for a retreat across the Isonzo.

At the moment the most dangerous point appeared to be the extreme left wing, where it was clear that Krauss would try and push through the val d'Uccea, the shortest way to the Tagliamento. Two Alpine groups had been dispatched to this sector the day before, and Cadorna gave orders that the val d'Uccea must be blocked at all costs. He sent out orders for resistance on three successive lines, all radiating from Monte Maggiore, which was the key position, but at the same time, as a precaution, he directed that plans and orders should be drawn up for a general retreat to the Tagliamento.

The news on the morning of Oct. 25 was increasingly grave. Krauss was pressing upon the Stol, and finding a weak resistance; no stand was being made at Creda; Monte Matajur had fallen, practically undefended. Other positions were seriously threatened, and there was no confidence that they would be held, for it was now known in Cividale and Udine that the behaviour of some of the troops in the line had been very unsatisfactory, and that this unexpected lack of spirit was communicating itself to some of the reserves. These had a difficult task in getting to the scene of action, for as they marched up the narrow mountain roads they were met by ever-increasing masses of fugitives, the bulk of whom belonged to the non-combatant services. This unfortunate state of affairs undoubtedly hastened the break-up of Capello's whole left wing.

**Preparations for Retreat.**—On the afternoon of Oct. 25 Capello, who could fight no more against his illness, and had been told by the chief medical officer of the army that he must resign his command, proposed an immediate retreat to the Tagliamento, arguing that it was useless to send more reserves into the chaos among the hills west of the Isonzo. Cadorna felt that unless he could delay the enemy advance down the Natisone and Judrio valleys he ran the risk of having his centre and right cut off. Montuori, who now succeeded Capello in command of the II. Army, thought that he could hold on a line from Monte Maggiore to Monte Carnizza and thence across the valleys to Monte Korada. Cadorna decided to attempt a further stand while warning Tassoni (Carnia force), di Robilant (IV. Army) and the duke of Aosta to hold themselves in readiness for retreat, but at midnight on Oct. 26 he was awakened to hear that Monte Maggiore had fallen. He at once drew up the orders for a general retreat beyond the Tagliamento, and his plans were already matured for the longer retreat across the Piave which he foresaw would be necessary in order to get to a shorter line. The retreat began on Oct. 27, and two days later provisional orders and plans were issued for the further retirement to the Piave.

Fortunately for Italy, and for the cause of the Entente, the Germans and Austrians were outrunning their transport. Krauss complained that only he and Krafft von Delmensingen, Below's chief-of-staff, had been inspired by adequate ambitions for the attack. The objective had been Cividale, or at best the Tagliamento. Krafft thought they should have had the Adige in view. Krauss expressed the opinion that the real objective should have been Lyons. It must be remembered, however, that the transport difficulties were very great. Germany could not spare troops or material for an unlimited effort here, and the unexpectedly weak resistance of the Italian II. Army could hardly have entered into the calculations of those who were bound not to take too many risks. Krauss admits that if Cavaciocchi had held the Stol in force his own move would have been frustrated.

The critical days for the Italians were Oct. 30 and 31, when the pressure from north and east threatened the flank and rear of the III. Army, whose task had been made more difficult by the premature blowing up, owing to a false alarm, of the permanent bridges at Casarsa, and by the fact that the Tagliamento had come down in sudden and violent flood. But by the evening of Nov. 1 the last of the duke of Aosta's troops had been successfully withdrawn across the river.

Cadorna's weakest point was the stretch of the river west of Tarcento, for which Krauss and Stein were making with all speed. Two divisions under Di Giorgio had been dispatched to hold this line, but their march athwart the line of the retreat had been very

difficult. Stein's troops were repulsed with heavy loss, but on the evening of Nov. 2 Krauss's Bosnians succeeded in crossing at Cornino, and the following morning Di Giorgio was strongly attacked at Pinzana. Two days later his left was pushed back still farther, endangering the line of retreat for the Carnia force and once more threatening the whole Italian line with envelopment from the north.

On the morning of Nov. 4 Cadorna ordered the retreat to the Piave, and that night the troops holding the line of the Tagliamento resumed their march westward. The IV. Army in Cadore was now in a difficult position, but Di Giorgio and the other covering troops of the worn-out II. Army slowed down the enemy's advance and gave time for most of di Robilant's troops to get away from Cadore and come into line between the I. and III. Armies. But the greater part of Tassoni's Carnia force was caught between Krauss's troops and Krobatin's X. Army.

### III. THE RECOVERY ON THE PIAVE

**New Italian Positions.**—By Nov. 8 the bulk of the IV. Army was in line. On Nov. 9 and 10 the last covering troops of the II. and III. Armies crossed the Piave from Pederobba to the sea. The line chosen to defend the fortunes of Italy implied a withdrawal of the right wing of the I. Army. Pecori-Giraldi retired from Asiago and Gallio and based his right on the fortified lines of the Meletta group, giving up the XVIII. Corps to di Robilant, who held the line from the Brenta to the Piave and the short stretch of the river as far as the Montello.

Reserves were coming in fast from the depots, including the young class of 1899. French and British divisions were already in Italy and others were on the way. But Diaz, who took over the command from Cadorna on Nov. 9, had to face a situation that seemed almost desperate. The Italian armies had lost some 320,000 men in killed, wounded and missing, the number of prisoners being estimated at 265,000. The bulk of the II. Army had to be counted out altogether and the total number of troops to be reorganized and refitted was over 300,000. More than 3,000 guns had been lost and over 1,700 trench mortars. It seemed very doubtful whether these greatly weakened forces could resist the renewed attacks of the victorious armies which had followed so closely on their heels. Fortunately, the plans for defence had been well and truly laid by Cadorna in the limited time that was available, and still more fortunately, as a result of the danger in 1916, he had caused elaborate preparations to be made in the Grappa sector. It was due to this forethought that resistance on the line now chosen was possible.

Diaz had little breathing space, though some days elapsed before the enemy could prepare for an attack in force on the new line, for Conrad, on the Trentino front, saw a chance and, though he was short of troops, struck at once while calling for reinforcements. He attacked Pecori's troops on Nov. 10 as they were preparing to come back to the line already indicated and continued his attack on the new positions. But ten days' fighting brought heavy losses and no success. Meanwhile, Boroević had tested the river defences. He got troops across in two places but failed to make further progress, and on Nov. 16 an attack in force failed completely, the Austrians losing some 1,500 killed and nearly as many prisoners.

Conrad and Boroević were making no headway, but a very dangerous attack was being conducted by Krauss between the Brenta and the Piave. Attempts to break through by the valley roads were quickly frustrated, and persistent efforts to capture the all-important ridge of Monte Tomba-Monfenera, which runs down from the Grappa *massif* to the Piave, failed to pierce the thin Italian lines. The struggle at this point lasted for five days, Nov. 18-22, and the Italian IX. Corps, under Ruggeri Laderchi, fought a great fight. The critical day was Nov. 22, when Krauss's Bosnians and German Jäger made a final effort to break through. The attacking columns reached the crest of Monte Tomba, but their bolt was shot. In the evening Ruggeri Laderchi counter-attacked and drove the enemy off the ridge, except at one point. Next day reserves arrived and the line was firmly established on its positions.

Meanwhile, in the Grappa sector, Krauss had attacked on Nov. 21 with his centre and right, but after a week's fighting, in spite of reinforcements drawn from Stein and Krobatin, he had to call a halt. A fresh attack was preparing when the situation was eased by the arrival of the British and French divisions which had hitherto been waiting in reserve. On Dec. 2 three British divisions, under Gen. the earl of Cavan, took over the Montello sector, and a similar French force under Gen. Duchesne relieved the IX. Corps in the Monte Tomba region. It was expected that both these points would be the object of early attack, but as it turned out they were both left unmolested. Conrad and Krauss continued their attempts on the mountain front, but Krauss confined his efforts to the Grappa sector. Krauss could not immediately renew his attack, but on Dec. 3 Conrad, reinforced but still complaining that he was starved for means of attack, opened a heavy bombardment on the curve of the Italian front from Monte Sisemol to east of Monte Badenecche.

Next day he pinched out the Meletta-Badenecche salient and took Monte Fior and Castelgomberto in the rear, and the day following he pushed down towards Foza. The position was critical, but the Italians succeeded in establishing a new line farther south, covering Valstagna and the mouth of the Frenzela valley. On Dec. 23, after careful preparation, Conrad launched a new attack on the lines between Monte Sisemol and the Frenzela valley. He gained a big initial success, taking both Col dell' Orso and Monte Melago and cutting off a large number of prisoners. The next day the Italians counter-attacked and retook both the hills. They established themselves firmly in their reserve lines and repulsed another attack, the last, on Christmas Day.

**Krauss's Final Effort.**—Meanwhile, between Conrad's two efforts, Krauss had made a determined attempt to drive the Italians off Monte Grappa. His command had been increased to ten divisions, six Austro-Hungarian and four German, and he did not spare his troops. He opened his attack on Dec. 11 by a push on each wing; from the Brenta valley and Monte Pertica against Col della Berretta, and against both sides of the Col dell' Orso-Solaro-lo salient. On the left, in spite of repeated attacks that lasted ten days, his German divisions made little headway, but on the right, at the end of four days' hard fighting, he had taken Col Caprile and Col della Berretta. Four days more and he was in possession of Monte Asolone, which looks down the valle di Santa Felicità to the longed-for haven of the plain. This was the term of the Austrian advance. On Dec. 20 the Italians counter-attacked and won back a good deal of the lost ground, the last move in the long struggle. Krauss accepted failure for the moment, hoping for an early spring offensive farther west. Five days later the snow came, the heavy winter fall that was a month late. The invaders had been favoured by the tardy coming of winter, which greatly prolonged the strain on the sorely-tried armies of Italy. But it gave also to the defending troops the chance to remake at once a shaken reputation. They took the chance and their recovery was a remarkable feat of courage.

**Conclusion.**—The narrative has indicated briefly the causes which led to the Italian disaster. The defending troops were subjected to a very severe trial; but it would seem clear that failure and disaster might have been largely averted if the preparations against the Austro-German attack and the actual conduct of the defence had been different. To sum up, there were too many troops in the front lines and too few in the "battle positions." Cadorna had not succeeded in making all his subordinates grasp the principles of defence in depth or of "elastic" defence. And, given the erroneous dispositions of the defensive lines, the reserves were too far back. The Italian armies on the Julian front had been constantly on the offensive. They had had no recent practice in meeting an attack on the grand scale. It was this lack of practice, no doubt, and a false confidence based on obsolete experience, which led to the belief that even if the opening phases of the battle were unfavourable to the defence, there would be ample time to restore the situation.

When retreat became inevitable, the prospects might well have seemed desperate to those who had to organize it. For the army, long used to the war of positions that had been the rule for 28

months, was in no condition to move. The retreat, with all its confusion, its mistakes and its tragedies, remains an astonishing achievement. The resistance which followed it, when the retreating armies turned and stood at bay on the mountains and on the Piave, was the greatest of Italian victories.

**CAPPADOCIA**, in ancient geography, an extensive inland district of Asia Minor. In the time of Herodotus the Cappadocians occupied the whole region from Mount Taurus to the Euxine. That author tells us that the name of the Cappadocians was applied to them by the Persians, while they were termed by the Greeks "Syrians," or "White Syrians" (*Leucosyri*). Under the later kings of the Persian empire they were divided into two satrapies or governments, the one comprising the central and inland portion, to which the name of Cappadocia continued to be applied by Greek geographers, while the other was called Cappadocia *κατὰ Πόντον*, or simply Pontus (*q.v.*). This division had already come about before the time of Xenophon. As after the fall of the Persian government the two provinces continued to be separate, the distinction was perpetuated, and the name Cappadocia came to be restricted to the inland province (sometimes called Great Cappadocia), which alone will be considered in the present article.

Cappadocia, in this sense, was bounded on the south by the chain of Mount Taurus, east by the Euphrates, north by Pontus, and west vaguely by the great central salt "Desert" (*Axylon*). But it is impossible to define its limits with accuracy; it was about 250 m. in length by less than 150 in breadth. The region is a high upland tract, attaining to more than 3,000 ft., and constituting the most elevated portion of the great tableland of Asia Minor (*q.v.*). The western parts of the province, where it adjoins Lycania, extending thence to the foot of Mount Taurus, are open treeless plains, affording pasture in modern as in ancient times to numerous flocks of sheep, but almost wholly desolate. But out of the midst of this great upland level rise detached groups or masses of mountains, mostly of volcanic origin, of which the loftiest are Mount Argæus (still called by the Turks Erjish Dag) (13,100 ft.), and Hassan Dag to the south-west (8,000 ft.).

The eastern portion of the province is of a more varied and broken character, being traversed by the mountain system called by the Greeks Anti-Taurus. Between these mountains and the southern chain of Taurus, properly so-called, lies the region known in ancient times as Cataonia, occupying an upland plain surrounded by mountains.

The only two cities of Cappadocia considered by Strabo to deserve that appellation were Mazaca, the capital of the kingdom under its native monarchs (see *CAESAREA-MAZACA*); and Tyana, not far from the foot of the Taurus, the site of which is marked by a great mound at a place called Kiz (or Ekuz) Hissar, about 10 m. south-west of Nigdeh. Archelais, founded by Archelaus, the last king of the country, subsequently became a Roman colony, and a place of some importance. It is now Akserai.

Several localities in the Cappadocian country were the sites of famous temples. Among these the most celebrated were those of Comana (*q.v.*) and Venasa in Morimene, where a male god was served by over 3,000 *hieroduli*. The local sanctity of Venasa has been perpetuated by the Moslem veneration for Haji Bektash, the founder of the order of dervishes to which the Janissaries used in great part to belong. Cappadocia was remarkable for the number of its slaves, who constituted the principal wealth of its monarchs. Large numbers were sent to Rome but did not enjoy a good reputation. The Cappadocian peasants are still in the habit of taking service in the west of the peninsula and only returning to their homes after long absences; their labour is now much valued by employers, as they are a strong sober folk. The province was celebrated for its horses, as well as for its vast flocks of sheep; but from its elevation above the sea, and the coldness of its climate, it could never have been rich and fertile.

## HISTORY

Nothing is known of the history of Cappadocia before it became subject to the Persian empire, except that the country was the home of a great "Hittite" power centred at Boghaz-Keui (see PTERIA). With the decline of the Syro-Cappadocians after their defeat by Croesus, Cappadocia was left in the power of a sort of feudal aristocracy. It was included in the third Persian satrapy by Darius but was governed by rulers of its own, more or less tributary to the Great King. Subdued by the satrap Datames, Cappadocia recovered independence under Ariarathes I, a contemporary of Alexander the Great.

The province was not visited by Alexander, who contented himself with the tributary acknowledgment of his sovereignty made by Ariarathes, and the continuity of the native dynasty was only interrupted for a short time after Alexander's death, when the kingdom fell to Eumenes. His claims were made good in 322 B.C. by the Regent Perdiccas, who crucified Ariarathes; but in the dissensions following Eumenes's death, the son of Ariarathes recovered his inheritance and left it to a line of successors. Under the fourth of the name Cappadocia came into relations with Rome, first as an enemy of Antiochus the Great, then as an ally against Perseus of Macedon. The kings henceforward threw in their lot with the republic against the Seleucids. Ariarathes V. marched with the Roman pro-consul, Crassus against Aristonicus, and their forces were annihilated (130 B.C.). His death led to interference by the rising power of Pontus; the Cappadocians, supported by Rome against Mithridates, elected a native, Ariobarzanes, to succeed (93 B.C.); but it was not till Rome had disposed of the Pontic and Armenian kings that his rule was established (63 B.C.). In the civil wars Cappadocia was now for Pompey, now for Caesar, now for Antony, now against him. The Ariobarzanes dynasty came to an end and Archelaus reigned by favour first of Antony, then of Octavian, and maintained tributary independence until A.D. 17, when the emperor Tiberius reduced Cappadocia to a province. Vespasian in A.D. 70 joined Armenia Minor to it and made the combined province a frontier bulwark. We still possess the report made to Hadrian by his legate Arrian (*q.v.*), which is a valuable picture of life in a Roman frontier province in the 2nd century (A.D. 131-137). Cappadocia remained part of the Eastern empire until the 11th century, though often ravaged both by Persians and Arabs. Before it passed into Seljuk hands (1074), and from them to the Osmanlis, it had already become largely Armenian; we find the southern part referred to as "Hermeniorum terra" by crusading chroniclers.

**CAPPEL, LOUIS** (1585-1658), French Huguenot divine and scholar, was born at St. Elier, near Sedan. He studied theology at Sedan and Saumur; and Arabic at Oxford, where he spent two years. In 1613 he accepted the chair of Hebrew at Saumur, and in 1633 became professor of theology. As a Hebrew scholar he concluded that the vowel points and accents were not an original part of Hebrew, but were inserted by the Massorete Jews of Tiberias, not earlier than the 5th century A.D., and that the primitive Hebrew characters are those now known as the Samaritan, while the square characters are Aramaic and were substituted for the more ancient at the time of the captivity. Cappel's important *Critica Sacra* (1634) met with such theological opposition that he was only able to print it at Paris in 1650, by the aid of a son who had turned Catholic. The various readings in the Old Testament text and the differences between the ancient versions and the Massoretic text convinced him that the integrity of the Hebrew text, as held by Protestants, was untenable. This amounted to an attack on the verbal inspiration of Scripture.

Bitter, however, as was the opposition, it was not long before his results were accepted by scholars.

Cappel's other works include the *Annotationes et Commentarii in Vetus Testamentum, Chronologia Sacra, Arcanum Punctuationis revelatum* (1624), the *Diatriba de veris et antiquis Ebraeorum literis* (1645), and *Commentarius de Capellorum gente*, which give an account of his family. See Herzog-Hauck, *Realencyklopädie*.

**CAPPELLO, BIANCA** (1548-1587), grand duchess of Tuscany, was the daughter of Bartolommeo Cappello, a member of a rich and ancient Venetian house, and celebrated for her great beauty. After a runaway marriage with Pietro Bonaventuri, a poor Florentine clerk, she became the mistress of Francesco, son and heir of the grand duke Cosimo de' Medici, who succeeded his father in 1574. Her husband having been murdered in Florence in 1572, and Francesco's wife having died in 1578, Bianca was married to him, the wedding being publicly announced on June 10, 1579. In Oct. 1587 both she and her husband died within a few days of each other in circumstances that at first gave rise to suspicions of poisoning. Colic, however, would seem to have been the real cause of their deaths.

**CAPPER, SIR THOMPSON** (1863-1915), British major-general, was born at Lucknow on Oct. 20, 1863, the son of a Bengal civil servant. He entered the army in 1882, and served in the Chitral (1895), Sudan (1898-99) and South African (1900-02) campaigns. Capper was one of the outstanding scientific soldiers of his day, and after some experience as professor at the Staff College he became First Commandant of the Indian Staff College at Quetta. For the three years before the World War he held a command in Dublin and, on the outbreak of war, was given the command of the hurriedly improvised 7th Division, which was sent to Belgium in October for the relief of Antwerp, but was actually employed to defend Ypres and to block the way to the Channel forts. The division saw three weeks' hard fighting (Oct.-Nov. 1914), during which its infantry strength was reduced from 14,000 to 4,000 men. Capper continued to command the 7th Division in France, and was killed in the battle of Loos on Sept. 26, 1915.

**CAPPERONNIER, CLAUDE** (1671-1744), French classical scholar, born at Montdidier on May 1, 1671. He took orders but devoted himself almost entirely to classical studies. He published an edition of Quintilian (1725) and his edition of the ancient Latin Rhetoricians was published posthumously in 1756. He furnished much material for Robert Estienne's *Thesaurus Linguae Latinae*. His nephew, JEAN CAPPERONNIER (1716-1775), was also a distinguished scholar, and published valuable editions of classical authors—Caesar, Anacreon, Plautus, Sophocles.

**CAPPONI, GINO, MARQUIS** (1792-1876), Italian statesman and historian, was descended from an ancient Florentine family. In 1811 he married the marchesina Giulia Riccardi. After the return of the grand duke Ferdinand III. from exile in 1814, Capponi embarked upon a long series of travels that brought him into touch with the most notable intellects of his day. In London he met Lord John Russell; and his visit to Edinburgh, where he made the acquaintance of Francis Jeffrey, inspired him to found, on his return home, a literary review like the *Edinburgh*—the *Antologia*. He also contributed to the *Archivio Storico*. After dallying with politics, he devoted himself to the economic development of Tuscany until in 1848 the grand duke Leopold II. decided to grant his people a constitution. Capponi threw himself heartily into the ruler's plans, and finally took office as prime minister. His conduct of foreign affairs was far-sighted, and he endeavoured to retrieve the situation after Charles Albert had been defeated on the Mincio. Although he had lost his sight in 1844, he continued to devote himself to his favourite historical studies. These he resumed on his resignation from the premiership in Oct. 1848, when he began his great work, the *Storia della Repubblica di Firenze*. In 1859 he voted for the union of Tuscany with Piedmont, and in 1860 he was created a senator by King Victor Emmanuel. A large num-

ber of his miscellaneous writings have been published under the title *Scritti Inediti*.

**BIBLIOGRAPHY.**—M. Tabarrini, *Gino Capponi* (Florence, 1879); A. von Reumont, *Gino Capponi. Ein Zeit- und Lebensbild* (Gotha, 1880); V. Benetti-Brunelli, *L'Educazione nazionale nel pensiero di Gino Capponi* (1920); G. Gentile, *Gino Capponi e la cultura toscana nel secolo decimonono* (Florence, 1922).

**CAPPONI, PIERO** (1447–1496), Florentine statesman and soldier, was employed as ambassador by Lorenzo de' Medici. After Lorenzo's death in 1492, Capponi became a leader of the anti-Medicean party. He later became chief of the republic, in which capacity he conducted the negotiations with Charles VIII. of France with conspicuous skill. Charles entered Florence in Nov. 1494 and sought to intimidate the republic; but Capponi's firm attitude soon caused the king to moderate his demands. After Charles's departure, Capponi led the army of the republic against the Pisans. He was killed while besieging the castle of Soiana on Sept. 25, 1496.

**CAPPS, EDWARD** (1866– ), American classical scholar, was born in Jacksonville (Ill.), on Dec. 21, 1866. He graduated at Illinois college in 1887, and received the degree of Ph.D. at Yale university in 1891. In 1890 he was appointed tutor at Yale. He was professor of Greek language and literature at the University of Chicago from 1892 to 1907. In 1903 he was special lecturer at Harvard, and during the next two years studied at Athens, and Halle, Germany. During 1906–7 he was managing editor of *Classical Philology*, and in 1907 was called to Princeton university as professor of classics. In 1914 he was president of the American Philological Association, and in 1917 was Turnbull lecturer on poetry at Johns Hopkins University. In 1918 he was appointed head of the American Red Cross Commission to Greece, and became also chairman of the managing committee of the American School of Classical Studies at Athens. In 1920 he was appointed minister to Greece, resigning in March 1921 and returning to Princeton. He is a leading authority on the Greek theatre. He was editor-in-chief of the University of Chicago decennial publications, 29 vols., and became the American editor of the Loeb Classical Library.

His works include: *The Greek Stage according to the Extant Dramas* (1891); *From Homer to Theocritus* (1901); *The Introduction of Comedy into the City Dionysia* (1903); and *Four Plays of Menander* (1910).

**CAPRAIA** (anc. *Capraria*, from Lat. *capra*, wild-goat), an island of Italy, off the north-west coast (the highest point 1,466 ft. above sea-level), belonging to the province of Genoa, 42 m. S.S.E. of Leghorn by sea. Pop. (1921), 548. It produces wine, and is a centre of the anchovy fishery. It became Genoese in 1527 and was strongly fortified. About 20 m. to the north is the island of Gorgona (highest point 836 ft.), also famous for its anchovies. Batu islands have penal colonies.

**CAPRARA, GIOVANNI BATTISTA** (1733–1810), Italian cardinal, was born on May 29, 1733, at Bologna of the family of the counts of Montecuculi. Having acted as nuncio at Cologne, Lucerne and Vienna, he received a cardinal's hat in 1792, and in 1801, at the special request of Bonaparte, was deputed by the Vatican as legate in France to execute the terms of the Concordat. When he was formally received on April 9, 1802, he read a Latin declaration promising to respect the Gallican liberties, and this he was afterwards alleged to have signed. He was no match for Napoleon and did not enforce the conditions he had made before instituting the "constitutional" bishops of Orleans and Vannes. He gave way on important points, and Napoleon secured his appointment as archbishop of Milan in 1802. In 1803, however, Caprara protested against the organic articles added to the Concordat by the French Government. He was the channel of communication between Pius VII. and Napoleon in the arrangement for the latter's coronation. He died in Paris on June 21, 1810. In 1802 he published *Concordat et recueil des bulles et brevets de N.S. Pie VII. sur les affaires de l'Eglise en France*.

**CAPRERA**, an island off the north-east coast of Sardinia, about 4 m. in length. It is connected by a bridge with La Maddalena. Its chief interest lies in its connection with Garibaldi, who first established himself there in 1856, and died there on June 2, 1882. His tomb is visited on this anniversary by Italians from all parts.

**CAPRI** (anc. *Capreae*), an island in the province of Naples (from which town it is 17 m. S.), on the south side of the Bay of Naples, of which it commands a fine view. Pop. (1921) of the commune of Capri, 4,629; of Anacapri, 2,214. It is 4 m. in length and the greatest width is 1½ m., the total area being 5½ square miles. The highest point is the Monte Solaro (1,920 ft.) on the west, while at the east end the cliffs rise to a height of 900 ft. sheer from the sea. The usual landing-place is on the north side (Marina Grande) with a funicular railway up to the town; but the Marina Piccola, on the south, is used when there is a strong north wind. The two small towns, Capri (450 ft.) and Anacapri (980 ft.), until the construction of a carriage road in 1874 were connected only by a flight of 784 steps. The island lacks water, and is dusty during drought, but is fertile, producing fruit, wine and olive oil. The indigenous flora comprises 850 species. The prosperity of the island depends mainly upon foreign visitors (some 60,000 annually). The famous Blue Grotto, the most celebrated of many sea caves known in Roman times, was rediscovered in 1826.

The high land in the west of the island and the less elevated region in the east are formed of limestones similar to the Urgonian (Lr. Cretaceous) of Sicily. The intervening depression, which is probably bounded on the west by a fault, is filled to a large extent by sandstones and marls of Eocene age. A superficial layer of recent volcanic tuff occurs in several parts of the island. At the Blue Grotto, as in other parts of the island, indications of recent changes of sea-level are seen.

Neolithic remains have been found in the Grotto delle Felci, see Rellini, in *Monumenti dei Lincei* xxix. (1924) 305 sqq., a cave on the south coast. Capri belonged to Neapolis, until the time of Augustus, who took it in exchange for Aenaria (Ischia) and often resided there. Tiberius, who spent the last ten years of his life at Capri, built no fewer than twelve villas there; to these the great majority of ancient remains on the island belong; the best preserved, on the east extremity, consisting of vaulted substructures and the foundations of a *pharos* (lighthouse). This was known as Villa Jovis, and the other eleven were perhaps named after other deities. Numerous ancient cisterns show that in Roman as in modern times rain-water was largely used for lack of springs. The wife and sister of Commodus were banished hither. The mediaeval town was at the Marina Grande; and to it belonged the early church of S. Costanzo. In the 15th century the inhabitants took refuge from pirates higher up, at the two towns of Capri and Anacapri. In 1806 the island was taken by the English fleet under Sir Sidney Smith, and strongly fortified, but in 1808 it was retaken by the French under Lamarque. In 1815 it was restored to Ferdinand I. of the Two Sicilies.

**BIBLIOGRAPHY.**—For the Archaeology of the island see F. Furchheim, *Bibliografia dell' Isola di Capri e della provincia Sorrentina* (Naples, 1899); C. Weichardt, *Das Schloss des Tiberius und andere Römerbauten auf Capri* (Leipzig, 1900); for a general account H. E. Trower, *The Book of Capri* (Naples, 1924; bibl.); E. Petraccone, *L'Isola di Capri* (Bergamo, Arti Grafiche, 1913), well-illustrated.

**CAPRICCIO** or **CAPRICE**, a musical term for a lively composition of a more or less fanciful nature, not following a set musical form, although the first known, written for the harpsichord, partook of the nature of a fugue. The word is also used for pieces of a showy type, in the nature of transcriptions and variations.

**CAPRICORNUS** ("the goat"), in astronomy, the tenth sign of the zodiac, represented by the symbol ♈ intended to denote the crooked horns of this animal. The word is derived from Lat. *capra*, a goat, and *cornu*, a horn. It was represented by the ancients as a creature having the forepart a goat, and the hindpart a fish, or sometimes simply as a goat.

**CAPRIFOLIACEAE**, a family of shrubs and trees, characterized by having the petals of the flower united. The plants are sympetalous Dicotyledons; common representatives are *Sambucus*

(elder), *Viburnum* (guelder-rose and wayfaring tree), *Lonicera* (see HONEYSUCKLE); *Adoxa* (moschatel), a small herb with a creeping stem and small yellowish-green flowers, is occasionally found on damp hedge-banks; *Linnaea*, a slender creeping evergreen with a thread-like stem and pink bell-shaped flower, a northern plant, occurs in cold woods and mountains of Asia, Europe and North America. The leaves are opposite, simple as in honey-

FROM CURTIS, "BOTANICAL MAGAZINE," BY PERMISSION OF THE ROYAL HORTICULTURAL SOCIETY  
FLOWERING BRANCH OF GUELDER ROSE (*VIBURNUM OPULUS*) SHOWING THE STERILE OUTER FLOWERS WITH LARGE COROLLAS  
Attractive to insects which pollinate the fertile inner flowers with reduced corollas

suckle, or compound as in elder; they have usually no stipules. The flowers are regular as in *Viburnum* and *Sambucus*, more rarely two-lipped as in *Lonicera*; the sepals and petals are usually five in number and placed above the ovary, the five stamens are attached to the corolla-tube, there are three to five carpels, and the fruit is a berry as in honeysuckle or snowberry (*Symphoricarpos*), or a stone fruit, with several, usually three, stones, as in *Sambucus*.

In *Sambucus* and *Viburnum* the small white flowers are massed in heads; honey is secreted at the base of the styles and, the tube of the flower being very short, is exposed to the visits of flies and insects with short probosces. The flowers of *Lonicera*, which have a long tube, open in the evening, when they are sweet-scented and are visited by hawk-moths. The family contains about 300 species, chiefly natives of the north temperate zone and the mountains of the tropics. Several genera afford ornamental plants; such are *Lonicera*, erect shrubs or twiners with long-tubed white, yellow or red flowers; *Symphoricarpos*, a North American shrub, with small whitish pendulous flowers and white berries; *Diervilla* (also known as *Weigelia*), and *Viburnum*, including *V. Opulus*, guelder rose, in the cultivated forms of which the corolla has become enlarged at the expense of the essential organs and the flowers are neuter.

The family is more abundant in the eastern part of North America than in the western mountain region, the large genera being honeysuckle (*Lonicera*) and arrow-wood (*Viburnum*).

**CAPRIMULGIDAE:** see NIGHTJAR; NIGHTHAWK; WHIP-POOR-WILL.

**CAPRIVI DE CAPRERA DE MONTECUCOLI, GEORG LEO VON, COUNT** (1831-1899), German soldier and statesman, was born on Feb. 24, 1831, at Charlottenburg. The family springs from Carniola, and the name was originally written Kopriva; in the 18th century one branch settled in Wernigerode, and several members entered the Prussian service; the father of the chancellor held a high judicial post, and was made a life member of the Prussian House of Lords. Caprivi was educated in Berlin, and entered the army in 1849; he took part in the campaign of 1866, being attached to the staff of the I. Army. In 1870 he served as chief of staff to the X. Army Corps, which formed part of the II. Army, and took part in the battles before Metz as well as in those round Orleans, in which he highly distinguished himself. One of the most delicate strategical problems of the whole war was the question of whether to change the

direction of the X. Corps on the morning of the 16th of August before Vionville, and in this, as well as in the actual manoeuvres of the corps on that day, Caprivi, as representative of, and counsellor to, his chief, General v. Voigts-Rhetz, took a leading part. At the battle of Beaune-la-Rolande, the turning-point of the Orleans campaign, the X. Corps bore the brunt of the fighting. After the peace he held several important military offices, and in 1883 was made chief of the admiralty, in which post he had to command the fleet and to organize and represent the department in the Reichstag. He resigned in 1888, when the command was separated from the representation in parliament, and was appointed commander of the X. Army Corps. Bismarck had already referred to him as a possible successor to himself, for Caprivi had shown great administrative ability, and was unconnected with any political party, and in March 1890 he was appointed chancellor, Prussian minister president and foreign minister. He was quite unknown to the public, and the choice caused some surprise, but was fully justified. The chief events of his administration, which lasted for four years, are narrated elsewhere, in the article on Germany. He showed great ability in quickly mastering the business, with which he was hitherto quite unacquainted, as he himself acknowledged; his speeches in the Reichstag were admirably clear, dignified, and to the point. His first achievement was the conclusion in July 1890 of a general agreement with Great Britain regarding the spheres of influence of the two countries in Africa. Bismarck had supported the colonial parties in Germany in pretensions to which it was impossible for Great Britain to give her consent, and the relations between the two powers were in consequence somewhat strained. Caprivi adopted a conciliatory attitude, and succeeded in negotiating terms with Lord Salisbury which gave to Germany all she could reasonably expect. But the abandonment of an aggressive policy in the East Africa and Nigeria, and the withdrawal of German claims to Zanzibar (in exchange for Heligoland) aroused the hostility of the colonial parties, who bitterly attacked the new chancellor. Caprivi had, however, by making the frontiers of the Congo Free State and German East Africa meet, "cut" the Cape to Cairo connection of the British, an achievement which caused much dismay in British colonial circles, regular treaties having been obtained from native chiefs over large areas which the chancellor secured for Germany. In Nigeria also Caprivi by the 1890 agreement, and by another concluded in 1893, made an excellent bargain for his country, while in South-West Africa he obtained a long but narrow extension eastward to the Zambezi of the German protectorate (this strip of territory being known as "Caprivi's Finger"). In his African policy the chancellor proved far-sighted, and gained for the new protectorates a period for internal development and consolidation. The Anglo-German agreement of 1890 was followed by commercial treaties with Austria, Rumania, etc.; by concluding them he earned the express commendation of the emperor and the title of count, but he was from this time relentlessly attacked by the Agrarians, who made it a ground for their distrust that he was not himself a landed proprietor; and from this time he had to depend greatly on the support of the Liberals and other parties who had been formerly in opposition. The reorganization of the army caused a parliamentary crisis, but he carried it through successfully, only, however, to earn the enmity of the more old-fashioned soldiers, who would not forgive him for shortening the period of service. His position was seriously compromised by the failure in 1892 to carry an education bill, which he had defended by saying that the question at issue was Christianity or Atheism, and he resigned the presidency of the Prussian ministry, which was then given to Count Eulenburg. In 1894, a difference arose between Eulenburg and Caprivi concerning the bill for an amendment of the criminal code (the *Umsturz Vorlage*), and in October the emperor dismissed both. Caprivi's fall was probably the work of the Agrarians, but it was also due to the fact that, while he showed very high ability in conducting the business of the country, he made no attempt to secure his personal position by forming a party either in parliament or at court. He interpreted his position rather as a soldier; he did his duty, but did not think of defending himself. He suffered much from the attacks made on

him by the followers of Bismarck, and he was closely associated with the social ostracism of that statesman; we do not know, however, in regard either to this or to the other events of his administration, to what extent Caprivi was really the author of the policy he carried out, and to what extent he was obeying the orders of the emperor. With a loyalty which cannot be too highly praised, he always refused even after his abrupt dismissal, to justify himself, and he could not be persuaded even to write memoirs for later publication. The last years of his life were spent in absolute retirement, for he could not even return to the military duties which he had left with great reluctance at the orders of the emperor. He died unmarried on Feb. 6, 1899, at the age of 68,

BIBLIOGRAPHY.—R. Arndt, *Die Reden des Grafen v. Caprivi* (1894), with a biography; G. Gothein, *Reichskanzler Graf. Caprivi* (1918). (J. W. H.)

**CAPRONNIER, JEAN BAPTISTE** (1814–1891), Belgian stained-glass painter, was born in Brussels in 1814, and died there in 1891. He had much to do with the modern revival of glass-painting, and first made his reputation by his clever restorations of old examples. He carried out windows for churches in Brussels, Bruges, Amsterdam, and elsewhere, and his work was commissioned also for France, Italy, and England. At the Paris Exhibition of 1855 he won the only medal given for glass-painting.

**CAPSICUM**, a genus of plants, the fruits of which are used as peppers. As used in medicine, the ripe fruit of *Capsicum minimum* (or *frutescens*), containing the active principle capsaicin (capsacutin), has remarkable physiological properties. Applied to the skin or mucous membrane, it causes redness and later vesication. Internally in small doses it stimulates gastric secretions but if used in excess causes subacute gastritis. In single excessive doses it causes renal irritation and inflammation and strangury. Capsicum is valuable in atony of the stomach due to chronic alcoholism, in the flatulency of the aged, and in functional torpidity of the kidney. Externally capsicum plaster placed over the affected muscles is useful in rheumatism and lumbago. Capsicum wool, known as calorific wool, made by dissolving the oleoresin of capsicum in ether and pouring it on to absorbent cotton-wool, is useful in rheumatic affections.

**CAPSTAN.** An appliance used on board ship and on dock walls, for heaving-in or veering cables and hawsers, whether of chain, steel or hemp. It differs from a windlass, which is used for the same purposes, in having the axis on which the cable or rope is wound vertical instead of horizontal.

The earlier forms were of a comparatively simple character, made of wood with an iron spindle and worked by manual labour with wooden capstan bars. As heavier cables were supplied to ships, difficulty was found, when riding at anchor, in holding, checking and veering cable. A cable-holder (W. H. Harfield's) was tested in H.M.S. "Newcastle" (wooden frigate) in 1870 and proved effective; its first development in 1876 was the application in the form of a windlass secured to the deck, driven by a messenger chain from the capstan, fitted in H.M.S. "Inflexible." Modern warships are fitted with a capstan in the centre-line, which may be capable of taking a chain cable as well as a hawser; also a cable-holder for each bower cable, all power-worked. The sheet cable, which normally rides round a dummy cable-holder, can be brought to the centre-line capstan by means of rollers. (See ANCHOR.)

Well-known types of cable-holders, like Napier's and Harfield's, differ chiefly in mechanical details. The principle of each type is that there is a long vertical shaft connected at the bottom by worm gearing to the engine. On the forecastle, at the top of the shaft, is pivoted the cable-holder, which can either revolve freely, as when cable is running out, or be locked to the shaft for "heaving in." In the latest types the locking arrangement is a "dead" lock, in an earlier one it was frictional. In the newer type too, a frictional band-brake is fitted to control the cable when it is running out. In the older type the friction plates acted as a brake. Cable-holders are not fitted with hand gear, nor can they be used for hauling in a hawser. The centre-line capstan can be either connected to the engine or worked by hand. For the latter, long bars are shipped into recesses in the capstan head at equal inter-

vals to enable it to be "manned." The bars are kept in place by a rope "swifter" passed round their extreme ends. To prevent the capstan taking charge when weighing, pawls and pawl stops are brought into use.

In the latest types of capstan the whelps (projections to grip a hawser) are portable and ship over the sprockets, i.e. the part of the capstan fitted with "stops" or "snugs" to take chain cable.

CABLEHOLDERS AND CAPSTAN ON THE FORECASTLE OF A BATTLESHIP. The middle line capstan can be worked by hand by means of capstan bars, after being disconnected from the engine. Portable whelps can be shipped to bring to a hemp or wire hawser. The cableholders can only be used for chain cable.

In older types, the capstan was only fitted for winding in hawsers and could only be used to work cables by employing a hook-rope or "messenger."

Merchant ships are usually fitted with a windlass type of anchor gear having a horizontal axis. The two bower cables lead over the sprockets of a cable-holder at each end of the driving shaft; outboard of these, at the extremities, are drums for bringing to hawsers. The cable-holders are frictionally connected to the driving shaft on much the same principle as the vertical type in warships.

The machinery for driving capstans and cable-holders on board ship may be steam or electric. Power-capstans on dock sides are generally electric or hydraulic. The derivation of the term "capstan" is connected with the O.Fr. *capestan* or *cabestan*, from Lat. *capistrum* a halter, *capere* to take hold of. (E. A.)

**CAPSULE**, a term in botany for a dry seed vessel, as in the poppy, iris, foxglove, etc., with one or more cavities. When ripe the capsule opens and scatters the seed (see FRUIT). The word is used also for a small gelatinous case enclosing a dose of medicine, and for a metal cap or cover on bottles and jars. In anatomy the term is used to denote a cover or envelope partly or wholly surrounding a structure. Every diarthrodial joint possesses a fibrous or ligamentous capsule, lined with synovial membrane, attached to the adjacent ends of the articulating bones. The term is particularly applied to the sac which encloses the crystalline lens of the eye; to Glisson's capsule, a thin areolar coat of fibrous tissue lying inside the tunica serosa of the liver; to the glomerular capsules in the kidney substance; to the suprarenal capsules, two small flattened organs in the epigastric region; and to the internal and external capsules of the brain (q.v.).

**CAPTAIN**, in its general application refers to the leader, master, chief or person of similar status in any walk of life, as illustrated in Deut. i. 15—"So I took the *chief* of your tribes, wise men and known, and made them *heads* over you, *Captains* over thousands, and *Captains* over hundreds, and *Captains* over fifties and *Captains* over tens, and *officers* among your tribes." In the realm of sport the "Captain of the side" exists in all team games. "Captains of Industry" is also another common expression. The word is derived from Lat. *caput*, the head; Ger. *Hauptman*; Sp. *Capitán*; It. *Capitano*.

In its limited sense it applies to a definite rank of an officer in the fighting services. It is the oldest military rank extant and implied a far higher command before the 16th century than it does now. Even in the military sense a great commander of whatever rank is sometimes referred to as a "Great Captain." The mediæval rank of "captain-general" was equal to commander-in-chief and it persisted in that general sense to the 18th

century. In 1772 the Prince of Wales was appointed Captain-General of the Honourable Artillery Company. In the British service it still survives in one solitary instance, in that the official title of the Governor of Jamaica is "Captain-general and Governor-in-chief." In the Spanish Army it is the rank of an army corps commander.

Up to about the middle of the 18th century the field officers had companies, the executive command being vested in the three senior lieutenants, styled "captain-lieutenants," being the modern equivalent of "acting-captains."

The captain of a ship, whether naval or mercantile marine, is the officer in charge of the vessel, and all persons whether officers, crew or passengers are by virtue of their being embarked, subject to his commands in all matters affecting the safety of the vessel and the well-being of the community on board. In the British Navy, the principal war-ships are commanded by captains, or, as they used to be known, "Post Captains." Smaller ships may have commanders or lieutenant-commanders in command, and they would be known on board as "the captain," but this does not warrant their using the rank, nor is it correct so to address them in writing.

It is, however, an old custom in the British Navy, less prevalent to-day, to give commanders the courtesy title of captain, although, in fact, they are of a definitely junior rank. The equivalent rank of captain is also held by officers of the non-military branch, e.g., engineer-captain, surgeon-captain, paymaster-captain, but they should not be addressed simply as "captain" without the proper prefix to the rank. The equivalent ranks in the British Navy, Army and Air Force are Captain, R.N., Colonel, Group-Captain R.A.F. (T. J. E.)

**The United States.**—This rank is used in the U.S. army and navy, the navy rank of captain corresponding to the army rank of colonel. The appropriate command of a captain in the army is the company of infantry, the troop of cavalry and the battery of artillery all of which are tactical as well as administrative units. Army officers of this rank generally comprise the staff of regiments and assistants to the staff of the higher echelons.

The appropriate command of a captain in the navy is the capital ship, the light cruiser, the division of destroyers or the yard. Staff assignments, in general, include chief of staff of a battleship division, and assistant chief of staff of a battle fleet. The insignia for the army is two parallel silver bars worn on the shoulder strap of the uniform, and for the navy, four parallel rows of gold braid on the cuff of the blue uniform and on the shoulder strap of the white uniform.

**CAPTAIN OF INDUSTRY.** A term sometimes used as an alternative for entrepreneur; one who by bringing together land, capital and labour, and causing them to function, is so important an agent in modern production. (See ENTREPRENEUR.)

**CAPTAL**, a mediaeval feudal title in Gascony, best known in connection with the famous soldier Jean de Grailly Captal of Buch (died 1376), immortalized by Froissart as the confidant of the Black Prince and the champion of the English cause against France.

**CAPTION**, a term still used in law, especially Scots, for arrest or apprehension. The term also has an old legal use, to signify the part of an indictment or document, etc., which shows where, when, and by what authority it is taken, found or executed; so its opening or heading. From this is derived the modern sense of the heading of an article in a book or newspaper. In Scotland a process caption is a summary warrant for the incarceration of a party who has borrowed and refused to return, or who has withdrawn authority taken away, documents in the custody of the court.

**CAPTIVE:** see WAR, LAWS OF: *Prisoners of War*.

**CAPTURE AT SEA:** see BLOCKADE; CONTRABAND; NEUTRALITY; PRIZE; VISIT AND SEARCH.

**CAPUA**, the chief ancient city of Campania, and one of the most important towns of ancient Italy, situated 16 m. N. of Neapolis, on the north-east edge of the Campanian plain. Its site in a position not naturally defensible, together with the regularity of its plan, indicates that it is not a very ancient town, though it probably occupies the site of an early Oscan settlement. It was

founded about 600 B.C. The origin of the name is *Campus*, a plain, as the adjective *Campanus* shows. Etruscan supremacy in Campania ended with the Samnite invasion in the latter half of the 5th century B.C.; these conquerors, however, themselves became luxurious, and made alliance with Rome against the Samnite mountain tribes; the dependent communities Casilinum, Calatia, Atella shared in this and Campania fell under Roman supremacy about 340 B.C. (See CAMPANIA.) After the second Samnite War the Ager Falernus on the right bank of the Volturnus was distributed among citizens of Rome, the *tribus Falerna* being thus formed, and in 318 the powers of the native officials (*meddices*) were limited by the appointment of officials with the title *præfecti Capuam Cumas* (taking their name from the most important towns of Campania); these were at first mere deputies of the *prætor urbanus*, but after 123 B.C. were elected Roman magistrates, four in number; they governed the whole of Campania until the time of Augustus, when they were abolished.

**Roads to Rome.**—In 312 B.C. Capua was connected with Rome by the construction of the *Via Appia*, which left Rome by the *Porta Capena*. The *Via Latina* was perhaps prolonged to Casilinum when Capua fell under Roman supremacy, i.e., before the construction of the *Via Appia*. The importance of Capua increased steadily during the 3rd century, and at the beginning of the second Punic War it was considered to be only slightly behind Rome and Carthage themselves, and was able to furnish 30,000 infantry and 4,000 cavalry.

Until after the defeat of Cannae it remained faithful to Rome, but, after a vain demand that one of the consuls should always be selected from it, it transferred its allegiance to Hannibal, who made it his winter-quarters, with bad results to the moral of his troops (see PUNIC WARS). After a long siege it was taken by the Romans in 211 B.C., its magistrates and communal organization were abolished, the inhabitants losing their civic rights, and its territory became Roman state domain.

**Reorganization.**—Parts of it were sold in 205 and 199 B.C., another part was divided among the citizens of the new colonies of Volturnum and Linternum established near the coast in 194 B.C. Illegal encroachments by private persons had to be bought out in 162 B.C. and, after that period, it was let not to large but to small proprietors. Frequent attempts were made by the democratic leaders to divide the land among new settlers. The inhabitants of this thickly-populated district were grouped round important shrines, especially that of Diana Tifatina, in connection with which a *pagus Dianæ* existed on the west slope of the Mons Tifata. The town of Capua was entirely dependent on the *præfecti*. It produced spelt, wine, roses, spices, unguents, etc., and fine bronze objects. Its luxury remained proverbial; and Campania is especially spoken of as the home of gladiatorial combats. From the gladiatorial schools of Campania came Spartacus and his followers in 73 B.C. Julius Caesar as consul in 59 B.C. established a colony in connection with his agrarian law, and 20,000 Roman citizens were settled in this territory.

The number of colonists was increased by Mark Antony, Augustus (who constructed an aqueduct from the Mons Tifata, and gave the town of Capua estates in the district of Cnossus in Crete to the value of £120,000) and Nero. In the 4th century it was the seat of the *consularis Campaniæ* and its chief town, though Ausonius puts it behind Mediolanum (Milan) and Aquileia in his *ordo nobilium urbium*. Under Constantine a Christian church was founded in Capua.

**Destruction.**—In A.D. 456 it was taken and destroyed by Gaiseric, but must have been soon rebuilt; it was, however, finally destroyed by the Saracens in 840 and the church of S. Maria Maggiore, founded about 497, alone remained. It contains 52 ancient marble columns, but was modernized in 1766. The site was occupied in the late middle ages by a village which has, however, outgrown the mediaeval Capua in modern days.

**Remains.**—Important cemeteries have been discovered on all sides of it, the earliest of which go back to the 7th or 6th century B.C. The tombs are of various forms, partly chambers with frescoes on the walls, partly cubical blocks of peperino, hollowed out, with grooved lids. They contained vases of bronze with incised

designs of Etruscan style and of clay, some of Greek, some of local manufacture, and paintings. On the east of the town, a temple has Oscan votive inscriptions, some of them inscribed upon terra-cotta tablets, others on *cippi*, while of a group of 150 tufa statuettes (representing a matron holding one or more children in her lap) three bore Latin inscriptions of the early imperial period. The extreme length of the town from east to west is most accurately determined by the fact that the *Via Appia*, which runs from north-west to south-east from Casilinum to Calatia, turns due east very soon after passing the so-called Arco Campano (a triumphal arch of good brickwork, once faced with marble, with three openings), and continues to run in this direction for 5,413½ English feet (= 6,000 ancient Oscan feet). The west gate was the Porta Romana; remains of the east gate (the name of which we do not know) have been found. This fact shows that the main street of the town was perfectly orientated, and that before the *Via Appia* was constructed, i.e., in all probability in pre-Roman times. The width of the town from north to south cannot be so accurately determined, but the plan was almost certainly rectangular. There are remains of *thermae* on the north of the *Via Appia* and of a theatre opposite, on the south. The former consisted of a large *cryptoporticus* round three sides of a court, the south side being open to the road; it now lies under the prisons. The stage of the theatre had its back to the road. A fine subterranean Mithraeum has been found, in which the sacrifice of the bull is shown in painting and not (as usual) in sculpture. (*Notizie degli Scavi* [1924], 353.)

**Environs.**—Outside the town on the north is the amphitheatre, built in the time of Augustus, restored by Hadrian and dedicated by Antoninus Pius, as the inscription over the main entrance recorded. The exterior was formed by 80 Doric arcades of four storeys each, but only two arches now remain. The keystones were adorned with heads of divinities. The interior is better preserved; beneath the arena are subterranean passages like those in the amphitheatre at Puteoli. It is one of the largest in existence; the longer diameter is 185 yd., the shorter 152, and the arena measures 83 by 49 yd., the corresponding dimensions in the Colosseum at Rome being 205, 170, 93 and 58 yd. To the east are considerable remains of baths.

On the *Via Appia*, to the south-east of the east gate of the town, are two large and well-preserved Roman tombs. To the north is the Pagus Dianae; the site of the temple is occupied by the Benedictine church of S. Angelo in Formis (944), reconstructed by the abbot Desiderius (afterwards Pope Victor III.) of Monte Cassino in 1073, with interesting paintings (11th–12th cent.), forming a complete representation of all the chief episodes of the New Testament. Deposits of votive objects (*favissae*), removed from the ancient temple from time to time as new ones came in and occupied all the available space, have been found, and considerable remains of buildings belonging to the Vicus Dianae (among them a triumphal arch and some baths, also a hall with frescoes, representing the goddess herself ready for the chase) still exist.

The ancient road from Capua went on beyond the Vicus Dianae to the Volturnus (remains of the bridge still exist) and then turned east along the river valley to Caiatia and Telesia. Other roads ran to Puteoli and Cumae (the so-called *Via Campana*) and to Neapolis, and as we have seen the *Via Appia* passed through Capua, which was thus the most important road centre of Campania (q.v.). See Giacomo's well illustrated *Da Capua a Caserta* (Bergamo, 1924).

**CAPUA**, a town and archiepiscopal see of Campania, Italy, in the province of Caserta, 7m. W. by rail from the town of Caserta. Pop. (1921) 9,832 (town), 13,191 (commune). It was erected in 856 by Bishop Landulf on the site of Casilinum (q.v.) after the destruction of the ancient Capua by the Saracens in 840, but it only occupies the site of the original pre-Roman town on the left (south) bank of the river. The cathedral of S. Stefano, erected in 856 has a handsome atrium and a lofty Lombard campanile, and an interior (modernized) with three aisles; both it and the atrium have ancient granite columns. The Romanesque crypt, with ancient columns, has also been restored. In 1232–1240 Frederick II. erected a castle to guard the (still existing) Roman bridge

over the Volturno. This was demolished in 1557. The Museo Campano contains antiquities from the ancient Capua. Capua changed hands frequently during the middle ages. In 1501 it was attacked by Caesar Borgia. It remained a part of the kingdom of Naples until Nov. 2, 1860, when it surrendered to the Italians.

**CAPUANA, LUIGI** (1839–1915), Italian poet and critic, was born at Mines, Sicily, on May 27, 1839. His *Giacinta* (1879) may be said to be the earliest of the Italian realistic novels. He wrote many other novels which found a wide public in Italy. They deal with complicated psychological problems, the most famous being *Il Profumo* (1890) and the Sicilian story, which is generally accounted his masterpiece, *Il marchese di Roccaverdina* (1901). Of Agrippina Solmi in this novel Croce wrote: "The passion of that humble contadina is no more mere analysis; it is poetry." Capuana also wrote children's books, made a collection of Sicilian plays and produced some volumes of criticism. He died at Catania on Nov. 28, 1915.

See P. Vetro, *Luigi Capuana, La vita e le opere* (Catania, 1922).

**CAPUCHIN MONKEY**, a tropical American monkey, *Cebus capucinus*; the name is often extended to embrace all species of the same genus, whose range extends from Nicaragua to Paraguay. These monkeys are the typical representatives of the family *Cebidae*, and belong to a sub-family in which the tail is generally prehensile. From the other genera of that group (*Cebinae*) with prehensile tails capuchins are distinguished by the comparative shortness of that appendage, and the absence of a naked area on the under surface of its extremity. The hair is not woolly, the general build is rather stout, and the limbs are of moderate length and slenderness. The name capuchin is derived from the cowl-like form assumed by the thick hair on the crown. These monkeys go about in troops, frequenting the summits of tall forest-trees. In addition to fruits, they consume tender shoots and buds, insects, eggs and young birds. Many of the species are difficult to distinguish, and little is known of their habits in a wild state (see PRIMATES).

**CAPUCHINS**, an order of friars in the Roman Catholic Church, the chief and only permanent offshoot from the Franciscans. It arose about the year 1520, when Matteo di Bassi, an "Observant" Franciscan, became possessed of the idea that the habit worn by the Franciscans was not the one that St. Francis had worn; accordingly he made himself a pointed or pyramidal hood and also allowed his beard to grow and went about barefooted. His superiors tried to suppress these innovations, but in 1528 he obtained the sanction of Clement VII. and also the permission to live as a hermit and to go about everywhere preaching to the poor; and these permissions were not only for himself, but for all such as might join him in the attempt to restore the most literal observance possible of St. Francis's rule. Matteo was soon joined by others and a recognized order grew out of the movement, their hood (*capuche*) giving them their popular name. In 1529 they had four houses and held their first general chapter, at which their special rules were drawn up. The eremitical idea was abandoned, but the life was to be one of extreme austerity, simplicity and poverty—in all things as near an approach to St. Francis's idea as was practicable. The great external work was preaching and spiritual ministrations among the poor. In theology the Capuchins abandoned the later Franciscan school of Scotus, and returned to the earlier school of Bonaventura (q.v.). The new congregation at the outset underwent a series of misfortunes, of which the most disastrous was the secession of the third vicar, Bernardino Ochino (q.v.), who became a Calvinist, 1543, and married. This brought the whole congregation under suspicion of heretical tendencies and the pope resolved to suppress it; he was with difficulty induced to allow it to continue, but the Capuchins were forbidden to preach, a prohibition that lasted for two years. The congregation then began to multiply with extraordinary rapidity, and by the end of the 16th century the Capuchins had spread all over the Catholic parts of Europe, and in 1619 they were constituted into an independent order, with a general of their own. They were one of the chief factors in the Catholic Counter-reformation, working assiduously among the poor, preaching, catechizing, confessing in all parts, and impressing

the minds of the common people by the great poverty and austerity of their life. By these means they were also extraordinarily successful in making converts from Protestantism to Catholicism. Nor were their activities confined to Europe; from an early date they undertook missions to the heathen in America, Asia and Africa, and at the middle of the 17th century a Capuchin missionary college was founded in Rome for the purpose of preparing their subjects for foreign missions. A large number of Capuchins suffered martyrdom for the Gospel. This activity in Europe and elsewhere continued until the close of the 18th century.

Like all other orders, the Capuchins suffered severely from the secularizations and revolutions of the end of the 18th century and the first half of the 19th; but they survived the strain, and during the latter part of the 19th century rapidly recovered ground. They still keep up their missionary work and have some 200 missionary stations in all parts of the world—notably India, Abyssinia and the Turkish empire. Though "the poorest of all orders," it has attracted into its ranks an extraordinary number of the highest nobility and even of royalty. The celebrated Father Matthew, the apostle of Temperance in Ireland, was a Capuchin friar. Like the Franciscans the Capuchins wear a brown habit.

In order fully to grasp the meaning of the Capuchin reform, it is necessary to know the outlines of Franciscan history (see FRANCISCANS). References to the literature will be found in the article "Kapuzinerorden" in Wetzer und Welte, *Kirchenlexicon* (2nd ed.), which is the best general sketch on the subject. Shorter sketches, with the needful references, are given in Max Heimbucher, *Orden und Kongregationen* (1896), i. § 44, and in Herzog-Hauck, *Realencyclopädie* (3rd ed.), art. "Kapuziner," F. Cuthbert, art. "Capuchin Friars Minor" in the *Catholic Encyclopedia*. On their missions, see Spitz, art. "Missions (Christian, Roman Catholic)," in Hastings, *Encyclopedia of Religion and Ethics*, viii., pp. 713 ff.

**CAPULETS AND MONTAGUES**, the English forms of the Italian names Capelletti and Montecchi, made familiar through Shakespeare's tragedy of *Romeo and Juliet*. They represent two legendary noble families of Verona in the 14th century whose enmity rendered tragical the loves of their two children. The legend, which may have been of Eastern origin, finds a parallel in Ovid's story of Pyramus and Thisbe. Dante mentions the two lovers in his *Purgatorio*; Shakespeare seems to have owed his version to Arthur Broke (q.v.).

**CAPULIN MOUNTAIN NATIONAL MONUMENT**, a tract of about 680 ac. in the extreme north-west corner of New Mexico, U.S.A., set aside as a Government reservation in 1916. It is a region of extinct volcanoes, the principal one being Capulin mountain which is about  $1\frac{1}{2}$  m. in diameter at its base and rises 1,500 ft. above the plain. There are also numerous "plugs" or lava columns isolated by erosion from the softer rock which once surrounded them.

**CAPUS, ALFRED** (1858–1922), French author, was born at Aix, in Provence. He joined the staff of the *Figaro* in 1894. Among his plays are *Brignol et sa fille* (Vaudeville, Nov. 23, 1894); *Innocent* (1896), written with Alphonse Allais; *Petites Folles* (1897); *Rosine* (1897); *Mariage bourgeois* (1898); *Les Maris de Léontine* (1900); *Les Deux Écoles* (1902); *La Châtelaine* (1902); *L'Adversaire* (1903), with Emmanuel Arène, produced in London by Mr. George Alexander as *The Man of the Moment*, and *Notre Jeunesse* (1904), the first of his plays to be represented at the Théâtre Français; *Monsieur Piégois* (1905); *L'Attentat* (1906), in collaboration with Lucien Descaves; *L'Aventurier* (1910); *La Traversée* (1920).

See Édouard Quet, *Alfred Capus* (1904).

**CAPYBARA** or **CARPINCHO** (*Hydrochaerus capybara*), the largest living rodent characterized by its partially-webbed toes, of which there are four in front and three behind, hoof-like nails, sparse hair, short ears, cleft upper lip and the absence of a tail (see RODENTIA). Capybaras are aquatic rodents, frequenting the banks of lakes and rivers in South America from Guiana to the river Plate. They associate in herds, and spend most of the day in covert on the banks, feeding in the evening and morning. They swim and dive with expertness, often remaining below the surface for several minutes. Their food consists of water-plants and bark, but in cultivated districts they do much harm to crops.

Their cry is a low, abrupt grunt. From five to eight is the usual number in a litter, of which there appears to be only one in the year. Extinct species of capybara occur in the Tertiary deposits of Argentina, some considerably larger than the living form. Capybaras belong to the family *Caviidae*. When full-grown the length of the animal is about 4 ft., and the girth 3 ft.

**CAR**, a term originally applied to a small two-wheeled vehicle for transport (see CARRIAGE), but also to almost anything in the nature of a carriage, chariot, etc., and to the carrying part of a balloon. With some specific qualification (tram-car, street-car, railway-car, sleeping-car, motor-car, etc.) it is combined to serve as a general word instead of carriage or vehicle. It has also passed into use in aeronautics.

From Ireland comes the "jaunting-car," which is in general use, both in the towns, where it is the commonest public carriage for hire, and in the country districts, where it is employed to carry the mails and for the use of tourists. The gentry and more well-to-do farmers also use it as a private carriage in all parts of Ireland. The genuine Irish jaunting-car is a two-wheeled vehicle constructed to carry four persons besides the driver. In the centre, at right angles to the axle, is a "well" about 18 in. deep, used for carrying parcels or small luggage, and covered with a lid which is usually furnished with a cushion. The "well" provides a low back to each of the two seats, which are in the form of wings placed over each wheel with foot boards hanging outside the wheel on hinges, so that when not in use they can be turned up over the seats, thus reducing the width of the car (sometimes very necessary in the narrow country roads) and protecting the seats from the weather. The passengers on each side sit with their backs to each other, with the "well" between them. The driver sits on a movable box-seat, or "dicky," a few inches high, placed across the head of the "well," with a footboard to which there is usually no splash-board attached.

A more modern form of jaunting-car, known as a "long car," chiefly used for tourists, is a four-wheeled vehicle constructed on the same plan which accommodates as many as eight or ten passengers on each side, and two in addition on a high box-seat beside the driver. In the city of Cork a carriage known as an "inside car" is in common use. It is a two-wheeled covered carriage in which the passengers sit face to face as in a wagonette. In remote country districts the poorer peasants still sometimes use a primitive form of vehicle, called a "low-backed car," a simple square shallow box or shelf of wood fastened to an axle without springs. The two wheels are solid wooden disks of the rudest construction, generally without the protection of metal tires, and so small in diameter that the body of the car is raised only a few inches from the ground.

**CARABINIERS**, originally 16th century light cavalry armed with "large pistols called carabins having barrels 3 ft. long." English carabiniers are mentioned as early as 1597 at the battle of Turnhout under Sir Francis Vere. The early practice in England and France was to attach a proportion of men armed with carabins to each regiment and it was not until the 17th century that regiments of carabiniers were formed. The original duties of carabiniers were analogous to those of grenadiers of the infantry, in fact they were mounted infantry. In 1660 the life guards were equipped with carabins (or carbines) whilst the other cavalry regiments had swords and pistols until 1678. As a reward for its services in Ireland in 1692 William III. designated the Ninth Horse "The Carabiniers" (later the 6th Dragoon Guards, or The Carabiniers), and although the term "carabiniers" was more common in France than in England it was not until 1693 that Louis XIV. constituted his companies of carabiniers into a corps with the distinct title of Royal Carabiniers. He had, however, regimented them for tactical purposes at Neerwinden in that year. In the old German army there was one Carabinier regiment, viz., the 2nd Saxon Reiter Regiment, but since the inauguration of the reichswehr in 1921 this regiment is "traditionally represented" by a squadron of the present 12th (Saxon) cavalry regiment. In Italy the gendarmerie are called *carabinieri*.

**CARABOBO**, next to the smallest of the 20 States of Venezuela, bounded north by the Caribbean Sea, east by the State of

Aragua, south by Cojedes and west by Lara. Its area is 2,985 sq.m., and its population (1926 official estimate) was 147,204. The greater part of its surface is mountainous with moderately elevated valleys of great fertility and productiveness, but south of the cordillera there are extensive grassy plains conterminous with those of Guárico and Cojedes, on which large herds of cattle are pastured. The principal products of the State are cattle, hides and cheese from the southern plains, coffee and cereals from the higher valleys, sugar and *aguardiente* from the lower valleys about Lake Valencia, and cacao, coco-nuts and coco-nut fibre from the coast. Various minerals are also found in its south-west districts. The capital is Valencia, and its principal towns are Puerto Cabello (pop. about 15,000) with the best harbour in the country; Montalbán (pop. about 9,000), 30m. W.S.W. of Valencia; and Ocumare (pop. about 3,000), near the coast 18½m. E. of Puerto Cabello, celebrated for the fine quality of its cacao. Carabobo is best known for the battle fought on June 24, 1821, on a plain at the southern exit from the passes through the cordillera in this State, between the revolutionists under Bolívar and the Spanish forces under La Torre. It was one of the four important battles of the war, though the forces engaged were only a part of the two armies and numbered 2,400 revolutionists (composed of 1,500 mounted *llaneros* known as the "Apure legion," and 900 British), and 3,000 Spaniards. The day was won by the British, who drove the Spaniards from the field at the point of the bayonet, although at a terrible loss of life. The British legion was afterwards acclaimed by Bolívar as "*Salvadores de mi Patria*." The Spanish forces continued the war until near the end of 1823, but their operations were restricted to the districts on the coast.

**CARACAL**, the capital of the department of Romanatzi, Rumania, between the Jiu and Oet rivers. Pop. c. 16,000. The town is named after the Roman Emperor Caracalla and the ruins of his tower, built A.D. 217 are still to be seen. The only trade is in grain.

**CARACAL** (*Lynx caracal*), sometimes called Persian lynx, an animal widely distributed throughout south-western Asia and a large portion of Africa. It is somewhat larger than a fox, uniform reddish brown above, and whitish beneath, with two white spots above each of the eyes, and a tuft of long black hair at the tip of the ears. It dwells among grass and bushes. Its prey consists of gazelles, small deer, hares and peafowl and other birds. The caracal is easily tamed and in some parts of India is trained to capture small antelopes, deer and large birds.

**CARACALLA** (or **CARACALLUS**), **MARCUS AURELIUS ANTONINUS** (186-217), Roman emperor, eldest son of the emperor Septimius Severus, was born at Lugdunum (Lyons) on April 4 186. His original name was Bassianus; his nickname Caracalla was derived from the long Gallic tunic which he wore. After the death of Severus (211) at Eboracum (York) in Britain, Caracalla and his brother Geta, who had accompanied their father, returned to Rome as co-emperors. In order to secure the sole power Caracalla murdered his brother (212) and afterwards put to death some 20,000 of Geta's supporters, amongst them the jurist Papinianus. In the same year he bestowed Roman citizenship on all free inhabitants of the empire, the object being partly to increase the yield from the inheritance-tax, to which only Roman citizens were liable. His own extravagances and the demands of the soldiery were a perpetual drain upon his resources. In 213 he defeated the Alamanni who had broken through the Raetian lines; in 214, after a few months spent in Rome, he went to the Danube. After wintering in Asia, he crossed, in 215, to Alexandria, where in revenge for some disrespect shown him he ordered a general massacre. In 216 he ravaged Mesopotamia. He spent the winter at Edessa, and in 217, when he recommenced his campaign, he was murdered at Carrhae on April 8, at the instigation of Opellius (Opilius) Macrinus, praefect of the praetorian guard, who succeeded him. The most famous of the buildings with which Caracalla adorned Rome are the baths and the triumphal arch of Septimius Severus in the forum.

See Dio Cassius, lxxvii., lxxviii.; Herodian, iii. 10, iv. 14; Lives of Caracalla, Severus and Geta, in *Scriptores Historiae Augustae*; Eutro-

pius, viii. 19-22; Aurelius Victor, *De Caesaribus*, 20-23; *Epit.* 20-23; Zosimus i. 9-10; H. Schiller, *Geschichte der römischen Kaiserzeit* (1883), 738 ff.; Pauly-Wissowa, *Realencyklopädie*, ii. 2,434 ff. (von Rohden). See also Gibbon, *Decline and Fall of the Roman Empire*, chap. vi.

**CARACARA**, the name given to three American genera of the family *Falconidae*. Also called carrion-hawks, the caracaras are recognized by their long legs and the brightly coloured naked skin of the cheeks and throat. They are gregarious and feed largely on carrion, birds, reptiles and amphibians. The Audubon caracara (*Polyborus cheriway*) is resident in Florida, Texas, Arizona, Lower California and also in South America.

**CARÁCAS**, the principal city and the capital of the United States of Venezuela, situated at the western extremity of an elevated valley of the Venezuelan Coast range known as the plain of Chacao, 6½m. S.S.E. of La Guaira, its port on the Caribbean coast, in lat. 10° 30' N., long. 67° 4' W. The plain is covered with well-cultivated plantations. The Guaira river, a branch of the Tuy, traverses it from west to east, and flows past the city on the south. Among its many small tributaries are the Catuche, Caroata and Anauco, which flow down through the city from the north and give it a natural surface drainage. The city is built at the narrow end of the valley and at the foot of the Cerro de Avila, its topographical centre, the elevation of the Plaza de Bolívar being 3,025 feet. Two miles north-east is the famous Silla de Carácas, whose twin summits, like a gigantic old-fashioned saddle (*silla*), rise to an elevation of 8,622ft.; and the Naiguaté, still farther eastward, overlooks the valley from a height of 9,186 feet. The climate of Carácas is subject to extreme and rapid variations in temperature, to alternations of dry and humid winds, to chilling night mists brought up from the coast by the westerly winds, and to other influences productive of malaria, catarrh, fevers, bilious disorders and rheumatism. The maximum and minimum temperatures range from 84° to 48° F, the annual mean being about 66°, and the daily variation is often as much as 15°. The city is built with its streets running between the cardinal points of the compass. Two intersecting central streets also divide the city into four sections, in each of which the streets are methodically named and numbered, as North 3rd, or West 2nd, etc., according to direction and location. This method of numeration dates from the time of Guzmán Blanco, but the common people adhere to the names bestowed upon the city squares in earlier times. There are

BY COURTESY OF THOMAS LEE

MODERN HOME OF AN UPPER CLASS FAMILY IN CARACAS

several handsome squares and public gardens, adorned with statues, trees and shrubbery. The principal square is the Plaza de Bolívar, the conventional centre of the city, in which stands a bronze equestrian statue of Bolívar, and on which face the cathedral, archbishop's residence, Casa Amarilla, the national library, general post office and other public offices. The Independencia park, formerly called Calvario park, which occupies a hill on the west side of the city, is the largest and most attractive of the public gardens. On the outskirts there is the famous "Paraiso" drive. Among the public edifices are the capitol, which occupies a

whole square, the university, the cathedral, pantheon, masonic temple, national library, and a number of large churches. The city is generously provided with all the modern public services. The principal water supply is derived from the Macarao river, 15m. distant. Railway connection with the port of La Guaira was opened in 1883 by means of a line 23m. long. Another line (the Gran Ferrocarril de Venezuela) passes through the mountains to

WEATHER GRAPH OF CARACAS. THE THERMOMETER INDICATES THE ANNUAL MEAN TEMPERATURE. THE CURVE SHOWS THE MONTHLY MEAN TEMPERATURE AND THE COLUMNS INDICATE THE NORMAL MONTHLY AMOUNT OF PRECIPITATION

Valencia, 111m. distant, and two short lines run to neighbouring villages. The archbishop of Venezuela resides in Carácas and has ecclesiastical jurisdiction over the dioceses of Ciudad Bolívar, Calabozo, Barquisimeto, Mérida, Maracaibo, Valencia, Coro, Cumaná and San Cristóbal. There are now some manufactures of note.

Carácas was founded in 1567 by Diego de Losada under the pious title of Santiago de León de Carácas, and has been successively capital of the province of Carácas, of the captaincy-general of Carácas and Venezuela, and of the republic of Venezuela. It is also one of the two chief cities, or capitals, of the Federal district. It was the birthplace of Simón Bolívar, and claims the distinction of being the first colony in South America to overthrow Spanish colonial authority. The city was almost entirely destroyed by the great earthquake of 1812. In the war of independence it was repeatedly subjected to pillage and slaughter by both parties in the strife, and did not recover its losses for many years. In 1810 its population was estimated at 50,000; 71 years later the census of 1881 gave it only 55,638, but in 1926 the population had risen to 135,253.

**CARACCILO, FRANCESCO**, PRINCE (1732-1799), Neapolitan admiral and revolutionary, was born on Jan. 18, 1732. He learnt his seamanship under Rodney, and fought with distinction in the British service in the American War of Independence, against the Barbary pirates, and against the French at Toulon. He was the only prominent Neapolitan trusted by King Ferdinand IV., and he remained loyal to the king until the latter's cowardly flight. In Jan. 1799 Caracciolo returned to Naples, where he found himself welcomed with great enthusiasm, and the city seething with revolution. He assumed command of the new Republic's naval forces and fought against the British and Neapolitan squadrons. Finally he found himself surrounded by the British fleet at sea while on land Cardinal Ruffo's army made resistance useless. In trying to escape in disguise, Caracciolo was arrested and brought in chains on board Nelson's flagship. There he was summarily tried and sentenced to death; the sentence being immediately executed by his being hanged from the yard-arm of the "Minerva" on June 30, 1799. The whole trial and execution were indefensible, alike on the grounds of legality and naval usage, and are to be ascribed to personal spite on the part of Queen Maria Carolina working through the influence of Lady Hamilton over Nelson.

**BIBLIOGRAPHY.**—R. Kossmann, *Lord Nelson und der Herzog Franz Caraccioli* (1895), in R. L. C. Virchow and F. von Holtzendorf-Vietmamsdorf, *Sammlung gemeinverständlicher wissenschaftlicher Vorträge*, vol. 224 (1887, etc.); F. Lemmi, *Nelson e Caraccioli e la Repubblica napoletana* in the Reale Istituto di Studi Superiori, *Pubblicazioni Sezione di filosofia* No. 35 (Florence, 1898); C. Giglioli, *Naples in 1799* (1903); *Nelson and the Neapolitan Jacobins* (ed. by H. C. Gutteridge, 1903), in the Navy Record Society *Publications*, vol. 25 (1894, etc.), containing all the documents on the episode, including those incorrectly transcribed by A. Dumas in his *Borboni di Napoli* (Naples, 1862-63), and bibliography.

**CARACOLE**, a French word, meaning the wheeling about of a horse (*cf.* Span. *caracol*, a snail). In horsemanship a half-turn to the left or right, or to both alternately, so as to describe a zigzag course; the term is loosely used to describe any display of fancy riding. In architecture, a spiral staircase in a tower.

**CARACTACUS** or (better) **CARATACUS**, the Latin form of the Celtic Caradoc (fl. A.D. 50), British chieftain of the tribe of Catuvellauni, a son of Cunobelinus, king of the Trinobantes. He led the native resistance against Aulus Plautus (A.D. 43-47), and after being defeated, probably at Wallingford, and afterwards at Colchester, he withdrew into South Wales. He was finally defeated by Ostorius Scapula in A.D. 50, somewhere in Shropshire, perhaps at Caer Caradock, where there are remains of an old camp. Caractacus and his family were captured and taken to Rome, where the Emperor Claudius granted them life.

See Tac. *Ann.* xii, 31, 37, *Hist.* 3, 45; Dio Cassius, lx., 19-22; E. Guest, *Origines Celticae* (1883).

**CARAGIALI, IOAN** (1852-1912), Rumanian dramatist and novelist, was born on Jan. 29, 1852, at Ploiesti. In his comedies, *The Stormy Night* (1880) and *The Lost Letter* (1885), he satirized the effects on Rumanian society of too hasty an introduction of western customs, and the pretensions of the bourgeois classes in Rumania at that time. He also wrote some powerful short stories, notably *The Easter Torch* (1890), and *The Sin* (1892). His *Momenta* were collected in 1900 and his plays in 1907. He died on June 22, 1912, in Berlin.

**CARALEs**, the most important ancient city of Sardinia, situated on the south coast (Gr. *Káραλις*, mod. *Cagliari*, *q.v.*). It is attributed to the Carthaginians, and Punic tombs exist in considerable numbers near the present cemetery on the east, and still more on the rocky plateau to the north-west of the town. They are hewn perpendicularly in the rock, while the Roman tombs are excavated horizontally (Taramelli in *Monumenti dei Lincei*, XXI.). It first appears in Roman history in the Second Punic War, and probably obtained full Roman civic rights from Julius Caesar. In imperial times it was the most important town in the island, mainly owing to its fine sheltered harbour, where a detachment of the *classis Misennensis* (the fleet of Misenum) was stationed. In the 4th and 5th centuries it was probably the seat of the governor (*praeses Sardiniae*). It is mentioned as an important harbour in the Gothic and Gildonic wars. It was also the chief point of the road system of Sardinia. Roads ran hence to Olbia by the east coast, and through the centre of the island, to Othoca (Oristano) direct, and thence to Olbia (probably the most frequented route), through the mining district to Sulci and along the south and west coasts to Othoca. The site of the mediaeval town with its Pisan fortifications must have been the Carthaginian acropolis; such a site could not have been neglected. The Romans, too, probably made use of it, though the lower quarters were mainly occupied in imperial times. The nucleus of the Roman *municipium* is probably represented by the present quarter of the Marina, in which the streets intersect at right angles and Roman remains are often found. An inscription found some way to the north towards the amphitheatre speaks of paving in the squares and streets, and of drains constructed under Domitian in A.D. 83. The amphitheatre in a natural depression of the rock just below the acropolis, opens towards the sea with a fine view. Its axes are 95½ and 79 yards, and it is in the main cut in the rock, though parts are concrete. Below it, to the south, are considerable remains of ancient reservoirs for rain-water, upon which the city entirely depended. Not far from the shore are remains of Roman baths, with a fine coloured mosaic pavement. To the east was the necropolis of

Bonaria, with both Punic and Roman tombs, and, on the site of the present cemetery, Christian catacombs. But the western quarter seems to have been far more important; it extended along the lagoon of S. Gilla (to the north-west of the town, which until the middle ages was an open bay) and on the lower slopes of the hill which rises above it. A large Roman house (or group of houses) is still visible. Beyond this quarter begins an extensive Roman necropolis. It is probable that the acropolis of Carales was occupied even in prehistoric times; but more abundant traces of prehistoric settlements have been found on the Capo S. Elia to the south-east of the modern town. An inscription records the existence of a temple of Venus Erycina on this promontory in Roman times. The museum contains an interesting collection of objects from many of the sites mentioned, and also from other parts of the island; it is in fact the most important in Sardinia, especially for its prehistoric bronzes (*see* SARDINIA).

**CARAN D'ACHE**, the pseudonym (meaning "lead-pencil") of Emmanuel Poiré (1858–1909), caricaturist and illustrator, who was born and educated at Moscow, being the grandson of one of Napoleon's officers who had settled in Russia. He determined to be a military painter, and when he arrived in Paris from Russia was advised by Detaille. He served five years in the army, where the principal work allotted to him was the drawing of uniforms for the Ministry of War. He drew for *La Vie militaire* a series of illustrations, among them being some good-tempered caricatures of the German army. His special gift lay in pictorial anecdote, the story being represented at its different stages with irresistible effect, in the artist's own mannered simplicity. Much of his work was contributed to *La Vie Parisienne*, *Le Figaro Illustré*, *La Caricature*, *Le Chat Noir*, and he also issued various albums of sketches, the *Carnet de chèques* (1893), illustrating the Panama scandals, *Album de croquis militaires et d'histoire sans légendes* (1890), *Histoire de Marlborough* (1897), etc., besides illustrating a good many books, notably the *Prince Kozakoff* of Bernadaky. He died on Feb. 26, 1909.

**CARAPACE**, the upper shell of a crustacean or tortoise.

**CARAPEGUA**, an interior town of Paraguay, 37m. south-east of Asunción on the old route between that city and the missions. The estimated population is 15,000 (probably the population of the large rural district about the town is included in this estimate). The town (founded in 1725) is situated in a fertile country producing cotton, tobacco, Indian corn, and sugar-cane.

**CARAT**, a unit of weight for diamonds, other gems, and pearls; it also indicates the purity or fineness of precious metals. Originally grains or leguminous seeds were used for the weighing of precious stones and as these were not of uniform size or weight the carat in different gem centres varied considerably. Thus, the London market has for many years used a carat equal to 0.2053 grams (3.163 troy grains); in Florence it was 0.1972 grams; in Amsterdam 0.2057 grams, and so on. After various attempts to simplify and standardize the carat, the metric carat of 0.200 grams, or 200 milligrams, was adopted in the United States in 1913, and is now standard in the principal countries of the world except England. The metric carat permits the weight of gems to be expressed conveniently in decimals, whereas formerly it was customary to use a clumsy series of fractions, such as  $\frac{1}{2}$ ,  $\frac{1}{4}$ ,  $\frac{3}{8}$ ,  $\frac{1}{16}$ ,  $\frac{1}{32}$ , and  $\frac{1}{64}$  of a carat.

When the term carat is used to indicate the purity or fineness of metals it means  $\frac{1}{24}$ th part. Thus, 18-carat gold consists of eighteen parts of gold and six parts of alloy. *See* Kraus and Holden, *Gems and Gem Materials*.

**CARAUSIUS, MARCUS AURELIUS**, tyrant or usurper in Britain, A.D. 286–293, was a Menapien from Belgic Gaul, a man of humble origin. In the Roman army he rapidly obtained promotion and was stationed by the emperor Maximian at Gessoriacum (Bononia, *Boulogne*) to ward off Frankish and Saxon pirates. On being accused of partnership with the barbarians he was sentenced to death by the emperor, but he escaped to Britain and proclaimed himself an independent ruler. In 289 Maximian attempted to recover the island, but his fleet was

damaged by a storm and he was compelled to acknowledge the rule of Carausius in Britain. Numerous coins are extant bearing the heads of Carausius, Diocletian and Maximian, and the legend "Carausius et fratres sui." In 292 Constantius Chlorus captured Gessoriacum (hitherto in possession of Carausius) and then made preparations to reconquer Britain, but before they were completed Carausius was murdered by Allectus, his praefect of the guards (Aurelius Victor, *Caesares*, 39; Eutropius ix. 21, 22; Eumenius, *Panegyrici* ii. 12, v.12).

*See* J. Watts de Peyster, *The History of Carausius, the Dutch Augustus* (1858); P. H. Webb, *The Reign and Coinage of Carausius* (1908).

**CARAVACA**, a town of south-eastern Spain, in the province of Murcia, near the left bank of the river Argos, a tributary of the Segura. Pop. (1920) 18,753. Caravaca is dominated by the mediaeval castle of Santa Cruz, the 17th century chapel which has a miraculous cross celebrated for its healing power, in honour of which a yearly festival is held on May 3. The hills to the north are rich in copper, marble and iron. Though over 15m. from the nearest railway station, Calasparra, the town is a considerable industrial centre, with large iron-works, tanneries and cloth, paper, oil and chocolate factories.

**CARAVAGGIO, MICHELANGELO AMERIGHI** (or MERIGI) **DA** (1569–1609), Italian painter, the son of a mason, was born in the village of Caravaggio, in Lombardy, from which he received his name. He painted portraits for about five years at Milan, and then went to Venice and to Rome, where he produced his first picture of note, "The Card Players." He despised every sort of idealism, became the head of the Naturalisti (unmodified imitators of ordinary nature) in painting, and adopted a style of potent contrasts of light and shadow, laid on with a sort of fury. At the close of a stormy life he fled to Malta and Sicily and died of fever on the beach at Pontercole in 1609. His best pictures are the "Entombment of Christ," now in the Vatican; "St. Sebastian," in the Roman Capitol; a magnificent whole-length portrait of a grand-master of the Knights of Malta, Alof de Vignacourt, and his page, in the Louvre; and the Borghese "Supper at Emmaus."

**CARAVAGGIO, POLIDORO CALDARA DA** (1495 or 1492–1543), a celebrated painter of frieze and other decorations in the Vatican. Polidoro's works, as well as those of his master, Maturino of Florence, have mostly perished, but are well known by the fine etchings of P. S. Bartoli, C. Alberti, etc. On the sack of Rome by the army of the Constable de Bourbon in 1527, Polidoro fled to Naples. Thence he went to Messina. He was murdered by an assistant, Tonno Calabrese, in 1543. Two of his principal paintings are a Crucifixion, painted in Messina, and "Christ bearing the Cross" in the Naples gallery.

**CARAVAN**, a word of Persian origin (more correctly *Karawan*), adopted into the later Arabic vocabulary. (1) A covered cart, drawn by horse or motor power, used for living purposes, chiefly by gypsies and holiday makers. (2) A body of traders travelling together for greater security against robbers (and in particular against Bedouins, Kurds, Tatars and the like, whose grazing grounds the proposed route may traverse) and for mutual assistance in the matter of provisions, water and so forth. In Arabia proper the name caravan is rarely employed in speech and never in writing, strictly Arabic words such as *Rikb* ("assembled riders") or *Qāfi'a* ("wayfaring band") being in ordinary use.

The precautions of the caravan are due to the absence of settled government, inns and roads. Strings of camels are generally employed for the transport of heavy goods, especially where the track, like that between Damascus and Baghdad, for example, lies across level, sandy and arid districts. The camels are harnessed in strings of 50 or more at a time, a hair-rope connecting the rear of one beast with the head of another; the leader is gaily decorated with parti-coloured trappings, tassels and bells; an unladen ass precedes the file, for guidance.

Where the route is rocky and steep, as between Damascus and Aleppo, mules, or even asses, are used for burdens. The wealthier members ride, where possible, on horseback. Every man carries arms; but these are in truth more for show than for use, and are commonly flung away in the presence of any serious robber attack.

Should greater peril than usual be anticipated, the protection of a company of soldiers is habitually pre-engaged,—an expensive, and ordinarily a useless adjunct. A leader or director, called *Karawan-Bashi* (headman), or, out of compliment, *Karawan-Seraskier* (general), but most often simply *Raïs* (chief), is before starting appointed by common consent. His duties are those of general manager, spokesman, arbitrator and so forth; his re-

MERCHANT CARAVAN CROSSING THE DESERT WASTES OF CENTRAL ASIA

muneration is indefinite. But in the matter of sales or purchases, either on the way or at the destination, each member of the caravan acts for himself. The number of camels or mules in a single caravan varies from 40 or so up to 600 and more; sometimes, as on the reopening of a long-closed route, it reaches 1,000.

**Caravan Seasons.**—The ordinary caravan seasons are the months of spring, early summer and later autumn. Friday, in accordance with a recommendation made in the Koran itself, is the favourite day for setting out, the most auspicious hour being that immediately following noonday prayer. The first day's march never does more than just clear the starting-point. Subsequently each day's route is divided into two stages,—from 3 or 4 A.M. to about 10 in the forenoon, and from between 2 and 3 P.M. till 6 or even 8 in the evening. Thus the time passed daily on the road averages from 10 to 12 hours, and, as the ordinary pace of a laden camel does not exceed 2m. an hour, that of a mule being  $2\frac{1}{2}$ , a distance varying from 23 to 28m. is covered every marching day. But prolonged halts of two, three, four and even more days often occur. The hours of halt, start and movement, the precise lines of route, and the selection or avoidance of particular localities are determined by common consent. But if, as sometimes happens, the services of a professional guide, or those of a military officer have been engaged, his decisions are final. While the caravan is on its way, the five stated daily prayers are, within certain limits, anticipated, deferred or curtailed, so as the better to coincide with the regular and necessary halts,—a practice authorized by orthodox Mohammedan custom and tradition.

Two caravans are mentioned in Genesis xxxvii.; the route on which they were passing seems to have coincided with that nowadays travelled by Syrian caravans on their way to Egypt. Allusions to caravans may be found in Job, in Isaiah and the Psalms.

**Pilgrims to Mecca.**—The yearly pilgrim-bands, bound from various quarters of the Mohammedan world to their common destination, Mecca, are sometimes, but inaccurately, styled by European writers caravans; their proper designation is *Hajj*, a collective word for pilgrimages and pilgrims. The two principal pilgrim-caravans start yearly, the one from Damascus, or, to

speak more exactly, from Mozarib, a village station three days' journey to the south of the Syrian capital, the other from Cairo in Egypt. This latter was formerly joined on its route, near Akaba of the Red Sea, by the North African Hajj, which, however, now goes from Egypt by sea from Suez; the former gathers up bands from Anatolia, Kurdistan, Mesopotamia and Syria. Since 1908, the Syrian and Egyptian Hajj have been able to travel by the railway from Damascus to the Hejāz. Besides these a third, but smaller, Hajj of Persians, chiefly sets out from Suk-esh-Sheikh, in the neighbourhood of Meshed Ali, on the lower Euphrates; a fourth of negroes, Nubians, etc. unites at Yambu on the Hejāz coast, whither they have crossed from Kosseir in Upper Egypt; a fifth, of Indians and Malays, centres at Jidda; a sixth and seventh of southern or eastern Arabs arrive, the former from Yemen, the latter from Nejd.

The Syrian Hajj is headed by the pasha of Damascus either in person or by a vicarious official of high rank, and is further accompanied by the *Sorrah Amir* or "Guardian of the Purse," a Turkish officer from Constantinople. The Egyptian company is commanded by an amir or ruler, appointed by the Cairene government, and is accompanied by the famous "Mahmal," or sacred pavilion. The other bands above mentioned have each their own amir, besides their *mekowwams* or agents, whose business it is to see after provisions, water and the like, and are not seldom encumbered with a numerous retinue of servants and other attendants. Lastly, a considerable force of soldiery accompanies both the Syrian and the Egyptian Hajj.

**Bedouins and Pilgrims.**—No guides properly so-called attend these pilgrim-caravans, the routes followed being invariably the same, and well known. But Bedouin bands generally offer themselves by way of escort, and not seldom designedly lead their clients into the dangers from which they bargain to keep them safe. This they are the readier to do because, in addition to the personal luxuries with which many of the pilgrims provide themselves for the journey, a large amount of wealth, both in merchandise and coins, is habitually to be found among the travellers, who, in accordance with Mohammedan tradition, consider it not merely lawful but praiseworthy to unite mercantile speculation with religious duty. Nor has any one, the pasha himself or the amir and the military, when present, excepted, any acknowledged authority or general control in the pilgrim-caravans; nor is there any orderly subdivision of management or service. The pilgrims do, indeed, often coalesce in companies among themselves for mutual help, but necessity, circumstance or caprice governs all details, and thus it happens that numbers, sometimes as many as a third of the entire Hajj, yearly perish by their own negligence or by misfortune,—dying, some of thirst, others of fatigue and sickness, others at the hand of robbers on the way.

The numbers which compose these pilgrim caravans are much exaggerated by popular rumour; yet it is certain that the Syrian and Egyptian sometimes amount to 5,000 each, with 25,000 or 30,000 camels in train. Large supplies of food and water have to be carried, the more so at times when the pilgrim season, following as it does the Mohammedan calendar, which is lunar, falls for years together in the very hottest season. Hence, too, the journey is usually accomplished by night marches, the hours being from 3 to 4 P.M. to 6 or 7 A.M. of the following day. Torches are lighted on the road, the pace is slower than that of an ordinary caravan, and does not exceed 2m. an hour.

See MECCA and MOHAMMEDAN RELIGION.

**CARAVANSERAI.** A public building, for the shelter of a caravan (*q.v.*) and of wayfarers generally in Asiatic Turkey. It is commonly constructed in the neighbourhood, but not within the walls, of a town or village. It is quadrangular in form, with a dead wall outside; this wall has small windows high up, but in the lower parts merely a few narrow air-holes. Inside, a cloister-like arcade, surrounded by cellular store-rooms, forms the ground floor, and a somewhat lighter arcade, giving access to little dwelling-rooms, runs round it above. Broad open flights of stone steps connect the storeys. The central court is open to the sky, and generally has in its centre a well with a fountain-basin beside it. A spacious gateway, high and wide enough to admit the passage of a loaded camel,

forms the sole entrance, which is furnished with heavy doors, and is further guarded within by massive iron chains, drawn across at night. The entry is paved with flag-stones, and there are stone seats on each side. The court itself is generally paved, and large enough to admit of three or four hundred crouching camels or tethered mules; the bales of merchandise are piled away under the lower arcade, or stored up in the cellars behind it. The upstairs apartments are for human lodging; cooking is usually carried on in one or more corners of the quadrangle below. Should the caravanserai be a small one, the merchants and their goods alone find place within, the beasts of burden being left outside. A porter, appointed by the municipal authority of the place, is always present, lodged just within the gate, and sometimes one or more assistants. These form a guard of the building and of the goods and persons in it, and have the right to maintain order and, within certain limits, decorum; but they have no further control over the temporary occupants of the place, which is always kept open for all arrivals from prayer-time at early dawn till late in the evening. A small gratuity is expected by the porter, but he has no legal claim for payment, his maintenance being provided for out of the funds of the institution. Neither food nor provender is supplied.

Many caravanserais in Syria, Mesopotamia and Anatolia have considerable architectural merit; their style of construction is in general that known as Saracenic; their massive walls are of hewn stone; their proportions apt and grand. The portals especially are often decorated with intricate carving; so also is the prayer-niche within. These buildings, with their belongings, are works of charity, and are supported, repaired and so forth out of funds derived from pious legacies, most often of land or rentals. Sometimes a municipality takes on itself to construct and maintain a caravanserai; but in any case the institution is tax-free, and its revenues are inalienable. When, as sometimes happens, those revenues have been dissipated by speculation, neglect or change of times, the caravanserai passes through downward stages of dilapidation to total ruin (of which only too many examples may be seen) unless some new charity intervenes to repair and renew it.

*Khans*, i.e., places analogous to inns and hotels, where not lodging only, but often food and other necessities or comforts may be had for payment, are sometimes by inaccurate writers confounded with caravanserais. They are generally to be found within the town or village precincts, and are of much smaller dimensions than caravanserais. The khan of Asad Pasha at Damascus is a model of constructive skill and architectural beauty.

**CARAVEL**, a light ship, of the 15th and 16th centuries, much used by the Spanish and Portuguese for long voyages. It was a broad-beamed vessel, with a double tower at the stern (the sterncastle), and a single one in the bows (the forecastle, a term which survives). Two of the three ships in which the Columbus expedition sailed were caravels, and the ship of Columbus himself was not fully decked. A nautical writer says that "her figure was that of a cask sawn in halves lengthwise and raised up at both ends. Such a contrivance might be safely trusted to blow along before the breeze; it is impossible to understand how vessels thus built and rigged managed to keep a true course when they braced up their yards." But they were eminently picturesque, and they made some glorious voyages. Carvel, the older English form of the word, is now used only in the term "carvel-built," for a boat in which the planking is flush with the edges laid side to side, as distinct from one "clinker-built," where the edges overlap.

**CARAVELLAS**, a small seaport of southern Bahia, Brazil, on the Caravellas river a few miles above its mouth, which is dangerously obstructed by sandbars. Population (1920) 9,966. Caravellas was once the centre of a flourishing whale fishery, but has since fallen into decay. It is the port of the Bahia and Minas railway, whose traffic is comparatively unimportant.

**CARAWAY**, the fruit, or so-called seed, of *Carum Carvi*, an umbelliferous plant growing throughout the northern and central parts of Europe and Asia, and naturalized in waste places in England and in North America from Newfoundland to Colorado. The plant has finely-cut leaves and compound umbels of small white flowers. The fruits are laterally compressed and ovate. Caraways evolve a pleasant aromatic odour when bruised, and

they have an agreeable spicy taste. They yield a volatile oil, the chief constituent of which is cymene aldehyde. The plant is cultivated in north and central Europe and Morocco, as well as in the south of England, the produce of more northerly latitudes being richer in essential oil than that grown in southern regions. The oil is obtained by distillation for use in medicine as an aromatic stimulant and carminative, and as a flavouring material in cookery and in liqueurs for drinking. Caraways are, however, more extensively consumed entire in certain kinds of cheese, cakes and bread.

**CARAYAN**, an independent linguistic stock of South American Indians, named from the Caraya (Karaya), its most important tribe. The Carayan tribes live in central Brazil on the Araguaya river from near its mouth south to about 14° S. lat. Krause finds their culture very similar to that of the Arawakan and Cariban tribes of Guiana, and thinks the Carayas may have come to their historic habitat from north of the Amazon. They are a primarily agricultural and fishing folk, living in rather crude thatched huts, and showing in general a simple type of culture. Their hair is occasionally curly. The men practise kynodesmy, while the women wear a fringed girdle. Tattoo, body painting and labrets constitute their ornament, together with arm and leg bands of various sorts. The bow, club and spear are their chief weapons. They have no form of armour or shield. Dug-out canoes are used for river travel. Pottery is made, but they have no textiles. Monogamy prevails except for chiefs, who have very little power. The dead are buried and then after an interval the bones are exhumed and buried in a pot. There are elaborate dance ceremonies, employing masks, held in connection with puberty festivals, at the men's houses where the youths live, but these ceremonials have thus far not been adequately described.

See F. Krause, *In den Wildnissen Brasiliens* (Leipzig, 1911).

**CARBALLO**, a town of north-western Spain, in the province of Corunna. It lies on the right bank of the river Allones, 20m. S.W. of Corunna, its nearest railway station. Pop. (1920) 13,774. Though a market centre for local cereals and dairy produce, Carballo is chiefly noted for the hot sulphurous springs of San Juan de Carballo, on the opposite bank of the Allones, which make it a minor watering place.

**CARBAZOLE**, a constituent of coal tar, occurring with crude anthracene, crystallizing in plates or tables, melting point 238° C, and readily subliming. It may be separated from crude anthracene by fusing it with caustic potash when it is converted into carbazole-potassium, which can be easily separated by distilling off the anthracene. The separation is, however, preferably effected on a large scale by extracting the crude anthracene with heavy coal tar pyridine (b.p. 140–180° C) in which solvent the carbazole dis-

solves more readily than anthracene. Carbazole, may be prepared synthetically by passing the vapours of diphenylamine or aniline through a red-hot tube; by heating di-orthodiaminodiphenyl with 25% sulphuric acid to 200° C for 15 hours; or by heating thioldiphenylamine with copper powder. It is also obtained as a decomposition product of brucine or strychnine, when these are distilled with zinc dust. Carbazole dissolves readily in the common organic solvents. Melted in combination with oxalic acid it gives carbazole blue. The potassium salt reacts with the alkyl iodides to give *N*-substituted alkyl derivatives. It gives the pine-shaving reaction, in this respect resembling pyrrole (*q.v.*). The chief importance of carbazole lies in the production of hydron blue (Alizone blue), a vat dye which in many respects rivals indigo. This dye is prepared by condensing carbazole with nitrosophenol in concentrated sulphuric acid. The resulting indophenol is then heated with alcoholic sodium tetrasulphide. Greener shades of hydron blue are obtained from the *N*-alkyl carbazoles.

**CARBIDES** are, strictly, compounds of carbon with one other element. The term, however, is generally used to designate only those binary compounds of carbon which are comparatively infusible and non-volatile. Carbides are generally products of the

electric furnace, and it may be said that Henri Moissan, who made many brilliant researches with this furnace, founded the chemistry of carbides. The volatile carbon compounds of oxygen, sulphur and the halogens are not included in the category of carbides.

The two most important carbides are calcium carbide and silicon carbide (carborundum, *q.v.*). Calcium carbide, which is of industrial value as the source of acetylene (*q.v.*), is manufactured by heating together lime and coke or powdered coal in an electric furnace, the molten product being tapped off at 1,800° C. The lime may be replaced by limestone (calcium carbonate). The electric furnace is employed merely as a convenient source of heat; there is no specific electrolytic action in the process,  $\text{CaO} + 3\text{C} = \text{CaC}_2 + \text{CO}$ . Commercial calcium carbide is a brownish-grey crystalline mass decomposed by water with evolution of acetylene,  $\text{CaC}_2 + 2\text{H}_2\text{O} = \text{Ca}(\text{OH})_2 + \text{C}_2\text{H}_2$ . The carbides of strontium and barium, which resemble the calcium compound, are prepared in a similar manner. Moissan prepared carbides from the alkali metals as greyish-white powders by heating them in a stream of acetylene, when, in the case of sodium, an intermediate product,  $\text{Na}_2\text{C}_2\text{C}_2\text{H}_2$  (or  $\text{C}_2\text{HNa}$ ) was formed; this on further heating evolved acetylene and left a residue of sodium carbide,  $\text{C}_2\text{Na}_2$ . Aluminium and beryllium carbides, yellow and yellowish-brown crystalline products respectively, are of scientific interest since they evolve pure methane when decomposed by water. The former is made by heating together aluminium and carbon, the reaction proceeding rapidly at 1,400° C. The latter is produced by the reduction of beryllia with carbon at 1,900° C. Carbides or acetylides of doubtful composition are precipitated by passing acetylene into ammoniacal solutions of cuprous and argentous salts, the products being reddish-brown and yellowish-white respectively. These compounds are explosive, as are also the acetylides of mercury and of gold.

The carbides may be roughly classified according to their interactions with water or dilute acids: (1) The acetylides, which evolve acetylene, are those of the alkali metals, the alkaline-earth metals, the currency group, and the carbides of magnesium and mercury; (2) the methanides are the carbides of aluminium, beryllium and manganese, since these substances evolve methane. Manganese carbide,  $\text{Mn}_3\text{C}$ , obtained by the interaction of carbon and manganese oxide,  $\text{Mn}_3\text{O}_4$ , at 1,500° C, is decomposed by water with evolution of methane and hydrogen; (3) mixed carbides, which on treatment with water or acids evolve both acetylene and methane, as for example, the carbides of the rare-earth metals (lanthanum, yttrium, etc.). Uranium carbide,  $\text{U}_2\text{C}_3$  or  $\text{UC}_2$ , is decomposed by water to give hydrogen, acetylene, ethylene and methane. Iron carbide (cementite),  $\text{Fe}_3\text{C}$ , is decomposed by hot acids with evolution of hydrogen and a mixture of hydrocarbons; (4) carbides not decomposed by water or dilute acids. The last group includes silicon carbide,  $\text{SiC}$ , obtained in pale green to steel-blue crystals; this is a typical furnace product which due to its extreme hardness is widely employed as an abrasive (*q.v.*). Boron carbide,  $\text{CB}_6$ , titanium carbide,  $\text{TiC}$ , and zirconium carbide,  $\text{ZrC}_2$ , are hard refractory substances all prepared in the electric furnace, the first by combination of its constituent elements and the other two by reduction of the corresponding oxides by carbon.

**BIBLIOGRAPHY.**—J. W. Mellor, *A Comprehensive Treatise on Inorganic Chemistry*, vol. v. (1924); H. Moissan, *Le Four Electrique*, (1894). (G. T. M.)

**CARBINE**, a word which came into use towards the end of the 16th century to denote a form of small fire-arm, shorter than the musket and chiefly used by mounted men (Fr. *carabine*, Ger. *Karabiner*). It has retained this significance, through all subsequent modifications of small-arm design, to the present day, and is now as a rule a shortened and otherwise slightly modified form of the ordinary rifle (see **SMALL ARMS**). During and since the World War, however, it has been largely replaced by the ordinary rifle even for cavalry.

**CARBO**, the name of a Roman plebeian family of the gens Papiria. The following are the most important members:—

1. GAIUS PAPIRIUS CARBO, tribune of the people (131 B.C.), carried a law extending voting by ballot to the enactment and

repeal of laws; another proposal, that the tribunes should be allowed to become candidates for the same office in the year immediately following, was defeated by Scipio Aemilianus. In 130 he became a member of the Gracchan land-commission (see **GRACCHUS**). Carbo was suspected of having been concerned in the sudden death of Scipio (129). He subsequently went over to the optimates, and (when consul in 120) successfully defended Lucius Opimius, the murderer of Gaius Gracchus. But the optimates did not trust Carbo. He was impeached by Licinius Crassus on a charge of murdering citizens without a trial, and committed suicide.

See Livy, *Epit.* 59; Appian, *Bell. Civ.* i. 18; Vell. Pat. ii. 4; Val. Max. iii. 7, 6; A. H. J. Greenidge, *History of Rome* (1904).

2. His son, GAIUS PAPIRIUS CARBO, surnamed Arvina, was a supporter of the aristocracy, and was put to death by the Marian party in 82. He is known chiefly for the law (Plautia Papiria) carried by him and M. Plautius Silvanus when tribunes of the people in 90 (or 89), whereby the Roman franchise was offered to every Italian ally domiciled in Italy at the time when the law was enacted, provided he made application personally within 60 days to the praetor at Rome.

See Cicero, *Pro Archia*, 4; Vell. Pat. ii. 26; Appian, *Bell. Civ.* i. 88.

3. GNAEUS PAPIRIUS CARBO (c. 130–82 B.C.), nephew of (1). He was a strong supporter of the Marian party, and took part in the blockade of Rome (87). In 85 he was chosen by Cinna as his colleague in the consulship, and the two prepared to carry on war against Sulla, who had announced his intention of returning to Italy. Cinna and Carbo declared themselves consuls for the following year, but Cinna was murdered by his own soldiers, leaving Carbo sole consul. In 82 Carbo, then consul for the third time, fought a drawn battle with Sulla near Clusium, but he was utterly defeated by Sulla's general, Metellus Pius [see under **METELLUS** (6)] near Faventia. Carbo fled from Italy, but was captured at Cossyra (Pentellaria), and put to death by Pompey.

See Appian, *Bell. Civ.* i. 67–98; Livy, *Epit.* 79, 84, 88, 89; Plutarch, *Pompey*, 5, 6, 10, and *Sulla*, 28; Cicero, *ad Fam.* ix. 21; Eutropius, v. 8, 9; Orosius, v. 20; Valerius Maximus, v. 3, 5, ix. 13, 2; art. **SULLA**, L. CORNELIUS.

**CARBOHYDRATES**, a group of substances which includes the sugars, starches, and celluloses, along with the many varied products, either found in nature or prepared in the laboratory, which are closely related to them chemically. This group of compounds is comparable in importance with the proteins and fats. Its members play an all-important part in the lives of plants and animals, as structural elements and in the maintenance of functional activity. Cane sugar, glucose, fructose, and the various forms of starch and cellulose may be cited as typical representatives. Their industrial importance may be estimated from the fact that amongst the undertakings directly dependent on carbohydrate materials are the cotton industry, the manufacture of paper, the artificial silk industries, certain branches of the explosives industry, brewing and the manufacture of power alcohol.

Chemically, the carbohydrates are characterised by great reactivity. As found in nature they are almost invariably optically active (see **STEREOCHEMISTRY**). They reveal exceedingly complex possibilities of isomerism and many of them occur in amorphous colloidal forms. For these reasons, their study has provided problems of exceptional interest and difficulty, and in spite of the long-continued efforts of chemists, it is only within recent years that definite knowledge has been obtained concerning the internal structure of even the simplest members. Formaldehyde undergoes polymerization (*q.v.*) in presence of alkali to give a product resembling fructose, and since formaldehyde is itself obtainable by reduction of carbonic acid, the synthetic processes which go on in the leaf of the plant with the formation of carbohydrates are partly explained.

The simplest carbohydrates function as polyhydroxyaldehydes or ketones containing from 3 to 9 carbon atoms, although, as will be seen later, these assume a cyclic character. With few exceptions they correspond to the formula  $(\text{CH}_2\text{O})_n$ . They are

soluble in water and possess a sweet taste. These simpler members, the sugars, may be regarded as the units of which the more complex carbohydrates are built up. The simplest sugars are termed monosaccharides and their nomenclature is based on the value of  $n$  in the above formula. If  $n=3$  the substance is said to be a triose, if  $n=6$  a hexose and so on. The commonest and most important representatives of the two classes of sugars are glucose (an aldohexose) and fructose (a ketohexose) and the reactions of these two will now be considered in greater detail. In essential respects the chemistry of the other monosaccharides may be taken to be similar either to that of glucose or to that of fructose.

**Glucose.**—Glucose, dextrose or grape sugar,  $C_6H_{12}O_6$ , is widely distributed in plants and animals. It occurs alone or combined with other sugars as in cane sugar, milk sugar, etc., or combined with alcohols of various types to form glucosides (*q.v.*). Glucose may be prepared readily from starch or from cane sugar by the action of dilute acids. It is very soluble in water and is easily fermented by yeast to give alcohol. From its aqueous solution it separates in warty masses containing one molecule of water of crystallization, m.p.  $86^\circ$ . It may be obtained from other solvents in two distinct forms (*see below*). In its chemical properties glucose resembles an aldehyde and is a strong reducing agent, quickly precipitating gold and silver from warm solutions of their salts. Solutions of glucose do not, however, restore the colour to Schiff's reagent. The reaction between glucose and an alkaline solution of copper hydroxide (Fehling's solution), which results in the precipitation of cuprous oxide, is used to estimate glucose in aqueous solution. In the absence of other sugars, glucose may be estimated by observing the extent to which it rotates the plane of polarized light since a given weight of pure glucose has a fixed rotation. This is known as its specific rotation.

The aldehydic functions disappear on reduction of glucose with nascent hydrogen, and a hexahydric alcohol, sorbitol (II.), is formed which, when further reduced with hydrogen iodide, yields a derivative of normal hexane,  $CH_3 \cdot (CH_2)_4 \cdot CHI \cdot CH_3$ . This proves that the arrangement of the six carbon atoms of glucose does not involve a branched chain of carbon atoms. That there are five hydroxyl groups present in the glucose molecule is shown by the fact that glucose gives penta-acetyl and penta-methyl derivatives and on the basis of the facts so far considered the simplest formula for glucose would be (I.). Furthermore, oxidation with bromine water yields gluconic acid (III.) which, even in aqueous solution, is transformed partly into the  $\gamma$ -lactone,  $[\alpha]_D +68^\circ$ , m.p.  $130-35^\circ$  (IV.). Reduction of

gluconolactone in aqueous solution with sodium amalgam and dilute acid gives glucose, whilst on oxidation with nitric acid both glucose and its lactone yield saccharic acid (V.).

The aldehydic functions are further illustrated by the action of such reagents as hydroxylamine and phenylhydrazine, which give respectively glucose-oxime and glucose-phenylhydrazone. Excess of the latter reagent causes oxidation, with the production of glucose-phenylosazone (m.p.  $210^\circ$ ), a substance of characteristic appearance which is often used as a qualitative test for the presence of glucose. The oxidation can be shown to involve the second carbon atom and the formation of the osazone may be summarized thus:

**Glycuronic Acid.**—The reactive grouping (No. 1 in formula I.) which functions as an aldehydic group in glucose can be masked (as in the glucosides), and then oxidation of the terminal primary alcoholic group (6) may be effected, and in this way it is possible to obtain glycuronic acid (VI.), which is of special importance in metabolism, since many objectionable substances are removed from the body in the form of their condensation products with it in the form of glucosides (*see below*).

The aldehydic formula for glucose explains satisfactorily most of the observations mentioned above, but it is impossible to account on this basis for the existence of two isomeric crystalline  $\alpha$ - and  $\beta$ -forms of the sugar or of its simple derivatives.

**Stereochemistry of the Sugars.**—To visualize the arrangement in space of the sugar molecule, it is imperative to know how a simple chain of six carbon atoms is disposed. It has been shown that three carbon atoms are linked together in such a manner that they are inclined at an angle of  $109^\circ 28'$ , thus:

If six such atoms are joined then the fifth and sixth will approach near in space to the first, that is, the chain of atoms curls round on itself. Even more important, is the recognition that when two other atoms are attached to each of these carbon atoms, these also will make an angle of  $109^\circ 28'$ . Hence to portray such a figure on a plane surface, such as this page, is impossible, and some pictorial convention must be devised. Thus in representing the H and OH attached to a carbon atom it is always assumed that the reader sees each individual carbon atom projected into the plane of the printed page, but the H and OH group attached to this carbon atom will emerge upwards from the page at the above angle.

Only thus is it possible to realize that the expression

Otherwise it may be erroneously considered that the former can be made to be identical with the latter by merely revolving the second carbon atom round the first. In the study of sugar chemistry, spherical models of the atoms are essential aids to the realization of these factors of the distribution of groups in three-dimensional space.

In the following expressions it is assumed: (a) that the chain of carbon atoms has been uncurred and placed in a straight line; (b) that the two or more addenda which point outwards from this plane are projected downwards into the plane of the paper.

Reference to the aldehydic formula (VI., *see below*) for glucose shows that the second, third, fourth, and fifth carbon atoms are asymmetric (*see STEREOCHEMISTRY*), and accordingly there exist  $2^4$  or 16 isomeric aldohexoses differing only in the stereochemical arrangement of the -H and -OH groups round the asymmetric carbon atoms. The 16 are arranged in 8 pairs, the two members of each pair being identical except that one form has a dextro-configuration (*d*-series) and the other a laevo-configuration (*l*-series). All eight aldohexoses are known. Similarly, on theoretical principles there could exist  $2^3$  or 8 aldopentoses which may be arranged in 4 pairs. Corresponding to these there exist *d*- and *l*-modifications of xylose, ribose, arabinose, and lyxose. The naturally occurring dextrorotatory glucose is genetically

related to the dextrorotatory form of glyceraldehyde, to which is assigned the projection formula (A), and the sugars are therefore classified into two series, called the *d*- and the *l*-series respectively, according as they may be built up by synthetical means from *d*- or *l*-glyceraldehyde (Rosanoff). On this basis the four *d*-forms of the aldopentoses can be represented by the projection formulae shown below.

The physical and chemical behaviour of these sugars renders possible the accurate diagnosis of the above configurations and it is on this basis that the formulae are assigned. Similarly there exist 16 aldohexoses—8 of the *d*-series, and 8 of the *l*-series—the chief representatives in the *d*-series being those formulated below. The corresponding formulae for those in the *l*-series are the mirror images of the formulae now given.

#### Synthetic Glucosides and the Structure of Glucose.—

Aldehydes ordinarily react with one or with two molecules of ethyl alcohol to give either an alcoholate,  $R\cdot CH\begin{smallmatrix} OEt \\ OH \end{smallmatrix}$  or an acetal,  $R\cdot CH\begin{smallmatrix} OEt \\ OEt \end{smallmatrix}$ . Methyl alcohol in the presence of an acid

as catalyst yields, a dimethyl-acetal,  $R\cdot CHO \rightarrow R\cdot CH(OMe)_2$ . A sugar aldose, however, under similar conditions reacts with one molecule of methyl alcohol, with elimination of one molecule of water:  $C_6H_{12}O_6 + CH_3\cdot OH \rightarrow C_7H_{14}O_6 + H_2O$ . The resulting compound, a methyl-aldoside, can only be represented, on the basis of rules of valency, as a *cyclic* compound (V. and VI., below). It is isolated in two different forms which are interconvertible. Thus, by the agency of methyl alcohol containing 0.5% hydrogen chloride, glucose is converted on heating into, (1)  $\alpha$ -methyl-glucoside having m.p. 166° and a specific rotation of +159°, and (2)  $\beta$ -methyl-glucoside having m.p. 105° and a rotation of -34°. These differ remarkably in their behaviour towards enzymes. The enzyme maltase is specific for  $\alpha$ -methyl glucoside, converting it into glucose and methyl alcohol. The enzymes of emulsin, on the other hand, convert the  $\beta$ -glucoside into glucose and methyl alcohol. Heating with aqueous mineral acid regenerates glucose from each glucoside.

A striking fact, related to these observations, is that dextrorotatory glucose can also be isolated in two crystalline forms which are interconvertible, and so also can its penta-acetate, its penta-benzoate, as well as other derivatives. By crystallizing glucose from alcohol or from acetic acid the  $\alpha$  form is obtained, m.p. 146°, having a specific rotation  $[\alpha]_D +113^\circ$ . From solution in pyridine the crystalline  $\beta$ -form is isolated, m.p. 148°,  $[\alpha]_D +17^\circ$ . Each of these forms changes in aqueous solution to an equilibrium mixture having  $[\alpha]_D +52.5^\circ$ , this change being known as "mutarotation." These two forms are structurally related to the  $\alpha$ - and  $\beta$ -methyl glucosides, and since the cyclic formulae

(V. and VI.) have been assigned to the latter, the  $\alpha$ - and  $\beta$ -forms of glucose may similarly be represented by formulae (I.) and (II.). Hence the formulation of glucose as an aldehyde must now be superseded by these more precise representations which admit of the explanation of all the aldehydic functions of glucose (as also for other sugars) whilst serving the better to elucidate the very special properties of sugars as modified aldehydes. It is seen that the —OH on the fifth carbon atom of the hexose chain is spatially near to the aldehyde group in the transitory phase, and by interaction the CHO deprives the OH of its hydrogen, thus:

In formulae (I.) and (II.) it is seen that the potential aldehyde group now becomes asymmetric and the arrangement of the H and OH in space in two possible ways at carbon atom No. 1 accounts for the existence of the two stereochemical forms,  $\alpha$ - and  $\beta$ -, having different specific rotations. It has been shown that the glucoside (V.) is hydrolysed to the glucose form (I.) and the glucoside (VI.) to (II.) by the action of enzymes. The analogous optical properties also support these inter-relations of sugar and glucoside. Moreover, the presence of the two OH groups on the right of the contiguous carbon atoms (1) and (2) in  $\alpha$ -glucose (I.) is demonstrated by the ease with which this form, as distinct from the  $\beta$ -form, combines with boric acid.

The general form of the structure here assigned to glucose and its glucosides applies equally to all the simple sugars, both of the pentose and hexose class; so that the generalization is reached that the ordinary varieties of these sugars exist as six-atom rings. To preserve the relationship between aldehyde and ring-forms the structures are usually written as (I.) and (II.) above, but actually a model constructed on these lines would more accurately represent the sugars as hexagonal figures. Indeed, the sugars may be clearly pictured if we consider that they are derivatives of a parent substance,  $\gamma$ -pyran (A), which, if suitably hydroxylated and reduced would give the sugar form (B) which has been named pyranose, wherein the group marked

\* is the potential aldehyde (or reducing) group. This is a

pentose. The corresponding formula for a hexose is (C), which contains as a side chain a  $-\text{CH}_2\text{OH}$  group.

The spatial distribution of the H and OH atoms or groups accounts for the existence of arabinose, xylose, ribose, and lyxose. These sugars may thus be named arabo-pyranose, xylo-pyranose, etc., the spatial relationships being clearly seen if we show the 6-atom ring in perspective, with the H and OH at each of the five C atoms either directed above this plane of the ring or below it.

The configurations for lyxose and ribose may be similarly sketched by referring to the provisional formulae for the pentoses given earlier. These would be designated lyxo-pyranose and ribo-pyranose on this nomenclature, which combines both structural and spatial considerations.

In the same way, formula (C) represents the common forms of glucose, of mannose and of galactose, which may be correctly described as gluco-pyranose, galacto-pyranose, etc. But the spatial relationships of H and OH at the carbon atoms of the ring are not shown in (C).

**Fructose.**—Fructose, laevulose or fruit sugar,  $\text{C}_6\text{H}_{12}\text{O}_6$ , is the commonest of the ketoses. It is formed along with glucose by inversion of cane sugar (sucrose) and occurs mixed with glucose in fruit juices. It is best prepared by digesting the polysaccharide, inulin (*q.v.*) with dilute oxalic acid. Crystalline fructose, m.p.  $93^\circ$ , is strongly laevorotatory in solution, having  $[\alpha]_D^{20} -134^\circ$ , which changes by mutarotation to  $-92^\circ$ . Although laevorotatory its configuration is closely related to *d*-glucose, and hence it is named *d*-fructose. This fact is established in that by nascent hydrogen fructose passes into *d*-sorbitol, as does glucose. Fructose gives the same phenyllosazone as glucose. It combines additively with hydrogen cyanide, and hydrolysis of this product, followed by reduction of the OH groups by hydriodic acid, gives methylbutylacetic acid (II.). Hence the provisional formula for fructose represents the sugar as a ketone (I.).

The mutarotation of fructose shows that an  $\alpha$ -form of the sugar exists, and again, as with glucose, the ketone formula (III.) must give place to the cyclic, 6-atom ring structure indicated in

the expressions (IV.) and (V.) for  $\alpha$ - and  $\beta$ -forms; but (VI.) is the most reasonable mode of formulating (V.) as fructo-pyranose.

Fructose, like glucose, is fermentable by yeast. It probably plays a different part in metabolism from glucose, and seems to be more intimately connected with tissue formation, whilst glucose is more concerned with respiration.

**The Labile or  $\gamma$ -Sugars (Furanoses).**—Whilst fructose on isolation is found to have the above 6-atom ring, yet there is strong evidence that when fructose occurs in combination in cane sugar and in inulin the structure is different and has a five-atom ring. The first sugar derivative of this type to be recognized (Emil Fischer) was  $\gamma$ -methyl-glucoside, which is obtained by condensing glucose and methyl alcohol containing 1% HCl in the cold. It is now known that most simple sugars can assume the  $\gamma$ - or labile form under analogous conditions. Derivatives of these have been prepared, and they are shown to be related, not to pyran as the parent substance, but to furan, and are therefore named furanoses.

The above constitutional problems have been elucidated by studying sugar derivatives such as methylated, acetylated, and benzoylated sugars, and also the acetone-sugars. A summary of the development of the experimental proofs has appeared in the *Annual Reports of the Chemical Society* (Organic Chemistry, Aliphatic Division) for the years 1923–1927; see also W. N. Haworth, *The Constitution of Sugars* (London, 1928).

**Synthesis of Sugars.**—By combining certain reactions which have been already considered it is possible to pass from any monosaccharide to the one containing an additional carbon atom. Thus addition of HCN to glucose (A) (Kiliani) gives two

nitriles (B and C), hydrolysable to the acids, the lactones of which may be reduced by Fischer's method to the corresponding heptoses. The opposite effect, or degradation, can be accomplished by several methods. In one of these the calcium salt of gluconic acid is oxidized with hydrogen peroxide in the presence of ferric acetate, when the following reaction takes place:

$\text{R}-\text{CHOH}\cdot\text{COOH} \xrightarrow{\text{O}} \text{R}-\text{CHO} + \text{CO}_2 + \text{H}_2\text{O}$ . In this case *d*-glucose yields *d*-arabinose.

The action of pyridine or quinoline on the lactones of gluconic acid results in the inversion of the groups attached to the second

carbon atom (epimerization). Mannonolactone is thus produced which may be reduced to mannose. The reaction is general and has been used frequently in the synthesis of rare sugars.

An aldose may be converted into a ketose through the osazone, the reactions being clear from the following scheme:

The reverse (e.g., glucose) transformation may be effected in the following way:

The elucidation of these and similar reactions prepared the way for the complete synthesis of the natural sugars from their elements. Glyceraldehyde,  $\text{CHO}\cdot\text{CHOH}\cdot\text{CH}_2\text{OH}$ , gives with dilute alkali dihydroxyacetone,  $\text{CH}_2\text{OH}\cdot\text{CO}\cdot\text{CH}_2\text{OH}$ , the crude mixture of the two being termed glyceroose. These two molecules then unite by an aldol condensation to give  $\alpha$ -acrose, which was identified as *dl*-fructose by means of its osazone.

The osazone yielded the osone which was then reduced to the pure *dl*-fructose (*see* above). The operations were next continued according to the scheme:  $\alpha$ -acrose  $\rightarrow$   $\alpha$ -acritol (mainly *dl*-mannitol)  $\rightarrow$  *dl*-mannose  $\rightarrow$  *dl*-mannonic acid  $\rightarrow$  *d*-mannonic acid  $\rightarrow$  *d*-mannose  $\rightarrow$  *d*-glucosazone  $\rightarrow$  *d*-glucosone  $\rightarrow$  *d*-fructose. Also *d*-mannonic acid  $\rightarrow$  *d*-gluconic acid  $\rightarrow$  *d*-glucose. The *l*-series of sugars may be obtained similarly from *l*-mannonic acid.

The photosynthesis of carbohydrates in the plant from carbon dioxide requires the presence of chlorophyll (*q.v.*). Very recently it has been claimed that on suitable coloured surfaces carbon dioxide and water can be induced to yield true carbohydrate material under the influence of light. The reaction requires intense energy supplies.

**Disaccharides.**—The disaccharides,  $\text{C}_{12}\text{H}_{22}\text{O}_{11}$ , are formed by the combination of two monosaccharide molecules with loss of one molecule of water:  $2\text{C}_6\text{H}_{12}\text{O}_6 \rightarrow \text{C}_{12}\text{H}_{22}\text{O}_{11} + \text{H}_2\text{O}$ . The reaction always involves one of the reducing groups and may involve both. The disaccharides may therefore be regarded as analogues of the methylglucosides in which the methyl radical is replaced by a sugar residue. As glucosides, they are readily hydrolysed to the component sugars by dilute acids and show the characteristic specific reactions towards enzymes. For example, maltose, an  $\alpha$ -glucosidic disaccharide, is readily hydrolysed in aqueous solution by maltase, whilst cellobiose, a  $\beta$ -glucosidic disaccharide, is attacked by emulsin and not by maltase. According as one or both reducing groups are involved in the disaccharide linkage there exist reducing and non-reducing disaccharides, the former reducing Fehling's solution and behaving like an ordinary aldose or ketose. Typical examples are lactose (reducing) and cane sugar (non-reducing).

In general the chemistry of the disaccharides resembles that of the monosaccharides, with the exception that the scope of the reactions which can be utilized is limited by the presence of the easily severed glucosidic linkage by which the two halves of the molecule are joined. The  $-\text{OH}$  groups may be substituted by acetyl groups (e.g., octa-acetyl sucrose) or by methoxy-groups (octamethyl-sucrose, etc.) or by other groups. Hydrazones, oximes and osazones are formed by the reducing disaccharides

and oxidation at the reducing group gives rise to the bionic acids, which correspond with a hexonic acid such as gluconic acid.

Disaccharide formation is not limited to the union of two similar molecules: compounds of glucose and galactose, glucose and fructose, etc., also occur, and these may exist either in  $\alpha$ - or  $\beta$ -forms. For these reasons the elucidation of the structure of the disaccharides has been a most complex problem. The methylated sugars have furnished a valuable means to this end.

**Lactose.**—Lactose or milk sugar may be obtained by evaporation of whey from milk. It is not encountered in the vegetable kingdom. It reduces Fehling's solution, gives a characteristic osazone, exists in  $\alpha$ - and  $\beta$ -modifications, shows mutarotation, and forms methyl lactosides.  $\alpha$ -Lactose has  $[\alpha]_D + 90^\circ$ , m.p.  $223^\circ$ . Oxidation with bromine water gives lactobionic acid which can be hydrolysed to a mixture of gluconic acid and galactose. Lactose therefore contains one glucose and one galactose residue and these two hexoses can be obtained from lactose by hydrolysis. The free reducing group in lactose is situated in the glucose portion. Lactose is thus a glucose  $\beta$ -galactoside, having the structural formula (IX.), wherein A = glucose, and B = galactose.

Similar experiments have been carried out with all the common reducing disaccharides and it is found that they may be accommodated by one or other of the two general formulae (IX. and X.), where A = glucose, B = either glucose or galactose according to the disaccharide selected; and the junction \* may be either  $\alpha$ - or  $\beta$ - as required by a particular example.

**Other Disaccharide Compounds.**—**Maltose** is formed by the action of the enzyme diastase on starch during the generation of cereals (preparation of malt). It is prepared by the hydrolysis of starch by diastase and forms crystals resembling glucose,  $[\alpha]_D + 137^\circ$  (equil. value), mutarotating upwards. Hydrolysis by acids or by the enzyme maltase gives two molecules of glucose. The structure of maltose is similar to that of lactose (formula IX., A and B = glucose) except that the sugar is a glucose  $\alpha$ -glucoside (\* =  $\alpha$ ).

**Cellobiose** (m.p.  $225^\circ$ ,  $[\alpha]_D + 16^\circ$ ,  $\beta$ -form; equil. value  $+35^\circ$ ) is obtainable in the form of its octa-acetyl derivative from cotton cellulose by treatment with acetic anhydride and sulphuric acid under special conditions. Its special interest lies in the apparently close relationship between it and cellulose. Structurally it resembles maltose except in the nature of the glucosidic linkage which is  $\beta$ -. It is glucose  $\beta$ -glucoside (formula IX.). **Gentiobiose** (m.p.  $190$ – $195^\circ$ ,  $[\alpha]_D - 11^\circ$ , equil. value  $+9.6^\circ$ ) is a reducing disaccharide obtained by partial hydrolysis of the trisaccharide gentianose. It is the sugar present in the glucoside amygdalin (*q.v.*). It differs structurally from maltose and corresponds with formula (X.). **Melibiose** (m.p.  $88$ – $95^\circ$ ,  $[\alpha]_D + 124^\circ$ , equil. value  $+143^\circ$ ) is one of the hydrolytic products of the trisaccharide raffinose. It contains glucose and galactose residues, corresponds structurally with gentiobiose (formula X.) but is glucose  $\alpha$ -galactoside.

**Sucrose** or cane sugar (m.p.  $160^\circ$ ,  $[\alpha]_D + 66.5^\circ$ ) is the most important non-reducing disaccharide. For description of its physical properties and the mode of extraction from the sugar cane and the sugar beet, *see* SUGAR. It is very readily hydrolysed by dilute acids to a mixture of equal quantities of glucose and fructose (termed invert sugar), but sucrose itself does not reduce Fehling's solution. In this case both reducing groups are involved in the disaccharide linkage. It gives octa-acetyl, octa-methyl derivatives, etc., and from a study of the latter the structure of

sucrose has been determined (formula XI.); it involves a pyranose structure in the glucose portion and a furanose structure in the fructose half of the molecule.

In addition to the disaccharides similar compounds are known in which three sugar molecules are linked together (*trisaccharides*). The best known of these are raffinose (from cotton seed meal), melezitose (from the manna exuded from the Douglas Fir) and gentianose (from gentian roots).

**Polysaccharides.**—The empirical formula of the members of this series is  $C_6H_{10}O_5$ , or in some cases  $C_6H_8O_4$ . Their molecular weight is, however, very high; they are mostly amorphous, colloidal complexes, which break down on hydrolysis to monosaccharides containing 5 or 6 carbon atoms. Several of the individual substances are of great industrial importance and are fundamental in the synthetic processes taking place in the living cell. Their colloidal nature and high molecular weight greatly increase the difficulties inherent in their chemical investigation, and the structural formula of no one of them can at present be regarded as definitely established.

**Cellulose.**—The name cellulose has been given to several products found in the vegetable kingdom. These consist for the most part of complexes of various extraneous materials with normal cellulose, the purest form of the latter being found in cotton. The same cellulose is present also to a greater or less extent in flax, hemp, wood, straw, etc. For the part played by cellulose in paper making, see PAPER.

Cotton cellulose is a white fibrous substance, which contains when air-dried some 7% of moisture. It is insoluble in all the usual solvents, but dissolves readily in an ammoniacal solution of copper hydroxide (Schweitzer's reagent) and in the concentrated solutions of certain metallic salts. On dilution it is again precipitated. It is unaffected by moist chlorine, and as this reagent converts into soluble substances almost all the materials which accompany cellulose this provides a convenient method for its purification and estimation. Treatment of unglazed paper with strong sulphuric acid converts the superficial layer into the so-called "amyloid" modification, with production of parchment paper. Another, somewhat similar transformation is the conversion of cellulose (cotton) into mercerized cotton by the action of cold 15–25% sodium hydroxide solution. Various indefinite substances known as hydrocelluloses and oxycelluloses are produced respectively by the action of acids and of oxidizing agents.

The most important compounds of cellulose are the esters. These include the nitrates which are used in the manufacture of explosives (*q.v.*), celluloid, photographic films, etc. The xanthate, formed by the action of caustic soda and carbon disulphide ( $R-OH + CS_2 + NaOH \rightarrow R-O-CS-SNa + H_2O$ ), is of prime importance in the viscose industry, in which a suitably prepared cellulose xanthate solution is forced through fine orifices into an acid bath, with the regeneration of cellulose in the form of silky filaments (see SILK, ARTIFICIAL).

The acetates of cellulose, produced by the action of acetic anhydride in the presence of a catalyst, are of equal importance in that in one or other of their forms they are the basis of cellulose acetate silk, of non-inflammable films, and of many varnishes and lacquers; they can be used as insulating materials in elec-

trical work.

Much attention is being given to the problem of the internal structure of cellulose. It can be converted into glucose quantitatively by hydrolysis and so consists solely of glucose residues. The first and fourth carbon atoms of the  $C_6$  unit are concerned in the mutual union of these glucose residues, which are all identical in structure in cellulose (formula I.). The acetolysis of cotton cellulose to give cellobiose (see above) strengthens this view.

formula (I.) and having the same mode of linking as the related disacchaside cellobiose.

**Starch.**—This polysaccharide is present in assimilating plants and occurs in large amounts in cereals, grains, roots, tubers, etc. It occurs in the form of granules built up of concentric layers round a nucleus. When heated with water the outer integument of the granule bursts and an opalescent liquid is formed which sets to a paste when cold. The granules and the paste give a characteristic deep blue colour with iodine. It has been claimed that starch can be separated into two portions termed amylose and amylopectin, which differ in their colour reactions with iodine (the latter giving a violet coloration and the former blue) and in their capacity to give a starch paste.

The action of diastase on starch yields the disaccharide maltose. Complete hydrolysis yields glucose quantitatively. The controlled action of acids or ferments has led to the preparation of a large number of substances intermediate between starch and maltose. These are classed generally as dextrans. They differ considerably from one another in physical properties and their relationship to starch on the one hand and to the simple monosaccharides on the other has yet to be worked out. Little can be said at present regarding the structural relationship of starch and cellulose, but that maltose is closely connected with the structure of starch seems to be clear (see also FERMENTATION).

**Glycogen** or animal starch,  $(C_6H_{10}O_5)_n$ , occurs in the animal muscle and in the liver of mammalia. It gives a red coloration with iodine and is readily hydrolysed to give glucose in quantitative yield. It is more labile than ordinary starch which it resembles in many particulars. Like starch and cellulose, its methylated derivative yields 2:3:6-trimethylglucose on hydrolysis. **Lichenin** or moss starch,  $(C_6H_{10}O_5)_n$ , is yet another example of a polysaccharide built up solely of glucose units. It occurs in Iceland moss. Chemically it has many properties in common with cellulose.

**Inulin**,  $(C_6H_{10}O_5)_n$ , is of common occurrence in plants as a reserve food-stuff, where it may often take the place of starch.

It is composed entirely of fructose units and hydrolysis of inulin by oxalic acid provides the best method for obtaining ordinary crystalline fructose. Despite this fact the fructose unit in inulin is not the pyranose type of fructose, but is the furanose or labile type of the sugar. Iodine gives a yellow colour with inulin. The two groups concerned in the union of the fructose units in the complex are the primary alcoholic group at the first carbon atom and the reducing group attached to the second carbon of the ketose.

The number of such units has not yet been ascertained. See special articles on various carbohydrates.

**BIBLIOGRAPHY.**—For summaries of the most recent developments see the *Annual Reports on the Progress of Chemistry* for recent years (Chemical Society, London); W. N. Haworth, *The Constitution of Sugar* (London, 1928); E. F. Armstrong, *The Simple Carbohydrates and the Glucosides*, contains bibliography and summarizes the chemistry of the sugars (excluding polysaccharides) to 1924; M. Cramer,

*Les Sucres et leurs Dérivés*, includes the polysaccharides (complete to 1926); H. Pringsheim, *Die Polysaccharide* (1923), and *Zuckerchemie*, excluding the polysaccharides (complete to 1924); P. Karrer, *Polymere Kohlenhydrate*, the polysaccharides considered more particularly as colloids (1925); W. M. Bayliss, *The Nature of Enzyme Action*; E. Heuser, *Lehrbuch der Cellulosechemie* (English trans., 1925). For references the following are invaluable: B. Tollens, *Kurzes Handbuch der Kohlenhydrate* (Leipzig, 1914); Emil Fischer, *Untersuchungen über Kohlenhydrate und Fermente*, I. u. II.; Lippmann, *Chemie der Zuckerarten* (Braunschweig, 1904).

**CARBOLIC ACID or PHENOL** discovered in 1834 by F. Runge in coal tar. A. Laurent in 1841, first obtained it in a pure crystalline condition, determined its composition and named it phenyl hydrate or phenic acid. It is, in fact, to be regarded as derived from benzene, the simplest hydrocarbon of the so-called aromatic series (see also CHEMISTRY: *Organic*), through the replacement of one hydrogen atom by the hydroxyl or alcoholic group,  $\text{-OH}$ . Thus it stands in the same relation to benzene as ordinary methyl alcohol (wood spirit),  $\text{CH}_3\text{OH}$ , does to methane (marsh-gas),  $\text{CH}_4$ ; just as methyl alcohol is hydroxy-methane so is phenol hydroxy-benzene, and, having the formula  $\text{C}_6\text{H}_5\text{OH}$ , is the prototype and simplest member of one of the most important groups of compounds in organic chemistry. Although, as explained above, it has certain analogies of composition with methyl and other alcohols of the aliphatic series, its properties differ greatly from those of an alcohol, properly so called, and this difference must be attributed to the great difference in structure and properties between the paraffin hydrocarbons, on the one hand (methane, ethane, etc.), and the coal-tar hydrocarbons (benzene, toluene, naphthalene, etc.), on the other. It is found in nature as a product of animal metabolism, occurring in the urine of man, horse and other mammals; also in the degradation products of proteins. It is formed in many chemical processes, particularly by the decomposition of organic matter such as wood or coal at high temperatures (carbonization). It has been observed in small quantities in Galician and Russian petroleum. It is contained in coal tar in proportions of from 0.1 to 1.0% and its principal commercial source is that fraction of coal tar which distills from 180°–220° C. For the manufacture of carbollic acid, this fraction is treated with an 8–10% aqueous solution of caustic soda. The phenol and its homologues are thereby dissolved in this solution, forming carbolate (phenoxide or phenate), whilst the hydrocarbon oils together with small quantities of pyridine and other evil-smelling bases are left as an oily layer floating above the carbolate solution. The latter is drawn off, steamed for the removal of adhering or dissolved neutral hydrocarbons, and then treated with carbon dioxide, which decomposes the carbolate to give sodium carbonate and thus liberates the carbollic acid and the higher phenols or cresols, forming a black oily layer of crude carbollic acid of characteristic odour.

The separated crude carbollic acid contains about 15–20% of water, traces of inorganic salts and other impurities from which it is freed by repeated fractional distillation, and, in this manner, the crude product is separated into fractions rich in phenol which crystallize upon cooling and fractions containing the cresols (higher homologues of phenol) which fail to crystallize. The raw crystals are passed through centrifuges in which they are freed from adhering "cresylic" liquid and they are then submitted to a final fractionation yielding a distillate of commercial carbollic acid in form of crystals of melting point 39°–40°C. The mixture of cresols or liquid carbollic acid forms an article of commerce, but is frequently further worked up and more or less efficiently separated into its constituents. Comparison of the boiling points of the pure compounds—phenol, 181.3°C; ortho-cresol, 188.0°; para-cresol, 199.5°; meta-cresol, 200.0°; symmetrical xylenol, 218.0°—shows that by fractional distillation they may be separated into phenol, ortho-cresol and a not easily separable mixture of para- and meta-cresols. A product rich in meta-cresol is of importance for the manufacture of explosives.

At times when carbollic acid is in great demand or when slackness in the demand for the products accompanying it in coal tar does not commercially justify its extraction, it is manufactured by synthesis from benzol. Only one process is carried out indus-

trially. Benzol is sulphonated with fuming sulphuric acid, the resultant benzenesulphonic acid after neutralization with milk of lime is converted into its sodium salt and the sodium benzenesulphonate is fused at 340°C with an excess of sodium hydroxide in cast iron vessels provided with powerful stirrers. The melt, on treatment with a limited amount of water, yields a solution of sodium phenate (carbolate or phenoxide) and a solid residue of sodium sulphite. From the carbolate solution crude carbollic acid is liberated by means of carbon dioxide and distilled, as in tar-works practice. As, however, the synthetic product is not associated with cresols, fractionation is simpler, and a very pure carbollic acid is obtained.

**Properties of Phenol or Carbollic Acid.**—Phenol crystallizes in colourless needles of characteristic odour. If chemically pure, the crystals are not hygroscopic and remain colourless, but when containing even slight impurities they are highly deliquescent and slowly assume a pink colour. Phenol has melting point 42.5–43°C, boiling point 181.3°C under 760mm. pressure; specific gravity ( $d_{20}^{20}$ ) 1.0722; calorific value 7,810 calories (14,060 B.T.U.). It forms a hydrate  $\text{C}_6\text{H}_5\text{-OH}\cdot\text{H}_2\text{O}$  of melting point 17.2°C. By mixing phenol with water two immiscible solutions are formed, one of phenol in water and one of water in phenol, but on adding more water a clear solution results; 100 parts of water dissolve at 11°C 4.8 and at 77°C 11.8 parts of phenol, whilst at 84°C phenol and water are miscible in any proportion. It is readily soluble in alcohol, ether, carbon disulphide, chloroform, glacial acetic acid and somewhat in light petroleum. It is also readily soluble in caustic alkalis, slightly soluble in aqueous ammonia solution, but almost insoluble in sodium carbonate solution. Good solvents are also gallic acids and a solution of sodium benzenesulphonate. It is volatile in steam. It gives a violet coloration with ferric chloride and a white precipitate of tribromophenol with bromine water. Phenol is a weak acid and forms salts with alkalis which react alkaline to litmus. It is readily acted upon by chlorine, bromine, iodine, sulphuric and nitric acid, chloroform in alkaline solution, formaldehyde, oxidizing and reducing agents, and a large number of derivatives can be obtained from it by these and other reagents.

**Uses of Phenol.**—The ease with which phenol reacts with a great number of chemical compounds marks it as a substance of wide and varied applicability in the chemical and other industries. It is used to a moderate extent as an intermediate in dyestuff manufacture. It is a component of the azo-dyes, such as diamine green B, brilliant yellow, chrysophenin and aurin or rosolic acid. The last is used as an indicator (*q.v.*) in chemical analysis and for colouring varnishes or in form of its sodium salt, yellow corallin, for printing wall paper. By heating phenol with phthalic anhydride and sulphuric acid another important indicator, phenolphthalein, is obtained, which is colourless in neutral or acid solution but turns deep red with caustic alkalis. Phenolphthalein also finds application as a purgative. A number of dye-stuffs are derived from the products of the nitration of phenol, ortho- and para-nitrophenol and their derivatives.

A very important product of the nitration, *i.e.*, the interaction of nitric acid with phenol, is picric acid, or 2:4:6-trinitrophenol. It was formerly used as a yellow dye-stuff, but its importance lies in its application as an explosive (lyddite). At the outbreak of the World War it was most widely used for bursting charges in high-explosive shells, although it was gradually replaced by the more reliable and efficient trinitrotoluol (T.N.T.). Another high explosive, mainly used in the French army, is trinitro-meta-cresol, derived from one of the three cresols, the higher homologues of phenol. In chemical warfare chloropicrin, a compound made by chlorination and oxidation of picric acid or its salts by means of bleaching powder, has been used as a lachrymator, mostly in combination with stannic chloride. Picric acid has usefulness in an entirely different direction, namely as a substitute for "carron oil" for the dressing of burns, and in the treatment of skin diseases such as erysipelas and eczema.

To the non-chemist phenol, or carbollic acid as it is usually named in this connection, is mostly associated with its antiseptic and disinfectant properties. It is a strong germicide and parasiti-

cide. It now plays a much less important rôle in surgery than it did in the first days of antiseptics, and on account of its irritant action and the danger of absorption it has become unpopular even as a dressing or lotion after operation or injuries, when it may lead to gangrene, necessitating amputation. Although, therefore, in surgical practice it has been largely superseded by its derivatives and other substances, it is still used as a standard of germicidal efficacy for the comparison and evaluation of other disinfectants. Amongst antiseptics directly obtained from phenol may be mentioned:—tribromophenol (bromol), phenolsulphonic acid (aseptol), di-iodophenol-para-sulphonic acid (sozoiodol). Moreover it is also widely used, either by itself in aqueous solutions or in soaps, tooth-powders and similar preparations.

One of the most important phenol derivatives is salicylic acid (*q.v.*), produced from dry sodium phenate (phenoxide) and carbonic acid at 130°C, the sodium salicylate formed being acidified to produce the acid. It is used in therapeutics and as an intermediate for over 100 azo-dyes. It is a powerful food preservative, though condemned by health authorities and not permitted in some countries for this purpose. Some derivatives of phenol are used in perfumery, the most prominent of which is coumarin (*q.v.*) synthesized by way of salicylaldehyde. Phenol finds a quantitatively important and steadily growing application in the production of artificial resins and plastic materials made by its condensation with formaldehyde. (*See RESINS, SYNTHETIC.*) Several photographic developers, such as metol, ortol and rodinal, are obtained from phenol, as are also certain sensitizers of the photographic plate. By the hydrogenation of phenol with nickel as catalyst at a temperature of 160°–180°C cyclohexanol or hexaline is obtained, a solvent used for intensifying the detergent action of soaps, particularly in the textile industry.

**Physiological Properties.**—Carbolic acid has a pungent and, in very dilute solutions, a somewhat sweet taste. It coagulates the proteins of the tissues, and forms, when concentrated, a white opaque scar on the skin which becomes red and shiny and falls off after a few days, leaving a light brown stain for several weeks. It acts as a caustic, and causes irritation and necrosis of the mucous membranes and even in dilute solution produces local anaesthesia which lasts for many hours. It is found in urine, mostly coupled with sulphuric or glucuronic acid, principally formed in the liver. It is oxidized in the body to hydroquinone (quinol) and pyrocatechol, these products causing a green coloration of the urine. Carbolic acid is formed by degradation of proteins.

**Toxicology.**—Carbolic acid acts upon the central nervous system by absorption through the unbroken skin, the intestines, wounds or the respiratory organs. The larger portion of toxic doses is excreted, partly through the lungs, thus causing inflammation of the air passages and corrosion of the points of entry. It is a typical nerve poison acting first by exciting and then by paralyzing. Administered as a chronic poison it degenerates kidney and liver, but the effect varies for different individuals. The fatal dose may vary considerably, but is in the adult of the order of one gram when introduced into open wounds and eight grams when taken by the mouth. In the latter case the patient collapses, and the skin becomes cold and clammy. By paralysis of the respiratory organs, the breathing gets shallow, the patient dying in a state of coma.

As antidote in cases of carbolic acid poisoning soluble sulphates, such as sodium or magnesium sulphate, used to be administered. These have been found to be of little or no use, because the phenol does not combine with sulphates as such, but with organic sulphur while being oxidized to sulphuric acid in the body. The first treatment is the removal of the poison by the stomach tube followed by the thorough rinsing of the stomach with water to which 10% of alcohol has been added. Saccharated solution of lime is also recommended. When coma and collapse set in, the patient should be sustained by the external application of warmth and by such nerve stimulants as caffeine or strychnine; artificial respiration may eventually be used, although there is little prospect of resuscitation, where intoxication has advanced so far. (R. LE.)

**CARBOLOY:** *see* TOOL STEEL.

**CARBON,** a non-metallic element, is found in the free state

as diamond, graphite and as crude forms of the former (symbol C, atomic number 6, atomic weight 12.000); in combination it occurs in all animal and vegetable tissues, in coal and petroleum and (as carbonate) in many minerals such as chalk or limestone, dolomite, calcite, witherite, calamine and spathic iron ore; as carbon dioxide (*q.v.*) it occurs in the atmosphere. It is a solid which assumes different forms having widely different properties. The *diamond* has the highest specific gravity (3.52) of these, and its high refractive index (2.417 for sodium light) is responsible for its characteristic brilliance. Very small diamonds have been made artificially by causing carbon to crystallize from molten iron under very high pressures. (*See* H. Moissan, *The Electric Furnace*, 1904.) Genuine diamonds differ from "paste" imitations in being transparent to Röntgen rays. *Carbonado* and *bort* (*boart*) are "black diamonds"; they are diamonds with a small percentage of impurity, and therefore valueless as gems. *Graphite* is an extremely soft form of carbon of much lower density (ranging from 2.0 to 2.6; the purest is about 2.25); it is probably of organic origin as it usually contains about 1% of hydrogen. Carbon is deposited in this form when it condenses from the vapour state in the electric furnace or in the arc. The purest artificial graphite (Acheson) contains only 0.5% of ash and is produced in a furnace of fire-brick lined with carborundum (*q.v.*), the space between and around the carbon electrodes being filled with petroleum coke. Graphite differs from diamond in being a conductor of electricity. The heats of combustion of diamond and graphite are both very close to 94,000 calories per 12 grams, so that it is not certain which is the stable form at ordinary temperatures, but diamonds are converted into graphite at high temperatures under ordinary pressures. Diamond and graphite crystallize in the cubic and hexagonal systems respectively. Graphite is slowly attacked by mixtures of sulphuric acid with nitric acid, potassium chlorate or chromic acid, to give "graphitic acid" and finally mellitic acid,  $C_6(COOH)_6$ , whereas the diamond is unaffected by such treatment. Graphite (*q.v.*) is used in "lead" pencils, in polishes (as "black lead"), and as a lubricant for machinery.

Numerous varieties of carbon are classed as "amorphous" in contrast to the foregoing crystalline varieties; the commonest are lamp-black, gas carbon, animal charcoal, sugar charcoal and wood charcoal. They are formed by burning substances, from which they are named, in a limited supply of air. *Lamp-black* is thus formed from tars, resins, turpentine, etc., and is collected on blankets suspended in condensing chambers; even after further purification by heating in closed vessels, it still contains oily impurities; it is used in printers' ink, in paints and in calico printing. *Gas carbon* is produced in gas manufacture (*q.v.*) and collects on the walls of retorts; it is a very dense and fairly pure form of carbon and is used for the rods of arc lamps. *Coke* is the residue from gas retorts; specially designed retorts and processes are used for the production of the coke used in metallurgical operations. The *charcoals* are very porous, and consequently their specific gravity is apparently only about 0.25, but when the air is pumped out of the pores this becomes 1.4–1.9. *Sugar charcoal* is purified by heating in a current of hydrogen chloride, extraction with water, and further heating in a current of hydrogen until free from hydrogen chloride. *Animal charcoal*, from bones, horns, etc., contains only about 10% of carbon and about 80% of calcium phosphate; a purer form is obtained by calcining blood with potassium carbonate. Being very porous, it is used for decolorizing solutions (*e.g.*, of sugars) and for filtration of contaminated water. *Wood charcoal* is produced either by the wasteful process of slowly burning carefully stacked wood or by carbonizing it in retorts, in which case certain volatile products, such as acetone, wood spirit and pyroligneous acid are retained, and the last two are worked up for methyl alcohol and acetic acid respectively. Specially prepared blocks of wood charcoal are used in "blowpipe" analysis. (*See* CHEMISTRY: *Analytical*.) The absorptive powers of charcoals for gases are greatly improved by regulated heating, and are very pronounced at low temperatures. (*See* CHARCOAL.) All the varieties of amorphous carbon are readily attacked by the reagents mentioned in connection with graphite.

The specific heats of all varieties of carbon are abnormally low at ordinary temperatures, but become nearly normal at about  $1,000^{\circ}\text{C}$ ; that of diamond is only about half that of graphite at  $-50^{\circ}\text{C}$ , but they gradually become more nearly equal at higher temperatures; graphite and wood charcoal have nearly the same specific heats at ordinary temperatures.

Carbon volatilizes at  $3,600^{\circ}\text{C}$ . In the electric arc it unites with hydrogen to give acetylene,  $\text{C}_2\text{H}_2$  (M. Berthelot), but small proportions  $\text{H}_2$  of methane and ethane are also produced; at lower temperatures the conditions are more favourable for methane,  $\text{CH}_4$ , and W. A. Bone and H. F. Coward obtained almost quantitative yields of this gas from very pure carbon and hydrogen at  $1,200^{\circ}\text{C}$ . Carbon unites directly with fluorine to give the tetrafluoride,  $\text{CF}_4$ ; it burns in oxygen to give oxides; and when heated in sulphur vapour it gives carbon disulphide (*q.v.*). When heated with nitrogenous substances and alkaline carbonates, it gives cyanides (*q.v.*); and in the electric furnace it gives carbides (*q.v.*) with many elements, that with silicon being the abrasive carborundum (*q.v.*). (A. D. M.)

**CARBONADO**, a name given in Brazil to a dark massive form of impure diamond, known also as "carbonate" and in trade simply as carbon. It is sometimes called black diamond. Generally it is found in small masses of irregular polyhedral form, black, brown or dark-grey in colour, with a dull resinoid lustre; and breaking with a granular fracture, paler in colour, and in some cases much resembling that of fine-grained steel. Being slightly cellular, its specific gravity is rather less than that of crystallized diamond. It is found almost exclusively in the state of Bahia in Brazil, where it occurs in the *cascalho* or diamond-bearing gravel. Borneo also yields it in small quantity. Formerly of little or no value, it came into use on the introduction of diamond-drills (*see BORING*), and is now extremely valuable for mounting in the steel crowns used for diamond-boring.

**CARBONARI**, the members of certain secret revolutionary societies that played an active part in the history of Italy and France early in the 19th century. The Carbonari (Ital. "charcoal burners") gained importance in southern Italy during the reign of Joachim Murat (1808–15). They aimed at freeing the country from foreign rule and obtaining constitutional liberties, and were ready to support the Bourbons or Murat, if either had fulfilled these aspirations. Murat himself had at first protected them, especially when he was quarrelling with Napoleon, but later, some Carbonarist disorders having broken out in Calabria, Murat sent General Manhès against the rebels, and the movement was ruthlessly quelled in Sept. 1813. But Malghella, Murat's minister of police, continued secretly to protect the Carbonari and even to organize them, so that on the return of the Bourbons in 1815 King Ferdinand IV. found his kingdom swarming with them. The society comprised nobles, officers of the army, small landlords, government officials, peasants, and even priests. Its organization was curious and mysterious, and had a fantastic ritual. A lodge was called a *vendita* ("sale"), members saluted each other as *buoni cugini* ("good cousins"), God was the "Grand Master of the Universe," Christ the "Honorary Grand Master." Its red, blue, and black flag was the standard of revolution in Italy until substituted by the red, white, and green in 1831.

When King Ferdinand felt himself secure he determined to exterminate the Carbonari, and to this end his minister of police, the Prince of Canosa, set up another secret society called the *Calderai del Contrappeso* ("braziers of the counterpoise"), recruited from the brigands and the dregs of the people, who committed hideous excesses against supposed Liberals, but failed to exterminate the movement. On the contrary, Carbonarism flourished and spread to other parts of Italy. Among the foreigners who joined it for love of Italy was Lord Byron. The first rising promoted by the Carbonari was the Neapolitan revolution of 1820. Some regiments comprised many Carbonari, and on July 1 a military mutiny broke out at Monteforte, to the cry of "God, the King, and the Constitution." The troops sent against them sympathized with the mutineers, and the king, being powerless to resist, granted the Constitution (July 13), which he swore on the altar to observe. But the Carbonari were unable to carry on the

government and after the separatist revolt of Sicily had broken out the king obtained from the Emperor of Austria the loan of an army. Early in 1821 a force of 50,000 Austrians defeated the constitutionalists under General Pepe and the king dismissed parliament, and set to work to persecute the movement.

A similar movement broke out in Piedmont in March 1821. Here as in Naples the Carbonari comprised many men of rank, and they were more or less encouraged by Charles Albert, the heir-presumptive. The rising was crushed, and a number of the leaders were condemned to death or long terms of imprisonment, but most of them escaped.

The French revolution of 1830 had its echo in central Italy. In the papal states a society called the *Sanfedisti* or *Bande della Santa Fede* had been formed to counteract the Carbonari, and their behaviour and character resembled those of the *Calderai* of Naples. In 1831 Romagna and the Marches rose in rebellion and shook off the papal yoke with astonishing ease. At Parma and Modena the rulers were expelled by Carbonarist risings, but re-established by the Austrians, who occupied Romagna and restored the province to the Pope. Among those implicated in the Carbonarist movement was Louis Napoleon, although it does not appear that he ever actually became a Carbonaro. Even in after years, when he was ruling France as Napoleon III., he never quite forgot that he had once been a conspirator, a fact which influenced his Italian policy. The Carbonari, after these events, ceased to have much importance, their place being taken by the more energetic Young Italy Society presided over by Mazzini.

In France, Carbonarism began to take root about 1820. The example of the Spanish and Italian revolutions incited the French Carbonari, and risings occurred at Belfort, Thouars, La Rochelle and other towns in 1821, which were easily quelled. The Carbonarist lodges were centres of discontent until 1830, when, after contributing to the July revolution of that year, most of their members adhered to Louis Philippe's Government.

The Carbonarist movement undoubtedly played an important part in the Italian Risorgimento, and if it did not actively contribute to the wars and revolutions of 1848–49, 1859–60 and 1866, it prepared the way for those events.

**BIBLIOGRAPHY.**—Much information is given in R. M. Johnston's *Napoleonic Empire in Southern Italy* (1904) which contains a full bibl.; D. Spadoni's *Sette, cospirazioni, e cospiratori* (Turin, 1904), is an excellent monograph; *Memoirs of the Secret Societies of Southern Italy*, said to be by one Bertoldi or Bartholdy (London, 1821), Ital. transl. by A. M. Cavallotti (Rome, 1904); Saint-Edmé, *Constitution et organisation des Carbonari*; P. Colletta, *Storia del Reame di Napoli* (Florence, 1848); B. King, *A History of Italian Unity* (London, 1899), with bibliography. (L. V.)

**CARBONATED BEVERAGES:** *see* AERATED WATERS.

**CARBONATES.** (1) The metallic carbonates are the salts of carbonic acid,  $\text{H}_2\text{CO}_3$ . Many of them are white solids, but some, such as those of copper (blue or green) and nickel (green), possess colours which are characteristic of the metal concerned. Many are found as minerals, the more important of such naturally occurring carbonates being cerussite (lead carbonate,  $\text{PbCO}_3$ ), malachite and azurite (both basic copper carbonates), calamine (zinc carbonate,  $\text{ZnCO}_3$ ), witherite (barium carbonate,  $\text{BaCO}_3$ ), strontianite (strontium carbonate,  $\text{SrCO}_3$ ), calcite, and aragonite (calcium carbonate,  $\text{CaCO}_3$ ), dolomite (calcium magnesium carbonate,  $\text{CaCO}_3\cdot\text{MgCO}_3$ ); sodium "sesquicarbonate,"  $\text{Na}_2\text{CO}_3\cdot\text{NaHCO}_3\cdot 2\text{H}_2\text{O}$ , occurs as a deposit in African lakes and is called "trona." Most metals form carbonates (aluminium and chromium are exceptions), the alkali metals yielding both acid and normal carbonates of the types  $\text{MHCO}_3$  and  $\text{M}_2\text{CO}_3$  ( $\text{M}$ =one atom of a univalent metal); whilst bismuth, copper and magnesium appear only to form basic carbonates. The acid carbonates (bicarbonates) of the alkali metals can be prepared by saturating an aqueous solution of the alkaline hydroxide with carbon dioxide,  $\text{M}\cdot\text{OH} + \text{CO}_2 = \text{MHCO}_3$ , and from these acid salts the normal salts may be obtained by gentle heating, carbon dioxide and water being evolved at the same time,  $2\text{MHCO}_3 = \text{M}_2\text{CO}_3 + \text{H}_2\text{O} + \text{CO}_2$ . Most other carbonates are formed by precipitation of salts of the metals by means of alkaline carbonates. All carbonates, except those of the alkali metals and of thallium,

are insoluble in water, and the majority decompose when heated strongly, carbon dioxide being liberated and a residue of an oxide of the metal left. Carbonates of the heavy metals, as silver, yield the metal on strong ignition. Alkaline carbonates undergo a very slight decomposition, even at a very bright red heat. The carbonates are decomposed by mineral acids, with formation of the corresponding salt of the acid, and liberation of carbon dioxide. Many carbonates which are insoluble in water dissolve in water containing carbon dioxide, giving bicarbonates which cause "temporary" hardness (*see* CALCIUM). The individual carbonates are described under the various metals.

(2) The organic carbonates are the esters of carbonic acid,  $\text{H}_2\text{CO}_3$ , and of the unknown ortho-carbonic acid,  $\text{C}(\text{OH})_4$ . The acid esters of carbonic acid of the type  $\text{HO}\cdot\text{CO}\cdot\text{OR}$  are not known in the free state.

Potassium ethyl carbonate,  $\text{KO}\cdot\text{CO}\cdot\text{OC}_2\text{H}_5$ , is obtained in the form of pearly scales when carbon dioxide is passed into an alcoholic solution of potassium ethoxide,  $\text{CO}_2 + \text{KOC}_2\text{H}_5 = \text{KO}\cdot\text{CO}\cdot\text{OC}_2\text{H}_5$ . It is not very stable, water decomposing it into alcohol and the alkaline carbonate. The normal esters may be prepared by the action of silver carbonate on the alkyl iodides, or by the action of alcohols on the chlorocarbonic esters. These normal esters are colourless, pleasant-smelling liquids, which are readily soluble in water. They show all the reactions of esters, being readily hydrolyzed by caustic alkalis, and reacting with ammonia to produce carbamic esters and urea. Heating with phosphorus pentachloride eliminates an alkyl group and a chlorocarbonic ester is formed. Dimethyl carbonate,  $\text{CO}(\text{OCH}_3)_2$ , is a colourless liquid, which boils at  $90.6^\circ\text{C}$ , and is prepared by heating the methyl ester of chlorocarbonic acid with lead oxide. Diethyl carbonate,  $\text{CO}(\text{OH}_2\text{H}_5)_2$ , is a colourless liquid, which boils at  $125.8^\circ\text{C}$ ; its specific gravity is 0.978 ( $20^\circ\text{C}$ ). When it is heated to  $120^\circ\text{C}$  with sodium ethoxide it decomposes into ethyl ether and sodium ethyl carbonate.

Ortho-carbonic ester,  $\text{C}(\text{OC}_2\text{H}_5)_4$ , is formed by the action of sodium ethoxide on chloropicrin,  $\text{CCl}_3\text{NO}_2 + 4\text{C}_2\text{H}_5\text{ONa} = \text{C}(\text{OC}_2\text{H}_5)_4 + \text{NaNO}_2 + 3\text{NaCl}$ . It is an ethereal-smelling liquid, which boils at  $158\text{--}159^\circ\text{C}$ , and has a specific gravity of 0.925. When heated with ammonia it yields guanidine, and boiled with alcoholic potash it yields potassium carbonate.

Chlorocarbonic ester,  $\text{Cl}\cdot\text{CO}\cdot\text{OC}_2\text{H}_5$ , is formed by the addition of well-cooled absolute alcohol to phosgene (carbonyl chloride). It is a pungent-smelling liquid, which fumes strongly on exposure to air. It boils at  $93.1^\circ\text{C}$ , and has a specific gravity of 1.144 ( $15^\circ\text{C}$ ). When heated with ammonia it yields urethane. Sodium amalgam converts it into formic acid; with alcohol it yields the normal carbonic ester. It is easily broken down by many substances into ethyl chloride and carbon dioxide.

**Percarbonates.**—Barium percarbonate,  $\text{BaCO}_4$ , is a white solid obtained by passing an excess of carbon dioxide into water containing barium peroxide in suspension; it is fairly stable, and yields hydrogen peroxide when treated with acids. Two potassium percarbonates having the formula  $\text{K}_2\text{C}_2\text{O}_6$  are known. One is obtained by the electrolysis of a concentrated solution of the carbonate at  $-20^\circ\text{C}$ , and the other by the action of carbon dioxide on potassium peroxide; the former liberates iodine from a solution of potassium iodide without loss of oxygen:  $\text{K}_2\text{C}_2\text{O}_6 + 2\text{KI} = 2\text{K}_2\text{CO}_3 + \text{I}_2$ , but the latter suffers loss of a part of its oxygen in the same circumstances. Sodium carbonate is not sufficiently soluble to permit of percarbonates being made by the electrolytic method, but the other method gives rise to a number of percarbonates, *e.g.*,  $\text{Na}_2\text{C}_2\text{O}_6$ ,  $\text{Na}_2\text{CO}_4$ ,  $\text{Na}_2\text{CO}_5$ ,  $\text{NaHCO}_4$ . The first of these resembles the second type of potassium percarbonate. An attempt has been made to classify percarbonates according as they are (1) merely percarbonates with hydrogen peroxide in crystallization, (2) permonocarbonates, (3) perdicarbonates (compare persulphates; *see* SULPHUR). Percarbonates find their chief use in bleaching, and the potassium salt is used as "antihypo" in photography for eliminating excess of "hypo."

**CARBON COMPOUNDS.** The element carbon is remarkable for the number and variety of compounds to which it can give rise in combination with common elements such as hydrogen,

oxygen and nitrogen. Organic chemistry is defined as "the chemistry of carbon compounds," and a few of the vast number known (some hundreds of thousands) are described in that article and under individual headings; only some of the simplest are described here.

Three oxides of carbon are well defined, *viz.*, the suboxide  $\text{C}_3\text{O}_2$ , the monoxide (or carbonic oxide),  $\text{CO}$ , and the dioxide (or carbonic acid gas),  $\text{CO}_2$ ; other suboxides, such as mellitic anhydride,  $\text{C}_{12}\text{O}_9$ , have been described. *Carbon suboxide* is formed by the action of phosphoric oxide on malonic acid or its ethyl ester at  $300^\circ\text{C}$  under diminished pressure; the reaction is essentially one of dehydration:  $\text{CH}_2(\text{COOC}_2\text{H}_5)_2 = 2\text{C}_2\text{H}_4 + 2\text{H}_2\text{O} + \text{C}_3\text{O}_2$ , and the oxide has the properties to be expected of a ketene (*q.v.*), since it is probably  $\text{OC}:\text{C}:\text{CO}$ , and of an anhydride of malonic acid. Its composition is confirmed by explosion with oxygen, whereupon it gives the correct amount of carbon dioxide ( $\text{C}_3\text{O}_2 + 2\text{O}_2 = 3\text{CO}_2$ ), and by vapour-density determinations. It boils at  $7^\circ\text{C}$  and has a colourless, suffocating vapour. When kept in a sealed tube, it slowly undergoes polymerization (*q.v.*) to a dark red mass which is soluble in water.

Carbon monoxide and dioxide are produced simultaneously when carbon is burnt in oxygen (T. F. E. Rhead and R. V. Wheeler), the relative proportions depending upon the amount of oxygen and other conditions. They are both concerned in many balanced reactions of great industrial importance; thus, in metallurgical processes and producer-gas the equilibrium  $\text{CO}_2 + \text{C} \rightleftharpoons 2\text{CO}$  is often involved, and under atmospheric pressure this is largely in favour of the monoxide, which constitutes 99% of the gas at  $950^\circ\text{C}$  and 94% at  $850^\circ\text{C}$ ; increased pressure tends to increase the proportion of the dioxide. With steam and hydrogen, as in the "water-gas" equilibrium, both oxides are involved:  $\text{CO} + \text{H}_2\text{O} \rightleftharpoons \text{CO}_2 + \text{H}_2$ ; at  $400^\circ\text{C}$  the dioxide and hydrogen predominate largely, but above  $830^\circ\text{C}$  the other pair predominates; this equilibrium is theoretically independent of the pressure. A knowledge of these equilibria (for the fundamental principles of which reference should be made to the articles CHEMICAL ACTION and CHEMISTRY: *Physical*) is necessary in dealing with the production of these two oxides now to be described.

*Carbon monoxide* is found in volcanic gases and is a constituent (6–12%) of ordinary coal-gas. It was first prepared by J. M. F. Lassone (1776) by heating zinc oxide and carbon, and was considered to be identical with hydrogen, but W. Cruikshank (1800) and F. Clément and J. B. Désormes (1801) showed it to contain only carbon and oxygen, and J. Dalton (1803) showed that it had only half as much of the latter as carbon dioxide. It may be prepared by passing carbon dioxide over red-hot carbon (*see* above) or red-hot iron; by heating many metallic oxides with carbon; by heating formic or oxalic acid or their salts with sulphuric acid (in the case of oxalic acid an equal volume of dioxide is produced); or best, by heating potassium ferrocyanide with a large volume of concentrated sulphuric acid:  $\text{K}_4\text{Fe}(\text{CN})_6 + 8\text{H}_2\text{SO}_4 + 6\text{H}_2\text{O} = 4\text{KHSO}_4 + \text{FeSO}_4 + 3(\text{NH}_4)_2\text{SO}_4 + 6\text{CO}$ . It is a colourless, odourless gas of density 0.967 (air=1), and is not easily liquefied; its critical temperature is  $-139.5^\circ\text{C}$  and its critical pressure 35.5 atmospheres; its boiling point is  $-190^\circ\text{C}$  and its melting point  $-200^\circ\text{C}$ ; it is only very slightly soluble in water. In all these and many other physical properties it shows an extremely close resemblance to nitrogen—a matter of interest in view of the electronic structure of the two molecules. Carbon monoxide burns with a well-known pale blue flame, giving the dioxide, but its burning is greatly retarded in dry air. It is very poisonous, uniting with the haemoglobin of the blood to give carboxyhaemoglobin, which has a characteristic absorption spectrum capable of detecting minute traces of the gas. It combines directly with heated alkaline hydroxides (or soda-lime) to give formates ( $\text{KOH} + \text{CO} = \text{H}\cdot\text{COOK}$ ), and with chlorine to give carbonyl chloride (*see* below). Under high pressures and with a suitable catalyst, it combines with hydrogen to give alcohols (*see* ALCOHOLS; PRESSURE CHEMISTRY) a reaction of increasing importance. It unites with many metals (*e.g.*, nickel, iron, cobalt, molybdenum and ruthenium) to give carbonyls (*q.v.*), that of nickel,  $\text{Ni}(\text{CO})_4$ , being used in the manufacture of the pure metal; potassium carbonyl,

$K_6(CO)_6$ , at times formed in heating the carbonate with coke, as well as by direct union, is explosive and is of a different type, being a benzene derivative. Carbon monoxide is a powerful reducing reagent, and its reduction of iodine pentoxide to iodine is utilized in detecting and estimating minute quantities of the gas in air; it is absorbed by ammoniacal or hydrochloric acid solutions of cuprous chloride (colourless crystals of the resulting compound,  $CuCl \cdot CO \cdot 2H_2O$ , may be obtained), and this reaction is used in gas analysis. For a series of interesting syntheses from carbon monoxide and various other gases and vapours in the silent electric discharge, see S. M. Losanitsch and M. Z. Jovanitschitsch, *Berichte*, 1897, 30, p. 135.

**Carbon dioxide**, first discovered by Van Helmont (1577–1644) in the products of combustion and fermentation, was called *gas sylvestre*, and later J. Black called it “fixed air,” owing to its being a constituent of carbonated alkalis. A. L. Lavoisier (1781–1788) demonstrated its nature by burning carbon in oxygen. It is a regular component of the atmosphere (normally 3 volumes per 10,000), and is found in mineral waters, volcanic gases, certain grottos near Naples, and in the Poison Valley, Java. It occurs as carbonate in many minerals (see CARBONATES). It may be prepared by burning carbon in excess of air or oxygen, by heating many carbonates, such as chalk, or bicarbonates or by the action of acids on these:  $M_2CO_3 + 2HCl = 2MCl + H_2O + CO_2$ . It is formed in the process of respiration, in the combustion of all carboniferous material, and in fermentation, much of the liquid carbon dioxide of commerce being derived from breweries.

It is a colourless gas, possessing a faint pungent smell and a slightly acid taste. It does not burn and does not ordinarily support combustion, but burning magnesium or alkali metals will continue to burn in it, giving oxides and liberating carbon. It is 1.529 times heavier than air, and only requires a pressure of 35 atmospheres to liquefy it at  $0^\circ C$ . Its critical temperature and pressure are  $31^\circ C$  and 72.9 atmos.; the liquid freezes at  $-56^\circ C$  under 5 atmos., and the solid sublimates at  $-79^\circ C$  under atmospheric pressure. The solid “snow” is used in the treatment of warts and other skin troubles. At  $0^\circ C$  1 volume of water dissolves 1.79 volumes of the gas (0.33%), and it is twice as soluble in alcohol. The physical properties of carbon dioxide display a remarkable resemblance to those of nitrous oxide (compare carbon monoxide and nitrogen, above). The aqueous solution is very feebly acidic, owing to the presence of a small proportion of carbonic acid,  $H_2CO_3$ ; solutions of caustic alkalis absorb the gas readily to give carbonates (*q.v.*) and ultimately bicarbonates. With lime- or baryta-water the gas gives a white precipitate of the corresponding carbonate, and these reactions are used in the detection and estimation of the gas. Carbon dioxide and ammonia gases unite to give ammonium carbamate,  $NH_2 \cdot COONH_4$  (see AMMONIA). If passed over moist sodium, carbon dioxide converts it to sodium oxalate,  $Na_2C_2O_4$ . At high temperatures, carbon dioxide dissociates slightly:  $2CO_2 \rightleftharpoons 2CO + O_2$ ; under atmospheric pressure only 0.1% is thus decomposed at  $1,300^\circ C$ , but about 40% at  $3,000^\circ C$ . Plants absorb carbon dioxide from the air and utilize the carbon in “photosynthesis” in virtue of the light-energy transmitted by the chlorophyll. Industrially, carbon dioxide is used in the manufacture of soda by the Solvay process (see ALKALI INDUSTRY), in the sugar industry, in the manufacture of mineral waters and in making artificial ice.

**Carbonyl chloride** (phosgene),  $COCl_2$ , is produced by the direct union of carbon monoxide and chlorine in sunlight, but in practice charcoal is used as a catalyst; it may also be prepared by heating carbon tetrachloride with fuming sulphuric acid:

It is a colourless, poisonous gas with an unpleasant, pungent smell, and it decomposes rapidly with water:  $COCl_2 + H_2O = 2HCl + CO_2$ ; it was used on a large scale in the World War, and has a characteristic action on the heart. It has a vapour density of 3.46 (air=1) and may be condensed to a liquid (specific gravity 1.43 at  $0^\circ C$ ) which boils at  $8^\circ C$ , and to a solid of melting point  $-127^\circ C$ ; it is readily soluble in toluene and is often stored in this way; it is decomposed by heat, the equilibrium  $COCl_2$

$\rightleftharpoons CO + Cl_2$  being equally distributed at  $450^\circ C$  and entirely to the right at  $800^\circ C$  under ordinary pressure. It reacts with alcohols to form chlorocarbonic (or chloroformic) esters or carbonates, according to which of the reactants is in excess, and with ammonia to give urea (*q.v.*). It is used commercially in the manufacture of Michler's ketone (a starting point for certain dyes) and benzophenone (*q.v.*). **Carbonyl bromide** is also known.

**Carbon tetrachloride**,  $CCl_4$ , is best prepared by passing chlorine into carbon disulphide containing a little iodine or antimony pentachloride as a “carrier”; it boils at  $76^\circ C$ , and has a specific gravity of 1.595 at  $0^\circ C$ . Its chief uses are as a fire-extinguisher, as a solvent and in dry-cleaning; its use as a hair-wash is dangerous. The **tetrabromide** and **tetraiodide** are also known. The **tetrafluoride** is the only one of the four that can be produced by direct combination of the elements; the lighter forms of charcoal inflame spontaneously in fluorine, but the denser forms have to be heated somewhat; it boils at  $-15^\circ C$  under atmospheric pressure.

**Carbon oxysulphide**,  $COS$ , can be produced by direct union of the monoxide with sulphur, or from the interaction of sulphur trioxide and carbon disulphide at  $100^\circ C$ ; it is better produced by decomposing ammonium thiocarbonate by hydrochloric acid; the only impurities are carbon dioxide and hydrogen sulphide, which are easily removed (A. Stock). The colourless and odourless gas can be liquefied at  $-47^\circ C$ ; it burns with a blue flame, is decomposed by heat, and dissolves in water to give a solution which slowly decomposes to carbon dioxide and sulphuretted hydrogen; dissolution in caustic alkalis gives sulphides and carbonates:  $COS + 4KOH = K_2CO_3 + K_2S + 2H_2O$ . (A. D. M.)

**CARBONDALE**, a city of Jackson county, Illinois, U.S.A., 80m. S.E. of St. Louis; on Federal highway 51, and served by the Illinois Central railway system. The population in 1920 was 6,267, and was 7,528 in 1930 by the Federal census. It is an important coal-mining region, as the name intimates, and peaches, apples and other fruits are grown extensively. The city is a railway division point, and has a tie-manufacturing plant and other industries. It is the seat of the Southern Illinois State Normal university (established in 1874), which has an enrolment of over 3,000.

**CARBONDALE**, a city in the anthracite fields of Lackawanna county (Pa.), U.S.A., amid beautiful mountain scenery near the upper end of the Lackawanna river valley, 16m. N.E. of Scranton. It is on Federal highway 106 and is served by the Delaware and Hudson, the Erie and the New York, Ontario and Western railways. The population in 1920 was 18,640, 2,813 foreign-born white; 1930, 20,061. Its primary industry is coal-mining, but it also has railway shops, tanneries and manufactures of silk, cut-glass, boilers, tanks and chemicals. The output of its factories in 1925 was valued at \$4,240,419. Carbondale was settled in 1824 and was chartered as a city in 1851.

**CARBON DIOXIDE**, a colourless gas at ordinary temperatures. It is found to be the most common oxide (*q.v.*) of carbon and is one of the usual products of combustion (*q.v.*) of all carbon compounds; it is the chief constituent of the breath exhaled by animals (see RESPIRATION). Commercially it is used extensively in the manufacture of aerated waters (*q.v.*). Solid carbon dioxide (the so-called carbonic acid snow) is used as a freezing agent, alone or in conjunction with ether (*q.v.*). (See also CARBON and LIQUEFACTION OF GASES.)

**CARBON DISULPHIDE**, carbon bisulphide or thiocarbonic anhydride, a chemical product first discovered in 1796 by W. A. Lampadius, who obtained it by heating a mixture of charcoal and pyrites. Carbon disulphide,  $CS_2$ , may be more conveniently prepared by passing the vapour of sulphur over red hot charcoal, the uncondensed gases so produced being led into a tower containing plates over which a vegetable oil is allowed to flow in order to absorb any carbon disulphide vapour, and then into a second tower containing lime, which absorbs any sulphuretted hydrogen. The crude product is very impure and possesses an offensive smell; it may be purified by forcing a fine spray of lime water through the liquid until the escaping water is quite clear, the washed disulphide being then mixed with a little colourless fat and distilled at a low temperature. Carbon disulphide is manufactured on a considerable scale. An

electric furnace built of fire-proof stone is heated by four insulated electrodes situated in the base of the hearth; the shaft is filled from above with charcoal, the sulphur is introduced at the side of the hearth and passes in a molten state through annular canals into the reaction zone, where it is vaporized into the charcoal mass. The crude product is purified by treatment with milk of lime and vegetable fats and by repeated distillation. Final purification for chemical purposes is effected by distillation over mercury and by drying over calcium chloride.

When quite pure, carbon disulphide is a colourless, somewhat pleasant smelling, highly refractive liquid, of specific gravity 1.2661 ( $18^{\circ}/4^{\circ}$ ) (J. W. Brühl) or 1.29215 ( $0^{\circ}/4^{\circ}$ ) (T. E. Thorpe). As generally met, however, it has a fetid odour, owing to the presence of small quantities of powerfully evil-smelling organic sulphur compounds. It boils at  $46.25^{\circ}$  C. and solidifies at  $-116^{\circ}$  C., melting at  $113^{\circ}$  C. Its critical temperature is  $277.7^{\circ}$  C., and its critical pressure is 78.1 atmos. It is very volatile, the vapour being heavy and dangerously inflammable. It burns with a pale blue flame to form carbon dioxide and sulphur dioxide, this change being also produced by oxidizing agents. It is almost insoluble in water, but mixes in all proportions with absolute alcohol, ether, benzene and various oils. It is a good solvent for sulphur, phosphorus, iodine, waxes, vegetable and animal fats and oils. A mixture of carbon disulphide vapour and nitric oxide burns with a very intense blue-coloured flame, which, being very rich in the violet or actinic rays, is sometimes employed photographically. Zinc and hydrochloric acid reduce it to tri-thioformaldehyde ( $\text{CH}_2\text{S}$ )<sub>3</sub>. When treated with chlorine in presence of an iron catalyst it yields carbon tetrachloride and sulphur chloride, and when passed over sodamide it yields ammonium thiocyanate. A mixture of carbon disulphide vapour and sulphuretted hydrogen, when passed over heated copper produces methane.

By the action of aqueous alkalis, carbon disulphide is converted into a mixture of an alkaline carbonate and an alkaline thiocarbonate,  $6\text{KHO} + 3\text{CS}_2 = \text{K}_2\text{CO}_3 + 2\text{K}_2\text{CS}_3 + 3\text{H}_2\text{O}$ ; alcoholic caustic alkali, on the other hand, converts it into a xanthate,

Carbon disulphide is used in the manufacture of viscose (artificial silk), as a solvent for oils, fats, resins and caoutchouc, as a germicide, and as an insecticide. It is also the starting point in the manufacture of carbon tetrachloride, ammonium thiocyanate, thiourea and thiourea formaldehyde resins.

**Carbon monosulphide**, CS, is formed when a silent electric discharge is passed through a mixture of carbon disulphide vapour and hydrogen or carbon monoxide. A polymerized form (CS)<sub>x</sub> is obtained by the action of nickel carbonyl on thiocarbonyl chloride.

**Carbon subsulphide**, C<sub>3</sub>S<sub>2</sub>, a red liquid, is produced by striking an electric arc under carbon disulphide between a carbon cathode and a carbon-antimony anode.

**CARBONIC ACID**, the acid assumed to be formed when carbon dioxide is dissolved in water (formula,  $\text{H}_2\text{CO}_3$ ); its salts are termed carbonates. The name is also given to the neutral carbon dioxide from its power of forming salts with oxides, and on account of the acid nature of its solution; and, although not systematic, this use of the term is very common.

**CARBONIC ACID SNOW**. Carbon dioxide under heavy pressure in cylinders is allowed to escape into a suitable cylindrical receptacle the diameter of which varies according to the size of the lesion to be treated. A semi-solid snow is formed and this can be compressed into a pencil. The pencil, covered with a towel or cotton wool to protect the operator's hands, is cut to a suitable size and then applied to the lesion, such as a naevus, port-wine stain or lupus patch. If the lesion be small, the pencil should cover the whole of it when pressed down; if large, an area about one inch in diameter should be treated at a time. Each application of the pencil should last from about half a minute to one minute.

**CARBONIFEROUS SYSTEM**, in geology, the whole of the great series of stratified rocks and associated volcanic rocks which occur above the Devonian and below the Permian sys-

tems. The period of time during which these rocks were accumulated is known as the Carboniferous period, and forms the last and most important of the major Palaeozoic systems. During this period were deposited the thick coal-bearing strata, which are of such great economic importance in many countries of the Northern Hemisphere; and this system of rocks, first referred to as "Carboniferous" in England and Wales, has been widely recognized by its fossils and by the similarity of its deposits in Europe, Asia, northern Africa and North America, and in small isolated areas in the Southern Hemisphere. Similar deposits of a slightly later date, usually referred to in England as Permo-Carboniferous, occur in India, the Urals, North America, South Africa and Australasia. By American geologists these deposits are, however, now referred to the Permian.

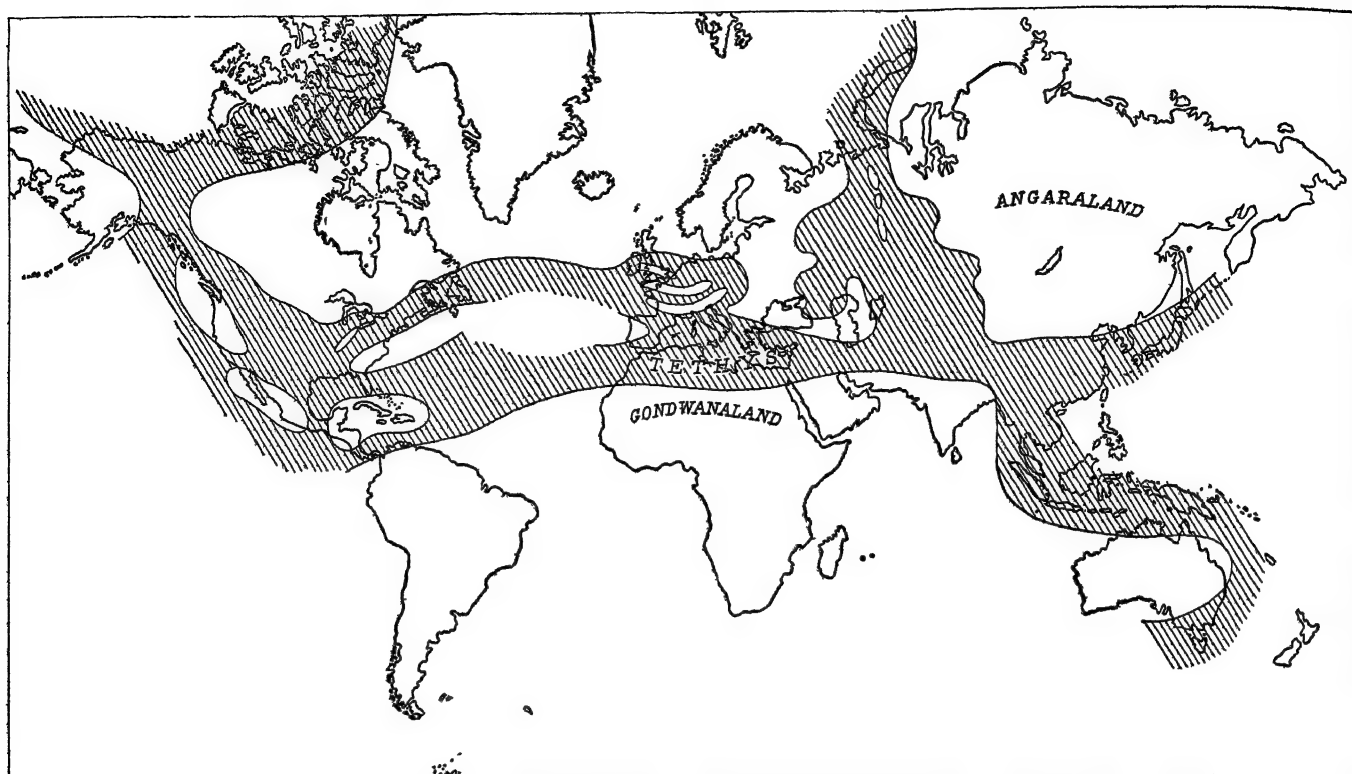

As typically developed in England and Wales, the Carboniferous period opens with marine conditions, at first localized and confined to small areas, but later spreading and covering the greater part both of the north and south of the country. At the bottom of this sea or seas were laid down a varied series of sediments, mainly calcareous, but including a considerable amount of detrital matter in the north. This initial period, predominantly marine, is usually termed Lower Carboniferous, and includes but few workable coal-seams, the rocks being termed "Mountain Limestone" or "Shales with Limestone" according to their character. These marine conditions were succeeded by detrital deposits, consisting of sandstone, often feldspathic and more or less coarse in grain, with intercalated shales containing marine faunas. These rocks are generally referred to as the "Millstone Grit Series," and form the lower part of the Upper Carboniferous. Succeeding these beds occurs a third great group of rocks, the "Coal Measures," which consist of sandstones, shales and coal-seams, with marls occurring in the highest portion of the sequence.

Thus as typically developed in the Midlands of England, there is a sequence easily divisible into three parts:—

|                                |        |   |
|--------------------------------|--------|---|
| Coal Measures                  | Upper  | Red and grey sandstones; marls and clays with occasional breccias; thin coals and limestones with <i>Spirorbis</i> ; workable coals in the South Wales, Bristol, Somerset and Forest of Dean coalfields.  |
|                                | Middle | Sandstones, marls, shales and the most important of the British coals.  |
|                                | Lower  | Flaggy hard sandstones (ganister), shales and thin coal-seams.  |
| Millstone Grit                 |        | Grits (coarse and fine), shales, thin coal-seams and occasional thin limestones. The shales contain bands with marine fossils (goniatites and thin-shelled lamellibranches).  |
| Carboniferous Limestone Series |        | A complex assemblage of beds, largely calcareous, but varying much according to locality. The uppermost beds (Goredale series) present only in the north and in Gower, exhibit a rhythmical succession of sandstones, limestones and shales. The lower beds are more dominantly calcareous, and the basement beds are seen only in the south. A distinct facies with goniatites occurs in Craven and in Devonshire and is closely allied to the Continental Culm. |

The calcareous Lower Carboniferous rocks of England exhibit considerable changes of facies, accompanied by more or less distinct faunas. These may be grouped as:—

- (1) Standard limestones and shales with fauna of brachiopods and corals.
- (2) Knoll-reef limestones, more or less imbedded, with a rich fauna of brachiopods, lamellibranches and occasionally goniatites.
- (3) Thinly bedded dark argillaceous cherty limestones and shales with abundant crinoids, zaphrentid and cyathaxonid corals, and brachiopods such as *Schizophoria resupinata*.
- (4) Calcareous shales with occasional thin limestone bands and bullions, containing a *Posidonomya* and goniatite fauna (Bowland shales).
- (5) Cherty shales with radiolaria (Devonshire and West-phalia).
- (6) Algal, oolitic and dolomitic limestones, with bryozoa (lagoon phase of Dixon).

MAP OF THE WORLD DURING LOWER CARBONIFEROUS PERIOD

The shaded area was occupied by seas, of which Tethys was the southern sea, during the Lower Carboniferous period. In Western Europe and Eastern North America this area became land in the Upper Carboniferous period, and here are to be found the great European and American coal fields

In the north of England the standard limestone phase, whilst persisting later than in the south and midlands, became invaded by intercalations of detrital deposits (shales and sandstones), forming the Yoredale series. This series is splendidly developed in Wensleydale, Swaledale and Teesdale, and in its upper part, above the Main Limestone, becomes dominantly detrital in character, passing up into the overlying Millstone Grit, with a slight stratigraphical break at the junction. The three main stratigraphical divisions represent fairly accurately the major phases of the Carboniferous system as developed in England, whilst leaving room for debate as to the position of the boundaries between these divisions. Taken as a whole, the system broadly shows us a complete cycle of deposits between the Old Red Sandstone and the upper red beds of the Coal Measures.

On commencing to trace the Carboniferous deposits away from England and Wales, it is found that the lithological character of the deposits affords but an uncertain guide, and recourse has to be had to fossils (whether of animals or plants), as a guide to relative age and position. Nevertheless, using these aids to correlation it is found that considerable tracts of the earth's surface were evidently connected either as seas or land areas, often surprisingly uniform in the character of their deposits. In western Europe there is no sharp line of demarcation between the Devonian and the Carboniferous rocks; neither can the fossil faunas and floras be clearly separated at any well-defined line; this is true in Britain, Belgium, Russia and Westphalia. Again at the summit of the Carboniferous series, as in Russia, Bohemia, the Saar region and Texas, both the rocks and their fossil contents merge gradually into those of the succeeding Permian system.

American geologists elevate the Upper and Lower Carboniferous into distinct systems—the Pennsylvanian and Mississippian respectively. Further they group the Mississippian with the Devonian, and the Pennsylvanian with the Permian, restricting the term Carboniferous to the latter group. Having regard to the wide-spread unconformity which exists in North America between the Mississippian and Pennsylvanian, this is understandable, but no such wide-spread or prolonged break is known in Europe.

In Europe the Lower Carboniferous (Dinantian or Avonian) is generally divided into two divisions, an older termed the Tournaisian, and a younger termed the Viséan, and one or both of these divisions have been recognized also in Asia and north Africa. Similarly in North America the Lower Carboniferous (Mississippian) has been divided into two stages, an earlier termed the Waverlian, and a younger termed the Tennessean.

In England and in Europe generally the Tournaisian seas were local and inhabited by varied faunas, rendering correlation frequently difficult, as for instance in the correlation of the lower beds of Cumberland and Westmoreland with those of the Bristol and Belgian basins. The Viséan sea, on the other hand, in Europe and especially in England and Scotland, occupied much wider areas than that of the Tournaisian period, and the fauna became more generally diffused. The separation of Viséan from Tournaisian in western Europe is based almost entirely on faunal evidence, there being few marked breaks in marine sedimentation.

In North America the conditions during the Lower Carboniferous period, whilst generally marine over large tracts of the present United States, appear otherwise to have been largely the reverse of those prevalent in Europe. The Waverlian (Tournaisian) seas spread over great areas of the North American continent, estimated by Schuchert at its maximum at 26% of the present continental area. The Tennessean (Viséan) seas, on the other hand, appear to have been comparatively restricted in North America, with a maximum submergence of 12% of the continent. Coupled with this marked reversal of European conditions there were of course wide-spread physiographical changes in North America at the junction of the Waverlian and Tennessean, as well as the more important break in the eastern part of the continent at the top of the Tennessean.

Various attempts have been made to establish a uniform table of major subdivisions of the Carboniferous period, based on changes in the fossil fauna and flora. These have been locally successful, but no one group of organisms was sufficiently wide-spread for its component species to be of use as zonal indices throughout the period or in all areas. As a result, any complete zonal scheme is largely a patchwork of more or less overlapping

divisions. The following main divisions are generally recognized throughout Europe:—

- (5) Stephanian (or Uralian).
- (4) Westphalian (or Moscovian).
- (3) Lancastrian (or Namurian, or Lanarkian).
- (2) Viséan.
- (1) Tournaisian.

#### PALAEOGRAPHY AND STRATIGRAPHY

**Tournaisian.**—The Carboniferous period opened in western Europe with the northward advance of the pre-existing Devonian seas over the old Devonian land surface. In England and Wales, so far as is known, comparatively little of the present land area was submerged. The bulk if not the whole of Scotland either remained dry land or was occupied by fresh water, and was the scene around Edinburgh of vigorous volcanic activity. In the south-west of England and in southern Wales the sea rapidly advanced to the southern edge of the ancient land mass of central England, and formed extensive deposits first of shales and then of crinoidal and dolomitic limestones extending from southern Wales through the Bristol area and across the English channel into Belgium. The age of the thin deposits of culm shales and radiolarian cherts found in Devonshire and Westphalia is rather uncertain, although it is presumed that part at any rate of these beds correspond in age with the more normal Tournaisian beds with a brachiopod and coral fauna found in Belgium and Somerset. In northern England the middle and upper parts of the Tournaisian, although with a somewhat different fauna, have been found in the Lake District and in the Craven Lowlands of Yorkshire, but the Tournaisian is absent in northern Yorkshire and Durham, Derbyshire and northern Wales. Towards the close of the period occurred a considerable local development of knoll-reef (unstratified) shelly limestones (Waulsortian phase), seen as Waulsort in Belgium, Co. Clare and St. Douglahs (Ireland) and Clitheroe (Lancs.). The Tournaisian zones formulated by Vaughan, based on corals and brachiopods, are generally recognized, and include:—

- |                |   |
|----------------|---|
| C <sub>1</sub> | Marked by abundance of <i>Caninia</i> in specialized forms.   |
| Z              | Marked by special brachiopods and zaphrentid corals. The equivalent beds in the Craven area of Yorkshire-Lancashire are only feebly fossiliferous, and the horizons have not yet been determined in detail. |
| K              |   |

In Ireland the basement shales and lower limestones of Cos. Clare and Sligo are of this age.

In western Europe the Tournaisian period is represented in its type locality the Tournai region of Belgium, but the unfossiliferous character of much of the Kieselskalk and Kieselschiefer of Westphalia makes the occurrence of beds of Tournaisian age in western Germany somewhat uncertain, unless one includes in the Tournaisian the beds with *Protocanites* at the extreme base of the Westphalian Carboniferous sequence. The exact correlation of the *Pericyclus* zones of Dr. H. Schmidt with the coral zones of Vaughan has not yet been accomplished.

The southern sea (the ancient *Tethys*) whose northern waters washed the southern part of central England in the Tournaisian period (with narrow gulfs extending farther north to Cumberland and Craven) is thus traceable by its deposits only obscurely through Germany towards Silesia. Marine deposits of this age reappear in central Russia (Kaluga), in the Urals and in the Kuznetzk coal-field in Siberia. Beds of this age may be present both in China and Japan, but their provenance appears doubtful.

In North America, according to Schuchert, "the submergence of Waverlian time began first in the Gulf States and along the western side of the Cincinnati uplift. At this early stage of the inundation the seas were small in extent, but in Middle Kinderhookian time the waterways were greatly expanded. The most striking change of the time, however, was the reappearance of the Cordillerian sea, depositing far and wide throughout the Rocky Mountains a great mass of limestones. . . . This Cordillerian sea . . . probably extended into the Arctic ocean." At the same period detrital deposits were being accumulated east and north of the Cincinnati uplift in the States of Ohio, Michigan and Pennsyl-

vania, with freshwater beds in the east (Pocono series). In New Brunswick and Nova Scotia were deposited the arkoses and sandstones of the Horton and Albert formations.

No definite records of a Tournaisian fauna from the Southern Hemisphere appear yet to have been made.

So far as west European waters were concerned the sea life of this period appears to have consisted mainly of corals such as *Caninia* and *Zaphrentis*, brachiopods of the type of *Productus burlingtonensis* and *Spirifer konincki* and crinoids. Goniatites were rare and local, being confined to the *Protocanites* beds at the extreme base in Westphalia and isolated occurrences of a *Pericyclus* fauna as at St. Douglahs near Dublin. There appears to have been a similar scarcity of goniatites in North America, and they are unknown in the southern hemisphere.

**Viséan.**—The Viséan sea spread over the whole of England and Wales with the exception of the central block of Archaean rocks extending from the centre of Wales through the Midlands towards Brabant. It thus overlapped the shores of the Tournaisian sea in most areas, spreading over the flat shelf of northern Yorkshire, Durham and so into the Northumbrian and Scottish basins. The influence of a land mass to the north and northwest was reflected in the predominantly detrital character of the beds in Northumberland and Scotland, but in Yorkshire and even more markedly in Derbyshire and northern Wales a great thickness of pure limestone accumulated. The Tournaisian genera of corals and brachiopods continued in existence, and new coral genera such as *Clisiophyllum* and *Lithostrotion* made their appearance. The productids reached their acme in such forms as *Productus giganteus* and *P. maximus*, and marine life in the upper portion (D<sub>2</sub>) was exceptionally abundant. The freer communication of the seaways rendered the fauna less local, but correlation in many places has been made difficult by the striking changes of facies in lithology and fauna. Of these facies the most important and striking undoubtedly is that seen in the Craven Lowlands. Here, around Clitheroe and Skipton, the lithology consists in the main of calcareous shales (Bowland Shales) with local developments of cherty limestones (Pendleside Limestone), and the fauna, analogous to that of the German and Devonshire Culm, consists of goniatites and *Posidonomya*. The goniatites form delicate zonal indices and spread far and wide through Europe, northern Africa and the central States of North America (Oklahoma, etc.). Presumably these forms were free-swimming at some stage of their individual ontogeny, but they seem to have had very definite limiting conditions, for the main genera are unknown in Durham, Northumberland and Scotland. This curious restriction may have been due to lack of suitable food or low temperature of the northern waters. The change in facies of the marine fauna is well seen in the Craven Fault area of Yorkshire, where the alteration is striking and abrupt, it being far easier to correlate the fossils of the Skipton area with those of the same facies in Oklahoma than it is to correlate them with the fossils of the same age only a few miles north in the Yorkshire Dale country.

In southern Wales and Somerset the limestone sequence is more or less truncated at the top, there being no representative of the Yoredale Series except in Gower.

In Belgium the development is very similar to that of the coral-brachiopod facies of England, but in Westphalia the period commences with cherty shales and limestones and changes to fossiliferous platy limestones with a goniatite and *Posidonomya* fauna. Farther east, around Brilon, the beds are more shaly and reminiscent of the Bowland Shales. In Silesia the beds of this age included shales and conglomeratic sandstones of enormous thickness, with a flora of Lower Carboniferous type and occasional goniatites and *Posidonomya*.

In Scotland the Lowland area (Ayrshire to Fifeshire) was still occupied by fresh water or an estuary, in which was laid down the Calcareous Sandstone Series and Oil Shale Group. Succeeding these beds occur the Lower Limestone Group of Scotland, which consists of a series of thin marine limestones with thick intercalated shales and sandstones, approximately equivalent in age to the uppermost Viséan. The whole group thickens greatly eastward, attaining a maximum thickness in Fifeshire.

In Northumberland the sequence is similar to the Scottish one, and has been divided into a lower part (Tuedian) and an upper part (Bernician). The Tuedian consists of the Cementstone Group and Fell Sandstone Series of uncertain age, succeeded by a Coal Measure phase in the Lower Bernician. Succeeding this occurs the Upper Bernician with occasional thin limestones corresponding to the Yoredale limestones, and representing the upper Viséan.

Ireland was largely occupied by sea during this period, but the faunal sequence and correlation has not yet been worked out except on the east coast near Dublin and in Co. Clare. Exposures at Great Ormes Head in northern Wales and in the south of the Isle of Man serve to connect the English Midland Province with the Irish sequence.

Seas of this period extended through Russia and Siberia to China and Japan and contained the same coral and brachiopod assemblage of fossils, which appeared again in the west of North America. A similar fauna is found in the Burindi Series of New South Wales. Towards the close of the period the localized abundance of goniatites formed the most striking feature in the generally luxuriant marine life. The segregation of this goniatite and *Posidonomya* fauna into well-defined areas free from the Productid and coral fauna, is one of the most striking and curious features in Carboniferous oecology. It is clear that the separation of the two faunas was effected without recourse to any serious diastrophic movements such as the Poseidon Deep suggested by Schuchert to account for the differences in the American and European faunas. Indeed, the existence of such a Deep appears to be negated by the identity of the Caney Shale fauna of Oklahoma and the Bowland Shale fauna of Craven, coupled as it may be with the close similarity of the Nebraskan and Scottish lamellibranchs a little later. The goniatite fauna, abundantly preserved in Craven and probably in Ireland, in Belgium and Westphalia, and less abundantly in Silesia, occurs also in the Pyrenees, in northern Africa, and with traces as far east as Siam, and reappears in great force in Oklahoma and the adjoining states of North America. It has not yet been recorded from the Southern Hemisphere.

In North America the sediments of this period were less extensive than in the Tournaisian period. They consist in the Central Interior area (of the United States of America) of limestones and oolites with sandy, calcareous shales on the flanks, and with beds of continental origin in the north-east. In New Brunswick, Nova Scotia and south-western Newfoundland occur narrow connected troughs between mountain ranges, with conglomerates, sands, thin dolomites and gypsum. Shell-feeding sharks were especially abundant in North America at the opening of the period, and extensive fish remains have also been found at the top of the series in the Red Beds of the Yoredale Series near Leyburn (Yorks.). The following life zones have been generally recognized in western Europe:—

#### CORALS AND BRACHIOPODS

- D<sub>3</sub> *Orionastrea*.
- D<sub>2</sub> *Lonsdaleia floriformis* and }  
*Productus giganteus*.
- D<sub>1</sub> *Cyathophyllum murchisoni*.
- S (*Semimula*) *Lithostrotion martini*.
- C<sub>2</sub> Late *Caninias*.

#### GONATITES

- P<sub>2</sub> *Goniatites spirale* (group).
- P<sub>1</sub> *Goniatites crenistria* (group).
- B *Beyrichoceras*.
- Prolecanites*.
- Pericyclus*.

The exact equivalence of the coral and goniatite zones has not yet been worked out.

**Lancastrian** (Millstone Grit and Lower Coal Measures) (*cf.* NAMURIAN AND LANARKIAN).—Succeeding the period represented by the highest beds of the Viséan division considerable physiographic changes occurred in western Europe. For some little time the greater part of the south-west of England had been above water, and it is probable that slight emergence took place at this period both in Belgium and Westphalia. Indeed, the only area in which an apparently complete succession of life forms has been worked out is in the Craven area of Yorkshire and Lancashire. A low and narrow ridge appears to have separated this basin from the Northumbrian and Scottish basins, where alone the Lower Carboniferous brachiopod fauna continued to exist. In the Craven basin or gulf a long series of goniatite forms suc-

ceeded one another, and the stratigraphy is well developed and clearly seen in the Pennine area generally. Several new genera of goniatites appeared (*Eumorphoceras*, *Homoceras*, *Reticuloceras*, etc.) and rapidly evolved. By means of these forms it has been possible to subdivide and distinguish at least four great outpourings of coarse felspathic grit (arkose) into the Pennine area, which grits together with the intercalated shales and subordinate sandstones form the Millstone Grit Series.

The major grit beds are:—

- (4) Rough Rock, of *Gastrioceras subcrenatum* age. (G)
- (3) 3rd Grit of Lancashire, of *Reticuloceras bilingue* age. (R<sub>2</sub>)
- (2) Kinderscout Grit, of *Reticuloceras reticulatum* age. (R<sub>1</sub>)
- (1) Grassington Grit, of *Eumorphoceras* age. (E)

Of these four major grit invasions, the first or Grassington Grit reaches a maximum thickness near Burnsall, forms the Pendle Top Grit and caps many of the highest of the northern Pennine peaks. To the south it dies out, and is absent in Derbyshire. The Kinderscout Grit attains a maximum in the Peak District of Derbyshire, and gradually thins to the north being probably not more than 50 ft. thick near Clapham (Yorks.). The 3rd Grit of Lancashire has recently been proved by boring to thicken rapidly to the south-west, reaching a concealed maximum near Horwich (Lancs.). These three grit invasions have maxima in distinct but adjacent territories of the deltaic basin, which appears to have been subsiding irregularly and disconnectedly. On the other hand, the fourth grit invasion (the Rough Rock) is known all over the Midland Province, and is fairly regular in its thickness. This fact, together with the immigration of freshwater mollusca into the area, suggest that depression and sedimentation were becoming much smoother in action, and this is again reflected in the finer grain of the Lower Coal Measure sandstones. The thin coal-seams of the Millstone Grit with their marine roofs are strongly suggestive of pauses in depression followed by a jerky subsidence which let in the adjacent sea (compare the buried forest bed and its marine roof in the Humber and other English estuaries in recent time).

At approximately the same period coarse detrital beds were laid down in many other areas in western Europe, but they nowhere appear to have been of the same coarseness and thickness as those of Lancashire, with the possible exception of the Silesian beds (of rather uncertain horizon). The source of the grit sediment of the Millstone Grit is not clear, as is also the exact mode of transport, but it seems probable that a northerly or north-westerly source furnished the bulk of the sediment, and it is significant that the whole of the fossiliferous bands in the Millstone Grit are marine (with the exception of one *Carbonicola* band near the summit). Similar grits occur in Newfoundland. It would appear that the Roslin Sandstone of Scotland is of approximately the same age, but the fauna is distinct and correlation is somewhat uncertain. The Flözleere Sandstein of Westphalia is of the same horizon as the Millstone Grit, and contains the same goniatite and lamellibranch succession.

Intercalated between the Grassington Grit and the Kinderscout Grit is an important series of marine shales, the Sabden Shales, containing many goniatite zones of upper E (*Eumorphoceras*), H (*Homoceras*) and R<sub>1</sub> (*Reticuloceras*) age. A similar shale series is present in Ireland (Foyne's island), Belgium (Chokier), and is partly represented in Westphalia, but in the latter area there is a slight suggestion of a sedimentation break, as several of the "H" goniatite zones have not yet been recorded. This sedimentation break was much more severe in southern Wales, where the earliest Upper Carboniferous goniatites so far recorded are of "H" age, and indeed the earliest goniatite is not uncommonly the basal goniatite of R<sub>1</sub> (*Reticuloceras inconstans*). At Haverfordwest the break extends up to R<sub>2</sub>, where *R. bilingue* is the first zonal goniatite present above the break.

In Silesia the period is represented by the Hultschiner Schichten and Ostrauer Schichten of the Sudetische Stufe.

The Lancastrian period in western Europe thus witnesses a great expansion in area of the goniatite fauna, and also of coarse detrital sediments. But the period has not yet been definitely recognized either in eastern Europe or America, except in the highest

or *Gastrioceras* beds, which appear to have been very widespread. The major life zones represented are:—

G. *Gastrioceras*.

R<sub>2</sub>. *Reticuloceras reticulatum* muts.  $\alpha, \beta, \sigma, \gamma$ .

R<sub>1</sub>. *Reticuloceras inconstans* and *R. reticulatum* (type form).

H. *Homoceras* (*H. beyrichianum*, etc.).

E. *Eumorphoceras* and *Cravenoceras* (early *Homoceras*).

By reason of the marked change in the goniatite fauna, and the expansion which took place in the detrital deposits at the beginning of the Lancastrian period, it has been suggested that the base of the Lancastrian division should be regarded as marking the inception of the Upper Carboniferous, as understood in Europe. It should, however, be pointed out that the change in the flora observed in Scotland occurs somewhat higher, namely, at or about the junction of the E and H goniatite zones. On the other hand, the Variscan mountain building commenced before the close of the Viséan period, as here understood.

In Scotland the period commences with the Edge Coal series (perhaps the equivalent of the Grassington Grits), succeeded by the Upper Limestone Group (probably the equivalent of the Sabden Shales) and the Scottish Millstone Grit (perhaps the equivalent of the Upper Sabden Shales and Kinderscout Grits). It is curious to note that the whole of the dominant and rapidly evolving goniatite genera are absent from the Scottish and Northumbrian basins, the goniatites present in Scotland belonging to two closely allied genera, *Dimorphoceras* and *Anthracoceras*, of feeble ornamentation and sluggish evolution. It is this fact which renders correlation of the Scottish beds difficult.

In eastern North America the break between the Mississippian and Pennsylvanian is so profound that it seems probable that the lower part of the Lancastrian is missing. Colour is given to this supposition by the apparent absence of the lower and middle Lancastrian goniatites from the area. According to Schuchert, in the earliest Pennsylvanian "the seaways were small and restricted to Texas, Oklahoma and Arkansas, and long before the submergence became general, three freshwater deltas were forming, one centring about Pottsville, Pa., another about the Kanawha river, West Virginia, and the third in the area of the Cahaba valley of Alabama. Finally these areas also came under the influence of the spreading seas at or before the close of Pottsville time. The submergence was most extreme in late middle Pennsylvanian time, when about 30% of North America was again under the sea."

Freshwater molluscs first became established in England towards the close of the period, when forms of *Carbonicola* occurred abundantly at several horizons in zone G. The same is true of Westphalia and the Franco-Belgian basin.

**Westphalian** (Middle and Upper Coal Measures).—Succeeding the coarse detrital beds of the Millstone Grit and Lower Coal Measures is a thick succession of fine-grained sandstones, clays, shales and coal-seams, forming the major coal-fields of western Europe. At or about the same period occur the Pennsylvanian Coal Measures of eastern North America, but in eastern Europe (Donetz Basin) the deposits are predominantly marine (Moscovian) with a *Fusulina* fauna.

In Britain occur the well-known adjoining coal-fields of Yorkshire, Nottinghamshire, Derbyshire, Lancashire and Staffordshire containing amongst other seams the celebrated Barnsley and Silkstone coals. Of this age also are the coal-fields of south Wales, and there are minor coal-fields in Scotland, Northumberland (and Durham) and Somerset. In most of these there are occasional thin marine intercalations, which often form the roof of a thin coal-seam. The major seams, however, have no marine roof, indicating that they were deposited during a period of tranquil subsidence, and not during a pause in subsidence. In this connection one may observe that the enormously thick measures of Silesia contain correspondingly thick coal-seams. In Britain the productive measures are succeeded by the Upper Coal Measures of Staffordshire and southern Wales, which consist mainly of red marls and sandstones and are the highest Carboniferous beds in the British Isles.

The Westphalian beds have been divided by means of the flora into three broad zones, the lowest characterized by *Neuropteris gigantea* and *N. Schlehani*, the middle by species of *Lonchopteris*, and the highest by *Neuropteris rarinervis* and *Sphenophyllum emarginatum*. A more detailed division by means of the non-marine mollusca has recently been propounded by Davies and Trueman and is as under:—

(5) *Anthracomya tenuis*.

(4) *Anthracomya phillipsi*.

(3) *Anthracomya pulchra*.

(2) *Carbonicola similis*.

(1) *Anthracomya modiolaris*.

The coal-fields of the Ruhr in Westphalia (Gaskohle and Gasflammkohle groups) correspond with this division, as do also the Saarbrücker beds of the Saar, and the Sattelgruppe and Mulden-gruppe of Silesia. Further east occurs the mixed marine and coal-bearing series in the Donetz Basin of Russia with a fauna including *Spirifer mosquensis*.

**Stephanian**.—The highest Carboniferous beds of western Europe are those of the isolated basins in the centre and south of France, with a *Pecopteris* flora and abundant insect remains. It is possible that the highest beds of northern Staffordshire and southern Wales may represent this period, but there is at present no definite means of correlation. Approximately equivalent are the Ottweiler beds of Silesia and the marine limestones of the Urals containing *Schwagerina*. A Stephanian flora is found also in Spain and Italy, and there is a mixed Uralian fauna and Stephanian flora in the Carnic Alps. The Uralian sea was present in Asia Minor, Persia, India and China. In North America the period is represented by the upper productive coal measures of the Monongahela series and the Cisco formation of Texas.

The extensive "Permo-Carboniferous" glaciation of the Southern Hemisphere, and the succeeding *Glossopteris* flora of Gondwanaland, are now classed by the American geologists in the Permian system.

Europe generally during the Carboniferous period was divided into an eastern and western area of deposition by a land mass stretching from Scandinavia to southwest Russia. To the east and west of this land mass the conditions were very distinct. To the east a shallow brachiopod sea existed over the greater part of what is now Russia, with islands in the Urals, and this sea persisted during the greater part of Carboniferous time, with somewhat divergent conditions in the Donetz Basin. During the whole range of the period there were in this area few strong tectonic movements. In western Europe, on the other hand, during the Carboniferous period there began the great mountain-building movements called Variscan or Hercynian. These movements, which commenced in the Lower Carboniferous, were continued in Lancastrian and Westphalian time with an energetic pressure towards the north. As a result, Middle Europe became a stable united land mass with great folds at the borders of the old Franco-Podolian ridge. This late Palaeozoic, augmented Franco-Podolian massif is termed by Bubnoff the Middle European Ridge. Volcanic activity reached a considerable intensity; Scotland especially was the scene of great eruptions, remarkably well preserved. In Derbyshire submarine lava flows, now termed "toadstones," occurred, and in the area of the later Variscan mountains (Brittany, Central plateau, Vosges, Schwarzwald, Bohemian Massif) occurred great grano-dioritic intrusions.

**Thickness of Carboniferous Rocks**.—The great variety of conditions under which the sediments and limestones were formed naturally produced corresponding inequalities in the thickness. In the Eurasian land area the greatest thickness of Carboniferous rocks is in the west; in North America it is in the east. In Britain the Carboniferous limestone series is 2,000–3,500ft. thick; in the Urals over 4,500ft.; the Culm in Moravia is credited with the enormous thickness of over 42,000ft. The Upper Carboniferous in Lancashire is from 12,000 to 13,000ft.; elsewhere in Britain it is thinner. In western Germany this portion attains a thickness of 10,000ft. In Pennsylvania the sandstone and shale, at its maximum, reaches 4,400ft., but even within the limits of the State this forma-

tion has thinned out to no more than 300ft. in places. In Colorado the Lower Carboniferous is only 400–500ft. thick; while the limestones of the Mississippi basin amount to 1,500ft. and in Virginia to 2,000ft.

#### LIFE OF THE CARBONIFEROUS PERIOD

**Fauna of the Marine Strata.**—Numerically, the most important inhabitants of the clear Carboniferous seas were the crinoids, corals, Foraminifera and brachiopods. Each of these groups contributed at one place or another towards the upbuilding of great masses of limestone. For the first time in the earth's history we find Foraminifera taking a prominent part in the marine faunas; the genus *Fusulina* was abundant in what is now Russia, China, Japan, North America; *Valvulina* had a wide range, as also had *Endothyra* and *Archæodiscus*; *Saccamina* is a form well known in Britain and Belgium, and many others have been described; some Carboniferous genera are still extant. Corals flourished in the clearer waters and have been used in Britain and Belgium as zonal forms. Crinoids were specially abundant in Scotland and the United States. Brachiopods reached their acme, the most important genus being *Productus*, now divided into several subgenera. Whilst many brachiopod species were long-lived, several forms have proved useful as zonal indices, and as a supplement to coral evidence of relative time. Amongst the cephalopods, the goniatites became abundant for the first time toward the close of the Lower Carboniferous (Viséan), and swarmed in many of the marine bands of the Upper Carboniferous (Lancastrian). They are represented by several closely allied genera which exhibit distinct evolutionary trends, and furnish very delicate zonal indices.

Trilobites were infrequent in the Lower Carboniferous, and practically extinct in the Upper Carboniferous. Fish, whilst no doubt numerous, and represented mainly by sharks, are not common as fossils, and their remains are usually in localized deposits, as the Red Beds of Wensleydale.

**Flora and Fauna of the Continental Facies.**—The strata deposited during this period are the earliest in which the remains of plants take a prominent place. The true ferns, including tree ferns with a height of upwards of 60ft., were associated with many plants possessing a fern-like habit and others whose affinities have not yet been determined. Our modern diminutive "horse-tails" were represented in the Carboniferous period by gigantic calamites, often with a diameter of 1 to 2ft., and a height of 50 to 90ft. The Carboniferous forerunners of the tiny club-moss were then great trees with dichotomously branching stems and crowded linear leaves, such as *Lepidodendron* and *Sigillaria*, with trunks sometimes 5ft. in diameter and 100ft. high.

The animals preserved include freshwater mollusca such as *Anthracomya*, *Naiadites* and *Carbonicola*, crustaceans and fishes. Many insects, etc., have been obtained from the coal-fields of Saarbrück and Commentry, cockroaches being especially abundant. Land-snails have been found in tree trunks in Nova Scotia, and from the uppermost coal measures of Worcestershire. In the later Carboniferous rocks the earliest amphibians make their appearance; they were all stegocephalians (labyrinthodonts) with long bodies, bony plates on the head, and undeveloped limbs.

**Economic Products.**—Foremost among the useful products of the Carboniferous rocks is coal (*q.v.*) itself; most of the petroleum of the Appalachian and mid-continent fields, U.S.A.—about one-quarter of the country's total; but associated with the coal-seams in Great Britain, North America and elsewhere, are very important beds of ironstone, fire-clay, terra-cotta clay and occasionally oil shale and alum shale.

In the Carboniferous Limestone series, the purer kinds of limestone are used for the manufacture of lime, bleaching powder and similar products, also as a flux in the melting of iron; some of the less pure varieties are used in making cement. Some of the harder and more crystalline limestones are beautiful marbles.

The sandstones are used for building, and for millstones and grindstones. Crushed and screened they are often used as an aggregate for concrete. In veins in the limestone occur lead and other metallic ores, now but little worked in Britain.

**BIBLIOGRAPHY.**—For a good general account of the Carboniferous system, see A. Geikie, *Text Book of Geology*, vol. ii. (4th ed., 1903); and for the American development see Pirsson and Schuchert, *Text Book of Geology* (2nd ed., 1924). See also *Recent Additions to Geological Literature*, Geological Society of London, pub. ann. since 1893. For a good account of the British coal-fields, see *Coal in Great Britain* (2nd ed., 1927) by J. W. Gibson, and the bibliography to COAL.

**CARBON MONOXIDE POISONING** results from breathing atmospheres containing the gas. Carbon monoxide is produced by burning carbon-containing fuels in a deficiency of air or oxygen. Common producers are room heaters, gas ranges, automobile exhausts, mine explosions, blasting, iron and steel furnaces and burning electric installation. Since the gas is colourless, tasteless and odourless (in the concentration usually encountered), its detection is difficult. Mice and birds are more quickly affected by it than man. The activated iodine pentoxide indicator, however, detects the presence of dangerous amounts in less than one minute. The gas exerts its extremely dangerous action on the body by displacing oxygen from its combination with haemoglobin, destroying the body tissue. Frequent symptoms are headache, weakness, nausea, fainting, paralysis of the nervous system and slowing of pulse and respiration. Treatment is by removal to fresh air; application of artificial respiration, administration of pure oxygen, or a mixture of 5% of carbon dioxide in oxygen for 20 min. or more; stimulation of circulation; complete relaxation; symptomatic treatment for after-effects.

**CARBON PAPER**, a tissue of varying weight coated with a colour, generally carbon, and some waxy medium. It is usually coated on one side but may be coated on both sides for special purposes. For typewriting duplication which is its chief usage it is of course coated on one side only. The paper upon which the coating is applied varies in weight from 4 to 10 lb. per ream of 480 sheets 20 by 30in. and is made from fibres such as rag, chemical wood, manila and jute. As it must be strong and durable it must not contain any ground wood pulp. The coloured waxy material which transmits the duplication is soft so that at least five copies can be made. It is also so strongly coloured and of such durability that a sheet will make at least 12 first carbons that are clear and legible. This coating is composed of waxes such as Japan, paraffin (kerosene) and canauba, and such oils as oleine and rosin thoroughly amalgamated with a colour which in the case of black paper is always carbon or gas black.

In coloured papers the colour consists of an aniline dye base combined with fatty acids as stearic and oleic or a fat soluble dye dissolved in the oleine or rosin oil present in the mixture. The actual manufacture of carbon paper resolves itself into two processes, viz., the preparation of the coating material and its application to the paper. The waxes and oils are melted in a steam-jacketed kettle at a temperature of approximately 300° F and the colour stirred in. Afterwards the hot mixture is passed through a steel plate grinding mill and is then ready for the coating machine. This machine, of web-type construction takes the paper in roll form, passing it over the coating roller which revolves in a steam-heated ink foundation containing the hot coating mixture and then over a spiral wire wiper which controls the thickness of the coating. From this wiper it passes over water-cooled rollers which chill and harden the coating, and subsequently it is rolled upon itself at the end of the machine. The roll is then cut into sheets in sizes according to its usage. (N. U.)

**CARBONURIA**, the presence of carbon in the urine. This is normally present as an end product of metabolism. It is found mainly in the form of carbon dioxide but small quantities of the element are also present. Anything causing an increase of metabolism will increase the quantity of carbon. After illuminating gas poisoning it is found in the form of carbon monoxide.

**CARBONYLS, METALLIC**, are compounds of the metals with carbon monoxide. Of these the most important is *nickel carbonyl*, Ni(CO)<sub>4</sub>, used in the manufacture of pure nickel. This substance is readily produced by passing carbon monoxide over finely divided nickel at 30–50° C, and is condensed in a freezing mixture of ice and salt to a colourless liquid, boiling at 43.3° C, and solidifying in acicular crystals at –25° C (L. Mond, 1890).

Prior to 1890 it had been observed in Mond's laboratory that, when exposed to an atmosphere contaminated with producer gas, nickel-plated taps and fittings became tarnished. This tarnish was ultimately traced to the action on the metal of the carbon monoxide contained in the producer gas. This observation led to systematic experiments on the interaction of carbon monoxide and nickel under varying conditions and thence to the discovery of nickel carbonyl, a volatile liquid having totally unsuspected properties and representing a new class of metallic derivatives. Mond and his co-workers then extended their researches to the allies of nickel and thus discovered the carbonyls of cobalt, iron, molybdenum and ruthenium. When passed through a hot tube at 180–200° C, this carbonyl is dissociated with deposition of nickel as a brilliant mirror. Hence the use of the carbonyl in the extraction and purification of nickel, since the associated metals do not so readily furnish volatile carbonyls.

Under the conditions employed in the preparation of nickel carbonyl, cobalt yields no analogous compound; but above 150° C and under a pressure of 30–40 atmospheres, this metal unites with carbon monoxide to form *cobalt tetracarbonyl*  $\{Co(CO)_4\}_2$ , an orange crystalline substance with the doubled molecular formula, which slowly dissociates at 60° C into cobalt tricarbonyl,  $Co(CO)_3$ ; thus obtained it consists of sparingly soluble black crystals of unknown molecular weight. *Iron pentacarbonyl*,  $Fe(CO)_5$ , a pale yellow viscid liquid, is produced by warming finely divided iron at 100–120° C in a slow current of carbon monoxide; it distils undecomposed at 102.8° C, and solidifies to a mass of yellow needles below –21° C. At 180° C it is completely dissociated. When exposed to sunlight below 60° C, the pentacarbonyl becomes transformed into orange-red hexagonal plates of iron enneacarbonyl  $Fe_3(CO)_9$ , which are almost insoluble in ether, benzene or light petroleum. When these crystals are heated to between 50° and 60° C in the presence of ether, ligroin or toluene, the liquid becomes green and deposits green prismatic crystals of iron tetracarbonyl  $\{Fe(CO)_4\}$ . This compound, the analogue of nickel carbonyl, is stable under atmospheric conditions but at 140–150° C it dissociates into iron and carbon monoxide. *Ruthenium carbonyl*,  $Ru(CO)_5$ , an orange-yellow deposit, is formed by passing carbon monoxide over ruthenium black. *Molybdenum carbonyl*,  $Mo(CO)_6$ , is obtained in highly refracting white crystals by the interaction of finely divided molybdenum and carbon monoxide at 200° C and under 200–250 atmospheres. These crystals sublime at 30–40° C in an atmosphere of hydrogen and carbon monoxide. Chromium is stated to yield a volatile carbonyl when carbon monoxide is absorbed by magnesium phenyl bromide in presence of chromic chloride (A. Job and A. Cassal, 1927; See GRIGNARD REAGENTS).

In addition to the foregoing compounds, where the metal is entirely associated with carbon monoxide, there are many complex metallic salts containing the carbonyl group, such as the carbonyl derivative of cuprous chloride,  $Cu_2Cl_2 \cdot CO \cdot 2H_2O$ , produced when the cuprous salt is employed in gas analysis. Platinoous chloride furnishes carbonyl derivatives, e.g.,  $PtCl_2 \cdot CO$ , which decomposes at 300° C into platinum and phosgene  $PtCl_2 \cdot CO = Pt + COCl_2$ . Palladium forms a similar compound,  $PdCl_2 \cdot CO$ . The crude ferrocyanides from coal gas contain salts of carbonylferrocyanic acid,  $H_3[Fe(CO)(CN)_5]$ . (G. T. M.)

**CARBORUNDUM** is the name given by Acheson in America to a substance he obtained accidentally when experimenting in 1891 with the electric furnace in the hope of producing artificial diamonds. These experiments were followed by others with an incandescent furnace of which a larger form is now used for the industrial manufacture of the product. Acheson generally receives credit for the discovery of carborundum, although it had previously been discovered by a few other experimenters, and gave it its name because he believed it to be a compound of carbon and corundum, a naturally occurring crystalline form of alumina (*q.v.*). It was subsequently found to be silicon carbide (*q.v.*), and is now manufactured on a large scale for use as an abrasive in the metallurgy of iron and steel. It has various other trade-names, crystalon, carbolon, carbonite, samite, etc., and is sometimes used with diamond dust, for cutting diamonds.

The name carborundum is protected by trade mark registration in Canada, Australia, New Zealand and the United States, and similar protection has been applied for in the Union of South Africa.

**CARBOY**, a large globular glass vessel or bottle, encased in wicker or iron-work for protection, used chiefly for holding vitriol, nitric acid and other corrosive liquids. (From the Pers. *qarābah*, a flagon.)

**CARBUNCLE**, in mineralogy, a garnet (*q.v.*) cut with a convex surface. In medicine the name given to an acute local inflammation of the deeper layers of the skin, followed by sloughing. It is accompanied by great local tension and constitutional disturbance, and pain is often acute. A hard, flattened swelling of a deep-red colour occurs on the back, face or extremities. This gradually extends until it may become as large as a dinner-plate. Towards the centre of the mass numerous small openings form on the surface, from which blood and matter escape, and through which a yellow slough or "core" of leathery consistence can be seen. Carbuncle is apt to occur in persons whose health is depressed by mental worries, or chronic disease of the kidneys or blood-vessels, or diabetes. The best treatment is surgical.

**CARBURETTER** is a device to form an explosive mixture of air and a hydrocarbon liquid fuel of a volatile nature such as petrol or gasolene. The function of a carburetter may be divided into three steps: to discharge into the air stream the desired amount of fuel; to atomize the fuel; and to make a homogeneous air-fuel mixture. (See MOTOR CARS.) Carburetters have to be multiplied in large-power engine outfits for aeroplanes, four being employed for a 12-cylinder engine, and they require an altitude control to compensate for the rarer atmosphere at high altitudes. Carburation is a process also required in the manufacture of air-gas and carburetted water-gas (see WATER GAS).

**CARCAGENTE** or **CARCAJENTE**, a town of eastern Spain, in the province of Valencia, near the right bank of the river Júcar, at the junction of the Valencia-Murcia and Carcagente-Denia-Alicante railways. Pop. (1920) 13,834. Carcagente is a picturesque old town with Roman remains, surrounded by the dense olive, carob, palm, mulberry and orange groves of some of the most productive land, thanks to irrigation, of the Valencian plain. Its many cupolas contrast with the chimneys of modern silk mills and linen factories. Orange essences and soap are made, and rice cultivation is important locally owing to the warm, moist climate of the low-lying Júcar valley.

**CÁRCAR**, a municipality (with administration centre and ten *barrios* or districts), of the province and island of Cebu, Philippine Islands, on the Cárcar river near its mouth at the head of Cárcar bay, 23 m. S.W. of Cebu, the provincial capital. Pop. (1918) 37,392, of whom 18,229 were males. It has railway connection with the capital, and by a branch with the municipalities of Barili and Dumanjug. Cárcar has some coast trade and is a good market community. The surrounding country is rugged and produces corn and sugar in considerable quantity. In 1918 it had 270 household industry establishments, with output valued at 24,200 pesos, and four sugar-mills. Of the 16 schools, 14 were public. It was founded in 1624. The language spoken is Cebu-Bisayan.

**CARCASS**, the dead body of an animal; a butcher's term, for the body of an animal without the head, extremities and offal. Also an iron case filled with combustibles and fired from a howitzer to set fire to buildings, ships, etc., the flames issuing through holes pierced in the sides.

**CARCASSONNE**, a city of south-western France, capital of the department of Aude, 57 m. S.E. of Toulouse, on the railway to Narbonne. Pop. (1926) 28,917. Carcassonne lies near the eastward bend of the river Aude, which divides it into two distinct towns, the Ville Basse and the ancient Cité, connected by two bridges, one modern, the other 13th century with a chapel at one end of 15th century date. The old town occupies the site of *Carcaso*, city of Gallia Narbonensis, with pre-Roman origins, on an isolated hillock on the right bank of the river. In its larger relations the position of this historic fortress is interesting: it lies

in the gap between the Montagne Noire on the north and the outliers of the Pyrenees (Mouthoumet) on the south. This northward avenue leads from the Mediterranean coasts round the central plateau to Aquitaine and northern France; and from its location in the transition zone Carcassonne had great human significance. On the disintegration of the Roman empire, it fell into the hands of the Visigoths, who, in spite of the attacks of the Franks, especially in 585, retained possession till 724, when they were expelled by the Arabs, destined in turn to yield before long to Pippin the Short. From about 819 to 1082 Carcassonne formed a separate countship, and later, till 1247, a viscountship. Towards the end of the 11th century the viscounts of Carcassonne assumed the style of viscounts of Béziers, a town which they had dominated since the fall of the Carolingian empire. The viscounty of Carcassonne, together with that of Béziers, was confiscated to the crown in 1247, as a result of the part played by the viscount Raymond Roger against Simon de Montfort in the Albigensian crusade, during which the city was taken (1209) by the Crusaders (see ALBIGENSES). A revolt of the city against the royal authority was severely punished in 1262 by the expulsion of its principal inhabitants, who were, however, permitted to take up their quarters on the other side of the river. This was the origin of the new town, which was fortified in 1347. In 1356 the citadel successfully resisted the Black Prince. During the religious wars, Carcassonne changed hands several times, and did not recognize Henry IV. till 1596. Its importance as a frontier station disappeared in 1659, when Roussillon was annexed to France. The narrow streets are still inhabited. The ramparts are surmounted by towers, and can be entered only by two fortified gates, to the east and west. Recent excavations have shown that the castle occupies the site of the Gallo-Roman Castellum. The foundations of the towers of the inner rampart are mostly Roman or Visigothic. The rest, including the castle, seem to belong to the 11th or 12th century, while the outer circuit is mainly the work of Louis IX. (1260-70). The old cathedral of St. Nazaire dates from the 11th to the 14th century. The Romanesque nave was begun in 1096; the transept and choir, which contain magnificent stained glass of the Renaissance period, are Gothic. Both the fortifications and the church were restored between 1850 and 1880 by Viollet-le-Duc, whose work Boeswillwald continued.

Across the Aude lies the well-planned new town, with streets intersecting each other at right angles. The most interesting buildings are the cathedral of St. Michel, dating from the 13th century but restored in modern times, and St. Vincent, a church of the 14th century, with an exceptionally wide nave (66 ft.).

Carcassonne is the seat of a bishop, a prefect and a court of assizes, and has tribunals of first instance and of commerce. The old cloth industry is almost extinct. The town is, however, an important wine-market, and the vineyards of the vicinity are the chief source of its prosperity, which is enhanced by its port on the Canal du Midi. Tanning and leather-dressing, the manufacture of agricultural implements and corks, cooperage and the preparation of preserved fruits, are the chief industries.

See E. E. Viollet-le-Duc, *La Cité de Carcassonne* (Paris, 1858); L. Fédie, *Histoire de Carcassonne* (Carcassonne, 1887).

**CARDAMOMS**, the fruit of several plants of the genera *Elettaria* and *Amomum*, belonging to the family Zingiberaceae, the principal of which is *Elettaria Cardamomum*, from which the true official or Malabar cardamom is derived. The Malabar cardamom plant is a large perennial herb with a thick fleshy rootstock, which sends up flowering stems 6 to 12 ft. high. The large leaves are arranged in two rows, have long sheaths enveloping the stem and a lanceolate spreading blade 1 to 2½ ft. long. The fruit is an ovate-triangular, three-celled, three-valved capsule (about ¼ to ¾ in. long, of dirty yellow colour) enclosing numerous angular seeds, which form the valuable part of the plant. It is a native of the mountainous parts of the Malabar coast of India. A cardamom of larger size growing in Ceylon, formerly regarded as a distinct species, is now known to be only a variety. In commerce, several varieties are distinguished according to their size and flavour. The most esteemed are known as "shorts," a name given to such capsules as are from a quarter to half an inch long

and about a quarter broad. The Ceylon cardamom attains a length of an inch and a half and is about a third of an inch broad, with a brownish pericarp and a distinct aromatic odour. The fruits of various species of *Amomum* pass in commerce as cardamoms, e.g., *A. Cardamomum*, a native of Siam and Java.

**CARDAN** (Ital. **CARDANO**), **GIROLAMO** (GERONYMO or HIERONIMO) (1501-1576), Italian mathematician, physician and astrologer, born at Pavia, was the illegitimate son of Facio Cardano (1444-1524), a learned jurist of Milan. He was educated at Pavia and at Padua, where he graduated in medicine. He was, however, excluded from the college of physicians at Milan on account of his illegitimate birth. In 1534 he became a public lecturer in geometry, on the foundation of one Thomas Plat, at Milan, and also (1535) physician to the Augustine Friars, whose prior he cured. A cure of the child of the Milanese senator Sfondrato led to his admission into the medical body, of which he actually became rector in 1541. In 1539 he published his *Practica arithmeticae generalis*, and he corresponded with Niccolo Tartaglia, who had discovered a solution of cubic equations. In 1543 the University of Pavia, driven by war to teach at Milan, offered Cardan its chair of medicine, and he accompanied the university on its return to Pavia in 1544.

In his comprehensive treatise on Algebra (*Artis magnae sive de regulis Algebrae liber unus*, Nuremberg, 1545) Cardan published the cubic solution, which he had obtained from Tartaglia under pledge of secrecy. In 1543 he had published his celebrated treatise on astrology.

His works on algebra and astrology had procured for him a European renown, and flattering offers from Pope Paul III. and the king of Denmark, which he declined. In 1551 his reputation was crowned by the publication of his great work, *De Subtilitate Rerum*, which embodied both the soundest physical learning of his time and its most advanced spirit of speculation. It contains indications for a method of teaching the blind to read and write by the sense of touch, and elsewhere Cardan suggests the use of signs for teaching the deaf. *De Varietate Rerum* (1557), is a supplement to it. Cardan gives false explanations of common phenomena, but glimpses of principles not fully understood by him or acceptable to his age are of interest. Inorganic nature he asserts to be animated no less than the organic; all creation is development; all animals were originally worms; the inferior metals must be regarded as *conatus naturae* towards gold. The indefinite variability of species is implied in the remark that nature is seldom content with a single variation from a type. The oviparous habits of birds are explained, precisely in the manner of modern naturalists, by their value for the perpetuation of the species. Animals were not created for the use of man, but exist for their own sakes. The origin of life depends upon cosmic laws, which Cardan naturally connects with astrology. The physical divergencies of mankind arise from the effects of climate and circumstances.

In 1552 Cardan was summoned to Scotland to attend Archbishop Hamilton of St. Andrews. The chief interest of his journey lies in his account of the disputes of the medical faculty at Paris over the new anatomical teaching of his friend Vesalius, and his favourable opinion, as an ecclesiastically unbiased observer, of the character and ability of Edward VI. of England.

Cardan had now reached the height of his prosperity; but later his fortune turned. His son, Giovanni Battista, also a physician, had contracted an imprudent marriage with a girl named Brandaia Seroni, who proved unfaithful. The injured husband's revenge by poison was detected, and the exceptional severity of the punishment—execution—seems to justify Cardan in attributing it to the rancour of his medical rivals (1560). The blow all but crushed him. His reputation and his practice waned. He was banished from Milan on some accusation unspecified, and although the decree was rescinded he accepted a professorship at Bologna (1562). There he was arrested (1570), deprived of his professorship and removed to Rome, where he spent his remaining years in receipt of a pension from the pope, and wrote his commentaries, *De Vita Propria*, which, with *De Libris Propriis*, is our principal authority for his biography.

**BIBLIOGRAPHY.**—Cardan's most important treatises, *De Subtilitate* and *De Varietate Rerum*, are combined and fully analysed in vol. ii. of Rixner and Siber's *Leben und Lehrmeinungen berühmter Physiker am Ende des xvi. und am Anfange des xvii. Jahrhunderts* (Sulzbach, 1820). His works were edited by Sponius (Lyons, 1663). A biography was prefixed by Gabriel Naudé, whose unreasonable depreciation has unduly lowered Cardan's character with posterity. See H. Morley, *Jerome Cardan* (1854); W. G. Waters, *Jerome Cardan* (1898); D. E. Smith, *Rara Arithmetica* (Boston, 1908).

**CARDBOARD.** The earliest cardboard was a layer of papyrus, beaten by hand to the desired thickness, pressed and dried by the sun. In the middle ages cardboard was made in the East from grasses. Playing cards so manufactured were painted by hand. The manufacture of machine-made cards is somewhat similar to paper-making. The fibre is boiled, beaten, coloured, if desired, and then put through a machine of the paper-making class. Modern board machines, particularly in America, Canada, England, Germany, Holland, Finland and Scandinavia, have grown enormously in size and capacity during the last decade. Australia also manufactures a portion of the cardboard required for home consumption. In 1927 there were three board-making machines in Australia, one mill producing 4,000 tons per annum.

Finland has a large and increasing production of mechanical wood pulp boards and the output totals about 35,000 tons per year. The exports of wood pulp board from Finland, Jan.-Sept. 1927, totalled 25,712 tons.

One of the cheapest forms of machine-made board is made in Holland and is made from straw which is boiled, beaten and worked up on machines somewhat similar to paper-making machines. In the year 1926 Holland exported 226,510,644 kg. to the value of 20,189,224 gld. Of these exports Great Britain took 183,217,604 kg. to the value of 16,211,936 gld. and America purchased 10,204,614 kg. valued at 934,544 gld. Ireland, South Africa, British India, The Argentine, Australia and New Zealand are also large buyers of Dutch-made strawboards.

**Duties on Paper.**—As early as March 24, 1801, says Mr. A. Dykes Spicer in *The Paper Trade*, an Act provided for the imposition of duties on paper, pasteboard, millboard and scaleboard made in Great Britain or imported. These duties were of two kinds, *i.e.*, customs and excise. Under the former a duty of 10d. per lb. was imposed on goods scheduled as first-class. Pasteboard, millboard and scaleboard paid 20s. per cwt. About the beginning of last century the average amount charged on all paper made in Great Britain was from 2d. to 2½d. per lb., and £200,000 were obtained from this charge. No paper-maker was allowed to make boards, nor might a board mill be opened within ¼ mile of a paper mill. After considerable agitation the duty on pasteboard imported into Great Britain was raised to £3.8s.2d. per cwt. In 1853, 2½d. per lb. was imposed on imported pasteboard. In 1860 Gladstone introduced a bill, which was carried by a majority of nine, for the repeal of the paper duty as a whole. On May 18, 1861, Gladstone moved that the paper duties be repealed and both the import and excise duties ceased.

**Growth of Container Industry.**—Since 1900 the container industry has developed enormously, and this has resulted in a greatly increased consumption of cardboard of various special kinds. Many items of food are customarily packeted. The enormous growth of the cigarette industry has also, particularly in America and Great Britain, meant the annual consumption of thousands of tons of light cardboard of fairly good special quality. The soap industry is another large consumer of cardboard for wrapping, and the boot and shoe industry and the textile trades also favour the use of the paper-box or a combination of wood and board manufactured from straw, waste-paper or wood-pulp.

Toward the end of last century America held a commanding position in the manufacture of boards for making good-class paper-boxes, and "American board" was accepted as a trade term. Great Britain now competes successfully for European trade. Approximately 200,000 tons of boards are manufactured in England and Scotland annually. Canada has also made great and rapid strides in the production of boards made from wood pulp. It is probable that the industry will continue to grow. Since the World War, Finland has made a successful bid for a share in the

world's markets, and Germany, Austria, Belgium, France and Italy also maintain a substantial output of cardboard for home requirements and for export. The trade in Christmas and New Year greetings has also become a great and specialized industry in Europe and America, and cardboard enters largely into the manufacture of these lines. (See BOX MANUFACTURE.)

**British Imports.**—In the year 1924, imports of millboard, leatherboard, cardboard and pasteboard into Great Britain totalled 1,284,986 cwt. to the value of £1,335,939; in 1925, 1,414,175 cwt. to the value of £1,476,908, and in 1926, 1,676,995 cwt. to the value of £1,727,909. In 1924 the British imports of strawboard totalled 3,748,978 cwt. to the value of £1,650,956; in 1925, 3,594,138 cwt. to the value of £1,569,945 and in 1926, 3,889,437 cwt. to the value of £1,591,501. During 1924 Great Britain exported 156,485 cwt. of millboard, strawboard, leatherboard and cardboard to the value of £256,449; in 1925, 144,190 cwt. valued at £245,287; in 1926, 154,087 cwt. valued at £274,754. During 1926 Great Britain exported playing cards to the value of £61,847, and boxes and cartons of paper and cardboard valued at £197,654; while in the same year the re-exports of various millboards, leatherboards, and cardboards amounted to 9,254 cwt., valued at £12,592, besides 8,360 cwt. of strawboard valued at £4,728. During the first nine months of 1927 the British imports of millboard, leatherboard, cardboard and pasteboard amounted to 1,313,102 cwt. valued at £1,302,029, and the exports of millboards, etc., totalled 147,582 cwt., valued at £244,649.

Boards made in Great Britain and in the United States include real strawboards, leatherboards, fence-boards, shoe stiffeners, shanks, millboards, jacquard cards, boards made from straw, old paper and wood pulp, glazed and rolled pressing boards, presspahn boards, fibre boards, chromo and art-coated boards, coated box boards, cloth-lined boards, hand-made millboards, boards for trunk-making, waterproof panel boards, drawing-boards, flaxibre, air-dried millboards for account books, pure rope hand-made boards for book-binders, folio boards, veneer boards, "SX" boards (for walls, ceilings, etc.), enamel boards, container boards, insulated boards, waterproof panel boards (for ships' cabins, electric cars, motor vans, exteriors and interiors of houses, etc.) hollow ware (from pressed wood pulp), pasteboards, mount boards, ticket boards, engine boards, middles, railway boards (for railway tickets), ticket boards (as used on public vehicles, for sports, etc.), duplex, triplex, etc., Bristol boards, ivory boards (for visiting cards), embossing boards, silk boards, etching boards, and various other kinds of boards. (See PAPER AND PULP MANUFACTURE.)

**Standard Sizes.**—The standard sizes for boards range from thin strawboards 22in. x 32in., 8oz. to 20oz., to folding box boards of no standard size but usually 28in. x 39in. Cut cards are qualified under nine heads namely: Thirds, 1½in. x 3in.; extra-thirds, 1¾in. x 3in.; small, 2½in. x 3½in.; carte-de-visite, 2½in. x 4½in.; large, 3in. x 4½in.; postcard, 3½in. x 5½in.; court, 3½in. x 4½in.; double small, 3½in. x 4½in.; cabinet (photo), 4½in. x 6½in.; double large, 4½in. x 6in.; quad small, 4½in. x 7½in.; quad large, 6in. x 9in. Boards trimmed are royal, postal, imperial, large imperial and index.

**Cardboard Proper.**—Cardboard proper or, to use the correct term, pasteboard, is made by combining several sheets of paper together by the application of paste or other similar adhesive by hand or machine. Pasteboards can be made to almost any desired thickness by using varying substances of raw material known in the trade as "middles" for the body or "midale" which, when combined with a covering of white paper on each side, varies in thickness from 1/64th to 1/16th of an inch, so far as this class of board is used for general commercial purposes by the printing trade. The greater tonnage of paste or pasted boards is made on huge machines from "middles," and white covering papers in reels, the thinner substances, as a rule, being combined from three reels (one of "middles" and two of white paper) placed on the pasting end of the machine, where either the "middle" or the covering paper receives a coating of paste from revolving rollers and is then passed over steam heated drying cylinders, finally being cut into sheets of a special or standard size which ever may be required.

**Method of Manufacture.**—Some makers produce the complete board in one operation whilst others re-wind after calendaring, and cut the reels into sheets later on. Either method may produce a satisfactory board. By the same process coloured pasteboard can be made by using tinted paper instead of white. The advantages of making pasteboards by hand are several. Small quantities of any materials (forming the "body" or "middles") can be pasted up with suitable or selected papers, and in any size which is economical for the printer (or anyone else) to use. Almost any substance thicker than that which can be produced on a big machine can be combined, hand pressed, dried and glazed between zinc sheets under varying pressure on a rolling-machine.

**Lined Boards.**—Large quantities of thick strawboards, wood pulp and other thick boards are lined up in this way, or by a specially constructed machine capable of treating this kind of material. Pasteboards are used mostly in the printing trade in standard sizes, viz., 20in. x 25in., 22in. x 32in. and 22½in. x 28½in., to be printed in either one or more colours and then cut to any desired size. Pasteboards (white and coloured) are cut into standard sizes of cards, most of which are used by printers. These cards are cut by rotary card cutting machines to ensure clean edges and accurate measurement. Pasteboards are also used largely in the manufacture of certain kinds of cardboard boxes and folding cartons; also by pattern card makers, and in the hosiery and lace trades; in fact, indirectly in all trades where cardboard is a necessary item.

The manufacture of pasteboards in Great Britain runs into a huge annual tonnage, but very large quantities are imported from the Continent, especially from Germany. The industry in the United States has reached enormous dimensions, but the official census of manufactures only distinguishes that part of the industry not carried on by paper-makers, and precise dimensions cannot therefore be stated. (J. L. Gr.)

**CARDENAL, PEIRE** (c. 1205–1305), French troubadour, was born at Puy-en-Velay of good family, and unlike other troubadours seems to have received a fair education, as he was intended for the Church. The national disorders, which led him to flee from Narbonne and Toulouse to escape the armies of Simon de Montfort, are reflected in the pessimism of his work, which is also extremely anti-clerical. With little taste for amorous poetry, Cardenal became one of the foremost cultivators of the moral *serventès*.

**CÁRDENAS** (*San Juan de Dios de Cárdenas*), a maritime town of Cuba, in Matanzas province, about 75m. east of Havana, on the level and somewhat marshy shore of a spacious bay of the northern coast of the island, sheltered by a long promontory. Pop. (1926), 34,117. It has a railway communication with the trunk system of the island, and communicates by regular steamers with all the coast towns. The city lies between the sea and hills. There are broad streets, various squares (including the Plaza de Colón, with a bronze statue of Columbus given to the city by Queen Isabella II. and erected in 1862) and substantial business buildings. Cárdenas is one of the principal sugar-exporting towns of Cuba. The shallowness of the harbour necessitates lighterage and repeated loading of cargoes. The surrounding region is famed for its fertility. A large quantity of asphalt has been taken from the bed of the harbour. A flow of fresh water from the bed of the harbour is another peculiar feature; it comes presumably from the outlets of subterranean rivers.

There is a large United States business element, which has been, indeed, prominent in the city ever since its foundation. At El Varadero, on a peninsula at the mouth of the bay, there is fine sea-bathing on a long beach, and El Varadero is a winter resort. Cárdenas was founded in 1828, and in 1861 already had 12,910 inhabitants. In 1850, Narciso Lopez landed there on a filibustering expedition, but could secure no support for his efforts on behalf of Cuban independence. On May 11, 1898, it was the scene of the first bloodshed in the Spanish-American war.

**CARDIFF**, a city, municipal, county and parliamentary borough, seaport and county town of Glamorganshire, South Wales, situated on the Taff, 1 m. above its outflow, 145½ m. from London by the G.W.R. via Badminton, and 45½ m. E.S.E. of

Swansea. A large number of branch lines once owned by different companies focus on Cardiff. These are all now run by the G.W.R. The Glamorganshire canal, opened in 1794, runs from Cardiff to Merthyr Tydfil, with a branch to Aberdare. The increase of the population of Cardiff during the 19th century was phenomenal; from 1870 inhabitants in 1801, it grew to 32,954 in 1861, and in 1931 was 223,648. The borough, which originally comprised only the parishes of St. John's and St. Mary's, was in 1875 and 1895 extended so as to include Roath and a large part of Llandaff, known as Canton, on the right of the Taff. The whole area was united as one civil parish in 1903. In 1922 the city boundaries were extended to include Llandaff and most of six other outlying parishes, and the area of the city is now 11,984 acres.

**History and Historic Buildings.**—In documents of the first half of the 12th century the name is variously spelt as *Kairdif*, *Cairti* and *Kardid*. The Welsh form of the name, Caerdydd, suggests that the name means "the fort of (Aulus?) Didius," rather than Caer Dâf ("the fortress on the Taff"), which is nowhere found (except in Leland), though Caer Dyv once existed as a variant. No traces have been found of any pre-Roman settlement at Cardiff. Excavations from 1889 onward showed that Cardiff had been a Roman station, and also revealed the sequence of subsequent changes. There was first, on the site occupied by the present castle, a camp of about ten acres, probably constructed after the conquest of the Silures A.D. 75–77, so as to command the passage of the Taff, which was here crossed by the *Via Maritima* running from Gloucester to St. David's. In later Roman times there were added a series of polygonal bastions, of the type found at Caerwent. To this period also belongs the massive rampart, over 10 ft. thick, and the north gateway, one of the most perfect Roman gateways in Britain. In post-Roman times the native princes of Glamorgan had their principal demesne, not at the camp but a mile to the north of Llystalybont, while Saxon invaders threw up within the camp a large moated mound on which the Normans about the beginning of the 12th century built the great shell-keep. A study of place names has revealed that the neighbourhood was in the hands of Scandinavian raiders in the 9th and 10th centuries. The builder of the Norman Castle was probably Robert, earl of Gloucester, who also built Bristol castle. Then or possibly even earlier the old rampart was for two-thirds of its circuit buried under enormous earthworks, the remainder being rebuilt. It was in the keep that Robert, duke of Normandy, was imprisoned from 1108 to 1134. Additions in Decorated and Perpendicular styles are due to the Despensers and to Beauchamp, earl of Warwick, while the present residential part ranges from the 15th–19th centuries. The original ditch, about 20 yd. wide, still exists on three sides, but it is now converted into a "feeder" for the docks and canal. The re-planning of the streets in front of the Castle (1924–26) has considerably improved this area.

Under the Norman Fitz Hamon, Cardiff became the caput of the seigniory of Glamorgan, and the castle the residence of its lords. The castle and lordship descended through the families of De Clare, Despenser, Beauchamp and Neville to Richard III., on whose fall they escheated to the Crown, and were granted later, first to Jasper Tudor, and finally by Edward VI. in 1550 to Sir William Herbert, afterwards created Baron Herbert of Cardiff and earl of Pembroke. Through the daughter and granddaughter of the 7th earl the castle and estates became the property of the 1st marquess of Bute (who was created Baron Cardiff in 1776), to whose direct descendant they now belong.

The town received its earliest known grant of municipal privileges before 1147 from Fitz Hamon's successor Robert, earl of Gloucester. In 1284 the inhabitants petitioned the burgesses of Hereford for a certified copy of the customs of the latter town, and these furnished a model for the later demands of the growing community at Cardiff from its lords, while Cardiff in turn furnished the model for the Glamorgan towns such as Neath and Kenfig. In 1324 Edward II. granted a number of exemptions to Cardiff and other towns in South Wales, and this grant was confirmed by Edward III., Henry IV., Henry VI. and Edward IV. Its most important early charter was that granted in 1340 by Hugh le Despenser, whereby the burgesses acquired the right to

nominate persons from whom the constable of the castle should select a bailiff and other officers; two ancient fairs, held on June 29 and Sept. 19, were confirmed, and extensive trading privileges were granted, including the right to form a merchant guild. A charter of 1421 made the constable of the castle mayor of the town but Queen Elizabeth granted a confirmatory charter to the mayor and bailiffs direct without reference to the lord of the castle. The town was treated as a borough by prescription until 1608, when James I. confirmed its status adding to its rights of self-government, and granting a third fair (on Nov. 30). The first step towards the modern improvement of the town was in 1774, when a special act was obtained for the purpose. Nineteen private acts and provisional orders were obtained during the 19th century.

In 1404 Owain Glyn Dwr burnt the town, except the quarters of the Friars Minors. In 1645, after the battle of Naseby, Charles I. visited the town, which until then had been mainly Royalist, but about a month later was taken by the Parliamentarians. In 1648, a week after the Royalists had been decisively defeated by Colonel Horton at St. Fagan's, 4 m. west of Cardiff, Cromwell passed through the town on his way to Pembroke.

Outside the north-west angle of the castle, Richard de Clare in 1256 founded a Dominican priory, which was burnt by Glyn Dwr in 1404. Though rebuilt, the building fell into decay after the dissolution. The site was excavated in 1887. Outside the north-east angle a Franciscan friary was founded in 1280 by Gilbert de Clare, which at the dissolution became the residence of a branch of the Herbert family. Its site was explored in 1896. The church of St. John the Baptist, in Perpendicular style, has a fine tower built about 1443 by Hart, who also built the towers of Wrexham and St. Stephen's, Bristol. A sculptured stone reredos by W. Goscombe John was erected in 1896. The original church of St. Mary's, at the mouth of the river, was swept away by a tidal wave in 1607.

**Modern Buildings.**—Probably no town in the kingdom has a finer group of public buildings than those in Cathays Park, which also commands a view of the castle ramparts and the old keep. On the south side of the park are the Law Courts and City Hall (1906) and the still unfinished Welsh National Museum, the finest of all. In 1905 Cardiff was selected by a privy council committee to be the site of the state aided national museum of Wales, the corporation offering the site in Cathays Park. A charter providing for its government was granted in 1907. The museum has absorbed the Municipal Museum and Art Gallery previously in the library building. There are also collections of archaeological finds, metal work and Welsh domestic appliances, as well as specimens of the Welsh flora and fauna. On the west side of the park, from south to north are the University of Wales registry (1903), the Glamorgan County hall (1911) and the Cardiff Technical college (1916). On the east side is the University college of South Wales and Monmouthshire (1909). The college was founded in 1883 and carried on work for some time in temporary buildings pending the erection of the present ones. Since 1893 the college has been one of the constituent colleges of the University of Wales. It has faculties of arts, science, music and medicine, the latter possessing fine well equipped buildings in Newport Road. Aberdare Hall is a hostel for the women students. The business buildings are developing fast and roads are being widened. The Taff is spanned by two important bridges, one a four-arched bridge rebuilt in 1858-59 leading to Llandaff and the other a cantilever with a central swinging span of 190 feet. The modern churches include St. Luke, Canton (1911), St. Joseph, Cathays (1913) and St. Samson (1923). In 1912 the parish of St. Stephen was formed, in 1920 that of Upper Grangetown and in 1923 that of St. David. The Baptist theological college of Pontypool was removed to Cardiff in 1895. The city owns over 300 acres of parks and "open spaces," the chief being Roath Park with a lake and botanical garden, Llandaff fields and Cathays Park, while Plymouth Great wood (42 acres), presented to the city by the earl of Plymouth, was opened in 1923.

**Commerce and Industries.**—Edward II.'s charter of 1324 indicates that Cardiff had become even then a trading and shipping centre of some importance. It enjoyed a brief existence as a staple

town from 1327 to 1332. During the reigns of Elizabeth and James I. it was notorious as a resort of pirates. It was for centuries a "head port," its limits extending from Chepstow to Llanelly; in the 18th century it sank to the position of "a creek" of the port of Bristol, but about 1840 it was made independent, its limits for customs purposes being defined as from the Rhymney estuary to Nash Point, so that technically the "port of Cardiff" includes Barry and Penarth as well as Cardiff proper. Down to the end of the 18th century there was only a primitive quay on the river side for shipping purposes. Coal was brought down from the hills on the backs of mules, and iron carried in two-ton wagons. In 1798 the first dock (12 acres in extent) was constructed at the terminus of the Glamorgan canal from Merthyr. When east Glamorgan became more interested in coal exporting (after about 1850), Cardiff developed greatly. Railways from all directions focused there, the slope from the high-lying coalfields facilitating transport of the heavily-laden trains and of the returning empty wagons. With the great demand for the South Wales steam coal (1850-1914) Cardiff became the greatest coal exporting port in the world.

The influence of the 2nd marquess of Bute cannot be over-estimated. In 1830 he obtained the first act for the construction of a dock which (now known as the West Bute dock) was opened in 1839 and measures (with its basin) 19½ acres. The opening of the Taff Vale railway in 1840 and of the South Wales railway to Cardiff in 1850 necessitated further accommodation, and the trustees of the marquess (who died in 1848) began in 1851 and opened in 1855 the East Bute dock and basin measuring 46½ acres. The Rhymney railway to Cardiff was completed in 1858 and the trade of the port so vastly increased that the shipment of coal and coke went up from 4,562 tons in 1839 to 1,796,000 tons in 1860. In 1864 the Bute trustees unsuccessfully sought powers for constructing three additional docks, but under the more limited powers granted in 1866, the Roath basin (12 acres) was opened in 1874, and (under a substituted act of 1882) the Roath dock (33 acres) was opened in 1887. These docks fell far short of the requirements of the district, for in 1865 the Taff Vale Railway Company opened a dock of 26 acres under the headland at Penarth, while in 1884 a group of colliery owners, dissatisfied with their treatment at Cardiff, obtained powers to construct docks at Barry. The Bute trustees in 1885 acquired the Glamorgan canal and its dock, and in the following year obtained an act for vesting their various docks and the canal in the Cardiff Railway Company. The South Bute dock of 50½ acres, authorized in 1894, was opened in 1907, bringing the whole dock area of Cardiff to about 210 acres. There are now some 5 m. of quays and 12 graving docks. The landing of foreign cattle is permitted by the Board of Trade, and there are cattle lairs and abattoirs near the Cardiff wharf. The period following the war (1914-18) saw a great disruption of Cardiff's export trade. The docks have been under the management of the G.W. Ry. since 1922.

The east moors, stretching towards the outlet of the Rhymney river, became an important metallurgical quarter when the local ores of the coal field were replaced by those imported mostly from Spain. The smelting works consequently migrated to the coastal regions. The influx of population connected with the coal trade brought with it a very large Irish element giving Cardiff a considerable Roman Catholic population and when Wales was made a separate Roman Catholic province in 1916, it became the seat of the archbishop. Copper works were established here in 1866, followed long after by tin-stamping and enamel works. In 1888 the Dowlais Iron Company (now Messrs. Guest, Keen and Nettlefold, Ltd.) acquired here some ninety acres for iron works. There are also in the city several large grain mills and breweries, a biscuit factory, wire and hemp roperies, fuel works, general foundries and engineering works.

**Administrative.**—In virtue of its being the shire-town, Cardiff acquired in 1535 the right to send one representative to parliament, which it did until 1832, from which date Cowbridge and Llantrisant have been joined with it as contributory boroughs returning one member. Following subsequent changes in representation consequent upon the growth of the city, the 1918 Act allo-

cated three members to Cardiff. The great sessions for the county were during their whole existence from 1542 to 1830 held at Cardiff, but the assizes (which replaced them) have since then been held at Swansea and Cardiff alternately, as also are the quarter sessions for Glamorgan. The borough has a separate commission of the peace, having a stipendiary magistrate since 1858. It was granted a separate court of quarter sessions in 1890, it was constituted a county borough in 1888, and, by letters patent dated Oct. 28, 1905, it was created a city and the dignity of lord mayor conferred on its chief magistrate. Under powers secured in 1884, the town obtains its chief water supply from a gathering ground near the sources of the Taff on the old red sandstone beyond the northern out-crop of the mineral basin and on the southern slopes of the Brecknock Beacons. Here two reservoirs of a combined capacity of 668 million gallons were constructed. In 1911 another large reservoir was begun in the Taff Fawr Valley and opened after the World War. A gas company first incorporated in 1837 supplies the city, while the corporation supplies electric power. In 1925-27 a central electrical power station was constructed at Treforest.

**BIBLIOGRAPHY.**—As to Roman Cardiff see articles by J. Ward in the *Archaeologia* for 1901 (vol. lvii.), and in *Archaeologia Cambrensis* for 1908. "The Scandinavian Settlement of Cardiff," *Archaeologia Cambrensis*, 1921. As to the castle and the Black and Gray Friars see *Archaeologia Cambrensis*, 3rd series, viii., 251 (reprinted in Clark's *Mediaeval Military Architecture*), 5th series, vi., 97; vii., 283; xvii., 55; 6th series, i., 69. The charters of Cardiff and "Materials for a History of the County Borough from the Earliest Times" were published by order of the corporation in *Cardiff Records* (5 vols., 1898 sqq.). See also *Cardiff, an Illustrated Handbook*, 1896; the *Annual Report of the Cardiff Chamber of Commerce*; the *Calendar of the University College*.

**CARDIGAN, JAMES THOMAS BRUDENELL, 7TH EARL OF (1797-1868)**, English soldier, born at Hambleden, Bucks, on Oct. 16, 1797. He entered the army in 1824, and as lieutenant-colonel, first in the 15th Hussars (1832-34), and later in the 11th Hussars, made himself one of the most unpopular officers in the army. Within two years he held 105 courts-martial, and made more than 700 arrests. He succeeded to the peerage in 1837. In 1840 he fought a duel with one of his own officers, Captain Tuckett, and was tried before the House of Lords on a charge of feloniously shooting his adversary, but he was acquitted on a trivial technical ground. In 1854, at the outbreak of the Crimean War, Lord Cardigan was appointed to the command of the light cavalry brigade, and in the famous charge of the light brigade at Balaclava, he was the first man to reach the Russian lines. He was created K.C.B. in 1855, and was appointed inspector-general of cavalry, and lieutenant-general in 1861. He died, without heirs, on March 28, 1868, and the family titles passed to the 2nd marquess of Ailesbury.

**CARDIGAN** (Aberteifi), municipal borough, Cardiganshire, Wales, situated on the right bank of the Teifi about 3m. above its mouth. (Pop., 1931, 3,309.) It is connected by an ancient stone bridge with the suburb of Bridgend on the southern or Pembroke bank of the river. The castle was originally built by Gruffydd ap Rhys on an old site and was rebuilt by the Normans. It changed hands frequently during the middle ages. During the later part of the 12th century it became the residence of Rhys ap Gruffydd, a powerful Welsh chieftain who ruled over most of south Wales. The castle was finally destroyed by the parliamentarians in 1645. The priory church of St. Mary has been much altered, but in its east window there are remains of ancient glass. About a mile below Cardigan are the ruins of St. Dogmael's abbey, founded in the 12th century by Martin of Tours for the Benedictine order of St. Bernard of Tiron. Henry VIII.'s charter of 1542 confirmed earlier privileges granted by Edward I. and other kings, and provided for the government of the town by a mayor, two bailiffs and a coroner. The 18th and early 19th centuries saw Cardigan a busy river port with an extensive coastal trade, but the advent of steamships together with silting up of the Teifi mouth has brought the trade of the town almost to extinction.

**CARDIGANSHIRE**, a county of South Wales (Ceredigion, Sir Aberteifi), bounded north by Merioneth, east by Montgomery, Radnor and Brecon, south by Carmarthen and Pembroke, and

west by Cardigan Bay and the Irish Sea. With an area of 688 sq.m. it ranks fifth in size of the Welsh counties. Cardiganshire may be divided physically into a coastal plateau on the west and a high plateau to the east. The latter is bordered by a rather sharp westward slope and shows finger like projections above the coastal plateau. The high plateau culminates in Plynlymon (2,468 ft.) composed mainly of a set of grits and shales of Bala (Ordovician age). Most of the high plateau is above the 800 ft. contour; it is a sheep rearing region of sparse population and poor communications with much boulder clay as surface soil. The valleys of the coastal plateau are composed in the east of flags and soft shales of the Valentian series (Lower Silurian system) and in the western section by the Tarannon series, gritty strata of considerable thickness. The latter (the Aberystwyth grits) occur in two belts, one along the coast from Borth to Llangrannog and the other forming a band following the high plateau from near Cwmystwyth southwards along the east side of the Teifi valley. The coastal plateau is lower and thus able to support a larger population mainly dependent on stock raising. A zone of geological faults cuts through both plateaux. East-north-east to west-south-west and parts of this fault system are occupied by the Ystwyth and Wyre rivers. South of the Wyre for some distance the coastline is lower and more approachable but the coastal plateau again reaches to the sea cliffs south of New Quay. Behind the approachable coast between the Wyre and the Aeron is the moorland of Mynydd Bach and beyond this again the swampy central section of the Upper Teifi with the southward continuation of the Plynlymon moorland in the background. The principal rivers pursue for a greater part of their length a course nearly parallel to the coast and the main watershed and then turn often abruptly west and north-west to the sea. The Upper Aeron, upper Rheidol and the Teifi exhibit this feature very clearly. The westward section of the Teifi from Lampeter to Cardigan forms the southern boundary of the county. In the north-eastern section of the county in an area about 20 miles long and four miles wide extending in a south-south-easterly direction from the Dovey estuary to Cwmystwyth is a metalliferous area of great importance historically. Lead, silver and zinc have been mined here for many centuries and in large quantities. Mining is now discontinued. The entire county shows evidence of heavy glaciation. The valleys are mostly U-shaped especially those with a westerly trend (e.g., Clarach valley). The high plateau has many examples of "cirques" while boulder clay occupies many of the lower valley slopes and much of the coast of Cardigan bay. The great Tregaron bog is thought to represent a former lake behind a boulder clay dam while Borth bog seems the result of a hindering of moor drainage owing to the building up of a storm beach by the sea from the remains of a former boulder clay plain no doubt a part of the legendary Cantref y Gwaelod. The large amount of boulder clay accounts largely for the fact that the sea penetrates inland along the valleys as in south Pembrokeshire or Cornwall or Devon. The drift in Cardigan bay together with the post glacial subsidence accounts for those peculiar features the "Sarns" (causeway) such as Sarn Cynfelin, Sarn Baurig and others, which figure in the legendary lore of the county as the remains of the "Cantref y Gwaelod" (the lowland hundred) seems to have become submerged through the drunken negligence of Seithenyn, its prince, who omitted one night to close the sluices of the sea dykes with disastrous results. As in other regions of western Britain the earliest remains of man are found on the high ground, hence the high ground of north and south Cardiganshire is dotted with tumuli and cairns. The finds of the bronze age are not very numerous but include a number of stone battle axes and are all on the western side of the county, marking possible trackways from the interior as well as ways in on the west from Ireland. One of the most conspicuous features of north Cardiganshire is the large number of hill-top camps supposedly of Romano-British age. They seem to be associated with the metalliferous veins in the north and guard important landing places on the coast, e.g., at Pendinas, Aberystwyth and at Llanrhystyd. There are traces in the eastern part of the county of a Roman trackway known in Welsh as Sarn Helen which seems to have run via Llanio through the hills to Carmarthen. The post-Roman centuries

were marked by numerous raids, especially from Ireland upon the open coast. The raiders were perhaps attracted by the mineral wealth of the area. It is interesting to note that the place-name "Gwyddel" (Irish) occurs with great frequency in the region behind the section of open coast. The raiding was long continued and the raiders later included Scandinavian elements from their settlement at Dublin. Counteracting, as it were, this movement of destruction was the civilizing and Christianizing influence of the Celtic Saint movement which seems to have been a special feature of this county. Llanddewi Brefi, a village in the centre of the county, is said to have been headquarters of St. David the patron saint; while St. Padarn headed Llanbadarn Fawr (1 m. E. of Aberystwyth) which in the 8th century became merged in the see of St. Davids. An interesting memorial of these days is the church of Ysbytty Cynfyn (14 m. E. of Aberystwyth) for in its churchyard walls are included many megalithic stones which once formed part of a stone circle. This illustrates the continuity of tradition which is an important feature of the far west. In post-Roman days the whole basin of the Teifi is said to have fallen to the power of Ceredig, son of Cunedda Wledig of north Wales and from Ceredig's name has been derived that of the present county. The Norman penetration of hilly Cardiganshire was a slow process. So the history of the county during the 12th and 13th centuries is one of a long series of skirmishes between the Norman who sought to keep open the valley lines of communication and the Welsh herdsmen among the hills. The county was so unsettled in this respect that in the opening years of the 15th century Owen Glyndwr actually held a court in Aberystwyth castle. The Cistercian abbey of St. Mary at Strata Florida (*q.v.*) founded by Rhys ap Griffith in 1164 continued to be prosperous and influential during the periods of Welsh independence. By the Statutes of Rhuddlan (1284) Edward I. constituted Ceredigion out of the former principality of Wales, a shire on the English model, dividing the new county into six hundreds and fixing the assizes at Carmarthen. By the Act of Union in the reign of Henry VIII., the boundaries of the county were subsequently enlarged to their present size by the addition of certain outlying portions of the Marches around Tregaron and Cardigan and the assizes were assigned to the county town. Under Henry VIII. the county was first empowered to send a representative to parliament and under Mary the same privilege was extended to the boroughs. During the Civil War the castles of Cardigan and Aberystwyth were held for Charles and reduced to ruins by the Cromwellian forces. The county became in the 18th century the centre of the Methodist movement, which seems to have had its greatest influence among the shepherds and cattle herders of the moorlands. Daniel Rowlands (1713-1790) the curate of Llangetho, a village almost in the centre of the county, became one of the chief leaders in this important movement. The 17th and 18th centuries saw the coastal towns and villages especially Cardigan, Llangrannog, Tresaith, Aberporth, New Quay, Aberayron, Aberystwyth and Borth enjoy a brisk coastal trade chiefly with Bristol. Owing to the bad landward communications of the county almost all imported material came by sea in those days. This trade was supplemented by fishing. After the fall in the importance of coastal trade—the above areas, especially New Quay, seem to have maintained seafaring skill and many of the young men leave these areas for Liverpool, Fleetwood, etc., and hold important posts in present day shipping concerns. Fishing on a small scale continues while these towns and villages have become summer resorts for the midlands and south Wales. The export trade as well as the general prosperity of the northern half of the county was much increased between 1830-80 by the extensive mining of lead previously referred to. The mines were worked intermittently for centuries, possibly from prehistoric days, but they reached their last maximum about 1870 when owing to difficulties of railway transport, obsolete machinery and the importation of foreign ores, the industry dwindled and has now almost passed away. Many families migrated to south Wales and others turned to a reliance on the scanty pastoral resources of the bleak moorlands. The unsettled state of agriculture during the middle of the 19th century produced in Car-

diganshire great activity among the Rebecca rioters (1842-43) as well as political agitation against the payment of tithes and general evictions (1864). The great movements of the industrial revolution affected Cardiganshire adversely. It ultimately destroyed local industries and seafaring activity and caused Cardiganshire's greatest export henceforth to be men and not goods. Many families left the county to become milk vendors and drapers in the large cities, particularly London. The only industry that escaped complete extinction by the new developments was the weaving industry of the lower Teifi valley where the water is especially suitable for weaving processes. The area has much inherited skill in the trade and shows social and religious peculiarities. The county has long been celebrated for its breeding of horses and the local horse fairs are well attended by English and Welsh dealers. The changes following the War of 1914-18 have seriously affected the industry. The fact that the ways from England into Cardiganshire are very difficult has caused the county to retain the Welsh language to a greater extent than most other Welsh counties and along with the language have been preserved many social and religious customs.

The county in virtue of its physical features is poorly served by communications both road and rail. Aberystwyth is the terminus of the old Cambrian line (now G.W.R.) from Shrewsbury as well as of the G.W.R. branch line from Carmarthen via Lampeter and Tregaron. Secondary branch lines run from Pencader to Llandyssul and Newcastle Emlyn and from Lampeter to Aberayron. Cardigan town is reached by a G.W.R. branch line from Whitland. The area of the administrative county is 443,071 acres with a population in 1871 of 73,441, and in 1931 of 55,164. The municipal boroughs are Aberystwyth, Pop. (according to 1931 census) 9,474, Cardigan (3,309) and Lampeter (1,742). Aberayron (1,155) and New Quay (1,112) are urban districts. Quarter sessions are held at Lampeter, and here also are held the assizes for the county which lies in the south Wales circuit. The county returns one member to Parliament, and has no parliamentary borough. Ecclesiastically it lies wholly in the diocese of St. Davids, and contains 66 parishes.

**CARDINAL**, in the Roman Church, the title of the highest dignitaries next to the pope. The cardinals constitute the council or senate of the sovereign pontiff in the government of the Church; they constitute a spiritual body called the Sacred College, act as administrators of the Church during a vacancy of the Holy See and elect the new pope. Their present position is the result, by a long process of evolution, of the association and co-operation with the pope of the chief clergy of Rome.

The name is derived from *cardo*, hinge; it was originally of a more general application, and the word is still used adjectivally in the sense of pre-eminent or that on which everything else "hinges." As early as the end of the 5th century the term cardinal was applied at Rome to the priests permanently attached to the Roman *tituli* or parish churches immediately under the pope.

It was also used, however, until late in the Middle Ages for the leading clergy of the more important churches; but the title was gradually confined by usage to the Roman cardinals, until Pius V. in 1567 reserved it to them exclusively.

**The Sacred College.**—The grouping of the cardinals into a body, the College of Cardinals, is connected, in the case at least of cardinal priests, with the ancient *presbyterium*, which existed in each church from the earliest times. The Sacred College as such was not, however, definitively constituted until the uniting of the three orders of cardinals into a single body, the body which was to elect the pope; and this only took place in the 12th century. Up till that time the elements remained distinct, and there were separate classes: the "Roman" bishops, *i.e.*, bishops of sees near Rome, presbyters of the *tituli* of Rome, and deacons of the Roman Church. Nowadays, the Sacred College is still composed of three orders: cardinal bishops, cardinal priests and cardinal deacons. But the process of evolution has not been the same in the case of all these orders.

Cardinal bishops are the bishops of suburbicarian churches, situated in the immediate neighbourhood of Rome. Very early we find them assisting the pope in his ritual functions and in deal-

ing with important business; they formed a kind of permanent synod (*cf.* the *σύνδος ἐκδημοῦσα* of Constantinople); and they also took the place of the pope in the ceremonies of the liturgy, except the most important ones, and especially in the service of the cathedral at Rome, the Lateran. The life of Stephen III. (768-772) in the *Liber Pontificalis* (ed. Duchesne, i. p. 478) states that he ordered solemn Mass to be said every Sunday on St. Peter's altar in the Lateran Church, *a septem Episcopis cardinalibus hebdomadariis, qui in ecclesia Salvatoris observant*. In 1058 they were called "cardinal bishops of the Lateran church" (St. Peter Damian, Ep. 1, lib. ii.). Their sees are the same to-day as they were then: Ostia, Porto, Santa Rufina (Sylva Candida), Albano, Sabina, Tusculum (Frascati) and Palestrina. From time immemorial the bishop of Ostia has had the right of wearing the "pallium" at the consecration of a pope who was not already a bishop; he is *ex officio* dean of the suburbicarian bishops, and consequently dean of the Sacred College. His see has been, since the 12th century, entitled Ostia and Velletri. The bishop of Porto is *ex officio* vice-dean of the Sacred College; his see was united by Calixtus II. to that of Santa Rufina, thus reducing the number of suburbicarian bishoprics and cardinal bishops to six; this number was confirmed by Sixtus V., and has not varied since.

The second order of cardinals is that of the cardinal priests. It represents and is a continuation of the ancient *presbyterium*; but in Rome the process of evolution was different from that in the other episcopal towns. In the latter, the division into parishes was but slowly accomplished; the bishop with the higher clergy, forming what became the chapter, were in residence at the cathedral, which was strictly the one parish church in the town. At Rome, on the contrary (and doubtless at Alexandria), certain churches, to which were attached certain districts, were at an early date entrusted to one or more priests. These churches, in which the sacraments of baptism and penance were administered, were called *tituli* (titles). According to the *Liber Pontificalis* (ed. Duchesne, i. pp. 122, 126, 164), the titles of Rome, numbering twenty-five, were already established as early as the 1st century; this seems hardly probable, but it was certainly the case in the 5th century. The priest (or the principal priest of two or more attached to the same church) serving one of these churches was the *presbyter cardinalis* of that title. Thus the Roman *presbyterium* did not give rise to a cathedral chapter, but to cardinal priests, each attached to his title. As the higher clergy of Rome gradually acquired a more important status, the relations between the cardinal priest and the church of which he bore the title became more and more nominal; but they have never entirely ceased. Even to-day every cardinal priest has his title, a church in Rome of which he is the spiritual head, and the name of which appears in his official signature, *e.g.* "Herbertus tituli sanctorum Andreae et Gregorii sanctae romanae ecclesiae presbyter cardinalis Vaughan." When the attachment of the cardinal priest to his title had become no more than a tradition, the number of cardinal titles, which in the 11th century had reached twenty-eight, was increased according to need, and it was held an honour for a church to be made titular. To-day the cardinal titles number fifty-three; since the number of cardinal priests never exceeds fifty, there are always a certain number of vacant titles.

**Cardinal Deacons.**—The third order of cardinals is that of the cardinal deacons. From an early date Christian Rome was divided into seven regions, each of which was administered (especially as regards the care of the poor) by a deacon. In course of time this division of the city disappeared, and the deacons came to be specially associated with certain "diaconal" churches, and gradually acquired a position analogous to that of the "cardinal" priests. In the 8th century Pope Adrian found sixteen diaconiae and founded two others (*Lib. Pont.* ed. Duchesne, i. p. 509); in the 12th century the cardinal deacons, who then numbered eighteen, were no longer distinguished by an ecclesiastical district, but by the name of the church connected with some diaconia (*loc. cit.* p. 364); and a cardinal deacon's connection with his diaconia eventually became merely nominal. Sixtus V. reduced the number of cardinal deacons to the present number, fourteen. A cardinal deacon does not mention his diaconia in his official signature: *e.g.* "Joannes

Henricus diaconus cardinalis Newman." There are at present sixteen diaconiae.

Cardinals resident in Rome enjoy what is known as *ius optionis*; that is to say, when a cardinalitial office is vacant, the cardinal next in seniority can claim promotion to it; cardinal deacons can pass in this way after ten years to the order of priests.

Cardinal bishops must naturally be bishops; for cardinal priests it is enough to have received the priesthood, though many of them are actually bishops; similarly, it is enough for cardinal deacons to have received the diaconate, though most of them are priests.

The cardinal camerlengo or chamberlain (*camerarius*) is chosen by the pope from among the Sacred College and entrusted with the administration of the common property. His office is important, for during the vacancy of the Holy See he exercises all external authority, especially that connected with the Conclave.

The number of cardinals was fixed by Sixtus V. (1586) at 70: six cardinal bishops, fifty cardinal priests and fourteen cardinal deacons; but the Sacred College never reaches its full number, and there are always ten or so "vacant hats," as the saying goes. The rule laid down by Sixtus V. has not been modified since, but before his time the number of cardinals varied considerably. In 1331 John XXII. said that there were twenty cardinals; in 1378 they were reckoned at 23. Their number increased during the Great Schism because there were several rival obediences. The councils of Constance and Basel reduced the number of cardinals to 24; but in the 16th century that number was more than doubled. In 1517 Leo X., to secure a majority in the Sacred College, created 31 cardinals at once. The highest number was reached under Pius IV., when the cardinals numbered 76.

The Sacred College was originally composed, as we have seen, of members of the Roman clergy exclusively; but as early as the 11th century cases are found in which the pope summoned to its ranks persons who did not belong to the Roman church, particularly abbots, who were not even required to give up the direction of their monasteries. In the following century occur a few cases of bishops being created cardinals without having to leave their see, and of cardinals upon whom were conferred foreign bishoprics (*cf.* Thomassin, *Vetus et nova discipl.* vol. I. lib. ii. cap. 114, n. 9). Most of the cardinals created by the Avignon popes were French, and in 1331 John XXII. remarks that 17 of the then existing 20 cardinals were French. The councils of Constance and Basel forbade that more than a third of the cardinals should belong to the same country. After the end of the Great Schism, the ancient customs were soon resumed; the cardinals were for the most part Italians, the non-Italian cardinals only amounting to a minority. The latter, with rare exceptions, are not resident in Rome; together with the rank of cardinal they receive a dispensation from residing *in curia*.

The reform of the College of Cardinals inaugurated by the councils of Constance and Basel, though without much immediate success, was not only concerned with the number and nationality of the cardinals; it also dealt with conditions of age, learning and other qualifications: men of the most honourable character, aged not less than thirty, were to be chosen; at least a third were to be chosen from among the graduates of the universities; persons of royal blood and princes were not to be admitted in too great numbers, and lastly, relatives of the pope were to be set aside. Moreover, in order to secure the effectiveness of these reforms, selection of the new cardinals was to be made by the votes of the members of the Sacred College given in writing. This mode of control was perhaps excessive, and the reform consequently remained ineffective. Up to the middle of the 16th century there were still instances of unfortunate and even scandalous appointments to the cardinalate of very young men, of relatives or favourites of the popes and of men whose qualifications were by no means ecclesiastical. But a real reform was at last effected by the council of Trent, and carried further by Sixtus V., whose regulations are still in force: a cardinal must, in the year of his promotion, be of the canonical age required for his reception into the order demanded by his rank, *i.e.* 22 for the diaconate, 23 for the priesthood and 30 for the episcopate, and if not already ordained he must take orders in the year of his appointment. Men of ill-

gitimate birth are excluded, as well as near relatives of the pope (with one exception) and of the cardinals; the personal qualities to be most sought for are learning, holiness and an honourable life. All these recommendations have been, on the whole, well observed, and are so better than ever in the present day. We may add that the mendicant orders have been represented, under the regulations of Sixtus V., by at least four theologians. The cardinals' hats granted at the request of the heads of Catholic states are subject to negotiations analogous to those concerning nominations to the episcopate, though entailing no concordatory agreement, strictly speaking, on the part of the popes.

**Creation.**—The creation of cardinals (to use the official term) is in fact nowadays the function of the pope alone. It is accomplished by the publication of the persons chosen by the pope in secret consistory (*q.v.*). No other formality is essential; the provision of Eugenius IV., requiring the reception of insignia for promotion to be valid, was annulled by Pius V. in 1571. Similarly neither the consent nor the vote of the Sacred College is required. The injunctions of the councils of Constance and Basel as to the written vote of the cardinals became before very long a dead letter, but there still remains a relic of them. In the consistory, when the pope has nominated those whom he desires to raise to the purple, he puts to the cardinals present the question: "Quid vobis videtur?" The cardinals bend the head as a sign of their consent, and the pope then continues: "Itaque, auctoritate omnipotentis Dei, sanctorum Apostolorum Petri et Pauli, et Nostra, creamus et publicamus sanctae romanae Ecclesiae cardinales N. et N., etc."

The new dignitary, who has been warned of his nomination several weeks in advance by "biglietto" (note) from the office of the secretary of state, is then officially informed of it by a *cere-moniarius* of the pope; he at once waits upon the pope, to whom he is presented by one of the cardinals. The pope invests him with the rochet and red biretta, but there is no formal ceremony. The conferring of the cardinal's red hat takes place a few days later in a public consistory; while placing the hat on his head the pope pronounces the following words: "Ad laudem omnipotentis Dei et Sanctae Sedis ornamentum, accipe galerum rubrum, insigne singularis dignitatis cardinalatus, per quod designatur quod usque ad mortem et sanguinis effusionem inclusive pro exaltatione sanctae fidei, pace et quiete populi christiani, augmento et statu sacrosanctae romanae Ecclesiae, te intrepidum exhibere debeas, in nomine Patris et Filii et Spiritus Sancti." While pronouncing the last words the pope makes the sign of the cross three times over the new cardinal. The public consistory is immediately followed by a secret consistory, to accomplish the last ceremonies. The pope begins by closing the mouth of the new cardinal, as a symbol of the discretion he should observe; after this he bestows on him the cardinal's ring, assigns him a title or diaconia; and finally, after going through the formality of consulting the Sacred College, finishes with the symbolic ceremony of the opening of the mouth, signifying the right and duty of the new cardinal to express his opinion and vote in the matters which it will fall to him to consider.

When the new cardinal is resident abroad and appointed at the request of the head of his state, a member of the Noble Guard is sent on the day of the consistory to give him the cardinal's "calotte"; after a few days the red biretta is brought by a Roman prelate, and is conferred on him with great pomp by the head of the state. But the conferring of the red hat always takes place at the hands of the pope in a public consistory.

Sometimes the pope announces the creation of cardinals whose names he does not divulge, but reserves the right of publishing at a later date. These cardinals, whose names he conceals "in his breast," are for that reason called cardinals *in petto*. This practice seems to go back to Martin V., who may have used this expedient to avoid the necessity of soliciting the votes of the cardinals; but for a long time past the popes have resorted to it for quite other reasons. If the pope dies before making known the cardinals *in petto*, the promotion is void; if he publishes them, they take rank from the day of the first announcement. In March 1875 Pius IX. announced the creation of several cardinals *in petto*, whose names would be given in his will. It was pointed out to him

that this posthumous publication would not be a pontifical act, and ran the risk of being declared invalid; and he published the names in a subsequent consistory (Sept. 17).

The dignity of the cardinals is a participation in that of the sovereign pontiff, and as such places them above all other ecclesiastical dignitaries. This rank was first attributed to the cardinal bishops, and afterwards claimed by the rest. Their common prerogative was definitively established when they became the sole electors of the pope, at a period when the papacy, under pontiffs like Innocent III., shone with its most brilliant lustre. For example, at the council of Lyons in 1245 all the cardinals took precedence of the archbishops and bishops. It was in 1245, or perhaps the year before, that Innocent IV. granted the cardinals the privilege of wearing the red hat; the scarlet robe, which still forms their costume of ceremony, was already worn by cardinals performing the functions of legate; and the use was soon extended to all. As to their civil relations, cardinals were assimilated by the Catholic kings to the rank of princes of the blood royal. They were granted the official style of Eminence by Urban VIII. (1630).

The most lofty function of the cardinals is the election of the pope (*see CONCLAVE*). But this function is necessarily intermittent, and they have many others to fulfil *sede plena*. On those rare occasions on which the pope officiates in person, they carry out, according to their respective orders, their former functions in the ritual. But they are, above all, the assistants of the pope in the administration of the Church; they fill certain permanent offices, such as those of chancellor, penitentiary, etc.; or again, temporary missions, such as that of legate *a latere*; they have seats in the councils and tribunals which deal with the affairs of the Church, and the Roman congregations of cardinals (*see CURIA ROMANA*).

**BIBLIOGRAPHY.**—All works on canon law contain a treatise on the cardinals. *See* particularly, for the history, Thomassin, *Vetus et nova discipl.*, tom. I., lib. ii., cap. 113-115. For history and law, Phillips, *Kirchenrecht*, vol. vi.; Hinschius, *System des kath. Kirchenrechts*, vol. i. p. 312. For the canonical aspect, Ferraris, *Prompta bibliotheca*, s.v. "Cardinales"; Bouix, *De curia romana* (Paris, 1859), pp. 5-141; Card. de Luca, *Relatio curiae romanae*, disc. 5. For details of the ceremonies and costume, Grimaldi, *Les Congrégations romaines* (Sienna, 1850), p. 99 *et seq.*; Barbier de Montault, *Le Costume et les usages ecclésiastiques* (Paris), s.d. For a list of the names of the cardinals, according to their titles, *see* De Mas-Latrie, *Trésor de chronologie*, col. 2219-2264; and in the chronological order of their promotion, from St. Leo IX. to Benedict XIV., *ibid.* 1177-1242; also *Dictionnaire des cardinaux* (Paris, 1856).

**CARDINAL FLOWER** (*Lobelia cardinalis*), a late-flowering herbaceous perennial of the lobelia family, widely distributed in eastern North America. It grows in moist rich soil, often on muddy banks, from southern New Brunswick and Ontario westward to Colorado and south to Florida and Texas, blooming in late August or September. The plant, which attains a height of from 2 to 4 ft., bears a large cluster of very showy, intensely red flowers, each about an inch long with a three-divided lower lip and a slender upright portion. This plant is one of the most handsome of North American wild flowers.

**CARDINALS, COLLEGE OF.** The Codex of Canon Law, ordered to be codified by Pius X. and promulgated by Benedict XV. by the Bull, *Providentissima Mater*, in 1917, contains perhaps the last word to be said concerning the cardinalial dignity and the privileges and duties attached to the office of those who wear the *ruber galerus*. The matter is there so well digested that little further compression is possible or comment necessary.

The cardinals are described as the Pope's counsellors and adjuncts in the three orders of 6 cardinal bishops, 50 cardinal priests and 14 cardinal deacons. They are to be chosen freely

from all countries for their doctrine, piety and prudence. The cardinal bishop first in promotion becomes dean of the Sacred College, but only as first among equals. Cardinals are required to live in Rome, even the cardinal bishops of suburban Sees. Cardinals occupying Sees abroad are required to approach the Pope on arrival in Rome, and not to leave without his permission.

The new Code contains the Constitution of Pius X. *Vacante Sede Apostolica*, which summarizes most minutely the duties of the cardinals during the *interregnum* between one pontificate and the next. The cardinals have no power, except in matter of immediate business. The cardinals are required to meet and make the ceremonial arrangements for burying one Pope and for electing another. The ingress of the cardinals into conclave and their closure is minutely ordered. Secrecy is imposed upon all the cardinals and the conclavists under pain of excommunication. By the *Commissum nobis* Pius X. abolished the veto claimed by the Catholic powers under an unwritten law. See **CARDINAL**; **CONCLAVE**.

**CARDINAL VIRTUES**, a phrase used for the principal virtues on which conduct in general depends. Socrates and Plato (see *Republic*, iv. 427) take these to be Prudence, Courage (or Fortitude), Temperance and Justice. It is noticeable that the virtue of Benevolence, which has played so important a part in biblical ethics and in modern altruistic and sociological theories, is omitted by the ancients. Further, against the Platonic list it may be urged (1) that it is arbitrary, and (2) that the several virtues are not specifically distinct, that the basis of the division is unsound and that there is overlapping. It is said that St. Ambrose was the first to adapt the Platonic classification to Christian theology. By the Roman Catholic Church these virtues are regarded as *natural* as opposed to the *theological* virtues, Faith, Hope and Charity. Some authors, combining the two lists, have spoken of the Seven Cardinal Virtues. In English literature the phrase is found as far back as the *Cursor Mundi* (1300) and the *Ayenbite of Inwit* (1340).

Eth.* (2nd ed.); H. Sidgwick, *History of Ethics* (5th ed.), pp. 44, 133, 143; and *Methods of Ethics*, p. 375.

**CARD INDEX**. A method of filing which has the great and peculiar advantage of enabling a list of records to be kept in

SECTIONS OF CARD INDEX USED IN PREPARING THE PRESENT EDITION OF THE ENCYCLOPÆDIA BRITANNICA

perfect alphabetical order even while its contents are increased or diminished.

Each name or subject is entered on a separate card, and the cards are arranged alphabetically in a suitable drawer or series of drawers. If a record becomes obsolete it is literally discarded. If a new record is needed, a fresh card is made out and placed in its proper alphabetical order. If and when the entire list grows beyond the filing cabinet's capacity, fresh drawers can be added. Thus, the untidy, unsightly and misleading character of a much

amended book-list is avoided. The card system has been applied to bookkeeping. "Looseleaf ledgers" are now popular.

Within wide limits, the size of the cards may be varied to suit the needs of the records required. So simple is the arrangement that no particular inventiveness is needed to give it effect, but many sorts of appliances are sold for the convenience of different businesses. The system was extensively employed in the preparation of the ENCYCLOPÆDIA BRITANNICA.

**CARDING**. The process of using the "card" (Lat. *carduus*, a thistle or teasel) for combing textile fibrous materials. The practice of carding is of such great antiquity that its origin cannot be traced. It consists in combing or brushing fibres until they are straight and placed in parallel lines; in doing this, imperfect fibres are separated from perfect ones, all impurities are removed, and the sound fibres are in condition for further treatment. The teasels once used have long given place to hand cards, and these in turn to what, in the rudest form, were known as "stock cards," namely, two wire brushes, each 4in. broad by 12in. long, and having teeth bent at a uniform angle. One was nailed upon a bench with the teeth sloping from the operator, the other was similarly secured upon a two-handled bar with the teeth sloping towards the operator. The material to be treated was thinly spread upon the fixed card, and the movable one drawn by hand to and fro over it. When sufficiently carded, a rod furnished with parallel projecting needles, called a "needle stick," was pushed amongst the card teeth to strip the fibres from the comb. The strip thus procured was rolled into a sliver and spun.

James Hargreaves, the inventor of the spinning jenny, suspended the movable comb by passing two cords over pulleys fixed in the ceiling and attached balance weights to opposite ends of the cords. This enabled him to lengthen the cards, to apply two or three to the same stock and to manipulate the top one with less labour, as well as to produce more and better work. In May of 1748, Daniel Bourn, of Leominster, patented a machine in which four parallel rollers were covered with cards, and set close together. Fibres were fed to the first rotating roller, each in turn drew them from the preceding one, and a grid was employed to remove the carded material from the last roller. This introduced the principle of carding with revolving cylinders whose surfaces were clothed with cards working point to point. In December of the same year Lewis Paul, of Birmingham, the inventor of drawing rollers, patented two types of carding machines. In one, parallel rows of spaced cards were nailed upon a cylinder which was revolved by a winch handle. Beneath the cylinder a concave trough had a card fixed on the inside, so that as the fibres passed between the two series of teeth they were combed. This was the origin of "flat-carding," namely, nailing strips of stationary cards upon transverse pieces of wood and adjusting the strips or flats by screws to the cylinder. In 1762, the father of Sir Robert Peel, with the assistance of Hargreaves, erected and used a cylinder carding machine which differed in some important particulars from Bourn's invention.

But although roller-carding and flat-carding are the only principles in use at the present time, to Sir Richard Arkwright belongs the merit of introducing an automatic carding engine, for between the years 1773 and 1775 he combined the various improvements of his predecessors, entirely remodelled the machine, and added parts which made the operation continuous. So successful were these cards that some of them were in use at the beginning of the present century. Notwithstanding the numerous and important changes that have been made since Arkwright's time, carding remains essentially the same as established by him. **CARDONA** (perhaps the anc. *Udura*), a town of north-eastern Spain, in the province of Barcelona; about 20m. N.W. of Mauresa, the nearest railway station. Pop. (1920) 4,139. Cardona, built on a hill nearly surrounded by the river Cardoner, is dominated by a castle with triple 13th century walls and a fine Romanesque chapel (founded 1040). It is celebrated for extensive rock salt deposits which form a neighbouring hill 260ft. high

PERSIAN PLAYING CARDS OF THE 16TH CENTURY  
The backs of these cards portray scenes from Persian court life

and 3m. in circumference. The salt, largely translucent, rests on sandstone and is covered by a thick layer of clay. The hill is worked like a mine and the rock is carved in Cardona into images, crucifixes, etc.

**CARDOON**, *Cynara Cardunculus* (family Compositae), a perennial plant from the south of Europe and Barbary, a near relation of the artichoke. The edible part, the chard, is composed of the blanched and crisp stalks of the inner leaves. Besides the common and Spanish cardoons, there are the prickly-leaved Tours cardoon, the red-stemmed cardoon, and the Paris cardoon, all of superior quality, the Paris being the largest and most tender. The species has been introduced into South America and has spread over great areas of the Pampas. The common artichoke is also used for the production of chard.

**CARDS, PLAYING.** As is the case with all very ancient pastimes, the origin of playing-cards is obscure; the widely taken view is that they come from Asia. In the Chinese dictionary, *Ching-tsze-tung* (1678), it is said that cards were invented in the reign of Sèun-ho, A.D. 1120, for the amusement of his concubines. There is a tradition that cards have existed in India from time immemorial—very ancient ones, round in form, are preserved in museums—and that they were invented by the Brahmans. Their invention has also been assigned to the Egyptians, with whom they were said to have had a religious meaning, and to the Arabs.

The time and manner of the introduction of cards into Europe are matters of dispute. The 38th canon of the council of Worcester (1240) is often quoted as evidence of cards having been known in England in the middle of the 13th century; but the games *de rege et regina* there mentioned are now thought to have been a kind of mumming exhibition (Strutt says chess). No queen is found in the earliest European cards. In the wardrobe accounts of Edward I. (1278), Walter Stourton is paid 8s. 5d. *ad opus regis ad ludendum ad quatuor reges*, a passage which has been thought to refer to cards, but it is now supposed to mean chess, which may have been called the "game of four kings," as was the case in India (*chaturanga*). If cards were generally known in Europe as early as 1278, it is very remarkable that Petrarch, in his dialogue that treats of gaming, never once mentions them; and that, though Boccaccio, Chaucer and other writers of that time notice various games, there is not a single passage in them that can be fairly construed to refer to cards. Passages have been quoted from various works, of or relative to this period, but modern research leads to the supposition that the word rendered *cards* has often been mistranslated or interpolated. An early mention of a distinct series of playing-cards is the entry of Charles or Charbot Poupert, treasurer of the household of Charles VI. of France, in his book of accounts for 1392 or 1393, which runs thus: *Donné à Jacquemin Gringonneur, peintre, pour trois jeux de cartes, à or et à diverses couleurs, ornés de plusieurs devises, pour porter devers le Seigneur Roi, pour son ébatement, cinquante-six*

*sols parisais*. This, of course, refers only to the painting of a set or pack of cards, which were evidently already well known. A safe conclusion with regard to their introduction is that, though they may possibly have been known to a few persons in Europe about the middle of the 14th century, they did not come into general use until about a half-century later. Whence they came is another question that has not yet been answered satisfactorily. If we may believe the evidence of Covelluzzo of Viterbo (15th century) cards were introduced into Italy from Arabia. On the authority of a chronicle of one of his ancestors he writes: "In the year 1379 was brought into Viterbo the game of cards, which comes from the country of the Saracens, and is with them called *naib*." The Crusaders, who were inveterate gamblers, may have been the instruments of their introduction (see *Istoria della città di Viterbo*, by F. Bussi, Rome, 1743). According to other authorities, cards came first to Spain from Africa with the Moors, and it is significant that, to this day, playing cards are called in Spain *naipes* (probably a corruption of the Arabic *Nabi*, prophet). Taken in connection with the statement of Covelluzzo, this fact would seem to prove the wide popularity of the game of *naib*, or cards, among the Arab tribes.

Towards the end of the 14th century cards seem to have become common, for in an edict of the provost of Paris, 1397, working-people are forbidden to play at tennis, bowls, dice, cards or nine-pins on working days. From an omission of any mention of cards in an ordinance of Charles V. in 1369, forbidding certain other games, it may be reasonably concluded that cards became popular in France between that date and the end of the century. In Italy it is possible that they were generally known at a somewhat earlier date. In the 15th century they were often the object of the attacks of the clergy. In 1423 St. Bernardino of Siena preached a celebrated sermon against them at Bologna, in which, like the English Puritans after him, he attributed their invention to the devil. Cards in Germany are referred to in a manuscript of Nuremberg about 1384, which illustrates the rapid spread of the new game throughout Europe. In form the earliest cards were generally rectangular or square, though sometimes circular.

Not long after their introduction, cards began to be used for other purposes than gaming. In 1509 a Franciscan friar, Thomas Murner, published an exposition of logic in the form of a pack of cards, and a pack invented in 1651 by Baptist Pendleton purported to convey a knowledge of grammar. These were soon followed by packs teaching geography and heraldry, the whole class being called "scientific cards." Politics followed, and in England satirical and historical sets appeared, one of them designed to reveal the plots of the Popish agitators. The first mention of cards in the New World is found in the letters of Herrera, a companion of Cortes, who describes the interest manifested by the Aztecs in the card games of the Spanish soldiers.

Early in the 15th century the making of cards had become a regular trade in Germany, whence they were sent to other coun-

tries. Cards were also manufactured in Italy at least as early as 1425, and in England before 1463; for by an act of parliament of 3 Edw. IV. the importation of playing-cards is forbidden, in consequence, it is said, of the complaints of manufacturers that importation obstructed their business. No cards of undoubted English manufacture of so early a date have been discovered; and there is reason to believe, notwithstanding the act of Edward IV., that the chief supplies came from France or the Netherlands. In the reign of Elizabeth the importation of cards was a monopoly; but from the time of James I. most of the cards used in this country were of home manufacture. A duty was first levied on cards in the reign of James I.; since when they have always been taxed.

CHINESE PLAYING CARDS

It has been much disputed whether the earliest cards were printed from wood-blocks. If so, it would appear that the art of wood-engraving, which led to that of printing, may have been developed through the demand for the multiplication of implements of play. The belief that the early card-makers or card-painters of Ulm, Nuremberg and Augsburg, from about 1418-50, were also wood-engravers, is founded on the assumption that the cards of that period were printed from wood-blocks. It is, however, clear that the earliest cards were executed by hand, like those designed for Charles VI. Many of the earliest wood-cuts were coloured by means of a stencil, so it would seem that at the time wood-engraving was first introduced, the art of depicting and colouring figures by means of stencil plates was well known.

It is undecided whether the earliest cards were of the kind now common, called *numeral* cards, or whether they were *tarocchi* or *tarots*, which are still used in some parts of France, Germany and Italy, but the probability is that the tarots were the earlier. A pack of tarots consists of seventy-eight cards, four suits of numeral cards and twenty-two emblematic cards, called *atutti* or *atouts* (= trumps). Each suit consists of fourteen cards, ten of which are the pip cards, and four court (or more properly *coat*) cards, viz., king, queen, chevalier and valet. The *atouts* are numbered from 1 to 21; the unnumbered cards, called the *fou*, has no positive value, but augments that of the other *atouts*.

The marks of the suits on the earliest cards (German) are hearts, bells, leaves and acorns. No ace corresponding to the earliest known pack has been discovered; but other packs of about the same date have aces, and it seems unlikely that the suits commenced with the deuces.

Next in antiquity to the marks mentioned are swords, batons, cups and money. These are the most common on Italian cards of the late 15th century, and are used both in Italy and in Spain. French cards of the 16th century bear the marks still in use in France and England, viz., *cœur*, *trèfle*, *pique* and *carreau*.

The French *trèfle*, though so named from its resemblance to the trefoil leaf, was in all probability copied from the acorn; and the *pique* similarly from the leaf (*grün*) of the German suits, while its name is derived from the sword of the Italian suits. It is not derived from its resemblance to a pike head, as commonly supposed. In England the French marks are used, and are named—*hearts*, *clubs* (corresponding to *trèfle*, the French symbol being joined to the Italian name, *bastoni*), *spades* (corresponding to the French *pique*, but having the Italian name, *spade*=swords) and *diamonds* (*carreaux*). The confusion of names and symbols Chatto accounts for thus: "If cards were actually known in Italy and Spain in the latter part of the 14th century, it is not unlikely that the game was introduced into this country by some of the English soldiers who had served, under Hawkwood and other free captains, in the wars of Italy and Spain. However this may be, it seems certain that the earliest cards commonly used in this country were of the same kind, with respect to the marks of the suits, as those used in Italy and Spain."

About the last quarter of the 15th century packs with animals, flowers and human figures, for marks of the suits, were engraved upon copper; and later, numerous variations appeared, dictated by the caprice of individual card-makers; but they never came into general use.

The court cards of the early packs were king, chevalier and knave. The Italians were probably the first to substitute a queen

BY COURTESY OF ACCADEMIA CARRARA

TAROT PLAYING CARDS

for the chevalier, who in French cards is altogether superseded by the queen. French court cards had fanciful names.

**CARDUCCI, BARTOLOMMEO** (1560-1610), Italian painter, better known as **CARDUCHO**, the Spanish corruption of his Italian patronymic, was born in Florence, where he studied architecture and sculpture under Ammanati, and painting under Zuccaero. He accompanied the latter to Madrid, where he painted the ceiling of the Escorial library, assisting also with the frescoes that adorn the cloisters. Most of his works are to be found in Spain; the most celebrated is a "Descent from the Cross," in the church of San Felipe el Real, in Madrid.

His younger brother **VINCENZO** (1568-1638), was born in Florence, and was trained as a painter by Bartolommeo, whom he followed to Madrid. He worked for Philip III. and Philip IV., and his best pictures are those executed for the former monarch as decorations in the Prado. Examples of his work are preserved at Toledo and other Spanish cities. Among his pupils were Giovanni Ricci, Pedro Obregon, Vela, Francisco Collantes, and other distinguished representatives of the 17th-century Spanish school. He was also author of a treatise or dialogue, *De las Excelencias de la Pintura*, published in 1633.

**CARDUCCI, GIOSUE** (1836-1907), Italian poet, was born at Val-di-Castello, Tuscany, on July 27, 1836, the son of Michele Carducci, a physician who had suffered imprisonment in his youth for his share in the revolution of 1831. Carducci was educated at the University of Pisa, and began life as a public teacher. He had been appointed to a post in the municipal college at Arezzo,

but the education department refused to confirm the appointment on account of his political opinions; and he then settled in Florence where he gave private lessons and edited a series of the Italian minor classics. In 1860 he became professor of Italian literature at Bologna, where he lectured for over 40 years with fruitful results for Italian criticism. At Florence he had been the centre of a group of young men bent on overthrowing the reigning romantic taste and on a return to classical models. The poems written during this period were collected under the title of *Rime* (1857), *Juvenilia* in the collected works. He showed at once his great power as a poet and the strength of his republican convictions in the hymn to Satan, *Inno a Satana* (written 1863, pr. 1865). *Levia Gravia* (1868) was a re-issue of the *Rime*, with some additions, but without the poems he had published separately in the interval. Then followed *Decennali* (1871), poems dealing with the main events of modern Italian history, and *Nuove Poesie* (1873), afterwards incorporated in *Giambi ed Epodi* (1882), and the three series of *Odi barbare* (1877-89). In these odes he renewed the efforts made by earlier Italian poets to adapt Latin prosody to Italian verse; he succeeded where his predecessors had failed. He did not attempt a mere imitation by the use of long and short syllables, but sought to reproduce the rhythm of the classical metres. He adopted classic forms because in thought and feeling he was Roman; he had a profound sense of the continuity of Italian history since the days of Rome's greatness. He was pagan at heart. "Other gods die," he wrote, "but the divinities of Greece know no setting."

**BIBLIOGRAPHY.**—Carducci's critical work may be studied in his *Opere* (20 vols., Bologna, 1889-1909), but he himself supervised a selection from his prose works, *Prose* (Bologna, 1905). His *Poesie* were separately printed (1902). See also *Lettere di Giosuè Carducci* (2 vols., 1911-14); G. L. Bickersteth, *Carducci: a selection from his poems*, with verse trans., notes, etc. (1913); G. Chiarini, *Memorie della vita di Giosuè Carducci* (Florence, 1903); B. Croce, *La letteratura della nuova Italia*, vol. ii. (1914); Orlo Williams, *Giosuè Carducci* (1914); E. Papini, *L'uomo Carducci* (1918).

**CARDWELL, EDWARD** (1787-1861), English theologian, was born at Blackburn in Lancashire in 1787. He was educated at Brasenose college, Oxford (B.A. 1809; M.A. 1812; B.D. 1819; D.D. 1831), and after being for several years tutor and lecturer, was appointed, in 1814, one of the examiners to the university. In 1825 he was chosen Camden professor of ancient history; and during his five years' professorship he published an edition of the *Ethics* of Aristotle (Oxford, 1828-30), and a course of his lectures on *The Coinage of the Greeks and Romans* (1833). In 1831 he succeeded Archbishop Whately as principal of St. Alban's Hall. He published in 1837 a student's edition of the Greek Testament, and an edition of the Greek and Latin texts of the *Josephus de Bello Judaico*, with illustrative notes (1837). He projected a history of the Church in England to be founded on David Wilkins's *Concilia Magnae Britanniae et Hiberniae*. Of this work he executed some portions only: *Documentary Annals of the Reformed Church of England from 1546 to 1716*, 2 vols. (Oxford, 1839); *History of Conferences, etc., connected with the Revision of the Book of Common Prayer* (1840); and *Synodalia, a Collection of Articles of Religion, Canons, and Proceedings of Convocation from 1547 to 1717* (1842). His *Reformatio Legum Ecclesiasticarum* (1850) treats of Church reform during the reigns of Henry VIII., Edward VI., and Elizabeth. Cardwell also edited Bishop Gibson's *Synodus Anglicana* (1854). He died at Oxford on May 23, 1861.

**CARDWELL, EDWARD CARDWELL**, VISCOUNT (1813-1886), English statesman, was the son of a merchant of Liverpool, where he was born on July 24, 1813. After a brilliant career at Oxford he entered parliament as member for Clitheroe in 1842, and in 1845 was made secretary to the Treasury. He supported Sir Robert Peel's free-trade policy and went out of office with him. In 1847 he was elected for Liverpool, but lost his seat in 1852 for having supported the repeal of the navigation laws. He soon found another constituency at Oxford, and upon the foundation of Lord Aberdeen's coalition ministry became president of the Board of Trade, although debarred by the jealousy of his Whig colleagues from a seat in the cabinet. In

1854 he carried, almost without opposition, a most important and complicated act consolidating all existing shipping laws; but in 1855 resigned, with his Peelite colleagues, upon the appointment of the Sevastopol enquiry committee, declining the offer of the chancellorship of the Exchequer pressed upon him by Lord Palmerston. In 1858 he moved the famous resolution condemnatory of Lord Ellenborough's despatch to Lord Canning on the affairs of Oude, which for a time seemed certain to overthrow the Derby government, but which ultimately dissolved into nothing. He obtained a seat in Lord Palmerston's cabinet of 1859, and, after filling the uncongenial posts of secretary for Ireland and chancellor of the duchy of Lancaster (1861), became secretary for the colonies in 1864. Here he reformed the system of colonial defence, refusing to keep troops in the colonies during time of peace unless their expense was defrayed by the colonists; he also laid the foundation of federation in Canada and, rightly or wrongly, censured Sir George Grey's (*q.v.*) conduct in New Zealand. Resigning with his friends in 1866, he again took office in 1868 as secretary for war. In this post he performed the most memorable actions of his life by the abolition of purchase and the institution of the short service system and the reserve in the army, measures which excited more opposition than any of the numerous reforms effected by the Gladstone government of that period, but which were entirely justified by their successful working afterwards. They laid the foundations, still almost unchanged, of the modern British Army. Cardwell justly ranks among the greatest military reformers since Louvois, and, like Haldane later, his achievement furnishes a proof that drastic reorganization in an army can only come from outside—the influence of a clear-sighted and militarily interested political chief. It is an ironical comment on the opposition which he met that to-day, although the Cardwell scheme of linked battalions, one at home and one on foreign service, is hampering the independent mechanization of the army at home, military opinion shrinks from modifying a scheme grown sacrosanct from long usage. On the resignation of the Gladstone ministry in 1874 he was raised to the peerage, but took no further prominent part in politics. His mental faculties, indeed, were considerably impaired during the last few years of his life, and he died at Torquay on Feb. 15, 1886. He was not a showy, hardly even a prominent politician, but effected far more than many more conspicuous men. The great administrator and the bold innovator were united in him in an exceptional degree, and he allowed neither character to preponderate unduly.

**CARDWELL**, a town of Cardwell county, Queensland, Australia, on Rockingham Bay. Pop. of town and district *c.* 5,000. Gold and tin are found in the neighbourhood; there are factories for preserve and sauce-making and for meat-extract and tinning production. Much cedar-wood is exported.

**CAREW, SIR GEORGE** (d. 1612), English diplomatist, second son of Sir Thomas Carew of Antony, was secretary to Sir Christopher Hatton, and was sent on an embassy to Sweden and Poland in 1598. In the reign of James he was employed in negotiating the treaty of union with Scotland, and from 1605 to 1609 he was ambassador to the court of France. On his return he wrote a *Relation of the State of France*, which remained in manuscript until 1749, when Dr. Birch appended it to his *Historical View of the Negotiations between the Courts of England, France and Brussels, from 1592 to 1617*.

**CAREW, RICHARD** (1555-1620), English poet and antiquary, was born on July 17 1555, at Antony House, East Antony, Cornwall. At the age of 11, he entered Christ Church, Oxford, and when only 14 was chosen to carry on an extempore debate with Sir Philip Sidney, in presence of the earls of Leicester and Warwick and other noblemen. From Oxford he removed to the Middle Temple, where he spent three years, and then went abroad. In 1586 he was appointed high-sheriff of Cornwall; he entered parliament in 1584; and he served under Sir Walter Raleigh, then lord lieutenant of Cornwall, as treasurer. He became a member of the Society of Antiquaries in 1589, and was a friend of William Camden and Sir Henry Spelman. His great work is the *Survey of Cornwall*, published in 1602, and reprinted in 1769 and 1811. It

still possesses interest, apart from its antiquarian value, for the picture it gives of the life and interests of a country gentleman of the days of Elizabeth. Carew's other works are: a translation of the first five cantos of Tasso's *Gerusalemme* (1594), printed in the first instance without the author's knowledge, and entitled *Godfrey of Balloigne, or the Recouerie of Hierusalem; The Examination of Men's Wits* (1594), a translation of an Italian version of John Huarte's *Examen de Ingenios*; and *An Epistle concerning the Excellences of the English Tongue* (1605). Carew died on Nov. 6 1620.

His son, Sir RICHARD CAREW (d. 1643?) was the author of a *True and Readie Way to learn the Latine Tongue*, by writers of three nations, published by Samuel Hartlib in 1654.

**CAREW, THOMAS** (b. 1595), English poet, was born at West Wickham, Kent, the son of Sir Matthew Carew, master in chancery, and his wife, Alice Ingpenney, widow of Sir John Rivers, lord mayor of London. At the age of 13 he matriculated at Merton college, Oxford. He took his degree of B.A. early in 1611, and studied at the Middle Temple. Two years later he was sent to Italy as one of the ambassador Sir Dudley Carleton's household, and when the ambassador returned from Venice he seems to have kept Thomas Carew with him, for he is found in the capacity of secretary to Sir Dudley Carleton at The Hague, early in 1616. In Aug. 1618 Carew entered the service of Lord Herbert of Cherbury, in whose train he started for France in March 1619.

Carew became gentleman of the privy chamber in 1628. Probably in 1630 he was made "server" or taster-in-ordinary to the king. To this period may be attributed his close friendship with Sir John Suckling, Ben Jonson and Clarendon; the latter says that Carew was "a person of pleasant and facetious wit." Donne, whose celebrity as a court preacher lasted until his death in 1631, exercised a powerful if not entirely healthful influence over the genius of Carew. In Feb. 1633 a masque by the latter, entitled *Coelum Britannicum*, was acted in the banqueting house at Whitehall, and was printed in 1634. Carew was generally supposed to have died in 1638, but Clarendon tells us that "after 50 years of life spent with less severity and exactness than it ought to have been, he died with the greatest remorse for that licence." If Carew was more than 50 years of age he must have died in or after 1645, and in fact there were final additions made to his *Poems* in the 3rd edition of 1651.

Carew's poems, at their best, are brilliant lyrics of the purely sensuous order. They open to us, in his own phrase, "a mine of rich and pregnant fancy." His metrical style was influenced by Jonson and his imagery still more clearly by Donne, for whom he had an almost servile admiration. His intellectual power was not comparable with Donne's, but Carew had a lucidity and directness of lyrical utterance unknown to Donne. It is perhaps his greatest distinction that he was the earliest of the Cavalier song-writers by profession, of whom Rochester was the latest, poets who turned the disreputable incidents of an idle court life into poetry which was often of the rarest delicacy and the purest melody and colour. The longest and best of Carew's poems, "A Rapture," would be more widely appreciated if the rich flow of its imagination were restrained by greater reticence of taste.

The best edition of Carew's *Poems* is that prepared by Arthur Vincent in 1899.

**CAREY, HENRY** (d. 1743), English poet and musician, reputed to be an illegitimate son of George Savile, marquess of Halifax, was born towards the end of the 17th century. Carey studied under Olaus Linnert, Roseingrave and Geminiani. He wrote the words and music of *The Contrivances; or More Ways than One*, a farce produced at Drury Lane in 1715. His *Hanging and Marriage; or the Dead Man's Wedding* was acted at Lincoln's Inn Fields in 1722. *Chrononhotonthologos* (1734) was a successful burlesque of the bombast of the contemporary stage. The best of his other pieces were *A Wonder; or the Honest Yorkshireman* (1735), a ballad opera, and the *Dragon of Wantley* (1737), a burlesque opera, the music of which was by J. F. Lampe. Carey is best remembered by his songs. "Sally in our Alley" (printed in his *Musical Century*) was a sketch drawn after following a shoe-

maker's 'prentice and his sweetheart on a holiday. The present tune set to these words, however, is not the one written by Carey, but is borrowed from an earlier song, "The Country Lasse," which is printed in *The Merry Musician* (vol. iii, c. 1716). It has been claimed for him that he was the author of "God Save the King" (see NATIONAL ANTHEMS). He died in London on Oct. 4 1743. Edmund Kean, the tragedian, was one of his great-grandchildren.

For a complete edition of his poems see *Poems on Several Occasions* (1729). His dramatic works were published by subscription in 1743.

**CAREY, HENRY CHARLES** (1793-1879), American economist, was born in Philadelphia, (Pa.), Dec. 15, 1793. At the age of 28 he succeeded his father, Mathew Carey (1760-1830)—an influential economist, political reformer, editor and publisher, of Irish birth, for many years a resident of Philadelphia—as a member of the publishing firm of Carey & Lea. He died in Philadelphia on Oct. 13, 1879.

Among Mathew Carey's many writings had been a collection (1822) of *Essays on Political Economy*, one of the earliest of American treatises favouring protection, and Henry C. Carey's life-work was devoted to the propagation of the same theory. He retired from business in 1838, almost simultaneously with the appearance (1837-40) of his *Principles of Political Economy*. This treatise, which was translated into Italian and Swedish, soon became the standard representative in the United States of the school of economic thought which, with some interruptions, has since dominated the tariff system of the country.

Carey's first large work on political economy was preceded and followed by many smaller volumes on wages, the credit system, interest, slavery, copyright, etc., and in 1858-59 he gathered the fruits of his lifelong labours into *The Principles of Social Science*, in three volumes. In this work Carey sought to show that there existed, independently of human wills, a natural system of economic laws, which was essentially beneficent, and of which the increasing prosperity of the whole community, and especially of the working classes, was the spontaneous result—capable of being defeated only by the ignorance or perversity of man resisting or impeding its action. He rejected the Malthusian doctrine of population, maintaining that numbers regulated themselves sufficiently in every well-governed society, and that their pressure on subsistence characterized the lower, not the more advanced, stages of civilization. He held that the law of diminishing returns from land was not true for all stages of cultivation. Carey attributed his attitude on protection to his observation of the effects of liberal and protective tariffs respectively on American prosperity. But it seems probable that the influence of the writings of Friedrich List added to his own deep-rooted and hereditary jealousy and dislike of English predominance, had something to do with his feeling (see PROTECTION).

**CAREY, WILLIAM** (1761-1834), English oriental scholar, and pioneer of modern missionary enterprise, was born at Paulerspury, Northamptonshire, on Aug. 17, 1761. Becoming pastor of a Baptist church in Leicester in 1787 Carey helped to found the Baptist Missionary Society, and was one of the first to go to India, in 1793. At Serampore he established a church, a school and a printing-press for the publication of the Scriptures and philological works. In 1801 Carey was appointed professor of Oriental languages in a college founded at Fort William by the marquess of Wellesley. He prepared numerous philological works, consisting of grammars and dictionaries in the Mahratta, Sanskrit, Punjabi, Telinga, Bengali and Bhotanta dialects. From the Serampore press there issued in his lifetime over 200,000 Bibles and portions in nearly forty different languages and dialects, Carey himself undertaking most of the literary work. He died June 9, 1834.

See *Lives* by G. Smith (1884), and S. P. Carey (1923).

**CARGILL, DONALD** (1610?-1681), Scottish Covenanter, was educated at Aberdeen and St. Andrews. In 1655 he was appointed to the Barony parish in Glasgow from which he was ejected in 1662. He ventured back to celebrate the Communion, and was arrested, but soon liberated. He was wounded at Both-

well Bridge, and fled to Holland, where he remained a few months. On his return he joined Richard Cameron in publishing the Sanquhar declaration, and excommunicated the king and his officials. He was apprehended, and brought to Edinburgh, where he was beheaded on July 27, 1681.

**CARGO**, a ship-load, or the goods (or even, less technically, persons) carried on board a ship; and so, by analogy, a term used for any large amount. For the maritime law affecting the cargo of a ship, see **AVERAGE**; **AFFREIGHTMENT**; **INSURANCE**; **SALVAGE**; **LIEN**; for the specialities of cargo-ships see **SHIP**.

**CARIA**, an ancient district of Asia Minor, bounded on the north by Ionia and Lydia, on the west and south by the Aegean Sea, and on the east by Lycia and a small part of Phrygia. The coast-line consists of a succession of great promontories alternating with deep inlets. The most important inlet, the Ceramic Gulf, or Gulf of Cos, extends inland for 70 m., between the great mountain promontory terminating at Myndus on the north, and that which extends to Cnidus and the remarkable headland of Cape Krio on the south. North of this is the deep bay called in ancient times the Gulf of Iasus, and beyond this again was the deeper inlet which formerly extended inland between Miletus and Priene, but of which the outer part has been entirely filled up by the alluvial deposits of the Maeander. South of Cape Krio again is the gulf known as the Gulf of Doris, with several subordinate inlets, bounded on the south by the rugged promontory of Cynossema (mod. Cape Alupo). Between this headland and the frontier of Lycia is the sheltered bay of Marmarice, noted in modern times as one of the finest harbours of the Mediterranean.

Almost the whole of Caria is mountainous. The two great masses of Cadmus (Boz Dag) and Salbacus (Baba Dag) are in fact portions of the great chain of Taurus (see **ASIA MINOR**). From these lofty ranges there extends a broad tableland (in many parts more than 3,000 ft. high).

The coast is fringed by numerous islands, in some instances separated only by narrow straits from the mainland. Of these the most celebrated are Rhodes and Cos. The country known as Caria was shared between the Carians proper and the Caunians, who were a wilder people, inhabiting the district between Caria and Lycia. They were not considered to be of the same blood as the Carians, and were, therefore, excluded from the temple of the Carian Zeus at Mylasa, which was common to the Carians, Lydians and Mysians, though their language was the same as that of the Carians proper. Herodotus (i. 172) believed the Caunians to have been aborigines, the Carians having been originally called Leleges, who had been driven from the Aegean islands by the invading Greeks. This seems to have been a prevalent view among the Greek writers, for Thucydides (i. 8) states that when Delos was "purified" more than half the bodies found buried in it were those of "Carians."

A considerable number of short Carian inscriptions has been found, most of them in Egypt. They were first noticed by Lepsius at Abu-Simbel, where he correctly inferred that they were the work of the Carian mercenaries of Psammetichus. The language, so far as it has been deciphered, is "Asiatic" and not Indo-European.

The excavations of W. R. Paton at Assarlik (*Journ. Hell. Studies*, 1887) and of F. Winter at Idrias have resulted in the discovery of Late-Mycenaean and Geometric pottery. Caria, however, figured but little in history. It was absorbed into the kingdom of Lydia, where Carian troops formed the bodyguard of the king. Cnidus and Halicarnassus on the coast were colonized by Dorians. At Halicarnassus (*q.v.*) the Mausoleum, the monument erected by Artemisia to her husband Mausolus, about 360 B.C., was excavated by Sir C. T. Newton in 1857-1858. Cnidus (*q.v.*) was excavated at the same time, when the "Cnidian Lion," now in the British Museum, was found crowning a tomb near the site of the old city (C. T. Newton, *History of Discoveries at Cnidus, Halicarnassus and Branchidae*).

In the Persian epoch, native dynasts established themselves in Caria and even extended their rule over the Greek cities. The last of them seems to have been Pixodarus, after whose death the crown was seized by a Persian, Orontobates, who offered a vigor-

ous resistance to Alexander the Great. But his capital, Halicarnassus, was taken after a siege, and the principality of Caria conferred by Alexander on Ada, a princess of the native dynasty. Soon afterwards the country was incorporated into the Syrian empire and then into the kingdom of Pergamum, as part of which it passed into the Roman province of Asia.

Friedrich, *Archäologische Karte von Kleinasien* (1899); Perrot and Chipiez, *History of Art in Phrygia, Lydia, Caria and Lycia* (Eng. trans., 1892); A. H. Sayce, "The Carian Language and Inscriptions" (*T.S.B.A. ix.*, 1, 1887); P. Kretschmer, *Einführung in die Geschichte der griechischen Sprache*, pp. 376-384 (1896). For the coinage see **NUMISMATICS**. (A. H. S.)

**CARIBAN**, one of the important linguistic stocks of South American Indians; the name is derived from the Caribs, the warlike and widely raiding Indians met first by Columbus in the Lesser Antilles and adjacent coast of Venezuela. The name Carib probably means "strangers." The Carib tribes in this region, where they were first met, were relatively recent invaders, having conquered and largely absorbed or driven out the older Arawakan (*q.v.*) inhabitants.

Tribes of this stock held, at the time of the first European contact, most of Venezuela north of the Orinoco river, and westward to the present border of Colombia, possibly penetrating as far as the lower Magdalena. They held most of the interior of the Guianas and the region southwards to the Amazon. Scattered tribes of this stock are found as far west as the Guaques on the headwaters of the Caqueta river in Colombia, while others, such as the Apiaca and Pimenteiras were on the Tocantins and Paranhya rivers in north-eastern Brazil. The Bakairi on the headwaters of the Xingu in Matto Grosso were the southernmost tribe, and this region of the Brazilian-Bolivian border is believed to have been the centre from which the Cariban tribes originally spread.

The Cariban tribesmen were somewhat taller than the Arawakan (*q.v.*) but like them were prevalently brachycephalic or round-headed. They sometimes had wavy hair. They were generally warlike, and often markedly cannibalistic, yet their general culture was on a par with that of their neighbours. In the Caribbean region they were excellent canoe-makers, and were one of the few peoples in the New World to employ sails.

See for lists of Cariban tribes, L. Adam, *Matériaux pour servir à l'établissement d'une grammaire comparée des dialectes de la Famille Caribée* (Paris, 1893); T. Koch-Gruneberg, *Die Hianakoto-Umaua* (*Anthropos*, 1908 vol. iii., pp. 90-95).

**CARIBBEAN SEA**, an arm of the Atlantic ocean bounded by the islands of the West Indies on the east and north, by Venezuela, Colombia, Panama and Costa Rica on the south, and by Nicaragua, Honduras, Guatemala, British Honduras and Mexico on the west. It is about 400 m. wide at its narrowest point, along the Windward isles at its easternmost boundary, about 700 m. wide at its widest between Panama and Cuba, and approximately 1,500 m. long, with a total area of about 7,500 square miles. The Caribbean was discovered by Columbus on his first voyage, and was extensively explored by him on his subsequent journeys. On his fifth and last voyage he skirted its western shores from Honduras to Venezuela in a search for the "strait" to the China seas.

The opening of the Panama canal (*q.v.*) has converted the Caribbean sea into one of the great ship highways of the world, but for 400 years prior to this the Caribbean was the busiest route of travel, transport and battles in the western hemisphere. The Isthmus of Panama, some 50 m. wide, early became the route for transshipment of the treasures of the Spanish colonies of the Orient and of South America, and the convoys of Spanish merchant ships became the objects of raids by pirates, freebooters

BY COURTESY OF THE MUSEUM OF THE UNIVERSITY OF PENNSYLVANIA  
MAN-EATING CARIB INDIAN IN FULL REGALIA

and buccaneers. The mainland bordering the Caribbean came to be called the "Spanish Main," and the fortified cities on its shores were the centre of Spanish colonial trade and the objects of raids by English, French and Dutch warships, privateers and pirates. An immense treasure passed across the Caribbean, for not only the estimated £1,500,000,000 of silver taken from Peru, but virtually all the traffic from (and to) Buenos Aires was carried overland across the Andes to Lima and by ships up the Pacific coast to Panama, there transhipped and thence by convoys of galleons to Spain. In later years the trade of the Caribbean colonies of Spain drifted into the hands of the English, and beginning with the capture of the island of Jamaica (*q.v.*) in 1655 (in the course of a raid ordered by Oliver Cromwell against the Spanish colony on the island of Santo Domingo), British outposts began to appear on the islands and mainland.

The strategic importance of the Caribbean region has been increasingly emphasized since the opening of the Panama canal. From its earliest history, however, it has been in the balance of diplomatic and commercial struggle, although seldom itself the prize or object of wars. During the slavery era, the islands produced an immense wealth of sugar and other plantation products, and during the earlier struggles for Canada, the French deliberately chose to hold their West Indian islands and to leave the bleak wastes of Canada to the British. Cuba (*q.v.*) has been the object of intrigue and controversy from the first sign of the weakening of Spain's hold upon her colonies of the New World, but was left to be the very last foothold of Spain. France, England and the United States all frankly sought occasions to annex the "gem of Antilles." Cuba's independence in the end was directly due to the fact that in the declaration of war against Spain on April 19, 1898, the United States Congress expressly stated that it would under no circumstances take over the sovereignty of Cuba, a pledge carried out to the letter, in spite of a two years' intervention early in the republican life of Cuba.

The British control of the Caribbean was from the first due largely to naval strength and commercial pre-eminence. By the end of the 16th century English ships were the predominating merchantmen between all Europe and the West Indies and the Spanish Main, and following the capture of Jamaica in 1655, there began the establishment of British colonies on certain islands and on three well-defined regions on the mainland, Belize (*q.v.*), the Mosquito coast of Nicaragua, and in what is now British Guiana (*q.v.*). The break-up of the Spanish empire at the beginning of the 19th century, and the abolition of slavery in the half century that followed, left the Caribbean islands relatively insignificant for a time, as commercial units, but their strategic importance remained. Indeed, Great Britain, from the very beginning of her political control in the region, was obviously conscious of the importance of this factor, even in the years when the commercial side was apparently overwhelming. The possession of Jamaica, Trinidad and other islands gave Great Britain a predominant position in the Caribbean sea, and during the years of Spanish decadence, no rival at all held any other strategic position there.

In 1849, the discovery of gold in California, newly acquired by the United States as a result of the Mexican War, created a demand for short and comfortable transport from the Atlantic seaboard to the Pacific. As a substitute for the long trek across the plains, fast packets on the Atlantic and others on the Pacific began to offer comfortable journeys, with land transport facilities across the Isthmus of Panama and also across Nicaragua, via the San Juan river and Lake Nicaragua and with only short land journeys around the rapids in the river and across the 12 miles from Lake Nicaragua to the Pacific. Thither was drawn commercial attention in the United States. Talk of an isthmian canal became more active than at any time in the previous 400 years, and the position of Great Britain in the Caribbean became a subject of American observation and negotiation. In the Clayton-Bulwer Treaty, signed in Washington on April 19, 1850, by John M. Clayton, secretary of State of the United States and Sir Henry Bulwer, H.M. minister in Washington, the British holdings in Belize were not discussed, but the treaty as signed and ratified provided (as

finally interpreted) that the British withdraw the Mosquito protectorate, and that the United States and Great Britain agree, as a principle, that neither would obtain or maintain any exclusive control over any ship canal to be built through the isthmus.

The construction of the canal proved impossible on these terms, owing to public opinion in the United States on the matter, and this treaty was finally replaced by the Hay-Pauncefote Treaty of Nov. 18, 1901, signed by John Hay, secretary of State of the

COAST LINE FRINGED WITH TROPICAL PALMS. CHARACTERISTIC OF THE ISLANDS OF THE CARIBBEAN SEA

United States, and Lord Pauncefote, H.M. special ambassador in Washington. It was there provided that the United States should build and fortify the canal, but should make no discrimination as to tolls and facilities in favour of American ships as against British ships. The canal was finally completed in 1914 and opened to traffic in 1920.

The possession and fortification of the Panama canal has, as a much-quoted phrase expresses it, extended the southern border of the United States to the canal. In addition, the Spanish-American War, while it left Cuba a free and independent country, reserved, under the Platt amendment, the right of supervision over foreign treaties and alliances made by Cuba, and gave to the United States naval bases at Bahia Honda on the northern and Guantanamo bay on the southern coast of the island. By these provisions, the United States stepped into strategic control of Cuba, the true "key" position of the whole Caribbean area. At the same time, the acquisition of Porto Rico placed the United States in the second most important strategic spot in the Caribbean, a position consolidated completely with the purchase of the Danish West Indies or Virgin islands (*q.v.*) in 1916, as St. Thomas, the largest of these islands, holds the key position on the Anegada passage, the shortest route from Europe to the Panama canal.

The strategy of the Caribbean sea is linked with that of the Gulf of Mexico, and the comparison with the Mediterranean sea is instinctive. The Mediterranean, however, is controlled by Gibraltar, the Bosphorus and Suez, and the Caribbean has but one position comparable to any of these—the Panama canal as compared with that of Suez. On the other hand, in place of the single strategic entry of the Strait of Gibraltar, there are a hundred possible entries into the Caribbean and the Gulf of Mexico, half a dozen of them of prime importance. Commencing with the Straits of Florida (with the Yucatan channel completing the access to the Caribbean) there are, in addition, the Windward passage around the eastern point of Cuba, the Mena passage between Haiti and Porto Rico, the Anegada passage eastward of St. Thomas, the routes between Martinique and Santa Lucia, and that north of Trinidad. Between all the Windward isles, indeed, passage is easy though unimportant.

The strategic importance of the Caribbean positions is due, however, primarily to the fact that the control of the northern passages must be held by the United States to ensure access to the canal and defence of her coast-line around the Gulf of Mexico. With the chief positions on Cuba and Porto Rico in the hands of

the United States, the question of strategy virtually disappears, but their loss in case of war would quickly change the whole strategic problem. With Cuba allied in war so closely as it is with the United States, the Straits of Florida become virtually an inland means of communication, and the resources of the continent stand behind the naval base at Guantanamo bay on the southern side of Cuba. Thus Guantanamo bay takes precedence as a military position over Jamaica, because it is based on a continent instead of on an island, yet before Spain lost Cuba, the possession of Jamaica by Great Britain, a great naval power, made any ports and naval bases that the British might build and supply on the island of Jamaica of vastly greater military importance than anything Spain, a weak power, might build in Cuba.

In recent years, two little Dutch islands, Curaçao and Aruba, off the coast of Venezuela, have acquired a new naval importance that greatly increases the strategic value of the British positions on Trinidad and in British Guiana: this is due to the location of great storage of oil from Venezuela in the refineries of important British, Dutch and American companies on these two Dutch islands. The United States has no actual or potential base on the islands or mainland of northern South America so that the strategic importance of Curaçao and of the port of Cartagena in Colombia are enhanced both for this reason and for their supply of oil, Cartagena now having oil coming via a 700m. pipe-line from the interior to loading stations close to the Colombian sea-coast. These two positions were, moreover, of considerable importance since earliest times, the one, Cartagena, as a Spanish fortified city with an excellent harbour for the small Spanish merchantships and warships, and Curaçao as one of the few literally perfect harbours of the world, and the rendezvous of the pirates and buccaneers of the early colonial period.

The Panama canal is of course the dominating strategic spot of the entire Caribbean region. The possession of this outstanding position by the United States has thus been the result of the developments following the Spanish-American War of 1898, prior to which time the only important base in the entire region that was in the hands of the United States was Key West. The British domination of the Caribbean was shared at once with the United States on the conclusion of the Spanish-American War and its terms of peace, and relinquished to her on her acquisition of the Canal Zone and the construction of the canal and its defences. The importance of the Hay-Pauncefote Treaty must not be overlooked in this connection, however, as without that voluntary cession of her right to build the canal in conjunction with the United States, Great Britain might still be in strategic control of many of the key positions of the Caribbean.

The United States had, however, been gradually growing in a consciousness of the importance of the Caribbean region to her national safety. The development of routes to the Pacific coast after 1849, mentioned above, was the first of many steps. That was followed by the effort to limit British possessions on the islands and the littoral of the Caribbean in 1850, and was manifested almost violently in the controversy with Great Britain over the arbitration of the boundary between British Guiana and Venezuela in 1896. In the years since the Hay-Pauncefote Treaty, the so-called "doctrine of the paramount interest" of the United States in the region of the Caribbean has become one of the most vigorous offsprings of the Monroe Doctrine (*q.v.*).

The dominating position of the United States in the Caribbean region has been accepted there with relatively little protest, although it was challenged by Mexico in 1927, when the Government of President Calles gave moral and financial support to the movement of the Liberal revolutionists in Nicaragua (*q.v.*).

The policy of paramount interest in the Caribbean has resulted from time to time in direct intervention by American official elements in the life of the islands and smaller continental republics. The financial and military interventions in the Dominican republic (*q.v.*) in 1907 and 1911 and in Haiti (*q.v.*) in 1915, all of which were undertaken on the ground that had the United States failed to act European Governments might have sought to do so, are the outstanding examples. The two interventions in Nicaragua, 1912-25 and in 1927, the landing of marines in Honduras in 1924,

and the purchase of the Danish West Indies (Virgin islands [*q.v.*]) in 1917 are among the other examples. The incidents surrounding the separation of Panama (*q.v.*) from Colombia, including the settlement of the Colombian claims for damages for the revolution by the payment of \$25,000,000 by vote of the United States Congress in 1921, furnish additional indications of this policy. The statements made at that time by President Roosevelt furnish the text for much of the trenchant literature on the subject of American predominance in the Caribbean.

The value of the holdings of any nation in the Caribbean region has been so greatly enhanced by the building of the Panama canal that the questions of strategy and paramount interest are in no sense the sole determinants of desirability. The growth of the traffic through the Panama Canal began, before 1927 (when the Nicaraguan difficulties caused new official enunciations of it) to bring forward the question of the possible building of a second canal, through Nicaragua, to which the United States holds option by treaty. In his Minneapolis address, Charles Hughes, while secretary of State, declared:

"So far as the region of the Caribbean sea is concerned, if there were no Monroe Doctrine, one would have to be created for it. . . . By building the Panama canal we have not only established a new and convenient highway of commerce, but we have created new exigencies and new conditions of strategy and defence. It is for us to protect that highway. It may also be necessary for us at some time to build another canal between the Atlantic and Pacific oceans and to protect that."

In general, the policy of the United States toward the countries of the Caribbean (chiefly manifested in the smaller and more turbulent republics of the islands and of Central America) has been to encourage their development into good neighbours for the canal, to assist them in economic and financial matters, and where trouble threatens, to forestall this well in advance of its becoming a crisis. Landings of American marines have invariably been in relatively small numbers, and on the ground of protection of American lives and property, the only ground on which the President of the United States as commander-in-chief of the army and navy can use the armed forces abroad without specific authorization of Congress. The officers and crews of the so-called "special service" squadron of a dozen small cruisers and gunboats based at the Panama canal make periodic friendly visits to the ports and capitals of the Central American and Caribbean countries, and the admiral of the United States fleet appears similarly at times in these capitals, while fully accredited ministers are posted in every country, whereas other World Powers maintain only legations accredited to two or more of the countries. These ministers, appealed to in time of crisis, aid in solving problems brought to their attention and furnish or invite professional aid from the United States in more complicated difficulties.

The system has been declared to be paternalistic, but the standing of the United States officials is always maintained in the most rigorous etiquette, and the position of decision and the immense power wielded by these representatives of Washington are entirely the gift of the countries themselves, although it should be added that the situation is not frowned upon by the Department of State. The whole state of balance in the Caribbean, with military position, naval strength and political "paramount interest" in the hands of the United States, furnishes not only a definite protection to the United States and her sister republics in the region, but renders the Panama canal safe from surprise and largely so from any real danger to its communications in time of war. The strategic as well as the commercial importance of a second canal, and the political value of such a construction in Nicaragua, unite in making this development, with its vast increase in the importance of all the elements considered, a not unlikely extension of the future history of the Caribbean region.

**BIBLIOGRAPHY.**—Alfred T. Mahan, *The Interest of America in Sea-power* (1906); Stephen Bonsal, *The American Mediterranean* (1912). Cf. also, Charles Evans Hughes, "Observations on the Monroe Doctrine," an address before the American Bar Association, August 30, 1923; and Wallace Thompson, "The Origins of the Doctrine of the Paramount Interest of the United States in the Region of the Caribbean Sea," an address before the Academy of Political and Social

Science, Philadelphia, reprinted in the *Annals of the Academy*, July, 1927. See also Theodore Roosevelt, *Fear God and Take Your Own Part*. The subject has not been developed, and source material remains to be studied in *Foreign Relations of the United States* at periods of crises and in the unpublished files of the Department of State in Washington. A summary of some of the diplomatic developments is contained in John Bassett Moore, *Digest of International Law* (1906). A large literature of newspaper and magazine articles and pamphlets has sprung up in the course of discussions of the activities of the United States in Central America, some of which are mentioned in the bibliographies under the articles CENTRAL AMERICA, MONROE DOCTRINE and PANAMA CANAL. (W. THEO.)

**CARIBBEE ISLANDS**, a name chiefly of historical importance, sometimes applied to the whole of the West Indies, but strictly comprehending only the chain of islands stretching from Porto Rico to the coast of South America. These are also known as the Lesser Antilles, and the bulk of them are divided into the two groups of the Leeward and Windward islands. See CARIBBEAN, THE.

**CARIBOU**, the name of the North American reindeer. There are two races, the larger "woodland caribou" and the "barren-ground caribou." (See REINDEER.)

**CARIBOU HIGHWAY** extends from Cache Creek, B.C., Canada, to Hazelton in the same province, and consists of about 500m. of improved roadway. This scenic route follows the Frazer river, crosses the great lake country to the headwaters of the Skeena river near Hazelton and passes through regions abounding in mountains, lakes, rivers and valleys that are rich in game, fishing and camping facilities. Cache creek, Clinton, Soda creek, Prince George, Vanderhoof, Burns lake and Smithers lie in its path.

CARIBOU HIGHWAY

**CARICATURE**, a general term, adopted from the French, for the art of pictorial ridicule or satire of any kind, whether personal, social or political, derived from the Italian word *caricatura* in the sense of a portrait in which characteristic features are ludicrously exaggerated.

The practice of personal caricature is at least as old as to be recorded by Aristotle and Aristophanes, both of whom tell us something of an artist named Pauson who made pictorial fun of people, and was made to suffer for it. Again, Pliny mentions two sculptors, Bupalus and Athenis, who, by way of a joke, exhibited a portrait of the poet Hipponax, who was very ugly, for public ridicule: the poet is said to have retaliated in satirical verse with such effect that the sculptors hanged themselves in despair. That none of these three appears to have benefited by his activities in this direction very possibly accounts for the fact that the line of their successors, if they had any, is not traceable, and that among all the stories related by Vasari there are none that point to any survival of their baneful influence. Leonardo da Vinci made many wonderful drawings of distorted heads, but these we are told were life-like portraits carefully studied from actual freaks, and it is not until the close of the 16th century that we can begin to trace a regular unbroken pedigree for the art of *Caricatura* (the "ritratto ridicolo di cui siansi esagerati i difetti" as it is defined in the *Nuova Enciclopedia*) from the Carracci and their school in Bologna, through Ghezzi, Townshend, Daumier, Dighton, "Ape" and "Spy," to its supreme living practitioner Max, and the very numerous brood of stinging birds whom his revival of the art in the closing years of the last century undoubtedly did much to encourage.

#### RISE OF CARICATURE

**Early Italian School.**—In Bologna *caricatura* was the natural result of its artistic and popular "atmosphere." So at least says Count Malaguzzi-Valeri in a recent brochure, and he quotes with

approval the opinion of Ludovico Frati (from an article in *La Villa Cittadina*, Nov. 1919) that when the history of caricature in Italy is studied as it has been in England, France and Germany, Bologna will have one of the first places in it. The foundation of the vivacious *Papagallo* in the '80s of the last century proved that the old spirit was not extinguished, and a glance at its activities in the 17th and 18th centuries reveals a considerable amount of material for such a history, which has somehow escaped the attention both of the historians of caricaturists and of the Magnasco society. So far from being *tenebroso*, the school—the actual studio of the Carracci—appears to have sparkled with continuous outbursts of artistic humour. "I Carracci stessi amavan lo scherzo," says Malaguzzi, and they habitually indulged in artistic frivolities in the intervals of serious work. They began by introducing the use of linear symbols and asking their friends to guess what they represented—a practice possibly foreshadowing those of some of the modernists—and visitors to the studio were regarded as fair game for caricature, and saw themselves portrayed under the guise of dogs, pigs, beasts of burden, and even of inanimate objects like jugs or loaves of bread. Annibale Carracci himself was responsible for some of these, and his followers included Pietro Facini, Lionello Spada, Giuseppe Maria Crespi and, most prolific of all, Giuseppe Maria Mitelli. Eight large volumes of Mitelli's drawings, many of them caricatures, are in the library at Bologna, and a pair presented to the British Museum by Lawrence Binyon are of a quality that induces a strong desire to see some of the others.

None of these names is familiar—at least as a caricaturist—but thanks to the English engraver, Arthur Pond, who published a series of 24 prints in 1743, we have examples from drawings in private collections by Guercino, Francesco Mola and Carlo Maratti. Most of Pond's subjects, however, are by the then "famoso cavaliere delle caricature," namely, Pietro Leone Ghezzi, who was renowned in Rome, not only among his fellow-countrymen, but also among foreigners for his caricature portraits.

To Pond we are also indebted for what is possibly the earliest example of pure caricature in Great Britain, a drawing made by Antoine Watteau when he was in London in 1720, of Dr. Misau bin, a French refugee who was so successful in his profession as to be branded by posterity as a quack. This drawing is said by Mariette to have been made in a coffee house, and it is not straining probability to suggest that the place may have been Button's, where Hogarth in his younger days made portrait sketches from the life. None of the work mentioned so far, it should be noted, was intended for publication, for *caricatura* was essentially personal, and it was only the vogue created by Ghezzi that led to the publication by Pond of his portraits of this class, and by Oesterreich of another series of about 40 at Potsdam in 1766. There is little if any malice in them, and they seem to have been done simply for the amusement of the subjects and their friends.

**Rise of Political Caricature.**—For the employment of this gentle art as an adjunct to political satire, it is not so easy as it may sound to find any absolute authority earlier than the middle of the 18th century. There may be one or two examples, but the prints of Chancellor Finch with a pair of wings behind him, in allusion to his flight from the country, or of Bishop Williams with a large blunderbuss, etc., and indeed of whole packs of cards representing individuals, in the 17th century, are purely symbolical in their satire, and cannot be said to attack the personal appearance of the victim. This wicked practice would appear to have been introduced by George (afterwards Marquis) Townshend, and even if he cannot be discredited with the sole responsibility for such a monstrous extension of a private artistic diversion, we can at any rate produce illuminating evidence of it in his case. In June 1765 a letter appeared in *The Public Advertiser* dealing banteringly with Townshend's activities of this kind. After referring to the use of the rolling-press in producing satirical prints, the writer proceeds thus: "He has dealt his grotesque cards from house to house, from Town's End to Town's End. Is there a great general of the highest rank and most eminent military abilities . . . ? If the size of his person as well as fame should be

# POLITICAL AND HISTORICAL SATIRE, 16TH-18TH CENTURIES

1. "The Scots Holding Their Young King's Nose to Ye Grinstone," a print from a broadside in prose, July 14, 1651, ridiculing the severe conditions exacted by the Scotch before offering Charles Stuart (later Charles II.) the crown. The central figure, Jack Presbyter, represents the church; Jockie (left), the laity. 2. Presentation of the Bible to Henry VIII.; from a woodcut, 1570. Henry (1491-1547), on his throne, is receiving the Bible from Thomas Cranmer, archbishop of Canterbury, and Lord Cromwell, and is trampling on Pope Clement VII., who denounced him. Cardinals Pole and Fisher are endeavouring to raise the Pope. 3. The European Powers throwing dice for the fort of Schenken, Holland; Dutch caricature, 1636. It represents the enemies and allies of the United Provinces, the gamblers being Prince Frederick Henry of Orange, Protestant leader, and Prince Cardinal Ferdinand, governor of

Spain. Standing are Richelieu and Louis XIII. of France, supporting Frederick; Emperor Ferdinand II., Philip IV. of Spain, the Pope and the Bishops of Cologne and Mayence support the governor. The peasants await the result in terror. 4. "Taste in High Life," one of William Hogarth's (1697-1764) satires on London society in the 18th century. 5. "Prenez des Pilules, Prenez des Pilules,"—"Dr. Misabin," This French caricature by Antoine Watteau (1684-1721), engraved by Arthur Pond, 1739, shows "Dr. Misabin," a Huguenot in London, who prescribed his pills with disastrous result. 6. "The True Portrait of Martin Scribbler," by George Duckett. The ape represents Alexander Pope (1686-1744), who was small and deformed; the donkey his friend William Cleland, who signed Pope's "Letter to the Publisher," in defence of "The Dunciad" (1729)

## POLITICAL AND HISTORICAL SATIRE IN CARICATURE, LATE 18TH AND EARLY 19TH CENTURIES

1. "The Plumb-pudding in Danger." An English caricature, dated Feb. 25, 1805, by James Gillray (1757-1815), showing Pitt and Napoleon dividing the world, Napoleon taking all Europe for France, Pitt the whole ocean and the rest of the world for England
2. "We Three Logger-heads be," a satire on the Court of Appeal by Thomas Rowlandson, England (1756-1827)
3. "Why hide them?" an etching by Francisco Goya y Lucientes, Spain (1746-1828), from his best-known satirical series, *Los Caprichos*
4. "Old Bumblehead the 18th trying on the Napoleon Boots," Louis XVIII. of France vainly trying to put on Napoleon's boots. This English political cartoon by George Cruikshank (1792-1878) satirizes the Spanish campaign, undertaken by Louis XVIII. in 1823. The figure, right, trying to snatch the falling crown of the Bourbons is Napoleon's son, Napoleon II. commonly known as the duke of Reichstadt (1811-32), who was twelve years old at this time

larger than ordinary, this malicious libeller at three strokes of his pencil scratches out his figure in all the ridiculous attitudes imaginable (duke of Cumberland). Is there a nobleman distinguished for wit, eloquence and learning? If his person be long and lank, lean and bony, he also is in the like manner exposed to ridicule (Lord Lyttleton). If the name of a Scotch peer bears the least resemblance of Boot, and his Christian name be John, a huge jack-boot serves for him on copperplate (Lord Bute). And if another lord bears the name of some animal (a fox, for instance) his features are assimilated perforce to those of the animal, and aggravated or distorted in the most ludicrous manner in order to produce a likeness between them."

The personal note has made "caricature" in the broader, modern sense, a living thing. The older satirists merely personified institutions. The papacy was figured as a monster with the trunk of a woman, the head of a donkey, and a different symbol lurking in every limb. The Dutch prints that were so effective against Louis XIV. show us merely dolls representing the various crowned and coroneted heads of the period, and the English ones simply dummies with labels issuing from their mouths, inscribed with the right thing. There is no human interest in any of these designs, valuable as they are to the student and the collector.

**Pictorial Satire.**—For pictorial satire in general, claims have been advanced to an even greater antiquity than for *caricatura*, which cannot be lightly dismissed, although they must necessarily be accepted with considerable reserve. With the very old as with the very new, it is not always obvious to the spectator whether a joke is intended or not, and it is a dangerous subject on which to be too positive. Champfleury, who ransacked every corner of antiquity for materials for his *Histoire de la Caricature antique*, turned away in despair from the Assyrian bas-reliefs; but are they a whit less solemn than those on the Albert Memorial? Man, as he declares, has laughed, as he has wept, in every age: so why should we deny the possibility of the existence of Assyrian satirists who worked in less enduring materials than granite or marble?

As it happens, the oldest example of pictorial humour put forward by Thomas Wright in his *History of Caricature* is of a religious, not a political, subject and, what is still more interesting, there is good *a posteriori* evidence for accepting it for inclusion in the gallery of the satirical. For, whatever difficulties the extension of the term "caricature" in modern times has occasioned in deciding what is and what is not to be properly included within its limits, there is one strain constantly recurring in the modern family which is also prominent in antiquity, and which may therefore be accounted as of some genealogical significance, namely the representation of human beings with the heads of animals, or, more generally, investing them with animal characteristics.

It is in Egypt that we find the example in question, a painting in the tomb of King Rameses V., presumably as early as 1100 B.C. It represents a soul condemned by Osiris to return to earth in the form of a pig, accompanied by two dog-headed monkeys. It may be that this is simply religious symbolism, but that need not exclude it from consideration here, for there is a definite historical, or, at least, traditional link between it and the famous Roman *graffito* of the Crucifixion, of the 3rd or 4th century A.D. In this the figure on the cross has the head of an ass, and a man contemplates it in an attitude which is interpreted by the legend in Greek characters "Alexamenos worships God." At first sight this might seem to be a scoff directed against the Saviour Himself, but it probably has a more general significance. There was a definite belief among some of the Gentiles that the Jews secretly worshipped the image of an ass, or of an ass's head, but the Gnostics, who were possibly nearer the mark, maintained that the Jewish God Sabaoth was figured in the form of a man with the head of an ass.

Little less than religious belief was the Roman tradition of descent from Aeneas, and at Herculaneum we find something very similar to the Crucifixion *graffito* in an exact parody of a well-known group of Aeneas carrying Anchises and leading Ascanius from Troy, in which the figures are drawn with the heads

and extremities of animals. Titian, some 1,200 years later, went even further than this in converting "the Laocöon" into a group of monkeys. In the animal strain, James Goupy satirized Handel "with a snout of a hog playing on an organ, with many symbols of gluttony round him," and Newton drew Wilton, the sculptor, with the head of an ass. None of these examples answers to the definition of *caricatura*—all are symbolic.

Conversely, Tenniel put the British Lion into trousers, while Landseer invested dogs of all sorts with every variety of human sentiment, whether he meant to or not. For this also there is good historical precedent, though hardly as ancient as the days of Rameses V. In some later Egyptian papyri are whole groups of animals performing human actions—notably a lion and a gazelle playing chess together, who are doubtless intended to typify a king and one of his ladies. The fox and the goose were taken to satirize monks and their dupes in the middle ages, and in later times apes for the admonition of humanity at large. Claude Gillot, and his more famous pupil, Antoine Watteau, festooned the way for the Victorian scientists with orgies of artistic anthropoids. "La Grande Singerie" and "La Petite Singerie" at Chantilly are developments of Gillot's numerous engravings, and Watteau, whether or not he actually painted these, has left us two simian satires, "La Peinture" and "La Sculpture." Christophe Huet, J. Gueland and Le Mire followed the lead, and even Chardin in 1740 exhibited "Le Singe Peintre" and "Le Singe Antiquaire." Seeing how many and how obvious are the resemblances between certain types of humanity and animal creation in general, it is no wonder if satirists of all ages have availed themselves freely of these opportunities. It is the same in literature, from Aesop to Gulliver, and on to Dr. Dolittle, while in conversation it is so common as to escape notice altogether. Is there any social circle that does not include a goose, an ass or a cow?

**The Effect of Printing.**—But whether or not caricature and pictorial satire had even a single ancestor in common in remote ages, it is certain that the latter, unlike the former, depends chiefly for its existence on circulation; and so we have to wait for the invention of the art of block printing on wood and of engraving and etching on copper before we can begin to trace its history with any success. The earliest example mentioned in the British Museum catalogue of Italian engraving, which dates from about 1460, is neither religious nor political, being known as "The battle for the hose." It represents a group of richly attired ladies scuffling for the possession of a pair of trunk hose held aloft in a garland by two winged genii. Dr. Warburg has suggested that the specific idea is a popular illustration of the text of Isaiah iv. 1, thus bringing the prophets of Israel again within our range. Somewhat similar in subject is a slightly later German woodcut of a duel between a man and a woman, which is supposed to symbolize the eternal marital question: "Who shall wear the breeches?" Less abstruse are one or two satires against the Jews; but the surviving examples of the 15th century (probably a mere percentage of such perishable and ephemeral material) are very few, and it is not until the Reformation, when Luther organized whole arsenals of pictorial artillery for his campaign against Rome, that we speak of it as fairly established.

Once the Reformation was established there may have been a less regular demand for satirical prints, though there was still intermittent firing; a contemporary Italian print of Diana and Calisto was altered by Peter Miriceny to represent the young Queen Elizabeth and the pope, the latter "uncovered by Time and Truth." Not until the end of the 17th century, when the Dutch followed Luther's example and employed Romeyn de Hooghe to satirize Louis XIV., did the stream begin to flow regularly and to swell into the great river it became in the time of the Georges.

#### EARLY BRITISH CARICATURE

**17th and Early 18th Century.**—The catalogue of satirical prints in the British Museum, compiled by F. G. Stephens, is unfortunately only carried down to the year 1770. Its contents, numbering over 4,000 items, with copious notes, are an indispensable

ble commentary on the history of the period they cover, and a veritable museum of literary and social curiosities. In his preface to the second volume Stephens emphasizes the importance attached to political satire in the time of William III., when Romeyn de Hooghe and his school were producing print after print directed against Louis XIV. One of the most famous of these was "The Reported Death of William III.," occasioned by the public rejoicings in Paris over the false news of William having been shot in 1690. Of this there were four editions, two of them made in Paris, in order to show the "folies extravagantes" of those who produced the original; and in a later print, "Pantagruel agonisant," one of the most elaborate and interesting satires connected with the history of England, the "Reported Death" is introduced as an accessory to the mortification of the French king. These prints continued into the next reign, another effective piece being "Vacarme au Trianon," occasioned by the battle of Ramillies.

British royalties had, up to this time, escaped personal attack in prints, but with the advent of the house of Hanover any restraint in that direction soon melted away. As Stephens observed in commenting on a print entitled "Aeneas in a Storm," not only is George I. hinted at without much respect, but the personal habits of his successor are vividly described, and his peculiar practice of kicking hats, if not larger and living objects, is laughed at. "The Festival of the Golden Rump" deals vigorously with this subject, and has wider bearings of very great importance, social as well as political and personal; it shows that royalty had become an object of stage satire, and indicates the parliamentary origin of the restraints on theatrical representations which were then newly imposed, and have been maintained.

Hogarth, whose period of activity coincides almost exactly with the reigns of the first two Georges, stands alone in the history of caricature. Champfleury calls him "le premier roi" and "le véritable père de la caricature," while Fielding, as we shall see, distinguishes his "comic painting" from *caricatura*, as, save for a few notable examples, he was quite right in doing. Hogarth rarely availed himself of personalities in his satires, and the identification of any of his characters with actual people must be taken with the greatest reserve. Nor did he, as a rule, take any particular event as a subject, looking much more widely over the whole range of human frailties, and selecting and staging them like a theatrical manager. Hogarth's great serial works were "not of an age, but for all time," whereas the satirical prints of the 18th century are merely squibs which light up some ephemeral extravagance or political brawl, brightly enough, but without any permanent illumination of the world's stage.

By the time George III. had ascended the throne the issue of satirical prints had become a regular institution. As already mentioned, a new species now first appeared, invented by George Townshend; they were caricatures on cards. The original one, which had an amazing success, was of Newcastle and Fox looking at each other, and crying, with Peachum in *The Beggar's Opera*, "Brother, brother, we are both in the wrong." Another of Townshend's masterpieces, published in 1762, was "The Scotch Hurdy-Gurdy or The Musical Boot," signed "D. Rhezzio inv., G. Oh! Garth scratchavit." Further activities against Bute are reflected in another advertisement of a Political and Satirical History.

Stephens claims rather too much for Townshend in saying that he may fairly be styled the inventor of the most modern form of artistic satire, but it may be allowed that he raised the tone of it, and that his skill, though often mercilessly employed and subject to political passion, was not disgraced by the unscrupulous frankness and licence of some of his predecessors or successors.

**Later 18th Century Caricature.**—In his fourth volume, which deals with the years 1761–70, Stephens writes that a very striking attestation of the growing importance of artistic satire which, by this time, was partly personal, partly political, is afforded by the fact that many magazines, illustrated by satirical prints, were published during this period. Previous to this date such work could hardly be said to exist. These publications were essentially arsenals of satirical weapons of which the cuts enrich-

ing them were the most efficient. The *London Museum* was one of the more prominent. The *Political Register* supplied a considerable number of satirical prints, notably one of Bute as Colossus with Pitt between his feet (1767). The *Oxford Magazine* was enriched by a series of very cleverly designed prints such as "The Siege of Warwick Castle," a satire on physicians (1768) and "The Rape of the Petti-coat." Even the decorous *Gentlemen's Magazine*, which in 1746 had published a version of Hogarth's portrait of Lord Lovat, issued among its few illustrations with figures the satirical print of "John Wilkes Esq. before the Court of King's Bench." The *Universal Museum* printed "The Present State of Surgery or Modern Practice" (1769). The *Town and Country Magazine*, the most prolific of satire-bearing works, had numerous illustrations, many of which were directed against men of note, and women of ill-fame. The former were nearly all politicians opposed to the popular leaders, and these prints may fairly be called the arrows of their party directed against the king and his court. These weapons showed that the dignified and honourable modes of English political warfare had given place to a coarser and meaner system of attack; the *Town and Country Magazine* spared neither the public nor the private lives of the courtiers, and their wives and daughters, living and dead, chaste or unchaste, had no more mercy at the hands of the satirists than was vouchsafed to their mistresses or the harlotry of the stage and opera. The common object of attack in these cases was that order of society which hung like a fringe about the court, and of which the most extravagant front comprised those "*macaronies*" whose vagaries occupied the *Universal Magazine* and other publications.

If Stephens could say as much as this of social satire down to 1770, one wonders how he would have expressed himself had he continued till the end of the century, the last quarter of which was enriched by a steadily growing production of caricatures of every sort, and not always of the nicest. But the establishment of the Royal Academy had certainly raised both the quantity and the standard of artistic work in Great Britain, and until the Regency there is much more in the comic part of it to be praised than blamed. Gillray and Rowlandson, in the work of their early prime, had no rival but each other, though the field was a large one, and included such men as Henry William Bunbury, Paul Sandby, P. J. de Louthembourg, James Sayer, John Raphael Smith, James Hamilton Mortimer and others less known but hardly less worthy. The demand for caricatures continued to increase, and on some of the prints issued by S. W. Fores—the founder of the still extant firm in Piccadilly—it was advertised that folios of caricatures were lent out for the evening, and that his gallery might be inspected for one shilling. The range of subjects also increased, and while politics continued to take first place, social subjects became much more numerous and more absurd. Rowlandson drew every class of society, in every sort of occupation, and as there was little or no "mixture" of the social classes in his time, his variety is enormous.

**Disappearance of the 18th Century School.**—By the end of the 18th century the rose had become somewhat overblown, and during the first quarter of the 19th, caricature sank into exceeding coarseness. The artistic reputation of its two gifted exponents, Rowlandson and Gillray, has suffered irreparable damage from the atrocious and often revolting quality both of their subjects and their interpretation of them; it is only in recent years that the former has been recognized from his immense output of beautiful drawings as one of our finest artists, while the latter, surviving only in his caricature prints, has still to wait for a recognition of his true powers which were so grossly employed in disgusting satire. Isaac Cruikshank, who with his still more gifted son, George, forms a link between the older order and what was to come, was never offensively coarse, though like Newton, Heath and one or two more, he was too fond of being funny to have much regard to artistic excellence. The extravagances of this school may be excused to some extent by the opportunities offered them in the ridiculous fashions, both sartorial and social, of their time, and they may very possibly be more appreciated in time to come than they are at the moment.

### LATE NINETEENTH AND EARLY TWENTIETH CENTURY CARICATURE

1. "Robert Browning taking tea with the Browning Society" by Max Beerbohm, one of the first satirical artists to break away from the conventional Victorian style of caricature
2. "Gladstone" from "The Phil May Folio"
3. "The Railways" by Honoré Daumier, showing third-class passengers frozen during a train trip
4. "Jules Renard" by "Sem" (George Goursat)
5. "S'r 'enry" (Sir Henry Wood) "refusing an encore" by Low
6. Yvette Guilbert, from "Stage Folks" by Alfred J. Frueh, an American born in Lima, Ohio
7. "Austen Chamberlain" by A. B. Sava
8. "Kruger and John Bull" by Caran d'Ache (Emmanuel Poiré), a satire on the Boer War. John Bull is rifling the pockets of President Kruger
9. Drawing by Daumier, published in *Charivari*. "Why the devil should this great red creature, only half-dressed, too, be called Olympia?" "But, my dear, it is the black cat they mean by that!"
10. "Old Bill. Full of determination and plum & apple." Central figure in a series of World War cartoons created by Bruce Bairnsfather
11. Cécile Sorel, by André Rouveyre

## FRENCH CARICATURE

**Effect of Censorship.**—Meanwhile, our attention may conveniently be turned to France, where personal caricature, even if it had established itself as soon as in England, was hardly likely to be allowed the same liberty in connection with political satire. The rarity of satirical prints of the earlier part of the 18th century is due rather to the extreme rigour with which they were suppressed than to their numbers, and apart from politics there was a large and varied supply of very interesting material for Grand-Carteret's volume *L'Estampe Satirique*, etc., and the more recent and fuller works of André Blum on the same subject. Among the earliest examples is another medical satire by poor Watteau who, in the short interval between his return from England and his death in 1721, burlesqued the whole faculty in a drawing which was engraved by Comte de Caylus. Caylus himself appears to have caught the infection of pure caricature from Ghezzi, and he made some very curious *portrait-chargés* of the frequenters of Madame Doublet's salon. Of more public interest were the satires against literary and artistic personages; in 1728 the *Almanac de Parnasse* had a frontispiece introducing portraits of Rousseau, Voltaire, Racine le jeune, Crébillon and other figures, which was suppressed by the police and the *Almanac* sold without it. Voltaire in later years was bombarded with caricatures, one of which had the interest for us of showing Urania offering him a pair of spectacles to help him in reading Newton's *Principia*. Jacques Saly produced a series of caricatures when he was at the French Academy in Rome in 1750, thus carrying on the true Carraccian tradition. The lighter side of social satire is represented by Jeurat, J. B. Huet and Gabriel St. Aubin, all of whom had a kindly eye for *les filles de joie*, and later by Duboucourt, some of whose works have more than a little in common with the best of Rowlandson's. With *Vauxhall Gardens* and *La Promenade de la Galerie du Palais Royal*, published in 1785 and 1787, England and France, the only two countries in which a continuous development of caricature is traceable, were within measurable distance of each other. In the years of the Revolution and Napoleonic Wars such an approach could hardly be expected to be continued; no later than 1791 the rift was wide enough for the following legend beneath a very telling print:—"La grande aiguiserie royale des poignards anglais: Le fameux ministre Pitt aiguissant les poignards . . . Le gros Georges Dandin tournant le roule en haletant de fatigue." The very numerous satires of these years are of the greatest interest historically, but are not of an attractive nature. It is, however, all the more interesting on this account to note that when the two countries were, so to speak, starting afresh in the second quarter of the next century, they did so on remarkably similar lines. Let us, therefore, continue with France.

**The Reign of Louis Philippe.**—Champfleury begins his *History of Modern Caricature* with the reign of Louis Philippe in 1830. In his preface he remarks that the book might well be styled "The demolishers of the bourgeoisie," for they had no more determined adversaries than Daumier, Traviés and Henri Monnier; and that whatever satirical characters might be created in the future to succeed those of Mayeux, Robert Macaire and Monsieur Prudhomme, those three types would subsist as the most faithful representatives of the bourgeoisie from 1830 to 1850. The king himself, he adds, was the first *bourgeois* in the realm, and seemed to think that he could govern it with an umbrella for a sceptre, and that he only had to open it to protect himself from political storms. Certainly that strikes the dominant note of modern caricature, which henceforth, not only in France and England, but generally everywhere, became gradually less rude and savage, and more "refined" and domesticated. As both politically and socially the world settled down after the Revolution and the Napoleonic Wars, so caricature, save for occasional necessities, assumed a more polite, if more sarcastic, tone, and monsters and deformities gave place to subtler rendering of human weaknesses or excesses. In France, at first, the satire was none the less biting, the ridicule none the less stinging for its artistic excellence, and personal, physical caricature was used by Daumier and others with terrific effect. The king's heavy physiognomy was transformed into a symbol—*la poire*—and there was no public character who es-

caped merciless caricature of his features, gestures and habits. At the same time, however, the artistic sense predominated, and when the bitterness had somewhat abated, survived as an example to be followed, a standard to be maintained. Even if this improvement was, so to speak, in the air, it was actually precipitated by one man, namely Charles Philipon. Whether or not he influenced John Doyle in the course of their lithographic studies, who, as we shall see, was doing something of the same sort for English caricature, he was certainly the great general who organized and led to glory the noble army of French satirical artists, and thereby furnished an example which has been followed more or less closely in every country in the world.

**Philipon's Career.**—Philipon was born at Lyons in 1800 and settled in Paris in 1825, where he took to lithography for a living and produced some very charming caricatures; but he soon realized his ambition to found a paper. This was *La Caricature*, which made its appearance on Nov. 4, 1830, and after braving a continuous deluge of legal actions, was suppressed in 1835. Its chief artists were Honoré Daumier, Henri Monnier and J. T. Traviés, above mentioned.

On Dec. 1, 1832, was born Philipon's second child, *Le Charivari*, which still survives in a new series, having only temporarily succumbed to the World War in 1915. This was a daily paper, "publiant chaque jour un nouveau dessin." Its birthday vignette, designed by Tony Johannot, the public were informed, required such special preparation that it could not appear in time. When no more than eight years old, it stood godfather to another lusty, and still thriving paper, *Punch, or the London Charivari*. In 1838, on Nov. 1, *La Caricature Provisoire* donned the shoes of its deceased brother, dedicated "aux amis de l'ancienne Caricature politique," and adorned by its artists Daumier, Grandville, Forest, Bouchot, etc.; and when asked about the adjective *provisoire*, Philipon replied: "Si elle n'est pas politique, elle sera non politique . . . elle sera morale, littéraire, théâtrale, artistique, sociale, médicale, chirurgicale, agricole, somnambuliste, anabaptiste, etc." In the following June it received a new sub-title, "revue morale, judiciaire, littéraire, artistique, fashionable et scénique," having abdicated its title of *provisoire*, "désormais trop sûre de vivre longtemps, et bien, pour ne pas se proclamer définitive." In Jan. 1842 its sub-title was further modified, and it broke out into coloured plates of a most distressing brilliance.

Philipon's third child to attain public importance was *Le Journal pour Rire*, a specimen number of which was issued in Dec. 1847, and No. 1 on Feb. 5 following. This was on large newspaper sheets and full of wood-cut illustrations by some of the older artists, and also some new ones. Among these one of the most brilliant was Gustave Doré, who furnished *Punch* with the idea for at least two of his most successful features, namely, the "Bird's Eye Views of Society" and "The Royal Academy Guyed." Besides these, Philipon was responsible for *Le Musée Philipon* and was also the godfather of a great many occasional publications. In No. 5 of *Le Journal pour Rire* is a list of "Caricatures par les principaux dessinateurs du Musée Philipon, du Charivari, du Journal pour Rire, et de la maison Aubert," some of them consisting of as many as 70 or 80 plates, a glance at which will give us a fair idea of what purely social caricature had become under the fostering influence of Philipon. First place is given to Gavarni, with "Le Carnaval," "Le Carnaval à Paris," "La Boîte aux Lettres," "Les Maris vengés," "Les Artistes," "Les Impressions de Ménage," "Les Lorettes," "Les Enfants terribles." Next is Daumier with "Les Beaux Jours de la Vie" (80 plates), "Les Croquis d'Expression" and "Les Robert Macaire" (with Philipon). Then Bouchot's 70 "Bonnes Fêtes Musicales"; Jacques's "Militariana"; Behr's "L'Amour à Paris"; "Croquis parisiens" and "L'Opéra au 19<sup>e</sup> siècle" by E. de Beaumont; "Au Bal de l'Opéra," "Les Troupiers Français," "Croquis militaires," "Les Grisettes," and "Physiologie des bals publics" by Vernier. The anonymous remainder is not long, and is necessary to complete the survey:—"Nos Gentilshommes," "Turlupiniades," "Souvenirs de Garnison," "À la Guerre comme à la Guerre," "Mœurs Algériennes," "Mœurs britanniques," "Les Chargés parisiens," "Le Conservatoire de danse," "Ces bons Parisiens," "Prophètes chariviques."

For one man such an achievement, of which the above is the barest outline, was prodigious, and its effect on caricature, both in France and other countries, has been decisive. He raised caricature from the precarious issue of occasional prints to the regular position of an indispensable auxiliary to journalism. To his recognition of the practical and artistic possibilities of lithography combined, we owe the magnificent series of drawings that await resurrection in the forgotten or neglected volumes above mentioned, and his undying ardour in political ridicule is still traceable in these days of milder expression.

Among the brilliant and very numerous band of his artists, three names only are familiar to the public in Great Britain or the U.S.A. Daumier, who stands head and shoulders above the rest; Doré, who might have rivalled him had he been prevented, as Daumier was, from evaporating into popular painting; and Gavarni. The first has now been recognized, like Rowlandson, as a serious factor in the history of art; the second had his popular triumph and must wait for reinstatement until the effects of it have cleared off. The third is still hovering. But none of the three can be fairly appreciated, until much more of their work is brought out into the light. Of the rest, Traviés and Monnier stand out conspicuously as the creators of two almost historical characters—the hunchback Mayeux and Monsieur Prudhomme—characters like Philipon's and Daumier's Robert Macaire and Bertrand (feebly imitated in "Ally Sloper" and "Ikey Mo"); and Grandville, who is best known for his ornithological whims, though they were but a part of his excellent works, deserves equal rank.

#### WORLDWIDE SPREAD OF CARICATURE

**Doyle and Seymour.**—In England, as in France, modern caricature may be fairly dated from 1830, when McLean, the printseller, commenced the issue of his *Monthly Caricature Sheets*, a series which outlasted Philipon's first venture by a year. These sheets were entirely covered with lithographs, mostly by Robert Seymour, but also by John Doyle who in the previous year had begun the famous series of political cartoons, also in lithograph, over the mysterious signature "H. B." These, too, were published by McLean, and although it would be paying him too high a compliment to style him the English Philipon, he is certainly to be congratulated on having brought out two such notable caricaturists as Doyle and Seymour, and also on having realized the practical and artistic possibilities of lithography for the purpose. Doyle was an Irishman who came to London to paint portraits, but turning his attention to lithography, like Philipon, found it an equally efficient and delightful means of improving and refining the artistic qualities of political caricature. George Cruikshank, not content to follow in his father's footsteps, but still using the needle, was also a great, and certainly a wider, influence in the general refinement upon the monstrous and extravagant fancies of the older school which is apparent in the work of John Leech, Richard Doyle, Hablot Browne and the rest. But there is a softness and a gentle spirit of railery in the elder Doyle's political sheets—numbering in all over 600—and at least equally discernible in the work of his son, that inclines one to place Doyle as high as Cruikshank among those to whom the spirit of modern caricature is most indebted for its high tone and gentle demeanour, no less than for its artistic excellence.

Robert Seymour, whose name and work are now entirely forgotten, was really one of the older school. Like Woodward and Bunbury, he was a born caricaturist. It was his suggestion of *Cockney Sporting Plates* to be issued monthly that was altered by Charles Dickens, whom he asked to supply the letterpress, into *The Pickwick Papers*, and he was their first illustrator. His art was not of the highest order, or he might not have achieved such a wide popularity in his inartistic period. It was in *Figaro in London*, edited by Gilbert & Beckett, that Seymour was described, in 1833, as the Shakespeare of caricature, and in the same year was announced *The Terrific Penny Magazine* with cuts by Seymour and other artists of celebrity, and later, *The Wag*, and a new supply of Figaro's caricature gallery. In this sort of company one might observe, like Dr. Primrose, that if there was not more wit than usual, there was certainly more laughter. But the dom-

inating figure of this period was, undoubtedly, George Cruikshank, who, if we allow for the difference in time and circumstances, occupied very much the same place in the 19th century as Hogarth did in the 18th.

The untimely death of Seymour, by his own hand, in 1836, and a diminishing output of H. B.'s lithographs, may possibly have accelerated the foundation in 1840 of *Punch or the London Charivari*. Certainly the time was ripe for such an event, thanks to the efforts of the preceding decade, and although neither the elder Doyle nor George Cruikshank had any hand in it, and its origins were of the humblest, it soon established itself, and only needed Richard Doyle and John Leech to make its success the more sure and more glorious.

But the success of Philipon's papers in Paris was bound to be attempted, sooner or later, in other countries than England, and for even a glance at the history of caricature during the second half of the 19th century we must look all over Europe—to say nothing of America, north and south—where in every capital the press was being requisitioned to provide a regular weekly service of vehicles for comical and satirical expression of feeling, which had hitherto had to go on foot or hire a conveyance for any particular occasion.

**Bismarck in Caricature.**—Such a consummation was, perhaps, dimly foreshadowed by the publication, in 1890, in Paris, of a little volume entitled *Bismarck en Caricatures*, illustrated by 140 cartoons, etc. from the more important periodicals since 1862. Its author, J. Grand-Carteret, was already well known for his work on caricatures in earlier periods, and he followed it some years later with volumes dealing similarly with Leopold II., Nicholas II., Alphonse XIII. and Edward VII., which bring us nearer to present days. But the first volume, in itself marking a distinct advance in the importance of caricature as an aid to history, and also emphasizing, as it happened, the beginning of a new epoch with the dismissal of the great Chancellor, is for many reasons the most valuable. Allowing for Bismarck being its only subject, with the stage all to himself, one cannot fail to see how clearly the mirror of caricature reflects the events, and the subtleties with which they are developed, throughout the whole quarter of a century in which Bismarck was violently, yet always respectfully attacked, both in his own country and in many other States. A French author might be pardoned for a little bias in dealing with such a subject, but throughout the volume there is hardly a cartoon which Bismarck himself could not have regarded with pleasure or pride. All are tributes to his incessant activity and efficiency, even those of the little Munich *Punsch*, which never ceased to sting him till it ceased to appear in 1870. The occasional issue of single caricatures to a very limited clientèle was now superseded by the regular publication of illustrated periodicals which were read by thousands, and the foundations of a permanent and world-wide alliance between caricature and journalism were firmly laid. On its social side this alliance was no less fruitful in its developments than in politics, and the gain to both parties to it became more and more apparent as the century advanced to its close. To posterity the gain is immeasurably greater, in having a live record of manners and customs in place of the haphazard fragments from which its knowledge of earlier periods is alone derivable. Astronomers contemplate the heavens in a pool of mercury, and the reflections of human action in the mercurial element, though the gaiety of nations may ripple the surface, are not so distorted as to impair their interest or their value. Rather do the ripples add that relish to matter of fact which, as we presently shall see, is at the root of the derivation of the word caricature, and, we may almost say, of a really spiritual understanding of anything human.

**Eastern Europe.**—Beginning with the remotest and least prolific of the nations, we find in Russia *Strekoza* and *Palimet*, in Cracow *Djabell* and in Warsaw *Mucha*. None of these is available for perusal in England, but the Buda-Pest *Borsszem Janko*, by some strange chance, though not mentioned by Grand-Carteret, is in the British Museum library. It began with the New Year in 1868, and had an excellent artist in Karl Klič. It is amusing to find scraps of English here and there; there is "Lord Jockey-mor-

land" in Janko's *Museum*, remarking on a bottled specimen "indeed very curious," while outside Queen Victoria is sitting attended by a Scotch piper. In 1887 the paper was still well illustrated, by Klosz and others unnamed, a really fine cartoon being a grim rendering of "Cholera," and a more amusing one showing Bismarck in the prompter's box dismissing the old year down a stage trap, and calling on the new, armed to the teeth. More surprising is a group of politicians in the disguise of Gilbert and Sullivan's *Mikado* and the "Three Little Maids from School." *Caviar*, another Hungarian paper, had a good caricaturist in C. Sieben.

Vienna, as might be expected, was far more prolific. *Kikeriki*, founded in 1861, is still crowing; *Figaro*, a name adopted by numerous papers and in all lands—there was even a *Sheffield Figaro*—was most famous in Vienna; and there were also *Der Floh*, *Lucifer*, *Die Bombe*, *Die Auste*, *Wiener Caricaturen* and *Die Muskete*. At Innsbruck, too, was *Der Scherer*, and at Prague *Humoristische Listy*.

**Spain and Portugal.**—In Lisbon, *Os Puntos nos ii* (the dots on the i's) had a notable cartoonist in Raphael Pinheiro. In Madrid the only considerable illustrated paper in the last century was *El Motin*, and the work of Spanish caricaturists must be looked for in North and South America. But there is now quite a long list including *El Liberal*, *España*, *Gil Blas*, *Gedeconcito*, *Blanca e Nera*, *La Espera*, *Gedéon*, *El Mundo Humorístico*. In Barcelona two excellent caricaturists, Bracons ("Apa") and Inglada, work for *Iberia*, and Picarol for *La Campana de Gracia*.

**Switzerland, Belgium, Holland.**—Switzerland was fortunate in having two caricaturists at a much earlier date, Rudolf Topffer and Martin Bisteli. Both were dead before 1850; but their influence may have contributed to the success of the Geneva *Carillon* and the Zurich *Postheiri* and *Nebelspalter*, the last of which attained first rate importance in political caricature and is still flourishing.

In Belgium, the grotesque and somewhat fearful expressions of Breughel, Bosch, Wierz and Jan van Beers found a remarkable exponent in Felicien Rops, whose contributions to the Brussels *Uylenspiegel* in the '50s and '60s are among the *rariora* of modern prints. On one occasion, in 1863, he paid Grandville the compliment of a new version of that artist's famous cartoon of 1831, "Order is established in Warsaw." In the '80s, the eccentricities of "Popold" had begun to afford opportunity for the caricaturists which were not neglected. At Liège, there were Lemaître in *Le Rasoir* and Lapière in *Le Frondeur*; and in Brussels, Boum-Kelkou in *Le Clairon*, Sebranc in the *Moniteur du Congo*, Levy in *Le Gourdin*, and Zarib in *Clair de Lune*. With the new century appeared G. Julio in *Le Cri du Peuple* and *La Réforme*, C. de Busschera in *Le Flirt*, Sicambre in *Le Zwanzeur*, besides others in *Le Sifflet*, *La Trique* and *Les Corbeaux*.

From the colder genius of Holland, where Romeyn de Hooghe established pictorial satire as a serious contribution to politics, we need not expect very much on the lighter side of caricature, but can appreciate all the better the extraordinary manifestation of the old spirit in Louis Raemaekers' War cartoons; and even forgive the Amsterdam *Weekblad von Nederland* and *De Kroniek* for their sharpest hits at the British Government in the Boer War. The magnificent conception of Cecil Rhodes in his coach, in 1897, needs no forgiveness. *De Notenkraker*, Amsterdam, and *De Nederlandische Spectator* at The Hague are also to be remembered.

**Scandinavia, Greece, Italy.**—Scandinavia, in an atmosphere comparatively free from the political smoke or social scents of its neighbouring countries, has produced numerous caricaturists whose delightfully fresh and simple touch proclaims their kinship with Grieg and Ibsen. With the exception of Olaf Gulbranson and "Blix" who became famous on *Simplisissimus*, their names and their works are little known abroad. Among the earliest were Wilhelm Marstrand, Constantin Harrisen and Fritz Jürgensen in Copenhagen and Wilhelm Petersen, the illustrator of Hans Andersen. In the Danish *Punch* we find excellent work of Hans Tegner and Knud Gamborg, in *Blaeksprutten* and *Klods-Hans* of Alfred Schmidt, and in *Vort Land* of Axel Thiess.

In Norway and Sweden the principal artists were Th. Kittlesen in *Tyrilhaus*, E. Schwart in *Sondags Nisse*, Knud Stangenberg in *Strix*, and Albert Engelström.

At the present time Copenhagen maintains a good display but of no special merit. "Blix" contributes on Sundays to the venerable *Berlingske Tidende* (no connection with Berlin), now in its 180th year. *Politiken*, approaching its jubilee, is wonderfully vivid and varied, as are the morning *Dagens Nyheder*, the noonday *B.T.* and the weekly *Hjemmet*.

If Greece was somewhat outside the European circle in the last century, and if her language and written character are still beyond the casual intelligence, her recent contributions to our subject are fuller and more certain than in the days of Pausan. *Romeos*, the most famous of all Greek comic papers, which first appeared in 1883 and was read by every Greek from Marseille to Trebizond, was the work of one man, Soures, the Aristophanes of modern Greece, who wrote the whole of it (including the advertisements) in verse. It ceased, with his death, in 1918. *Asty* was more remarkable for its caricatures (a volume of which has been published) by its editor Themistocles Anninos (d. 1906). *Eleutheron Bema*, the present leading morning paper, exhibits a daily cartoon (*Γελοιογραφία*) by Ph. Demetriades; and *Proia*, another daily, rivals it in the productions of El. Koumetakes and N. Kastanakes. *Gatos* (the Cat), a weekly paper, supplies the only coloured caricatures in this country.

In Italy, modern caricature began with the establishment of *Il Fischietto* in 1848, at Turin, as a very small paper with one or two crude woodcuts. But it soon enlarged itself, and early in the '60s it was admirably, one is almost tempted to say superbly, illustrated by three artists, Virginio, Teja and Redenti. If Virginio's lithographs lacked the genius of Daumier, as any but Daumier's must, they lacked little else to recommend them both to the collector and to the historian. Had Grand-Carteret included Napoleon III. in his series, the Italian artists would have had a preponderating share of the illustrations, for as he points out in his *Bismarck*, French influence was predominant in Italy right up to 1870, and it seemed that the caricaturists were violently protesting against it. After 1870, he adds, there is a complete change; the kingdom of Italy, having now attained her unity and territorial integrity, began to look abroad, and the press admirably reflected the new state of affairs. Italian comic papers might be those of a neutral country with cosmopolitan ideas, and *Papagallo*, soon afterwards established in Bologna, was a veritable European picture gallery, unfolding week by week in a succession of coloured cartoons the broadest outlines and most important questions of European politics. So great was the success of *Papagallo* that it was soon imitated by *Il Trottola* and *Il Rana*. *Il Pasquino* was already established at Turin and *Il Pulchinella* in Naples. *Il Fischietto* was later managed and illustrated by Camillo Marietti, who signalized the retirement of Bismarck in 1890 by a cartoon which may take rank with Tenniel's "Dropping the Pilot." It was entitled "L'Armoire aux retraites," and showed Tisza and Bismarck each occupying a cupboard, and the hand of history pointing out a third to Crispi. *Il Travaso* in Rome, *Il 420* in Florence, *L'Uomo di Pietra* and *Guerin Meschino* in Milan, are lively younger brothers of the still flourishing *Pasquino*. Among the modern caricaturists none is finer than Musacchio, and none more effective than Sacchetti.

**Germany, France.**—The extent and diversity of modern Germany, apart from her great place in Europe, precludes more than a very scanty tribute in our space to the very large and accomplished family descended from Luther and Cranach as also from Gutenberg and the early block printers. Between the homeliness of Adolf Oberlander and the mordancy of Th. H. Heine there is a wide gulf, but it is by no means a void; and from *Fliegende Blätter* of 1845 to *Des Junggeselle* of 1928 one cannot step as through a desert. Berlin and Munich were naturally the two most prolific centres, and they were not long in following England in Philipon's train with *Kladderadatsch* (1848) and *Fliegende Blätter* (1845). Munich was first in point of time, and has certainly never been eclipsed by Berlin in point of quality. The miniature cartoons of E. Schleich from 1862 to 1870 in the Munich *Punsch*

are a most valuable commentary on the story of the rise of Prussia under the influence of Bismarck. *Jugend* and *Simplizissimus* in later times have developed the artistic possibilities of caricature, and if with more vigour than charm, it may be added that even their most cruel and brutal satire has something about it which compels laughter. In Berlin, besides *Kladderadatsch*, there were soon *Der Ulk* in 1868, *Wespen* in 1870, *Lustige Blätter*, and *Humoristische Blätter*. The Frankfurt *Latern*, the Stuttgart *Wahre Jacob*, the Dusseldorf *Monatshefte*, the Danzig *Bunte Blätter* are all of them to be reckoned with the Berlin and Munich papers.

In France, the school of Philippon continued to flourish, and also to expand. Daumier lived on to 1879, and his cartoon after Sedan was one of his most impressive. Doré had abandoned caricature, or "Cham" would not have been Daumier's next of kin. The foremost names or pseudonyms of the next generation were Nadar, André Gill, Draner, Sahib, Stop, Luque, Félix Regamey, Alfred le Petit, Moloch and Pilotell. Of the many new papers before 1890 were *L'Eclipsé*, *Le Trombinoscope*, *La Chronique Parisienne* and *La Chronique Amusante* (all containing cartoons by Moloch), *Le Journal Amusant*, *Le Cri de Paris*, *La Lune*, *La Charge*, *Triboulet*, *La Journée*, *Le Figaro Illustré*, *La Silhouette*, *Le Carillon* and *Le Sifflet*. The last named, which began in 1872, was peculiarly vivacious, and its large coloured cartoons by Le Mare and others, though of little artistic merit, and vulgar in their extravagant outlines, were still very amusing and informing. It was thoroughly radical, and the ex-emperor, the royalists and the church cut very sorry figures in it. Certainly there was a decline in artistic illustration, not in France alone, towards and during the '80s; and though we can hardly drag in Bismarck here, it is noticeable that after 1890 there were signs of a very potent revival. The appearance of *Gil Blas* in the kiosques in 1891, and of *Le Courrier Français*, if not a challenge to the inanities of "Mars" in *La Vie Parisienne*, was truly a relief. Though Steinlen was even less a caricaturist than Gavarni, and Forain little more, both were great artists, and it was a pity that so much of their subject matter being "the unmentionable," their really fine qualities, like those of Rowlandson and Gillray, had to wait to be discovered.

The first appearance of *Le Rire* on Nov. 10, 1894, may fairly be regarded as an event of some importance in the history of caricature, at any rate as to its lighter side, and its opening number, with a coloured plate by J. L. Forain, is a document of considerable interest. In the first place, there is its list of artists, which, even without the further promise "d'autres noms, aimés du public, et d'autres encore qui seront des surprises," is surprising enough:—J. L. Forain, Willette, Caran d'Ache, Fernand Frau, Dépaquit, Paule Crampel, Courboin, Jossot, Georges Delaw, G. Darbour, D'Espagnet, Gyp, Heidbruck, Jean Veber, Léandre, Louis Anquetin, Ch. Maurin, H. de Toulouse-Lautrec, P. Bonnard, Hermann-Paul, Marc Mouclier, Vallotton, Rupert-Carabin, Roedel, Louis Morin, A. Schlaich, Alphonse Lévy ("Saïd"), Grellet, Gumery, Verbeck, Vavasseur, Guydo, Charly, Lebègue. Even without Steinlen, Guillaume, Gerbault, Abel Faivre and many more, there are names in this list to which none of the previous generation, with the great Cham, Moloch, Sahib, Bac, etc., can deny at least equal places in the niches of fame. Of no less interest, and of considerable historical significance, is the introduction of two features, "Le Rire d'Autrefois" and "Le Rire à l'Étranger," the latter still continuing. The former was distinctly homage to Philippon, the first item being a double page reproduction of Daumier's famous "Le Ventre Legislatif," with the mischievous parenthesis added "Ça n'a pas beaucoup changé depuis 1834." Later numbers reproduced still older caricatures, by Isabey and others. The foreign section had a distinctly English flavour, being introduced by a note signed "Globe-Trotter," and two out of its three items (nowadays it contains a dozen) were English—one by Sambourne from *Punch*, and the other by Phil May from *The Sketch*. The third was from the Vienna *Floh*, but still with a Gladstonian allusion—Bismarck as "The Grand Old Man" trying to fell Capriva personified as a tree. Of more recent date were *L'Assiette au Beurre*, *Le Canard sauvage* (subsequently *Le Can-*

*ard enchainé*), *L'Intransigeant*, *L'Indiscret*, *Mon Dimanche*, *D'Artagnan*, *Fantasio* and many others.

**Great Britain.**—Returning at last to England, it is interesting to observe that *Punch*, though dominating the realm of caricature from its very inception, and for over a quarter of a century almost alone in its glory, was always equal to the occasion, sustaining with dignity and charm the whole responsibility of an ancient and most honourable inheritance. Victorian conditions inflated the popular love of monarchy, and the public at large came more and more to regard established institutions like the Royal Academy, Covent Garden theatre or the Langham hotel as all-sufficient, and to look askance at any attempt to supplement them with new ones. So that when *Judy*, *Fun*, *Moonshine* and *Ally Sloper's Half Holiday* were successfully established, they were never in any sense rivals to the legitimate monarch. It is rather surprising that half-a-dozen artists in a single journal, of so small a size, and with no coloured illustrations, should for half a century more or less have been the only representatives of the great family with its ramifications that flourished in former days. But *autres temps, autres mœurs* and the extraordinary vulgarities with which the domestic life of the young queen and her consort was made fun of soon gave place to the refinement introduced by the Doyles and established by their successors, Leech, Tenniel, Keene, Du Maurier and Sambourne. For Victorian England this must be allowed to have sufficed, and Dr. Primrose might now have observed that if there was not more laughter than of yore there was certainly as much wit. At the same time it must be admitted that the Victorian climate was not suitable for the development of rude health in caricature. Heavy academical foliage absorbed the sun, and the pungent undergrowth of Pre-Raphaelitism only succeeded in forcing its way up by virtue of its deadly earnestness. *Punch* alone enjoyed the free air.

One plant, however, appeared in 1869, which by its fruits we know must have been from a seed of the original tree, namely *Vanity Fair*. Here, at last, was a revival, and in its pleasantest form, of personal caricature. Though "Ape" and "Spy" (Carlo Pellegrini and Leslie Ward) were the only two of its artists whose names are familiar to the general public, it is significant that many of the finest portraits in the earliest numbers were by J. J. Tissot, so that the success of the paper was really established by Italian and French artists. Historically this is quite as it should be, just as "Punch" is named after the mythical "Polichinello" whose characteristics were illustrated by Ghezzi, and one of its most successful artists, Du Maurier, was of French extraction. Not until the last decade—*la fin du siècle*—did the Victorian glaciation give any sign of loosening. Among the first, in 1890, and of itself insignificant, was a little paper called *The Whirlwind* edited by Herbert Vivian and Stewart Erskine and illustrated by some of the founders of the New English Art club—another sign. A little later *Pick me up* made a gallant bid for popular favour, but was before its time. In 1894 there was a more decided crack, and *The Yellow Book*, published by Matthews & Lane, threw up two volcanoes in the shape of Aubrey Beardsley and Max Beerbohm, whose molten streams combined to flow with ever increasing effect on the artistic and literary climate. Widely different as they were, both these young men achieved the same result in bursting the shackles that were cramping the arts of illustration and caricature. Reed's caricature in *Punch*, "Britannia à la Beardsley," was far too witty and too clever to have been designed in derision of so fine an artist; but there was something so entirely new to the Victorian in Beardsley's uncanny grotesque, that he was for long looked at askance. His influence on "black and white" in general was enormous, and in caricature it is traceable everywhere. Max, on his part, being a caricaturist in the strict Carraccian tradition, loosened the buttons, shook out the folds and generally disorganized the growing trimness of personal caricature as exemplified in the *Vanity Fair* cartoons, which in the '80s were becoming more and more suitable for *The Tailor and Cutter*. The most baffling thing about his marvellous gift of spiritual portraiture seems to be that the farther he gets from actuality the nearer he gets to truth.

1. "Pillars of the Constitution—Three o'clock and a Cloudy Morning," by James Gillray (1757-1815). Gillray, one of the best known satirists of the 18th and early 19th centuries, made Georgian politics and manners the target of his scathing humor. Here Sheridan and the Duke of Norfolk are shown reeling out of Brooks's. (The Duke is stammering, "And now for the Majesty of the People," while Sheridan calls out, "And now have at the Ministry, Damme!")

2. "Rien n'est si joli que la fa-a-a-ble-e-e, si triste que la vérité!" This is one of a series of 79 sketches, "Les Lorettes," by Gavarni (1804-66), *nom de plume* of the French caricaturist, Hippolyte Sulpice Guillaume Chevalier

3. "A Sufferer for Decency," by Thomas Rowlandson (1756-1834). Rowlandson, a contemporary of Gillray, produced landscape paintings as well as drawings and etchings of many types of subject, the fine quality of which gave to them a definite place of importance in English art. He was a keen satirist of the social life of his era

## ENGLISH AND FRENCH CARICATURE, 19TH CENTURY

BY COURTESY OF (1, 2) COLLIER'S WEEKLY, (4) HARPER AND BROTHERS, (5) THE SUN, NEW YORK

# CARICATURE IN THE UNITED STATES

- 1, 2. "Two Strikes and the Bases Full," and "Fanned Out," two caricatures by Charles Dana Gibson of types among the spectators at a base-ball game
3. Silhouette of William Henry Harrison, by W. H. Brown
4. One of the caricatures by Thomas Nast (published August 19, 1871, in *Harper's Weekly*) in the long series in which he attacked "Boss" Tweed and the Tweed Ring. The firm of J. H. Ingersoll and Co. was used by Tweed to cover fraudulent transactions
5. "The Boss," by Oscar Cesare, caricature of Theodore Roosevelt, published in May 1912. The legend was "I typify and embody—T. R."

**Recent Developments.**—With the most recent developments of caricature it is impossible for the staid historian to keep pace. He can only shout after the caricaturists, not to stop, but to wish them still more activity in still wider fields. As it is they have rushed in at the studio doors opened to them by the cubists, vorticists, post-impressionists and their imitators, and rushed out again with their arms full of fancies which they have twisted up and thrown, like confetti, into the most unexpected places. Some have stuck to the hoardings, others have got into the circulars of the most respectable and stately commercial firms, and the least humorous of the weekly papers. This great and surprising expansion is due, in no small measure, to the World War, when they were employed with Lutheran vigour and insistence, both as propaganda and as a relief to the feelings. Posterity may perhaps decide which were the most successful (for either purpose) among such as King George reviewing the British fleet in a diving suit (German), the Bolsheviks at the telephone (Musacchio), or "What did you do in the Great War, Daddy?" (English); but there is no doubt that all of them contributed something to the very general extension of the employment of caricature for artistic and commercial, no less than for satirical purposes, in these present days. Instead of being destroyed, or reserved for private circulation, as in the old times, the careless rapture of the modern artist now finds a place on the hoardings. These modern artists are a determined lot of fellows, a large and exceedingly fierce tribe, and they are doing much more for caricature than any one before them. Adopting the most advanced and highly artistic tenets, they have imposed significant form alike on the commonest objects of the ideal home and the rarest flowers in the garden of public affairs. They know to a hair's breadth how far a statesman's face can be stretched without snapping, they have the bursting strain of every bulge in his figure calculated to a decimal point. With a few strokes of the pen they can visualize an international situation or a social tendency in a manner that saves us reading whole columns of print. Finally, notwithstanding every excess, they have shown themselves equal to the delicate task of sustaining the traditions of the very oldest of the comic papers under the double disadvantage of the devastations of the World War and the complete change of outlook on many subjects resulting therefrom. *Charivari*, now in its 87th year, has in Soupault, Bib and Cyl, cartoonists as lively as ever, and if an artistic comparison with their earliest predecessors is impossible now, it is probably only because it is too soon to make it. *Punch*, the next oldest, having enjoyed uninterrupted prosperity with a sound constitution and no incitement to change, is still an old friend with a young face. *Kladderadatsch* and *Fliegende Blätter* are oftener quoted by *Le Rire* than any others, and side by side with them we find *Nebelspalter*, *Simplissimus*, *Mucha*, *Ulk*, *Jugend*, *Pasquino*, *Lustige Blätter* and *Wahre Jacob*, most of them past their jubilee and all well up to date. If the tight-lacing of the '80s was finally abolished by the War, and if the reaction seems a little too startling just at the moment, it must be accepted nevertheless as a very healthy symptom in an art which to be an art at all, must always be allowed its own way.

**United States.**—Political caricature in the United States began with William Charles, a Scotsman who, forced to leave Great Britain, emigrated to America, and, in the War of 1812, used his pencil and invention with great bitterness against his renounced country. Pencil and invention were both crude. Charles was an imitator of James Gillray, and his most widely-circulated cartoon, "John Bull Making a New Batch of Ships to Send to the Lakes," bore a close resemblance, in conception and detail, to Gillray's "Tiddy-Doll (Napoleon) Making a New Batch of Kings." Gillray, influencing Charles, also influenced the work of Charles's successors for several decades. The basis of the early American cartoon was the Gillray group of many figures. A school of distinctively American caricature came in with the first administration of President Jackson. These lithographs told their stories by means of legends enclosed in balloon-like loops issuing from the lips of the various members of the groups. The anonymous artists were most productive in the heat of political campaigns, during the Mexican War, and with the rising slavery agitation. The Civil War naturally let loose a flood of cartoons; among them the early work of Nast.

Thomas Nast (1840-1902) remains the dominant figure in the history of American caricature. Lincoln called Nast's cartoons the best recruiting sergeants on the Union side. His picture "Peace," originally called "Compromise with the South," first made his reputation. It appeared just after the election of 1862, and was circulated by the million as a campaign document. Nast's later influence was both national and local. He was the inventor of the "donkey" used as the symbol of the Democratic Party, the Tammany "Tiger," the "rag-baby" of inflation, and the cap and dinner pail emblematic of labour. More than any other man he was responsible for the overthrow of the notorious Tweed Ring that long held New York city in its clutches. Such cartoons as "The Brains of Tammany" and "The Tammany Tiger in the Arena" proved the siege guns in the battle for civic reform. Finally it was a Nast picture that led to the capture, in Spain, of the fugitive Tweed. The traditions of Nast were carried on in the late '70s, '80s and '90s by Keppler and Gillam. The series of "Tattooed Man" cartoons, depicting James G. Blaine in the title rôle, contributed to Cleveland's victory in 1884. They were the work of Bernard Gillam, who, upon leaving *Puck*, drew equally vindictive caricatures of Cleveland and the Democratic Party on the rival pages of *Judge*. A cartoon with a story was Gillam's "Where Am I At?" of 1892. It was originally drawn to commemorate an expected smashing Republican victory. When the election returns showed that Cleveland had won it was too late to prepare another cartoon, so Gillam set to work making the necessary changes in the plate, capping his labour with a likeness of himself in the form of a monkey turning an uncomfortable somersault. Two outstanding cartoons of the later '90s, "Don Quixote Bryan Meets Disaster in his Encounter with the Full Dinner Pail," and "Be Careful: It's Loaded!" a warning to Spain just before the outbreak of the Spanish-American War, were the work of Victor Gillam.

American caricature of the present century is abundant and of a high order. Syndicate service has brought the work of the most efficient and highly paid cartoonists to the readers of the most rural communities. There is a Pulitzer prize annually awarded for the cartoon deemed the most effective. Conspicuous among these awards for recent years have been (1921) to Rollin Kirby for "On the Road to Mandalay," in the *New York World*; (1924) to J. N. Darling for "In the Good Old U.S.A.," in *New York Tribune*; and (1926) to Nelson Harding for "Toppling the Idol," in the *Brooklyn Daily Eagle*. (A. B. M.)

**CARIGARA**, a municipality (with administration centre and 35 *barrios* or districts) of the province and island of Leyte, Philippine Islands, on Carigara bay, 22 m. W. of Tacloban, the provincial capital. Pop. (1918) 17,558, of whom 8,862 were males and none white. Carigara is open to coast trade, exports large quantities of abacá, raises much rice and corn and manufactures cotton and abacá fabrics. It also has important fisheries

and mineral springs exist in or near the municipality. In 1918 it had 18 manufacturing establishments, with an output valued at 28,726,700 pesos, and 317 household industry establishments, output, 134,400 pesos. Of the four schools, three were public. The language spoken is a dialect of Bisayan.

**CARIGNANO**, a town of Piedmont, Italy, in the province of Turin, 11m. S. by tramway from the town of Turin. Pop. (1921) town, 3,952, commune, 6,639. It has a handsome church (S. Giovanni Battista) erected in 1756-66 by the architect Benedetto Alfieri di Sostegno (1700-1767), uncle of the poet Alfieri. S. Maria delle Grazie contains the tomb of Bianca Palaeologus, wife of Duke Charles I. of Savoy, at whose court Bayard was brought up. The town passed into the hands of the counts of Savoy in 1418. Carignano was erected by Charles Emmanuel I. of Savoy into a principality as an appanage for his third son, Thomas Francis (1596-1656), whose descendant, Charles Albert, prince of Carignano, became king of Sardinia on the extinction of the elder line of the house of Savoy at the death of Charles Felix in 1831.

**CARILLON**, an arrangement for playing tunes upon a set of bells by mechanical means. The word is said to be a Fr. form of late Lat. or Ital. *quadrighio*, a simple dance measure on four notes or for four persons (Lat. *quattuor*); and is used sometimes for the tune played, sometimes (and more commonly in England) for the set of bells used in playing it. The earliest mediaeval attempts at bell music, as distinct from mere noise, seem to have consisted in striking a row of small bells by hand with a hammer, and illustrations in mss. of the 12th and 13th centuries show this process on three, four or even eight bells. The introduction of mechanism in the form either of a barrel (see **BARREL-ORGAN**) set with pegs or studs and revolving in connection with the machinery of a clock, or of a keyboard struck by hand (*carillon à clavier*), made it possible largely to increase the number of bells and the range of harmonies. In Belgium, the home of the *carillon*, the art of the *carillonneur* has been brought to its greatest perfection, and here, and in Holland and France, the number of carillons, great and small, runs into hundreds. (See **BELL**.)

In Britain the system of ringing bells by peal, known as the change-ringing, has always been preferred. But carillons and keyboards on the Continental model exist here and there, e.g., at the Manchester town hall, at Armagh and Cobh cathedrals, Bournville, Cattistock and elsewhere, while British made carillons have been set up in America. Among the latter are that of the Houses of Parliament at Ottawa (53 bells, the largest weighing 10 tons), and that of Riverside Drive church, New York, containing 57 bells, of which the deepest-toned, weighing 18½ tons, is the fourth largest bell in existence. Some of the most important improvements in bell-ringing mechanism, as well as in methods of tuning, have had their origin in Britain.

This mechanism is very similar in general to that employed in the case of organs, one difference, however, being that light wooden levers take the place of the ivory keys. These levers are attached by means of wires and cranks to the clappers, which strike the bell on the inside surface at a point near its largest diameter. The travel of the clapper is about one inch, which is sufficient to bring out the full volume of sound required for carillon playing, while still permitting the delicacy of touch necessary to the obtaining of the best effects.

Pedals are attached to the levers connected with the heavier bells, so that these can be played by foot or by hand, their performance being further facilitated in some cases by the employment of "assistance pistons." These provide that directly the player begins to depress the pedal, electrical contact brings into operation an electro-pneumatic motor, the piston of which is coupled to the clapper and its force thereby added to that of the performer. This device, the invention of Gillett and Johnston, was employed first in the case of the fine carillon of 48 bells made by this firm and presented to Louvain university library by the American engineering societies. As regards the compass of carillons, the smallest usually have a range of at least two octaves, in semi-tones, while the largest may have a compass of as much as four-and-a-half octaves, or 53 bells.

**BIBLIOGRAPHY**.—W. Gorham Rice, *Carillons of Belgium and Holland, The Carillon in Literature and Carillon Music and Singing Towers of the Old World and the New*; lecture by W. W. Starmer, *Proc. Mus. Assoc., London*, 31st session.

**CARINA**, one of the three constellations (see **CONSTELLATION**) into which the large southern Ptolemaic constellation Argo (q.v.) was subdivided. It contains several variable stars (see **STAR**).

**CARINATAE**, the name often given in contradistinction to *Ratitae* (q.v.) to a large section of birds, including all the modern flying forms except the tinamous, on account of the keel-like process on the breast-bone. The terms are now commonly replaced by *Palaeognathae* (= *Ratitae*) and *Neognathae* (= *Carinatae*).

**CARINI**, a town in the province of Palermo, Sicily, 13m. by rail W.N.W. of Palermo. Pop. (1921) 12,912 (town); 14,217 (commune). On the coast lay the ancient *Hyccara*, said to be the only Sican settlement on the coast. It was stormed and taken by the Athenians in 415 B.C., and the inhabitants, among them the famous courtesan *Lais*, were sold as slaves.

**CARINTHIA** is an Alpine province of Austria occupying the drainage area of the upper Drava and its headwaters. Its isolation is emphasized by the difficult enclosing mountain masses. Within the province two distinct regions exist, viz., Upper Carinthia, west of the confluence of the Gail and the Drava, and Lower Carinthia, east of that junction. The former is very mountainous and is divided into two sharply contrasted types of country by the west-east flowing Drava. North of the river lies a belt of crystalline rock highly dissected into blocks by the numerous left-bank tributaries of the main stream, e.g., the Isel, the Möll, etc. Here, though the heights are well-watered and clothed with forests and high pastures, settlement is sparse; scattered dwellings and hamlets concerned with cattle-raising predominate, for the valleys are narrow and rise steeply to the glaciated summits of the Hohe Tauern. There are, however, great possibilities for the development of electricity from the numerous falls and the present trend of Austria in this direction will doubtless react favourably upon the prosperity of this region. South of the Drava the southern

limestone zone of the Alps is entered. Although several thousand feet lower in general level than the crystalline zone this region offers few attractions to human occupation. The prevalence of faulting and steep scarps, the lack of good passes, the absence of surface drainage and the marshy nature of the valley floors combine to restrict settlement which, with agriculture, favours the sunny northern slopes and the occasional alluvial fans, particularly in the valley of the Gail which divides the mass of the Carnic Alps into two groups. In both a decrease in height and difficulty towards the east is accompanied by an increase in cultivation and by a growth in the number and size of the villages.

BY COURTESY OF THE AUSTRIAN TOURIST OFFICE

MAN AND WOMAN OF THE ALPINE PROVINCE, CARINTHIA, DRESSED IN THEIR NATIVE GALA COSTUME

Lower Carinthia centres on the nucleus of the busy Klagenfurt basin, an undulating area, between 1,300 ft. and 1,650 ft. above sea-level, floored with Tertiary sediments and morainic debris. Its fertility is in great contrast to that of the crystalline Gurktal Alps and Saualpe to the north and of the Karawanken limestone belt of the south, for suitable soil and the high summer temperatures favour the growth of cereals and fruit while the surrounding mountain pastures aid the breeding of horses and cattle. In addition leather, paper, cement and mineral products are extensively manufactured, the latter particularly in the south-east near Bleiburg where lead ores are extracted. These, with the iron of the Saualpe and local lignite are the bases of small but important metal-

lurgical industries at many places, among which Ferlach, Klagenfurt and St. Veit are the best known. The development of Carinthia is hindered in every direction by its remoteness and internal difficulties of communication. The old longitudinal route from Innichen to Bleiburg, now followed by a railway, carries little through trade because of frontier difficulties at either end, while only two transverse railways exist. One of these, however, the eastern, leads to the important Semmering pass and has brought additional prosperity to the important route junctions of Klagenfurt (32,000) and Villach (22,000). The other, crossing the Hohe Tauern by tunnel, handles a large proportion of the local trade in timber and wood products while both carry increasing numbers of tourists to the numerous small bathing resorts that line the shores of the remarkably warm Carinthian lakes which lie in the longitudinal valleys, e.g., the Wörther-see, the Millstätter-see, the Ossiach-see, etc.

The population (371,000 in 1923) is predominantly Roman Catholic in religion and German in speech. Only in the south-east, where access is most easy, has a foreign element succeeded in penetrating along the main valleys and here alterations in customs, language and architecture herald the passage to Slovene territory.

See also AUSTRIA; V. Paschinger, M. Wutte, *Landeskunde von Kärnten*, Klagenfurt, 1923. (W. S. L.)

**CARINUS, MARCUS AURELIUS**, Roman emperor, A.D. 283–84, was the elder son of the Emperor Carus, on whose accession he was appointed governor of the western portion of the empire. He fought with success against the German tribes, but soon left the defence of the Upper Rhine to his legates and returned to Rome, where he abandoned himself to dissipation. He also celebrated the *Iudi Romani* on a magnificent scale. After the death of Carus, the army in the East demanded to be led back to Europe; Numerianus, the younger son of Carus, was forced to comply, but was murdered on the way, and Diocletian, commander of the body-guards, was proclaimed emperor by the soldiers. Carinus at once marched against Diocletian, whom he met in Moesia. Carinus was successful in several engagements, but at the battle on the Margus (Morava), according to one account, he was assassinated in the hour of victory; another tradition represents the battle as a complete victory for Diocletian.

See Vopiscus, *Carinus* (mainly the recital of his crimes); Aurelius Victor, *De Caesaribus*, 38, Epit. 38; Eutropius ix. 18–20; Zonaras xii. 30; Orosius vii. 25; Pauly-Wissowa, *Realencyklopädie*, ii. 24 ff. (Henze).

**CARISBROOKE**, a town in the Isle of Wight, England, 1 m. S.W. of Newport. Pop. (1921) 4,767. The valley of the Lugley brook separates the village from the steep conical hill on which stands the famous castle. There are remains of a Roman villa in the valley, but no reliable mention of Carisbrooke occurs in Saxon times, nor does the name appear in the Domesday Survey. The castle is mentioned in the Survey under Alvington, and was probably raised by William Fitz Osbern, first lord of the Isle of Wight. From this date lordship of the island was always associated with ownership of the castle, which thus became the seat of government. Henry I. bestowed it on Richard de Redvers, in whose family it continued until Isabella de Fortibus sold it to Edward I., after which the government was entrusted to wardens as representatives of the crown. The keep was added in the time of Henry I., and in the reign of Elizabeth, when the Spanish Armada was expected, it was surrounded by an elaborate pentagonal fortification. The castle was garrisoned for Maud in 1136, but was captured by Stephen. In the reign of Richard II. it was unsuccessfully attacked by the French; Charles I. was imprisoned here for fourteen months before his execution. In 1904 the chapel of St. Nicholas in the castle was reopened and reconsecrated, having been re-built as a memorial of Charles I. The remains of the castle are imposing: parts are inhabited, but the king's apartments are in ruins. The church of St. Mary has a beautiful Perpendicular tower and transitional Norman portions. Only the site can be traced of the Cistercian priory to which it belonged. This was founded shortly after the Conquest and originated from the endowment which the monks of Lyre near Evreux

held in Bowcombe, including church, mill, houses, land and tithes of the manor. Richard II. bestowed it on the abbey of Mount-grace in Yorkshire. It was restored by Henry IV., but was dissolved by act of parliament in the reign of Henry V., who bestowed it on his newly-founded charter-house at Sheen. Carisbrooke formerly had a considerable market, several mills, and valuable fisheries, but it never acquired municipal or representative rights, and was important only as the site of the castle.

See *Victoria County History: Hampshire*; William Westall, *History of Carisbrooke Castle* (1850).

**CARISSIMI, GIACOMO** (c. 1604–1674), one of the most celebrated masters of the Italian school of music, was born about 1604 in Marino, near Rome. Of his life almost nothing is known. At the age of twenty he became chapel-master at Assisi, and in 1628 he obtained the same position at the church of St. Apollinaris belonging to the Collegium Germanicum in Rome, which he held till his death on Jan. 12, 1674, at Rome. He seems never to have left Italy. The two great achievements generally ascribed to him are the further development of the recitative, previously introduced by Monteverde, and of infinite importance in the history of dramatic music; and the invention of the chamber-cantata, by which he superseded the madrigals formerly in use. It is impossible to say who was really the inventor of the chamber-cantata; but Carissimi and Luigi Rossi were the composers who first made this form the vehicle for the higher kind of chamber-music, a function which it continued to perform until after the time of Alessandro Scarlatti, Astorga and Marcello. His oratorios in turn were of the first importance as having definitely established the form and style of that class of work.

**CARLEN, EMILIA SMITH FLYGARE** (1807–1892), Swedish novelist, was born at Strömstad on Aug. 8, 1807, and died at Stockholm on Feb. 5, 1892. Her first husband, a doctor, A. Flygare, died in 1833, and in 1841 she married a poet, Johan Gabriel Carlen, and went to live in Stockholm, where she formed a literary salon. Among her numerous novels, some of which depicted the life of fishermen and sailors, others the manners of the middle classes of her time, were *Waldemar Klein* (1838); *Gustaf Lindorm* (1839, Eng. trans. 1853); *Professorn och hans skyddslingar* (1840; Eng. trans. *Professor's favourites*, 1843); *The Rose of Fiselön* (1842, Eng. trans. 1844); *Jungfrutornet* (1848, Eng. trans. *The Maiden's Tower*, 1853). In 1878 she published an autobiography, *Reminiscences of Swedish literary life* (1878). Emilia Carlen's novels were collected in 31 vols., *Samlade romaner* (Stockholm, 1869–75), and were translated into German in 72 vols. (5th ed. Stuttgart, 1893).

**CARLETON, WILL (WILLIAM MCKENDREE)** (1845–1912), American poet, was born in Hudson, Lenawee county, Mich., on Oct. 12, 1845. After graduating at Hillsdale college in 1869 he made extensive lecture tours through the Western States, Canada and Great Britain. He then engaged in editorial work for local Michigan papers, and in Jan. 1872 became editor of the *Detroit Weekly Tribune*. From 1873–78, he was editor of the *Detroit Tribune*. He had early shown a taste for poetry, and his "Betsey and I Are Out" (1871) won for him immediate recognition. For many years he was a frequent contributor to *Harper's Weekly*. In 1883 he published *City Ballads*. He died in Brooklyn, N.Y., on Dec. 18, 1912.

His published works include: *Farm Ballads* (1873); *Farm Legends* (1876); *City Ballads* (1883); *City Legends* (1890); *City Festivals* (1892); *Songs of Two Centuries* (1902); *Poems for Young Americans* (1906); *A Thousand More Verses* (1912); *Over the Hill to the Poor-House* (1927).

See A. E. Corning, *Will Carleton; A Biographical Sketch* (1917).

**CARLETON, WILLIAM** (1794–1869), Irish novelist, was born at Prillisk, Clogher, Co. Tyrone, on March 4, 1794.

As his father removed from one small farm to another, William attended at various places the hedge-schools, which used to be a notable feature of Irish life. Most of his learning was gained from a curate named Keenan, who taught a classical school at Donagh (Co. Monaghan), which Carleton attended from 1814 to 1816 with the intention of becoming a priest. After various experiments in earning his living he set out for Dublin, and arrived in the metropolis with 2s. 9d. in his pocket. He first sought occupa-

tion as a bird-stuffer, but a proposal to use potatoes and meal as stuffing failed to recommend him. He then determined to become a soldier, but the colonel of the regiment in which he desired to enlist persuaded him (Carleton had applied in Latin) to give up the idea. He obtained some teaching and a clerkship in a Sunday school office, began to contribute to the journals, and his paper "The Pilgrimage to Lough Derg," which was published in the *Christian Examiner*, excited great attention. In 1830 appeared the first series of *Traits and Stories of the Irish Peasantry*, which at once placed the author in the first rank of Irish novelists. A second series, containing, among other stories, "Tubber Derg, or the Red Well," appeared in 1833, and *Tales of Ireland* in 1834. From that time till within a few years of his death Carleton's literary activity was incessant. "Fardorougha the Miser, or the Convicts of Lisnamona" appeared in 1837-38 in the *Dublin University Magazine*. Among his other famous novels are: *Valentine McClutchy, the Irish Agent, or Chronicles of the Castle Cumber Property* (1845); *The Black Prophet, a Tale of the Famine*, in the *Dublin University Magazine* (1846), printed separately in the next year; *The Emigrants of Ahadarra* (1847); *Willy Reilly and his dear Colleen Bawn, in The Independent* (London, 1850); and *The Tithe Proctor* (1849), the violence of which did his reputation harm among his own countrymen. Some of his later stories, *The Squanders of Castle Squander* (1852) for instance, are defaced by the mass of political matter with which they are overloaded. Carleton remained poor, but in 1848 a pension of £200 a year was granted by Lord John Russell in response to a memorial on Carleton's behalf, signed by numbers of distinguished persons in Ireland. He died at Sandford, Co. Dublin, on Jan. 30, 1869.

Carleton's best work is contained in the *Traits and Stories of the Irish Peasantry*. He wrote from intimate acquaintance with the scenes he described; and he drew with a sure hand a series of pictures of peasant life, unsurpassed for their appreciation of the passionate tenderness of Irish home life, of the buoyant humour and the domestic virtues, which would, under better circumstances, bring prosperity and happiness. He alienated the sympathies of many Irishmen, however, by his unsparing criticism and occasional exaggeration of the darker side of Irish character.

During the last months of his life Carleton began an autobiography which he brought down to the beginning of his literary career. This forms the first part of *The Life of William Carleton* . . . (1896), by D. J. O'Donoghue, which contains full information.

**CARLETON PLACE**, a town and port of entry of Lanark county, Ontario, Canada, 28m. S.W. of Ottawa, on the Mississippi river, and at the junction of the main line and Brockville branch of the Canadian Pacific railway. It has abundant water-power privileges, and extensive railway-repair shops and woollen mills. Pop. (1931) 4,105.

**CARLILE, RICHARD** (1790-1843), English reformer and freethinker, was born on Dec. 8, 1790, at Ashburton, Devonshire, the son of a shoemaker. He was educated in the village school and, after apprenticeship to a tinman, obtained occupation, in 1813, in London as a journeyman tinman. Influenced by Paine's *Rights of Man*, he became an uncompromising radical, and in 1817 started pushing the sale of the *Black Dwarf*, a new weekly paper, edited by Thomas Wooler, all over London, and in his zeal to secure the dissemination of its doctrines frequently walked 30m. a day. In the same year he also printed and sold 25,000 copies of Southey's *Wat Tyler*, reprinted the suppressed *Parodies of Hone*, and wrote himself, in imitation of them, the *Political Litany*. This work cost him 18 weeks' imprisonment. In 1818 he published Paine's works, for which and for other publications of a like character he was fined £1500, and sentenced to three years' imprisonment in Dorchester gaol. Here he published the first 12 volumes of his periodical the *Republican* (1820, etc.). The publication was continued by his wife, who was accordingly sentenced to two years' imprisonment in 1821. A public subscription, headed by the duke of Wellington, was now raised to prosecute Carlile's assistants. At the same time Carlile's furniture and stock-in-trade in London were seized, three years were added to his imprisonment in lieu of payment of his fine, his sister was fined £500 and imprisoned for a year for publishing an address

by him, and nine of his shopmen received terms of imprisonment varying from six months to three years. In 1825 the government decided to discontinue the prosecutions. After his release in that year Carlile edited the *Gorgon*, a weekly paper, and conducted free discussions in the London Rotunda. For refusing to give sureties for good behaviour after a prosecution arising out of a refusal to pay church rates, he was again imprisoned for three years, and a similar resistance cost him ten weeks' more imprisonment in 1834-35. He died on Feb. 10, 1843, after having spent in all nine years and four months in prison.

See G. J. Holyoake, *The Life and Character of Richard Carlile* (1870); T. C. Campbell, *The Battle of the Press, as told in the life of R. Carlile* (1899); G. A. Aldred, *Richard Carlile, Agitator* (1923).

**CARLINGFORD, CHICHESTER SAMUEL FOR- TESCUE**, BARON (1823-1898), British statesman, belonged to a family long settled in Ireland, and became Liberal M.P. for Louth in 1847. He was junior lord of the treasury (1854), chief secretary for Ireland (1865) under Lord Russell and (1867) under Gladstone, president of the board of trade (1871-74), lord privy seal (1881-83), and president of the council (1883-85). He received a peerage in 1874. At first a warm supporter of Gladstone's Irish policy, he parted from him in 1885 on the Home Rule question.

**CARLINGFORD**, market town and port, Co. Louth, Ireland. Pop. (1926) 547. King John's castle dates from 1210. There are remains of castellated houses built during Elizabethan and previous wars. A Dominican monastery was founded in 1305. The town received several charters between the reigns of Edward II. and James II., and was represented in the Irish parliament until the Union. Carlingford Lough is a rock basin hollowed out by glacial action. The oyster beds have long been valuable.

**CARLINVILLE**, a city of western Illinois, U.S.A., on the Chicago and Alton railroad, 60m. N. by E. of Saint Louis; the county seat of Macoupin county. The population in 1930 was 4,144. Natural gas is found in the vicinity, and in a normal year the county mines over 6,000,000 tons of coal. The city manufactures brick, tile and monuments. It was settled about 1828 and incorporated as a city in 1865.

**CARLI-RUBBI, GIOVANNI RINALDO**, COUNT OF (1720-1795), Italian economist and antiquarian, was born at Capo d'Istria. At the age of 24 he was appointed professor of astronomy and navigation in the University of Padua, and entrusted with the superintendence of the Venetian marine. After filling these offices for seven years he resigned them in order to devote himself to the study of antiquities and political economy. Among his principal works are his *Delle origine et del commercio della moneta, e della istituzione delle zecche d'Italia*, published in four parts between 1751 and 1759; his *Ragionamento sopra i bilanci economici delle nazioni* (1759); his *Sul libero commercio dei grani* (1771), and his *Antichità Italiane* (1771).

**CARLISLE, EARLS OF**. This English title has been held by two families, being created for James Hay in 1622, and being extinct in that line on the death of his son in 1660, and then being given in 1661 to Charles Howard, and descending to the present day in the Howard family.

**James Hay**, 1st earl of Carlisle (d. 1636), the son of Sir James Hay of Kingask (a member of a younger branch of the Erroll family), was knighted and taken into favour by James VI. of Scotland, brought into England in 1603, treated as a "prime favourite" and made a gentleman of the bedchamber. He received many titles and honours, was created Lord Hay of Sawley (1615), Viscount Doncaster (1618), and earl of Carlisle (1622). James employed him on many important diplomatic missions to France, Germany and Spain. On July 2, 1627, Lord Carlisle obtained from the king a grant of all the Caribbean Islands, including Barbados, this being a confirmation of a former concession given by James I. He was also a patentee and councillor of the plantation of New England, and showed great zeal and interest in the colonies. He became gentleman of the bedchamber to King Charles I. after his accession. In 1628, after the failure of the expedition to Rhé, he was sent to make a diversion against Richelieu in Lorraine and Piedmont; he counselled peace with Spain and the

vigorous prosecution of the war with France, but on his return home found his advice neglected. He took no further part in public life, and died in March 1636. "He left behind him," says Clarendon, "a reputation of a very fine gentleman and a most accomplished courtier, and after having spent, in a very jovial life, above £400,000, which upon a strict computation he received from the crown, he left not a house or acre of land to be remembered by."

The charms and wit of his second wife, Lucy, countess of Carlisle *née* Percy (1599-1660) which were celebrated in verse by all the poets of the day, including Carew, Cartwright, Herrick and Suckling, and by Sir Toby Matthew in prose, made her a conspicuous figure at the court of Charles I. There appears no foundation for the scandal which made her the mistress successively of Strafford and of Pym. Strafford valued highly her sincerity and services, but after his death, possibly in consequence of a revulsion of feeling at his abandonment by the court, she devoted herself to Pym and to the interests of the parliamentary leaders, to whom she communicated the king's most secret plans and counsels. Her greatest achievement was the timely disclosure to Lord Essex of the king's intended arrest of the five members, which enabled them to escape. But she appears to have served both parties simultaneously, betraying communications on both sides, and doing considerable mischief in inflaming political animosities. In 1647 she attached herself to the interests of the moderate Presbyterian party, which assembled at her house, and in the second Civil War showed great zeal and activity in the royal cause, pawned her pearl necklace for £1,500 to raise money for Lord Holland's troops, established communications with Prince Charles during his blockade of the Thames, and made herself the intermediary between the scattered bands of royalists and the queen. In consequence her arrest was ordered on March 21, 1649, and she was imprisoned in the Tower, whence she maintained a correspondence in cipher with the king through her brother, Lord Percy, till Charles went to Scotland. According to a royalist newsletter, while in the Tower she was threatened with the rack to extort information. She was released on bail on Sept. 25, 1650, but appears never to have regained her former influence in the royalist counsels, and died soon after the Restoration, on Nov. 5, 1660.

The first earl was succeeded by JAMES, his only surviving son by his first wife, at whose death in 1660 without issue, the peerage became extinct in the Hay family.

**Charles Howard**, 1st earl of Carlisle in the Howard line (1629-85), was the son and heir of Sir William Howard, of Naworth in Cumberland. In 1645 he became a Protestant and supported the government of the commonwealth, being appointed high sheriff of Cumberland in 1650. He bought Carlisle Castle and became governor of the town. He distinguished himself at the battle of Worcester on Cromwell's side, was made a member of the council of state in 1653, chosen captain of the protector's body-guard and selected to carry out various public duties. In 1655 he was given a regiment, was appointed a commissioner to try the northern rebels, and a deputy major-general of Cumberland, Westmorland and Northumberland. In the parliament of 1653 he sat for Westmorland, in those of 1654 and 1656 for Cumberland. In 1657 he was included in Cromwell's House of Lords and voted for the protector's assumption of the royal title the same year. In 1659 he urged Richard Cromwell to defend his government by force against the army leaders, but his advice being refused he used his influence in favour of a restoration of the monarchy, and after Richard's fall he was imprisoned. In April 1660 he sat again in parliament for Cumberland, and at the Restoration was made *custos rotulorum* of Essex and lord-lieutenant of Cumberland and Westmorland. On April 20, 1661, he was created Baron Dacre of Gillesland, Viscount Howard of Morpeth, and earl of Carlisle; the same year he was made vice-admiral of Northumberland, Cumberland and Durham, and in 1662 joint commissioner for the office of earl marshal. In 1663 he was appointed ambassador to Russia, Sweden and Denmark, and in 1668 he carried the Garter to Charles XI. of Sweden. In 1667 he was made lieutenant-general of the forces and joint com-

mander-in-chief of the four northernmost counties. In 1672 he became lord-lieutenant of Durham, and in 1673 deputy earl marshal. In 1678 he was appointed governor of Jamaica and reappointed governor of Carlisle. He died on Feb. 24, 1685, and was buried in York Minster.

**Frederick Howard**, 5th earl (1748-1825), was a member of a commission sent out by Lord North to attempt a reconciliation with the American colonies. In 1780 he became viceroy of Ireland. The two years of Carlisle's rule passed in quietness and prosperity, and the institution of a national bank and other measures which he effected left permanently beneficial results upon the commerce of the island. In 1789, in the discussions as to the regency, Carlisle took a prominent part on the side of the prince of Wales. In 1791 he opposed Pitt's policy of resistance to the dismemberment of Turkey by Russia; but on the outbreak of the French Revolution he left the opposition and vigorously maintained the cause of war. In 1815 he opposed the enactment of the Corn Laws; but from this time till his death, in 1825, he took no important part in public life. Carlisle was the author of some political tracts, a number of poems, and two tragedies, *The Father's Revenge* and *The Stepmother*, which received high praise from his contemporaries. His mother was a daughter of the 4th Lord Byron, and in 1798 he was appointed guardian to Lord Byron, the poet, who lampooned him in *English Bards and Scotch Reviewers*.

**George Howard**, 6th earl (1773-1848), eldest son of the 5th earl, entered parliament as Lord Morpeth in 1795 as a Whig. He was appointed to the Indian board in 1806, when the "Ministry of all the Talents" took office, but resigned in 1807, though he remained prominent in the House of Commons. After his elevation to the House of Lords (1825), he held various cabinet offices under Canning and Grey. He made some minor contributions to literature and left the reputation of an amiable scholar.

**George William Frederick Howard**, 7th earl (1802-64), was born in London on April 18, 1802, eldest son of the 6th earl by his wife Lady Georgiana Cavendish. He was educated at Eton and Christ Church, Oxford, where (as Lord Morpeth) he earned a reputation as a scholar and writer of graceful verse. He sat in parliament for Morpeth (1826-32), and subsequently for the West Riding. In the agitation for parliamentary reform he took the side of Earl Grey. In 1835 he was appointed by Lord Melbourne chief secretary for Ireland. This post he held for about six years (being included in the cabinet in 1839), winning great popularity by his amiable manners and kindly disposition. Losing his seat at the election of 1841, he visited the United States, but in 1846 he was again returned for the West Riding, and was made chief commissioner of woods and forests in Lord John Russell's cabinet. Succeeding to the peerage in 1848, he became chancellor of the duchy of Lancaster in 1850. The great event of his life, however, was his appointment by Lord Palmerston to the lord-lieutenancy of Ireland in 1855. This office he continued to hold till Feb. 1858, and again from June 1859 till within a few months of his death. Among his writings may be mentioned a lecture on *The Life and Writings of Pope* (1851); *The Last of the Greeks*, a tragedy (1828); a *Diary in Turkish and Greek Waters* (1854), the fruit of travels in the East in 1853 and 1854; and a volume of *Poems*, published after his death. In 1866 appeared his *Viceregal Speeches*, collected and edited by J. Gaskin. He took warm interest in the reformation of juvenile criminals, and established on his own estate one of the best conducted reformatories in the country. Lord Carlisle died at Castle Howard on Dec. 5, 1864. He never married, and was succeeded in the peerage by his brother, the REV. WILLIAM GEORGE HOWARD (d. 1889), as 8th earl.

**George James Howard**, 9th earl (1843-1911), was the son of Charles, 4th son of the 6th earl. He was educated at Eton and Trinity and Cambridge and married in 1864 Rosalind, daughter of the 2nd Lord Stanley of Alderley. Howard sat in parliament as a Liberal in 1879-80, and again from 1881 to 1885; and succeeded his uncle in the peerage in 1889. In the split in the Liberal party over Home Rule Carlisle joined the Liberal Unionists, but did not again sit in the Commons. In the House of Lords he rarely spoke,

except on licensing questions, in which, as a lifelong temperance advocate, he took a keen interest. His real distinction lay in his knowledge and practice of art. He was a pupil of Legros and Giovanni Costa, and was an excellent landscape painter. For 30 years he was a trustee of the National Gallery, London, and a great connoisseur. The Mabuse "Adoration of the Magi" in the National Gallery was sold from the Carlisle Collection to the National Gallery at a figure far below its market price. He died at Hindhead, Surrey, on April 16, 1911.

His wife, *Rosalind Frances* (1845-1921), youngest daughter of the 2nd Lord Stanley of Alderley, was married in 1864. Her mother was one of the founders of Girton college, Cambridge, and Lady Carlisle took a keen interest in the advancement of women's education. Up to 1885 the Howards' house in Kensington was a centre for Liberal politicians, as well as for the artists who gathered round George Howard. When the Home Rule split came Lady Carlisle remained a staunch friend of Gladstone, and she moved gradually further and further to the Left. Most of her life was spent in the North on her husband's estates, the management of which was left to her. She was an even more enthusiastic temperance advocate than her husband, and was president from 1903 onwards of the National British Women's Temperance movement. She was president also of the Women's Liberal Federation from 1896 to 1901, then from 1906 to 1914, and worked with her group for a democratic franchise for women, when many Liberal women were prepared to accept a narrower measure. She died in London on Aug. 12, 1921.

**Charles James Stanley Howard**, 10th earl (1867-1912), son of the 9th earl and his wife Rosalind noticed above, was an active member of the London School Board (1894-1902) and Unionist M.P. for Birmingham (1904-11). Viscount Morpeth succeeded his father in 1911, and died the January following. He was succeeded by his son **GEORGE JOSELYN**, 11th earl (b. 1898), who was educated at Osborne and Dartmouth, and served in the navy until 1920.

**CARLISLE**, a city, municipal and parliamentary borough, and the county town of Cumberland, England, 299m. N.N.W. of London, and 8m. S. of the Scottish border. Pop. (1931), 57,107. It lies on the south bank of the river Eden, a little below the point where it debouches upon the Solway plain, 8m. above its mouth in the Solway firth, at the junction of two tributaries from the south, the Caldew and the Petteril, which leave a small strip of land between them. The city grew up originally about two slight eminences on this peninsula, crowned respectively by cathedral and castle. To the north of the Eden lies the suburb of Stanwix. The rivers are not navigable, and a canal, opened in 1823, connecting the city with Port Carlisle on the Solway firth, was unsuccessful and was replaced by a railway. Silloth, on the Irish sea, is the nearest port (21 miles). Carlisle is one of the principal railway centres in Great Britain, the chief lines being those of the L.M.S. and L.N.E. railways. Through connections with Scotland are maintained past the head of the Solway firth. The Romano-British *Luguvalium* occupied the site of the city. It lay a mile south of Hadrian's wall and seems to have been a town rather than a fort. Its position near the small ports on the Solway firth brought it much intercourse with Ireland and the Isle of Man.

Carlisle (*Caer Luel*, *Karliol*) is first mentioned in 685, when under the name of Luel it was bestowed by Egfrith on St. Cuthbert to form part of his see of Lindisfarne. It was then a thriving and populous city, and when St. Cuthbert visited it in 686 he was shown with pride the ancient walls and a Roman fountain. The saint was believed to have founded a convent and a school here. Nennius, writing in the 9th century, mentions it in a list of British cities under the name of *Caer Luadiit*, *Caer Ligualid* or *Caer Lualid*, but about this time it was destroyed by the Danes, and vanishes completely from history until in 1092 it was re-established as the political centre of the district by William Rufus, who built the castle. During the centuries of border-strife which followed, the history of Carlisle centres round that of the castle, which formed the chief bulwark against the Scots on the western border, and played an important part in the history of the country down to the rebellion of the Young Pretender in 1745. At the time of the

Scottish wars two parliaments were held at Carlisle, in 1300 and in 1307. A charter from Edward I., dated 1293, exemplifies two earlier grants. The first, from Henry II., confirmed the liberties and customs which the city had theretofore enjoyed, granting in addition a free gild merchant, with other privileges. This grant is exemplified in the second charter, from Henry III., dated 1251. A charter from Edward II., dated 1316, grants to the citizens the city, the king's mills in the city, and the fishery in the Eden. A charter from Edward III. in 1352 enumerates the privileges and liberties hitherto enjoyed by the citizens, including a market twice a week, on Wednesday and Saturday; a fair for 16 days at the feast of the Assumption of the Virgin (Aug. 15); free election of a mayor, bailiffs and two coroners; and the right to hold their markets in the place called "Battailholm." It also mentions that the city was greatly impoverished by reason of the devastations of the Scots and by pestilence. Confirmations of former privileges were issued by Richard II., Henry IV., Henry VI. and later sovereigns. Although the city had been under the jurisdiction of a mayor and bailiffs at least as early as 1290, the first charter of incorporation was granted by Elizabeth in 1566. A charter of James I. confirmed former liberties, and in 1638 Charles I. granted a charter under which the town continued to be governed until 1835. It declared Carlisle a city by itself.

**The Cathedral.**—Bede named a monastery which seems to have had close connections with Irish and Scottish Churches until its destruction by the Danes. William Rufus is given the credit for its rehabilitation. The bishopric of Carlisle was created by Henry I., in 1133, out of the house of Augustinian canons, founded in 1102. This was the sole episcopal chapter of regular canons of St. Augustine in England. It was dissolved in 1540. Between 1156 and 1204 the bishop's throne was unoccupied, but thereafter there was a continuous succession. The diocese covers the whole of Westmorland, and practically of Cumberland, with Furness and the adjacent district in the north of Lancashire. The cathedral, a fine cruciform building with a central tower, is incomplete. Of the Norman nave, built by Aethelwold, the first prior and bishop, only two bays are standing, the remainder having been destroyed by the Parliamentarians in 1646. The south transept, and the lower part of the tower piers, are also of the period. Remarkable distortion is seen in the nave arches, owing to the sinking of the foundations. The thinness of the aisle walls, and the rude masonry of the foundations of the original apse which have been discovered, point to native, not Norman, workmanship. The choir is ornate and beautiful, and the huge decorated east window, with its elaborate tracery, is perhaps the finest of its kind extant. The reconstruction of the Norman choir was begun in the middle of the 13th century, but the work was almost wholly destroyed by fire in 1292. The north transept and the tower also suffered. Building began again c. 1352, and the present tower, erected with some difficulty on the weak foundations of the Norman period, dates from 1400-19. The conventual buildings are scanty, including little more than a perpendicular gateway and refectory.

The moated castle, now used as barracks, has been so far altered that only the keep is of special interest. Fragments of the old city walls are seen on the western side over against the river Caldew. Notable public buildings are the city hall, the court-houses, museum and art gallery. The grammar-school, of very early foundation, received endowment from Henry VIII. Much valuable information relating to the early history and customs of Carlisle is furnished both by the Dormont Book, which contains an elaborate set of bye-laws dated 1561, and by the records of the eight craft guilds—weavers, smiths, tailors, tanners, shoemakers, skimmers, butchers and merchants. The constant wars until the union of the Crowns of England and Scotland impeded commerce; and Fuller, writing in the 17th century, says that the sole manufacture was that of fustian. In 1750 the manufacture of coarse linen cloth was established, and was followed in a few years by the introduction of calico stamperies. The commercial prosperity of Carlisle, however, began with the railway development of the 19th century. The main industries are those connected with transport and the production of textiles. Metal and wood working are

also carried on. The parliamentary borough returns one member. Area of municipal borough, 4,488 acres.

See *Victoria County History, Cumberland*; R. S. Ferguson, *Some Municipal Records of the City of Carlisle* (Cumberland and Westm. Antiq. and Archaeol. Soc., Carlisle and London, 1887), and *Royal Charters of Carlisle* (1894); Mandell Creighton, *Carlisle* in "Historic Towns" series (London, 1889).

**CARLISLE**, a borough of Cumberland county, Pennsylvania, U.S.A., in the pleasant and fertile Cumberland valley, 18m. W. by S. of Harrisburg. It is on Federal highway 11, and is served by the Pennsylvania and the Reading railways. The population in 1930 was 12,596. It is the county seat, and a busy industrial centre, with a factory output in 1925 valued at \$11,817,679. Rugs, carpets and shoes are the leading products.

Dickinson college, founded here in 1783 by John Dickinson (q.v.), Dr. Benjamin Rush (q.v.) and other citizens, is the second oldest college in the State. Its oldest building (West college), designed by Latrobe, is a fine example of classic colonial architecture. Enrolment is restricted to 500, and the number of women to 25% of the entire student body. A medical field service school of the U.S. army now occupies a Government reservation where British prisoners were kept during the Revolutionary War, and which later was used successively for a cavalry post, for the famous Carlisle Indian school (established in 1879), and for a hospital during the World War. A guard-house built there by Hessians captured in the battle of Trenton still stands.

Carlisle was laid out in 1751, and its stockade (Ft. Lowther) was a refuge for the pioneers of the Cumberland and the Juniata valleys. County and borough were named after Cumberland, England, and its county town. In 1794 Washington made Carlisle his headquarters during the "whisky rebellion" in western Pennsylvania. It was the home of "Molly Pitcher," heroine of the battle of Monmouth. On the night of July 1, 1863, it was bombed by Confederate troops. The borough was incorporated in 1872, and in 1921 adopted a commission-manager form of government.

**CARLOFORTE**, a town of Sardinia, in the province of Cagliari, the capital of the small island (6 m. by 5 m.) of San Pietro (anc. *Accipitrum* or *Ἱερακωνήσος*, i.e., the hawk's island) off the west coast of Sardinia. Pop. (1921) 7,864. It lies on the east coast of the island, 6 m. west by sea from Porto Vesme, which is 15 m. S.W. by road from Iglesias. It was founded in 1737 by Charles Emmanuel III. of Savoy, who planted a colony of Genoese whose dialect and costume still prevail. In 1798 it was attacked by the Tunisians and 933 inhabitants were taken away as slaves. They were ransomed after five years and the place fortified. It is now a centre of the tunny fishery, and there are manganese mines, while most of the ore from the mines of the Iglesias district is shipped here. Three miles to the south-east is the island of S. Antioco (see *SULCI*).

**CARLOMAN** (828–880), king of Bavaria and Italy, was the eldest son of Louis the German, king of the East Franks. He married a daughter of Ernest, count of the Bohemian mark, and in conjunction with his father-in-law resisted the authority of his father in 861. In 865 an arrangement was made by which he became possessed of Bavaria and Carinthia as his expectant share of the kingdom of Louis. During the troubles between Louis and his two younger sons Carloman remained faithful to his father, and carried on the war with the Moravians so successfully that when peace was made at Forchheim in 874 they recognized the Frankish supremacy. In 875 the emperor Louis II. died, having named his cousin Carloman as his successor in Italy. Carloman crossed the Alps to claim his inheritance, but was cajoled into returning by the king of the West Franks, Charles the Bald. In 876, on his father's death, Carloman became actually king of Bavaria, and after a short campaign against the Moravians he went again to Italy in 877 and was crowned king of the Lombards at Pavia; but his negotiations with Pope John VIII. for the imperial crown were fruitless. Stricken with paralysis, he bequeathed the whole of his lands to Louis. He died on Sept. 22, 880, at Ottingen, where he was buried, leaving an illegitimate son, afterwards the emperor Arnulf.

See Regino von Prum's "Chronicon" and "Annales Bertiniani" in *Monumenta Germaniae Historica. Scriptores*, Bd. i. (ed. G. H. Pertz,

Hanover, 1826–92); E. Dümmler, "Geschichte des Ostfränkischen Reiches," in *Jahrbücher der Deutschen Geschichte* (Leipzig, 1887–88); J. F. Böhmer, *Die Regesten des Kaiserreichs unter den Karolingern*, vol. i. (ed. E. Mühlbacher, Innsbruck, 1908).

**CARLOMAN**, the name of three Frankish princes.

**CARLOMAN** (d. 754), mayor of the palace under the Merovingian kings, was a son of Charles Martel, and, together with his brother, Pippin the Short, became mayor on his father's death in 741, administering the eastern part of the Frankish kingdom. He extended the power of the Franks in various wars, and strengthened the church in the lands under his rule. In 747 Carloman retired to a monastery which he founded on Monte Soracte, but subsequently entered a monastery on Monte Casino. He died at Vienne on Aug. 17, 754.

**CARLOMAN** (751–771), king of the Franks, was a son of King Pippin the Short, and consequently a brother of Charlemagne. The brothers became joint kings of the Franks on Pippin's death in 768. Trouble between them arising out of the conduct of the war in Aquitaine was followed by Carloman's death at Samoussy on Dec. 4, 771. He married Gerberga, daughter of Desiderius, king of the Lombards.

**CARLOMAN** (d. 884), king of France, was the eldest son of King Louis II., the Stammerer, and became king, together with his brother Louis III., on his father's death in 879. Although some doubts were cast upon their legitimacy, the brothers obtained recognition and in 880 made a division of the kingdom, Carloman receiving Burgundy and the southern part of France. In 882 he became sole king owing to his brother's death. Carloman met his death while hunting on Dec. 12, 884.

See E. Lavisse, *Histoire de France*, tome ii. (1903).

**CARLOS I.** (1863–1908), king of Portugal, the third sovereign of Portugal of the line of Braganza-Coburg, son of King Louis I. and Maria Pia, daughter of King Victor Emmanuel of Italy, was born at Lisbon on Sept. 28, 1863. On May 22, 1886, he married Marie Amélie, daughter of Philippe, duc d'Orléans, comte de Paris, and on the death of his father (Oct. 19, 1889) he succeeded to the throne of Portugal. In that year the British Government remonstrated against Portuguese encroachments in South Africa, and relations between the two countries were greatly strained for some time. The king's attitude at this crisis was conciliatory, and aided peaceful relations. King Carlos was an artist of some repute, and a keen student of oceanography. In May 1907 he suspended the constitution of Portugal and temporarily appointed Senhor Franco as dictator for the execution of necessary reforms. Some discontent was aroused by this proceeding; this was increased by Franco's drastic measures, and on Feb. 1, 1908, King Carlos and his elder son, Louis, duke of Braganza (1887–1908), were assassinated whilst driving through the streets of Lisbon. The king was succeeded by his only surviving son, Manuel, duke of Beja (b. 1889), who took the title of Manuel II.

See L. de Colleville, *Carlos Ier intime* (1906).

**CARLOS, DON** (1545–1568), prince of Asturias, the son of Philip II., king of Spain, by his first wife Maria, daughter of John III. of Portugal, was born at Valladolid on July 8, 1545. In 1560 he was recognized as heir to the throne of Castile, and three years later to that of Aragon, but his mental derangement became so acute that in his morbidness he even contemplated the murder of his father. At length, in Jan. 1568, when he had made preparations for flight from Spain, he was placed in confinement by order of Philip, and on July 24 he died. He had not married, though Elizabeth and Margaret, daughters of Henry II. of France, Mary, queen of Scots, and Anne, daughter of the emperor Maximilian II. had been suggested for him. The marriage of his father and Elizabeth, to whom Carlos had once been betrothed, is believed by some writers to have hastened his death. Schiller and Alfieri, J. G. de Campistron in *Andronic*, and Lord John Russell have made the relations between Don Carlos and his father the subject of dramas; and other dramas based upon the life of Don Carlos have been written by Thomas Otway, M. A. Chénier, J. P. de Montalvan, and D. X. de Enciso.

See L. von Ranke, *Zur Geschichte des don Carlos* (1829); W. H. Prescott, *History of the Reign of Philip II.*, vol. ii. (1855, 1859);

Maurenbrecher, *Don Carlos* (1876); M. Büdinger, *Don Carlos, Haft und Tod* (1891); F. Rachfahl, *Don Carlos Kritische Untersuchungen* (Freiburg, 1921).

**CARLOS, DON** (CARLOS MARIA ISIDRO) (1788–1855), the first of the Carlist claimants of the throne of Spain, was the second surviving son of King Charles IV. and his wife, Louisa Maria of Parma. He was born on Mar. 29, 1788. From 1808 till 1814, he was a prisoner of Napoleon in France. Returning to Madrid, he married, in 1816, Maria Francesca de Asis, daughter of King John VI. of Portugal, and sister of the second wife of his elder brother King Ferdinand VII. Though he took no part in the Government, except to hold a few formal offices, Don Carlos was known for his religious orthodoxy and his firm belief in the divine right of kings. During the revolutionary troubles of 1820–23 he was threatened by the extreme radicals, but no attack was made on him. Towards the close of Ferdinand's reign Don Carlos was forced into the position of a party leader, for when Ferdinand endeavoured to alter the law of succession in order to secure the crown for his daughter Isabella, the Spanish clericals banded to protect the rights of Don Carlos, and he might easily have placed himself at the head of an insurrection had he not considered rebellion a sin. In Mar. 1833, Don Carlos went to Portugal to support Don Miguel, then regent. While there he was called upon by Ferdinand to swear allegiance to the infanta Isabella, afterwards queen, but he refused to renounce his rights and those of his sons. On the death of his brother in Sept. 1833, he was shut off from Spain by the civil war in Portugal, and could do nothing to direct the Spaniards who rose on his behalf and proclaimed him king as Charles V. When the Miguelite party was beaten in Portugal, Don Carlos escaped in a British warship to England in June 1834, and, crossing to France, joined his partisans at Elizondo in the valley of Bastan, in the western Pyrenees. On Oct. 27, 1834, he was deprived of his rights as infante by a royal decree, confirmed by the Cortes on Jan. 15, 1837. Don Carlos remained in Spain till the defeat of his party, and then escaped to France in Sept. 1839. The defeat of his cause, which had many chances of success, was due to his want of capacity and apathy. His first wife having died in England, Don Carlos married her elder sister, the princess of Beira, in Oct. 1837. He abdicated his pretensions in May 1845, took the title of count of Molina, and died at Trieste on Mar. 10, 1855.

By his first marriage, Don Carlos had three sons, Charles (1818–61), John (1822–87) and Ferdinand (1824–61). Charles succeeded to the claims of his father, and was known to his partisans as Don Carlos VI., but more commonly as the count of Montemolin. In 1846, when the marriage of queen Isabella was being negotiated, the Austrian Government endeavoured to arrange an alliance between the two, but as Charles insisted on the complete recognition of his rights, the Spanish Government refused the alliance. In April 1860 he and his brother Ferdinand landed at San Carlos de la Rápita, at the mouth of the Ebro, but no Carlist rising took place, and the princes only saved their lives by an abject surrender of their claims. Later at Cologne, the count of Montemolin publicly retracted his renunciation on June 15 on the ignominious ground that it had been extorted by fear. Both princes died in Jan. 1861 without issue.

The third brother, John, who had advanced his own claims before his brother's retraction, now came forward as the representative of the Carlist cause. On Oct. 3, 1868, he made a formal renunciation in favour of his son Charles, Don Carlos VII. (q.v.).

See H. Baumgarten, *Geschichte Spaniens* (Leipzig, 1861); H. Butler Clarke, *Modern Spain* (Cambridge, 1906), which contains a useful bibliography.

**CARLOS, DON** (CHARLES MARIA DE LOS DOLORES) (1848–1909), prince of Bourbon, claimant, as Don Carlos VII., to the throne of Spain, was born at Laibach on March 30, 1848, the son of Don Juan (John) of Bourbon and the archduchess Maria Beatrix, daughter of Francis IV., duke of Modena. Don Carlos was the grandson of the first pretender. He married in 1867, Princess Marguerite, daughter of the duke of Parma, and niece of the comte de Chambord, who bore him a son, Don Jaime, in 1870,

and three daughters. Don Carlos boldly asserted his pretensions to the throne two years after the revolution of 1868 had driven Queen Isabella II. and the other branch of the Bourbons into exile, but his supporters were routed at Oroquista by the troops of King Amadeus in 1872, and Don Carlos himself became a fugitive in the French Pyrenees. When the Federal republic was proclaimed on the abdication of King Amadeus, the Carlists, organized in guerrilla bands, many of them led by priests, had overrun Spain to such an extent that they held the interior of Navarre, the three Basque provinces, and a great part of Catalonia, Lower Aragon, and Valencia, and had made raids into Old Castile and Estremadura. Don Carlos re-entered Spain in July, 1873, and was present at the siege of Bilbao and at the battle near Estella on June 27, 1874, in which Marshal Concha was killed and the liberals were repulsed with loss. Twice he lost golden opportunities of making a rush for the capital in 1873, during the Federal republic, and after Concha's death. His cousin, Alphonso XII. being proclaimed king, the tide of war turned against him, and in 1875, the Carlist bands were swept out of central Spain and Catalonia and in March 1876 from the Navarre district. From that date Don Carlos became a wanderer residing successively in England, Paris, Austria, and Italy. Two further chances of testing the power of his party in Spain came to him, but he failed to profit by them because of his lack of decision. The first was when he was invited to unfurl his flag on the death of Alphonso XII., when the perplexities of Castilian politics reached a climax during the first year of a long minority under a foreign queen-regent. The second was at the close of the war with the United States and after the loss of the colonies, when the discontent was so widespread that the Carlists were able to assure their prince that many Spaniards looked upon his cause as the solution of the national difficulties. After the death of his first wife in 1893, Don Carlos married, in 1894, Princess Marie Bertha of Rohan. He died at Varese, in Italy, on July 18, 1909.

**CARLOW**, a county of Ireland in the province of Leinster, bounded north by the counties Kildare and Wicklow, east by Wicklow and Wexford, south by Wexford, and west by Laoighis Co. (formerly Queen's Co.) and Kilkenny. Excepting Louth, it is the smallest county in Ireland, having an area of 221,539 acres. Pop. (1926), 34,504.

In the south-east is a range of barren granitic mountains, the chief peaks being Knockroe (1,746 ft.) and Mt. Leinster (2,610 ft.). This range is flanked on the east by mica-schists and Silurian slates and on the west by Carboniferous limestone, the level expanse of which covers the greater portion of the county. On the west side, the Barrow affords means of communication with Waterford whilst to the east the drainage is chiefly to the Slaney. Beyond the Barrow is the elevated tract of land known as the ridge of Old Leighlin (Gallows hill bog, 974 ft.), forming the beginning of the coal-measures of Leinster. Glacial deposits cover much of the lower land and many eskers may be seen near Bagenalstown.

Carlow, under the name of Catherlogh, is among the counties generally considered to have been created in the reign of John. Leinster was confirmed as a liberty to William Marshal, earl of Pembroke, by John, and Carlow, among other counties in this area, had the privileges of a palatinate on descending to one of the earl's heiresses. The relics of antiquity in the county comprise large dolmens, some relics of ecclesiastical and monastic buildings, and the remains of several castles built after the English settlement. Old Leighlin, where the 12th century cathedral of St. Lazerian is situated, is merely a village, although until the Union it returned two members to the Irish parliament. The soil is rich but stock-raising has become the most important rural activity. Sheep, poultry and dairy cattle are kept and the farms are often large. The staple trade of the county is in corn, flour, meal, butter and provisions, which are exported in large quantities. There are no manufactures. The sandstone of the county is frequently of such a nature as to split easily into layers, known in commerce as Carlow flags. Porcelain clay exists in the neighbourhood of Tullow, but no attempt is made to turn this product to use.

The Great Southern railway from Kildare to Wexford follows the river Barrow through the county, with a branch from Bagenalstown to Kilkenny, while another branch from the north terminates at Tullow. Co. Carlow and Co. Kilkenny together form one constituency returning five members to the Dáil Eireann.

**CARLOW**, county town, Co. Carlow, Ireland, on the river Barrow. Pop. of urban district (1926) 7,175. Little of the castle now remains. In the reign of Edward III. the king's exchequer was removed thither and money applied to building town walls. Early in Elizabeth's reign Rory Oge O'More burnt the town. Carlow submitted to Ireton in 1641 and was attacked in the insurrection of 1798. It obtained a charter of incorporation in the 13th century and was reincorporated by James I., returning two members to the Irish parliament. Two miles north-east of the town is an important dolmen and 3 m. W. is the church of Killeshin of Norman and pre-Norman date. Brewing and flour-milling are important and there is trade in dairy produce.

**CARLSBAD**, a celebrated spa of Bohemia, Czechoslovakia (Czech, Karlovy Vary), lies about 1,225 ft. above sea level at the junction of the Teplá and the Ohře. Surrounded by the precipitous pine-forested foothills of the Erzgebirge, it is squeezed along the valleys of both streams and rises picturesquely tier above tier on the slopes of the hills around. Legend ascribes its origin to an accidental discovery of its famous springs by the emperor Charles IV., but there was certainly an old pre-existent settlement, Vary, which derived enhanced prosperity and an addition to its name from his interest. His experience of the medicinal qualities of its waters caused him to build a castle near by and to confer many privileges upon the town. Its function as a curative spa tends to obscure other important activities of the district. The 17 warm mineral springs are believed to rise from a common reservoir, known as the Sprudelkessel, and range in temperature from 107.7° to 164° F. While they vary in temperature the chemical composition is constant and the following figures per thousand parts of water for the largest, the Sprudel, delivering 405 gallons per minute, are typical:—2.405 sulphate of soda, 1.298 bicarbonate of soda, 1.042 sodium chloride, 0.186 sulphate of potash, 0.166 bicarbonate of magnesia, 0.012 bicarbonate of lithium, 0.966 carbon dioxide, with traces of arsenic, antimony, rubidium, selenium, tin and organic substances. Free from colour and odour, the waters are slightly acid and saline and are used for drinking and bathing with beneficial effects in liver diseases and troubles due to uric acid. Owing to their powerful action they require to be used under careful medical direction regarding diet and exercise, and there are many elaborate curative establishments supplemented by several hospitals and hospices for poorer patients. Though the waters were first used for bathing in 1520 the rapid growth of the town as an international health resort dates from the middle of the 19th century, after which many of its imposing buildings, e.g., the Kurhaus, the Kaiserbad, the Mühlbrunnen and Sprudel colonnades were erected. Concurrently, the porcelain and stoneware industries, for which the town is the centre in Czechoslovakia, have developed in range of markets and in character of products, concentrating to-day upon luxury articles. The industries have a long record of prosperity based upon rich local supplies of high grade kaolin and ornamental stone with easy access to the coal of the Falkenau basin, some miles west of Carlsbad. There is a flourishing trade in fine leather goods, confectionery and the preparation of evaporated salts and bottled waters for export. During winter the town is dominated by the manufactures but with the advent of the season, which reaches its height in June and July, everything is subordinated to catering for visitors; the normal population of about 19,000 is trebled by the influx and the town assumes a cosmopolitan appearance, reflected in the number of its churches and the variety of their denominations. The charming wooded heights, e.g., the Aberg (1,980 ft.), the König Otto's Höhe (1,960 ft.), the Dreikreuzberg (1,805 ft.) and many others approached by easy well-kept paths and commanding superb panoramas attract increasing numbers of tourists seeking recreation rather than health. (W. S. L.)

**CARLSBAD**, a city in south-eastern New Mexico, U.S.A., on the Pecos river; the county seat of Eddy county. The population

in 1930 was 3,708. It is served by the Santa Fe railway, and is a shipping point for large quantities of cotton, wool, alfalfa and live stock. The Carlsbad irrigation project of the Federal Government comprises 25,045 ac., of which over 90% is under crops. The city has cotton-gins, a cotton-seed oil mill and a gypsum-plaster mill. There are five large lakes and mineral springs in the vicinity. In the Guadalupe mountains, 30 m. S.W., is Carlsbad Cave National Monument, an immense cavern not yet fully explored, containing vast lofty chambers, with limestone formations of extraordinary beauty and impressiveness. The "Big Room" is over ½ m. long and has a maximum width of 400 ft. and a maximum height of 348 feet.

**CARLSBAD CAVE NATIONAL MONUMENT**, a tract of about 720 ac. in south-east New Mexico, U.S.A., set apart in 1923 as a Government reservation. The series of caverns from which it is named was formed by the dissolvent action of water on original beds of rock salt, limestone and gypsum in the predominating shale. Its total extent is not known, but is probably much greater than that of the present area of the reservation. One of the most notable discoveries is the Big Room, a cavern over ½ m. in length with a maximum width of 400 ft. and 348 ft. in height, containing a great variety of stalactites and stalagmites and portions of white limestone and onyx marble.

**CARLSBAD DECREES**, the name usually given to a series of resolutions (*Beschlüsse*) passed by a conference of the ministers of the more important German States, held at Carlsbad Aug. 6–31 1819. The occasion of the meeting was the desire of Prince Metternich to take advantage of the consternation caused by recent revolutionary outrages (especially the murder of the dramatist Kotzebue) to persuade the German Governments to combine in a system for the suppression of the Liberal agitation in Germany. The business to be discussed, as announced in Metternich's opening address, was twofold: (1) Matters of urgent importance necessitating immediate action; (2) Questions affecting the fundamental constitution of the German Confederation, demanding more careful and prolonged discussion.

These questions were debated in 23 formal conferences. On the issues raised by the first class there was practical unanimity. All were agreed that the state of Germany demanded disciplinary measures, and it was decided to lay before the Federal Diet definite proposals for (1) a uniform press censorship of all periodical publications; (2) a system of "curators" to supervise education in universities and schools; and (3) the erection of a central commission at Mainz, armed with inquisitorial powers, for the purpose of unmasking the widespread revolutionary conspiracy assumed to exist.

On the questions raised under the second class there was more fundamental difference of opinion, especially on the burning question of the due interpretation of Article XIII. of the Federal act. The controversy raged round the distinction between "assemblies of estates," as laid down in the article, and "representative assemblies," such as had been already established in several German States. Gentz, in an elaborate memorandum, laid down that representation by estates was the only system compatible with the conservative principle, whereas representative assemblies were based on "the sovereignty of the people." In answer Count Wintzingerode, on behalf of the king of Württemberg, placed on record a protest, in which he urged that insistence upon the system of estates would be to stereotype caste distinctions foreign to the whole spirit of the age, would alienate public opinion from the Governments, and—if enforced by the central power—would violate the sovereign independence of those States which, like Württemberg, had already established representative constitutions. Though the majority of those present favoured the Austrian interpretation of Article XIII. as elaborated by Gentz, they were as little prepared as the representative of Württemberg to agree to any measures for strengthening the Federal Government at the expense of the prerogatives of the minor sovereignties. The result was that constitutional questions were reserved for further discussion at a general conference of German ministers to be summoned to Vienna later in the year. The effective Carlsbad resolutions, subsequently issued as laws by the Federal Diet, were

therefore only those dealing with the curbing of the "revolutionary" agitation.

See GERMANY: *History*. The acts, protocols and resolutions of the conference of Carlsbad are given in M. de Martens's *Nouveau Recueil général de traités*, etc., t. 4, pp. 8-166 (Göttingen, 1846).

(W. A. P.)

**CARLSTADT**, KARLSTADT or KARLOSTADT. Andreas Rudolf Bodenstein (1480-1541), German reformer, was born at Carlstadt, Bavaria. He studied at the universities of Erfurt (1499-1503), Cologne and Wittenberg, where he acquired fame as a champion of the scholasticism of Thomas Aquinas. In 1513 he became professor of theology. In 1515 he went to Rome to take a degree in law. He returned to Germany as an ardent opponent of Thomism and as a champion of the Augustinian doctrine of the impotence of the human will and salvation through Divine grace alone. The 151 theses of Carlstadt, dated Sept. 16, 1516, discovered by T. Kolde (*"Wittenberger Disputationsthesen"* in *Zeitschrift für Kirchengeschichte*, xi.), prove that Carlstadt was at this time actually in advance of Luther.

In 1518, in reply to Eck's *Obelisci*, an attack on Luther's 95 theses, Carlstadt published a series of theses, maintaining the supremacy of the Holy Scriptures over the authority of the fathers, and asserting the liability of general councils to error. A public disputation with Eck, in which Luther also took part, led to three polemical treatises against Eck in which he proclaimed the doctrine of the exclusive operation of grace in the justification of believers.

In 1520 he appeared as the first of modern biblical critics, denying the Mosaic authorship of the Pentateuch and classifying the Scriptures into three categories of different value in accordance with the degrees of certainty as to their traditional origin. He still, however, held their verbal inspiration, and attacked Luther for rejecting the epistle of James. The inclusion of Carlstadt's name in the papal bull excommunicating Luther resulted in his attack upon the papacy in *Von päpstlicher Heiligkeit*, (Oct. 1520).

In 1521 Carlstadt went to Denmark, on the invitation of Christian II., to assist in the reform of the church; but he was forced, by the hostility of nobles and clerics alike, to leave after a few weeks. In June he was back in Wittenberg, busy with tracts on the Holy Sacrament (he still believed in the corporeal presence) and against monasticism and the celibacy of the clergy. He was accepted as the leader of Protestantism in Wittenberg; and, at his instance, auricular confession, the elevation of the Host communion under one species, and the rules for fasting were abolished. In January he was married.

The return of Luther early in March, however, ended Carlstadt's supremacy, and communion in one kind and the elevation of the Host was restored. Carlstadt himself, though still professor, was deprived of all influence in practical affairs, and devoted himself to theological speculation. He now denied the necessity for a clerical order and retiring to Orlamünde abolished the Mass and even preached against the necessity for any sacraments. He occasionally lectured at Wittenberg and fulminated against Luther's policy of compromise.

All this brought him into conflict with the elector, Frederick the Wise, the university and Luther himself. His professorship and living were confiscated and in 1524 he went into exile. He was exposed to great privations, but found opportunity for polemical writing, proclaiming for the first time his disbelief in the "Real Presence." He visited Strasbourg, Heidelberg, Zürich, Basel, Schweinfurth, Kitzingen, Nördlingen and Rothenburg on the Tauber, from whence he had to fly for his life after the Peasants' War. His spirit was now broken, and from Frankfort he wrote to Luther humbly praying him to intercede for him with the elector. Luther agreed to do so, on receiving from Carlstadt a recantation of his heterodox views on the Lord's Supper, and as a result, the latter was permitted to return to Wittenberg (1525), but not to lecture. His refusal to take up the cudgels against Zwingli and Oecolampadius ended in his flight to avoid imprisonment. Taking refuge in Holstein and later in East Friesland, he ultimately reached Zürich, where Bucer and Oecolampadius secured him a friendly

reception by Zwingli, who procured him employment. After Zwingli's death he remained in close intercourse with the Zürich preachers, who defended him against Luther's attacks; and finally, in 1534, on Bullinger's recommendation, he was called to Basel as preacher at the church of St. Peter and professor at the university. He died there on Dec. 24, 1541.

During these latter years Carlstadt's attitude became more moderate. Despatched to Strasbourg in 1536, to discuss a proposed compromise in the matter of the Lord's Supper between the theologians of Strasbourg and Wittenberg, he displayed a conciliatory attitude which earned him the praise of Bucer. Carlstadt's historical significance lies in the fact that he was one of the pioneers of the Reformation; but he was a thinker and dreamer rather than a man of affairs. He lacked the balance of mind and sturdy common sense that inspired Luther's policy of consideration for "the weaker brethren." In reply to Luther's attack in *Wider die himmlischen Propheten*, he issued his *Anzeig etlicher Hauptartikel christlicher Lehre*, a compendious exposition of his views.

Besides the above mentioned works, Carlstadt's chief writings are *De Canonicis Scripturis* (1520), *Von Gelübden Unterrichtung* (1521), *De legis litera sive carne et spiritu* (1521), *Priestertum u. Opfer Christi* (1524), *Ob man gemach faren soll* (1524). His disputations with Eck were reprinted in 1903.

See C. F. Jaeger, *A. Bodenstein von Carlstadt* (Stuttgart, 1856); H. Barge, *A. Bodenstein von Carlstadt*, 2 vols. (Leipzig, 1905); K. Müller, *Luther und Carlstadt* (Tübingen, 1907); Von Ranke, *Hist. of the Reformation in Germany* (Eng. trs., 1905) and J. Janssen, *Hist. of the German people*.

**CARLSTADT**, a borough of Bergen county, New Jersey, U.S.A., 5m. north of Jersey city, on the Erie railroad. The population was 4,472 in 1920 (25% foreign-born white), and was 5,425 in 1930 by the Federal census. The numerous and varied manufactures include silk, wire gauges, dynamos, candles, wax, cigars, safety razors, buttons, embroidery, marble, chemicals and petroleum products. The borough was incorporated in 1894.

**CARLYLE, ALEXANDER** (1722-1805), Scottish divine, was born on Jan. 26, 1722, at Combertrees Manse, Dumfriesshire, and passed his youth and early manhood at Prestonpans, where he witnessed the battle of 1745. He was educated at Edinburgh (M.A. 1743), Glasgow, and Leyden. From 1748 until his death, on Aug. 28, 1805, he was minister at Inveresk in Midlothian and became the leader of the moderate or "broad" Church section in the Scottish church. His personal appearance earned him the name of "Jupiter Carlyle," and Sir Walter Scott called him "the greatest demigod I ever saw."

See his *Autobiography* (published 1860; new ed., 1910).

**CARLYLE, JOSEPH DACRE** (1759-1804), British orientalist, was born at Carlisle. He was appointed, in 1795, professor of Arabic in Cambridge university. His translation from the Arabic of Yusuf ibn Taghri Birdi, the *Rerum Egypticarum Annales*, appeared in 1792, and in 1796 a volume of *Specimens of Arabic Poetry*, from the earliest times to the fall of the caliphate, with some account of the authors. Carlyle was appointed chaplain by Lord Elgin to the embassy at Constantinople in 1799, and in a tour through Asia Minor, Palestine, Greece and Italy, collected several valuable Greek and Syriac mss. for a projected critical edition of the New Testament, collated with the Syriac and other versions—a work, however, which he did not live to complete. On his return to England in 1801 he was presented to the living of Newcastle-on-Tyne, where he died April 12 1804.

**CARLYLE, THOMAS** (1795-1881), British essayist, historian and philosopher, born on Dec. 4, 1795, at Ecclefechan, in Annandale, was the eldest of the nine children of James Carlyle by his second wife, Janet Aitken. The father was by trade a mason, and afterwards a small farmer. He had joined a sect of seceders from the kirk, and had all the characteristics of the typical Scottish Calvinist. He was respected for his integrity and independence, and a stern outside covered warm affections. The family tie between all the Carlyles was unusually strong, and Thomas regarded his father with a reverence which found forcible expression in his *Reminiscences*. He always showed the tenderest love for his mother, and was the best of brothers. The narrow

means of his parents were made sufficient by strict frugality. He was sent to school when he was about five and to Annan grammar-school when ten years old, and soon showed an appetite for learning which induced his father to decide to educate him for the ministry. He walked to Edinburgh in Nov., 1809, and entered the university. Of the professors, he liked Sir John Leslie the best and distinguished himself in mathematics. But he benefited most by his reading of books obtained from the University library and the Advocates' Library. A few lads in positions similar to his own began to look up to him as an intellectual leader, and their correspondence with him shows remarkable interest in literary matters. In 1814 Carlyle, still looking forward to the career of a minister, obtained the mathematical mastership at Annan. The salary of £60 or £70 a year enabled him to save a little money. He went to Edinburgh twice to deliver the discourses required from students of divinity, but the main occupation of his leisure time was wide reading in French and English literature and the study of mathematics. In 1816 he was appointed, through the recommendation of Leslie, to a school at Kirkcaldy, where Edward Irving, Carlyle's senior by three years, was also master of a school. Irving's severity as a teacher had offended some of the parents, who set up Carlyle to be his rival. A previous meeting with Irving, also a native of Annan, had led to a little passage of arms, but Irving now welcomed Carlyle with a generosity which entirely won his heart, and the rivals soon became the closest of friends. The intimacy, affectionately commemorated in the *Reminiscences*, was of great importance to Carlyle's whole career. "But for Irving," he says, "I had never known what the communion of man with man means." Irving had a library, in which Carlyle devoured Gibbon and much French literature, and they made various excursions together. Carlyle did his duties as a schoolmaster punctiliously, but found the life thoroughly uncongenial. No man was less fitted by temperament for the necessary drudgery and worry. His admiration for a Miss Gordon there seems to have suggested the "Blumine" of *Sartor Resartus*; but he made no new friendships, and when Irving left at the end of 1818 Carlyle also resigned his post.

He had by this time given up the ministry and altogether ceased to believe in Christianity in the winter of 1817-18, though he was and always remained in profound sympathy with its moral teaching. A period of severe struggle followed. He studied law for a time, but liked it no better than schoolmastering. He took a pupil or two, and wrote articles for the *Edinburgh Encyclopædia* under the editorship of Brewster. He occasionally visited his family, and their unflinching confidence helped to keep up his courage. Meanwhile he was going through a spiritual crisis. Atheism was profoundly repugnant to him. At last, one day in July or Aug., 1822, after three weeks' total sleeplessness, he went through the crisis afterwards described quite "literally" in *Sartor Resartus*. He cast out the spirit of negation, and henceforth the temper of his misery was changed to one, not of "whining," but of "indignation and grim fire-eyed defiance." That, he says, was his spiritual new-birth, though certainly not into a life of serenity. The conversion was coincident with Carlyle's submission to a new and very potent influence. In 1819 he had begun to read German, with which he soon acquired a very remarkable familiarity. Many of his contemporaries were awakening to the importance of German thought, and Carlyle's knowledge enabled him before long to take a conspicuous part in diffusing the new intellectual light. The chief object of his reverence was Goethe. In many most important respects no two men could be more unlike; but, for the present, Carlyle seems to have seen in Goethe a proof that it was possible to reject outworn dogmas without sinking into materialism. Goethe, by singularly different methods, had emerged from a merely negative position into a lofty and coherent conception of the universe. Meanwhile, Carlyle's various anxieties were beginning to be complicated by physical derangement. A rat, he declared, was gnawing at the pit of his stomach. He was already suffering from the agonies of indigestion from which he continued to suffer all his life.

Irving's friendship now became serviceable. Carlyle's confession of the radical difference of religious opinion had not alienated

his friend, who was settling in London, and used his opportunities for promoting Carlyle's interest. In Jan. 1822 Carlyle, through Irving's recommendation, became tutor to Charles and Arthur Buller, who were to be students at Edinburgh. Carlyle's salary was £200 a year, and this, with the proceeds of some literary work, enabled him at once to help his brother John to study medicine and his brother Alexander to take up a farm. Carlyle was tutor to the young Bullers till July, 1824, when it was decided to send them to Cambridge and both Charles Buller and his parents continued to be his friends as long as they lived. It was through Charles Buller that he later became acquainted with the Barings. Meanwhile he was employed upon a life of Schiller and a translation of *Wilhelm Meister*. He received £50 for a translation of Legendre's *Geometry*; and an introduction, explaining the theory of proportion, is said by De Morgan to show that he could have gained distinction as an expounder of mathematical principles. The impressions made upon him by London men of letters in 1824 were most unfavourable. Carlyle felt by this time conscious of having a message to deliver to mankind, and the men of letters, he thought, were making literature a trade instead of a vocation, and prostituting their talents to frivolous journalism. He went once to see Coleridge, who was then delivering his oracular utterances at Highgate, and the only result was the singularly vivid portrait given in a famous chapter in his life of Sterling. Coleridge seemed to him to be ineffectual as a philosopher, and personally to be a melancholy instance of genius running to waste. Carlyle, conscious of great abilities, and impressed by such instances of the deleterious effects of the social atmosphere of London, resolved to settle in his native district. There he could live frugally and achieve some real work. He could for one thing, be the interpreter of Germany to England. A friendly letter from Goethe, acknowledging the translation of *Wilhelm Meister*, reached him towards the end of 1824 and greatly encouraged him. Goethe afterwards spoke warmly of the life of Schiller, and it was translated into German. Letters occasionally passed between them in later years, which were edited by Charles Eliot Norton in 1887. Goethe received Carlyle's homage with kind complacency. The gift of a seal to Goethe on his birthday in 1831 "from fifteen English friends," including Scott and Wordsworth, was suggested and carried out by Carlyle. Carlyle did much to promote interest in German literature during the next few years, and made some preparations for a history of German literature. British curiosity, however, about such matters seems to have been soon satisfied, and the demand for such work slackened.

Carlyle meanwhile was passing through the most important crisis of his personal history. Jane Baillie Welsh, born 1801, was the only child of Dr. Welsh of Haddington. She had shown precocious talent, and was sent to the school at Haddington where Edward Irving (*q.v.*) was a master. After her father's death in 1819 she lived with her mother, and her wit and money attracted many admirers. Her father had bequeathed to her all his property which was worth about £200 a year.

Her old tutor, Irving, was now at Kirkcaldy, where he became engaged to a Miss Martin. He visited Haddington occasionally in the following years, and a strong mutual regard arose between him and Miss Welsh. They contemplated a marriage, and Irving endeavoured to obtain a release from his previous engagement. The Martin family held him to his word, and he took a final leave of Miss Welsh in 1822. Meanwhile he had brought Carlyle from Edinburgh and introduced him to the Welshes. Carlyle was attracted by the brilliant abilities of the young lady, procured books for her and wrote letters to her as an intellectual guide. The two were to perform a new variation upon the theme of Abelard and Héloïse. (A good deal of uncertainty long covered the precise character of their relations. Until 1909, when Mr. Alexander Carlyle published his edition of the "love-letters," the full material was not accessible; they had been read by Carlyle's biographer, Froude, and also by Charles Norton, and Norton [in his edition of Carlyle's *Early Letters*, 1886] declared that Froude had distorted the significance of this correspondence in a sense injurious to the writers. The publication of the letters certainly

seems to justify Norton's view.) Miss Welsh's previous affair with Irving had far less importance than Froude ascribes to it; and she soon came to regard her past love as a childish fancy. She recognized Carlyle's vast intellectual superiority, and the respect gradually deepened into genuine love. The process, however, took some time. By 1825 Carlyle and she were planning marriage, and at Carlyle's instance she conveyed to her mother the house at Haddington, and everything in it, and gave her the life rent of Craigenputtock estate. She also made her will and bequeathed the fee-simple of the estate to Carlyle. She had been brought up in a station superior to that of the Carlyles, and could not accept the life of hardship which would be necessary in his present circumstances. Carlyle, accustomed to his father's household, was less frightened by the prospect of poverty. He was determined not to abandon his vocation as a man of genius by following the lower though more profitable paths to literary success, and expected that his wife should share the necessary sacrifice of comfort. The natural result of such discussions followed. The attraction became stronger on both sides, in spite of occasional spasms of doubt.

About the same time, July 1825, a friend of Irving's, Mrs. Basil Montague, wrote to Miss Welsh, to exhort her to suppress her love for Irving, who had married Miss Martin in 1823. Miss Welsh replied by announcing her intention to marry Carlyle; and then told him the whole story, of which he had previously been ignorant. He properly begged her not to yield to the impulse without due consideration. She answered by coming at once to his father's house, where he was staying; and the marriage was finally settled. It took place on Oct. 17, 1826.

Carlyle had now to arrange the mode of life which should enable him to fulfil his aspiration. His wife had made over her income to her mother, but he had saved a small sum upon which to begin housekeeping. A passing suggestion from Mrs. Carlyle that they might live with her mother was judiciously abandoned. Carlyle had thought of occupying Craigenputtock, a remote and dreary farm belonging to Mrs. Welsh. His wife objected to his utter incapacity as a farmer; and they finally took a small house at Comely Bank, Edinburgh, where they could live on a humble scale. The brilliant conversation of both attracted some notice in the literary society of Edinburgh. The most important connection was with Francis, Lord Jeffrey, still editor of the *Edinburgh Review*. Though Jeffrey had no intellectual sympathy with Carlyle, he accepted some articles for the *Review* and became warmly attached to Mrs. Carlyle. Carlyle began to be known as leader of a new "mystic" school, and his earnings enabled him to send his brother John to study in Germany. The public appetite, however, for "mysticism" was not keen. In spite of support from Jeffrey and other friends, Carlyle failed in a candidature for a professorship at St. Andrews. His brother, Alexander, had now taken the farm at Craigenputtock, and the Carlyles decided to settle at the separate dwelling-house there, which would bring them nearer to Mrs. Welsh. They went there in 1828, and began a hard struggle. Carlyle, indomitably determined to make no concessions for immediate profit, wrote slowly and carefully, and turned out some of his most finished work. He laboured "passionately" at *Sartor Resartus*, and made articles out of fragments originally intended for the history of German literature. The money difficulty soon became more pressing. John, whom he was still helping, was trying unsuccessfully to set up as a doctor in London; and Alexander's farming failed. In spite of such drawbacks, Carlyle in later years looked back upon the life at Craigenputtock as on the whole a comparatively healthy and even happy period, as it was certainly one of most strenuous and courageous endeavour. Though absorbed in his work, he found relief in rides with his wife, and occasionally visiting their relations. Their letters during temporary separations are most affectionate. The bleak climate, however, the solitude, and the necessity of managing a household with a single servant, were trying to a delicate woman. In the autumn of 1831 Carlyle accepted a loan of £50 from Jeffrey, and went in search of work to London, whither his wife followed him. He made some engagements with publishers, though no one would take *Sartor Resartus*,

and he returned to Craigenputtock in the spring of 1832. Jeffrey, stimulated perhaps by his sympathy for Mrs. Carlyle, was characteristically generous. Besides pressing loans upon both Thomas and John Carlyle, he offered to settle an annuity of £100 upon Thomas, and finally enabled John to support himself by recommending him to a medical position.<sup>1</sup> Carlyle's proud spirit of independence made him reject Jeffrey's help as long as possible; and even his acknowledgment of the generosity (in the *Reminiscences*) is not so cordial as might have been expected. In 1834 he applied to Jeffrey for a post at the Edinburgh Observatory, for which his knowledge of mathematics and astronomy made him specially well qualified. But Jeffrey preferred to give the job to a man who had been clerk in his service, which led to a break between Carlyle and Jeffrey which lasted some years.

In the beginning of 1833 the Carlyles made another trial of Edinburgh. There he found materials in the Advocate's Library for the article on the *Diamond Necklace*, one of his most perfect writings, and he began to study the history of the French Revolution. *Sartor Resartus* was at last appearing in *Fraser's Magazine*, though the rate of payment was cut down, and the publisher reported that it was received with "unqualified dissatisfaction." Both Carlyle and his wife liked Edinburgh, but on the whole preferred London. Besides, the materials for the history of the French Revolution which he had decided to write were more accessible in London; so they went there in the summer of 1834, and took the house at 5 (now 24) Cheyne row, Chelsea, which Carlyle inhabited till his death; the house has since been bought for the public. Irving, who had welcomed him on former occasions, was just dying—a victim, as Carlyle thought, to fashionable cajoleries. A few young men were beginning to show appreciation. J. S. Mill had made Carlyle's acquaintance in the previous visit to London, and had corresponded with him. Mill had introduced Ralph Waldo Emerson, who visited Craigenputtock in 1833. Carlyle was charmed with Emerson, and their letters published by Norton show that his regard never cooled. Emerson's interest showed that Carlyle's fame was already spreading in America. Carlyle's connection with Charles Buller, a zealous utilitarian, introduced him to the circle of "philosophical radicals."

Carlyle called himself in some sense a radical; and J. S. Mill, though not an intellectual disciple, was a very warm admirer of his friend's genius. Carlyle had some expectation of the editorship of the *London Review*, started by Sir W. Molesworth at this time as an organ of philosophical radicalism. The combination would clearly have been explosive. Meanwhile Mill, who had collected many books upon the French Revolution, was eager to help Carlyle in the history which he was now beginning. He set to work at once and finished the first volume in five months, and lent the ms. to J. S. Mill, who left it at the house of a Mrs. Taylor, who had separated from her husband on account of her intimacy with Mill. There it was burned accidentally, according to Mrs. Taylor, and Carlyle who had no copy and few notes had to write it afresh. Mill sent a cheque for £200 as compensation. Carlyle accepted only £100, the actual cost of living while he was writing what had been burned. On Jan. 12, 1837, the writing of the history was finished, and Carlyle said to his wife: "What they will do with this book, none knows, my Jeannie, lass; but they have not had, for a two hundred years, any book that came more truly from a man's very heart; and so let them trample it under foot and hoof as they see best." "Pooh, pooh! they cannot trample that," was her answer.

The publication, six months later, of the *French Revolution* marks the turning-point of Carlyle's career. Many readers hold it to be the best, as it is certainly the most characteristic, of Carlyle's books. The failure of *Sartor Resartus* to attract average readers is quite intelligible. It contains, indeed, some of the most impressive expositions of his philosophical position, and some of his most beautiful and perfectly written passages. But there is something forced and clumsy, in spite of the flashes of grim

<sup>1</sup>John Aitken Carlyle (1807-79) finally settled near the Carlyles in Chelsea. He began an English prose version of Dante's *Divine Comedy*—which has earned him the name of "Dante Carlyle"—but only completed the translation of the *Inferno* (1849). The work included a critical edition of the text and a valuable introduction and notes.

humour, in the machinery of the *Clothes Philosophy*. The mannerism, which has been attributed to an imitation of Jean Paul, appeared to Carlyle himself to be derived rather from the phrases current in his father's house, and in any case gave an appropriate dialect for the expression of his peculiar idiosyncrasy. But it could not be appreciated by readers who would not take the trouble to learn a new language. In the *French Revolution* Carlyle had discovered his real strength. He was always at his best when his imagination was set to work upon a solid framework of fact. The book shows a unique combination: on the one hand is the singularly shrewd insight into character and the vivid realization of the picturesque; on the other is the "mysticism" or poetical philosophy which relieves the events against a background of mystery. The contrast is marked by the humour which seems to combine a cynical view of human folly with a deeply pathetic sense of the sadness and suffering of life. The convictions, whatever their value, came, as he said, "flamingly from the heart." It was, of course, impossible for Carlyle to satisfy modern requirements of matter-of-fact accuracy in details. He could not in the time have assimilated all the materials even then extant, and later accumulations would necessitate a complete revision. Considered as a "prose epic," or a vivid utterance of the thought of the period, it has a permanent and unique value.

The book was speedily successful. It was reviewed by Mill in the *Westminster* and by Thackeray in *The Times*, and Carlyle, after a heroic struggle, was at last touching land. In each of the years 1837 to 1840 he gave a course of lectures, of which the last only (upon "Hero Worship") was published by himself; they materially helped his finances. By Emerson's management he also received something during the same period from American publishers. At the age of 45 he had thus become independent. He had also established a position among the chief writers of the day. Young disciples, among whom John Sterling was the most accepted, were gathering round him, and he became an object of social curiosity. Monckton Milnes (Lord Houghton), who won universal popularity by the most genuine kindness of nature, became a cordial friend. Another important intimacy was with the Barings, afterwards Lord and Lady Ashburton. Carlyle's conversational powers were extraordinary; though, as he won greater recognition as a prophet, he indulged too freely in didactic monologue. In his prophetic capacity he published two remarkable books: *Chartism* (1839), enlarged from an article which Lockhart, though personally approving, was afraid to take for the *Quarterly*; and *Past and Present* (1843), in which a recently published *Medieval Chronicle* was taken as a text for the exposure of modern evils. They may be regarded as expositions of the doctrine implicitly set forth in the *French Revolution*. Carlyle was a "radical" as sharing the sentiments of the class in which he was born. He had been profoundly moved by the widely-spread distresses in his earlier years. When the yeomanry were called out to suppress riots after the Peace, his sympathies were with the people rather than with the authorities. So far he was in harmony with Mill and the "philosophical radicals." A fundamental divergence of principle, however, existed and was soon indicated by his speedy separation from the party and alienation from Mill himself. The Revolution, according to him, meant the sweeping away of effete beliefs and institutions, but implied also the necessity of a reconstructive process. *Chartism* begins with a fierce attack upon the *laissez faire* theory, which showed blindness to this necessity. The prevalent political economy, in which that theory was embodied, made a principle of neglecting the very evils which it should be the great function of government to remedy. Carlyle's doctrines, entirely opposed to the ordinary opinions of Whigs and Radicals, found afterwards an expositor in his ardent disciple Ruskin, and inspired Keir Hardie and other leaders of the labour movement. At the time he was as one crying in the wilderness to little practical purpose. Liberals were scandalized by his apparent identification of "right" with "might," implied in the demand for a strong government; and though he often declared the true interpretation to be that the right would ultimately become might, his desire for strong government seemed too often to sanction the inverse view. He came into collision with

philanthropists, and was supposed to approve of despotism for its own sake.

His religious position was equally unintelligible to the average mind. While unequivocally rejecting the accepted creeds, and so scandalizing even liberal theologians, he was still more hostile to simply sceptical and materialist tendencies. He accepted the nickname of "mystic," which had been applied to him by critics. The God he revered and held up for worship was the living God of Nature—inspiring all human effort, revealed by all reality, and speaking in the hearts of men and women. Any philosophy of history which emphasized the importance of general causes seemed to him to imply a simply mechanical doctrine and to deny the efficacy of the great spiritual forces. He met it by making biography the essence of history, or attributing all great events to the "heroes," who are the successive embodiments of divine revelations. This belief was implied in his next great work, the *Life and Letters of Oliver Cromwell*, published in 1845. The great Puritan hero was a man after his own heart, and the portrait drawn by so sympathetic a writer is not only intensely vivid, but a very effective rehabilitation of misrepresented character. He was the first to make plain the greatness of Oliver Cromwell as one of the makers of the modern British empire. The "biographical" view of history, however, implies the weakness, not only of unqualified approval of all Cromwell's actions, but of omitting any attempt to estimate the Protector's real relation to the social and political development of the time. The question, what was Cromwell's real and permanent achievement, is not answered nor distinctly considered. The effect may be partly due to the peculiar form of the book as a detached series of documents and comments. The composition introduced Carlyle to the "Dryasdust" rubbish heaps of which he here and ever afterwards bitterly complained. A conscientious desire to unearth the facts, and the effort of extracting from the dullest records the materials for graphic pictures, made the process of production excessively painful. For some years after *Cromwell* Carlyle wrote little. His growing acceptance by publishers, and the inheritance of her property by Mrs. Carlyle on her mother's death in 1842, finally removed the stimulus of money pressure. He visited Ireland in 1846 and again in 1849, when he made a long tour in company with Sir C. Gavan Duffy, then a young member of the Nationalist party (see Sir C. G. Duffy's *Conversations with Carlyle*, 1892, for an interesting narrative). Carlyle's strong convictions as to the misery and misgovernment of Ireland recommended him to men who had taken part in the rising of 1848. Although the remedies acceptable to a eulogist of Cromwell could not be to their taste, they admired his moral teaching; and he received their attentions, as Sir C. G. Duffy testifies, with conspicuous courtesy. His aversion from the ordinary radicalism led to an article upon slavery in 1849, to which Mill replied, and which caused their final alienation. It was followed in 1850 by the *Latterday Pamphlets*, containing "sulphurous" denunciations of the do-nothing principle. They gave general offence, and the disapproval, according to Froude, stopped the sale for years. The *Life of Sterling* (d. 1844), which appeared in 1851, was intended to correct the life by Julius Hare, which had given too much prominence to theological questions. The subject roused Carlyle's tenderest mood, and the *Life* is one of the most perfect in the language.

Carlyle meanwhile was suffering domestic troubles, unfortunately not exceptional in their nature, though the exceptional intellect and characters of the persons concerned have given them unusual prominence. Carlyle's constitutional irritability made him intensely sensitive to petty annoyances. He suffered the torments of dyspepsia; he was often sleepless, and the crowing of "demon-fowls" in neighbours' yards drove him wild. He would gladly have retired to the country again for the sake of quiet; but his wife's love of London kept him there. What helped to decide him to humour her by remaining there was the state of her health. For many years she was in danger of a mental breakdown, from which she was delivered mainly by his continual care and attentions.

In 1851 Carlyle commenced work on his *History of Frederick the Great*. He shut himself up in his study to wrestle with the

Prussian Dryasdusts, whom he discovered to be as wearisome as their Puritan predecessors and more voluminous. He went to Scotland to see his mother, to whom he had always shown the tenderest affection, on her deathbed at the end of 1853. He returned to shut himself up in the "sound-proof room," a study built on the top of his house and designed to be as free as possible from noises. He twice visited Germany (1852 and 1858) to see Frederick's battlefields and obtain materials; and he occasionally went to the Ashburtons and his relations in Scotland. The first two volumes of *Frederick the Great* appeared in 1858, and succeeding volumes in 1862, 1864 and 1865. The success was great from the first. The book is in some respects his masterpiece, and its merits are beyond question. Carlyle had spared no pains in research. The descriptions of the campaigns are admirably vivid, and show his singular eye for scenery. These narratives are said to have been used by military students in Germany, and at least convince the non-military student that he can understand the story. The book was declared by Emerson to be the wittiest ever written. Many episodes, describing the society at the Prussian court and the relations of Frederick to Voltaire, are unsurpassable as humorous portraiture. The effort to fuse the masses of raw material into a well-proportioned whole is perhaps not quite successful; and Carlyle had not the full sympathy with Frederick which had given interest to the *Cromwell*. Carlyle's general conception of history made him comparatively blind to aspects of the subject which would, to writers of other schools, have a great importance, but the extraordinary power of the book is undeniable, though it does not show the fire which animated the *French Revolution*. A certain depression and weariness of spirit darken the general tone.

Mrs. Carlyle had apparently recovered from an almost hopeless illness, when at the end of 1865 Carlyle was elected to the rectorship of the University of Edinburgh. He delivered an address there on April 2, 1866, unusually mild in tone, and received with general applause. He was still detained in Scotland when Mrs. Carlyle died suddenly while driving in her carriage. The immediate cause was the shock of an accident to her dog. She had once hurt her mother's feelings by refusing to use some wax candles. She had preserved them ever since, and by her direction they were now lighted in the chamber of death. Carlyle was overpowered by her loss. His life thenceforward became more and more secluded. He went to Mentone in the winter of 1866 and began the *Reminiscences*. He afterwards annotated the letters from his wife, published (1883) as *Letters and Memorials*. He was impressed by the story of Johnson's "penance" at Uttoxeter, and desired to make a posthumous confession of his shortcomings in his relations to his wife, according to Froude, whose statements to this effect, however, are not generally accepted. A few later utterances made known his opinions of current affairs. He joined the committee for the defence of Governor Eyre in 1866; he also wrote in 1867 an article upon "shooting Niagara," that is, upon the tendency of the Reform Bill of that year; and in 1870 he wrote a letter defending the German case against France. The worth of his *Frederick* was acknowledged by the Prussian Order of Merit in 1874. In the same year Disraeli offered him the Grand Cross of the Bath and a pension. He declined very courteously, and felt some regret for previous remarks upon the minister. The length of his literary career was now softening old antipathies, and he was the object of general respect. His infirmities enforced a very retired life, but he was constantly visited by Froude, Ruskin, and many others. Many friends paid him constant attention. A niece, Miss Aitken afterwards Mrs. Alexander Carlyle, became his housekeeper and ministered to him like a daughter till the end of his life. His conversation was still interesting, especially when it turned upon his recollections, and though his judgments were sometimes severe enough, he never condescended to the scandalous. His views of the future were gloomy. The world seemed to be going from bad to worse, with little heed to his warnings. He would sometimes regret that it was no longer permissible to leave it in the old Roman fashion. He sank gradually, and died on Feb. 4, 1881. A place in Westminster Abbey was offered, but he was buried, according to his own desire,

by the side of his parents at Ecclefechan. He left Craigenputtock, which had become his own property, to found bursaries at the University of Edinburgh. He gave his books to Harvard college.

Carlyle's appearance has been made familiar by many portraits. The statue by Boehm on the Chelsea Embankment is characteristic; and there is a fine painting by Watts in the National Portrait Gallery, London. J. McNeill Whistler's portrait of him is in the possession of the Glasgow corporation.

During Carlyle's later years the antagonism roused by his attacks upon popular opinions had subsided; and upon his death general expression was given to the emotions natural upon the loss of a remarkable man of genius. The rapid publication of the *Reminiscences* by Froude produced a sudden revulsion of feeling. Carlyle became the object of general condemnation. Froude's biography, and the *Memorials* of Mrs. Carlyle, published soon afterwards, strengthened the hostile feeling. Carlyle had appended to the *Reminiscences* an injunction to his friends not to publish them as they stood, and added that no part could ever be published without the strictest editing. Afterwards, when he had almost forgotten what he had written, he verbally empowered Froude to use his own judgment; Froude accordingly published the book at once, without any editing, and with many inaccuracies. Omissions of a few passages written from memory at a time of profound nervous depression would have altered the whole character of the book. Froude in this and the later publications held that he was giving effect to Carlyle's wish to imitate Johnson's "penance." No one, said Boswell, should persuade him to make his lion into a cat. Froude intended, in the same spirit, to give the shades as well as the lights in the portrait of his hero. His admiration for Carlyle probably led him to assume too easily that his readers would approach the story from the same point of view, that is, with an admiration too warm to be repelled by the admissions. Moreover, Froude's characteristic desire for picturesque effect, unchecked by any painstaking accuracy, led to his reading preconceived impressions into his documents. The result was that Carlyle was too often judged by his defects, and regarded as a selfish and eccentric misanthrope with flashes of genius, rather than as a man with many of the highest qualities of mind and character clouded by constitutional infirmities. Yet it would be difficult to speak too strongly of the great qualities which underlay the superficial defects. Through long years of poverty and obscurity Carlyle showed unsurpassed fidelity to his vocation and superiority to the lower temptations which have ruined so many literary careers. His ambition might be interpreted as selfishness, but certainly showed no coldness of heart. His unstinted generosity to his brothers during his worst times is only one proof of the singular strength of his family affections. No one was more devoted to such congenial friends as Irving and Sterling. He gave away a great deal of money when the sale of his books made him rich in the later years of his life, but he was careful to hide his benefactions as much as possible.

The harsh judgments of individuals in the *Reminiscences* had no parallel in his own writings. He scarcely ever mentions a contemporary, and was never involved in a personal controversy. But the harshness certainly reflects a characteristic attitude of mind. Carlyle was throughout a pessimist or a prophet denouncing a backsliding world. His most popular contemporaries seemed to him to be false guides, and charlatans had ousted the heroes. The general condemnation of "shams" and cant had, of course, particular applications, though he left them to be inferred by his readers. Carlyle was the exponent of many of the deepest convictions of his time. Nobody could be more in sympathy with aspirations for a spiritual religion and for a lofty idealism in political and social life. To most minds, however, which cherish such aspirations the gentler optimism of men like Emerson was more congenial. They believed in the progress of the race and the triumph of the nobler elements. Though Carlyle, especially in his earlier years, could deliver an invigorating and encouraging, if not a sanguine doctrine, his utterances were more generally couched in the key of denunciation, and betrayed a growing despondency. Materialism and low moral principles seemed to him to be gaining the upper hand; and the hope that religion might

survive the "old clothes" in which it had been draped seemed to grow fainter. The ordinary mind complained that he had no specific remedy to propose for the growing evils of the time; and the more cultivated idealist was alienated by the gloom and the tendency to despair. To a later generation it will probably appear that, whatever the exaggerations and the misconceptions to which he was led, his vehement attacks at least called attention to rather grave limitations and defects in the current beliefs and social tendencies of the time. The mannerisms and grotesque exaggerations of his writings annoyed persons of refinement, and suggested Matthew Arnold's advice to flee "Carlylese" as you would flee the devil. Yet the shrewd common sense, the biting humour, the power of graphic description and the imaginative "mysticism" give them a unique attraction for many even who do not fully sympathize with the implied philosophy or with the Puritanical code of ethics. The letters and autobiographical writings, whether they attract or repel sympathy, are at least a series of documents of profound interest for any one who cares to study character, and display an almost unique idiosyncrasy.

(L. S.; D. A. W.)

The materials for the Life of Carlyle consist of his *Reminiscences* and his own and his wife's correspondence and the reports of many disciples and other witnesses. The best edition of the *Reminiscences* is that of C. E. Norton (1887), who has also edited the correspondence with Goethe (1887) and with Emerson (1883) and four volumes of other letters (1888). Alexander Carlyle has edited his *Love Letters* (1909), *Letters of Carlyle to Mill, Sterling and Browning* (1923) and two more volumes, *New Letters* (1904) and *Carlyle intime* (1907). A book published in 1892, *Last Words of Thomas Carlyle*, is mainly letters. The correspondence of Mrs. Carlyle is in her *Letters and Memorials*, three volumes edited by Froude (1883), supplemented by two more edited by Alexander Carlyle (1903), and her *Early Letters*, edited by David G. Ritchie (1889), and *Letters to her Kinsfolk*, edited by Leonard Huxley (1924). The reports by disciples and others are numerous. Among the best are *Conversations with Carlyle*, by Sir Charles Gavan Duffy (1892); *Literary Recollections*, by F. Espinasse (1893); "Carlyle in Society and at Home," by G. S. Venables (*Fortnightly Review*, 1883-84); *William Allingham, A Diary*, edited by H. Allingham and D. Radford (1907); *Personal Reminiscences of Carlyle*, by A. J. Symington (1886); "Conversations with Carlyle," by William Knighton (*Contemporary Review*, 1881), and *Carlyle Personally and in his Writings*, by David Masson (1885).

There have been many short biographies. That by Richard Garnett (1887) is one of the best, but many others are also good, and so is Augustus Ralli's *Guide to Carlyle* (1920) in two volumes. The four-volume life by J. A. Froude (1882-84) was riddled by many critics, and in the posthumously published book, *My Relations with Carlyle* (1903), Froude at last confessed how he had shaped his work in complete reliance on the truth of what he had been told by Geraldine Jewsbury, that "Carlyle was one of those persons who ought never to have married." This led to a controversy, the upshot of which is that Miss Jewsbury and Mr. Froude, who believed her, were both mistaken. See *The Nemesis of Froude*, by Sir James Crichton-Browne and A. Carlyle (1903) and *The Truth about Carlyle*, by D. A. Wilson (1913), with a preface by Sir James Crichton-Browne. Thanks mainly to Crichton-Browne, there is now no room left for doubt in the medical profession and among people of sense about a matter of peculiar importance in the case of a great moralist.

Of a new *Life of Carlyle*, by D. A. Wilson, in which Carlyle is reported like Dr. Johnson or Confucius, the first volume, *Carlyle till Marriage*, appeared in 1923, and was followed by *Carlyle to the French Revolution* in 1924, *Carlyle on Cromwell and Others* (1925) and *Carlyle at his Zenith* in 1927. Later volumes are entitled *Carlyle to Threescore-and-ten* and *Carlyle in Old Age*. (D. A. W.)

**CARMAGNOLA, FRANCESCO BUSSONE**, COUNT OF (1390-1432), a *condottiere*, won back Gian Galeazzo Visconti's divided territories for Gian's son and heir Filippo Maria Visconti, duke of Milan. In 1425, feeling that he had not been sufficiently rewarded by Visconti, Carmagnola sold his services to the Venetians. In the ensuing war with Milan, he was so dilatory in his actions that the republic became suspicious of his intentions; and indeed Carmagnola was in treaty with his former master. Summoned to Venice by the doge, he was seized, tried for treason, condemned to death and beheaded on May 5, 1432.

See Horatio Brown, *Studies in Venetian History* (1907). A. Manzoni made this episode the subject of a poetical drama, *Il Conte di Carmagnola* (1826).

**CARMAGNOLA**, a town of Italy, in the province of Turin, 18 m. by rail S. of Turin. Pop. (1921) 3,740 (town), 11,914 (commune). It is the junction where the lines for Savona and

Cuneo diverge; it is also connected with Turin by a steam tramway via Carignano. It was captured by the French in 1796.

**CARMAGNOLE**, a word first applied to a Piedmontese peasant costume (from Carmagnola, the town in Italy) well known in the south of France, and brought to Paris by the revolutionaries of Marseilles in 1793. It consisted of a short skirted coat with rows of metal buttons, a tricoloured waistcoat and red cap, and became the popular dress of the Jacobins. The name was then given to the famous revolutionary song, composed in 1792. Each verse of this ends with the refrain:

Vive le son, vive le son,  
Dansons la Carmagnole,  
Vive le son  
Du Canon.

**CARMAN, WILLIAM BLISS** (1861-1929), Canadian poet and journalist, was born at Fredericton, New Brunswick, on April 15, 1861, and was educated at the universities of New Brunswick, Edinburgh (1882-83), and Harvard (1886-88). From 1890 to 1892 he was literary editor of the *New York Independent*, afterwards working on the staffs of *Current Literature* and the *Atlantic Monthly*. The keynote of Carman's poetry is a pagan love of nature. He is a self-acknowledged disciple of Robert Browning, and in a lesser degree, of Matthew Arnold. His numerous volumes of verse include: *Low Tide on Grand Pré* (1893); *Songs from Vagabondia* (Boston, 1894); *More Songs from Vagabondia* (Boston, 1896); and *Last Songs from Vagabondia* (Boston, 1901); these last three containing lyrics by Richard Hovey; *Ballads of Lost Haven* (1897); *By the Aurelian Wall* (1898); *Sappho* (1902); *Pipes of Pan* (1903-05); *Daughters of Dawn* (1912); *April Airs* (1916, repr. 1922); and *Later Poems* (1921). Some of Carman's prose essays have been collected in *Kinship of Nature* (1904); *Friendship of Art*; and *The Poetry of Life* (1905). He died in New Canaan, Conn., June 8, 1929.

See O. Shepard, *Bliss Carman* (1923); and H. D. C. Lee, *Bliss Carman* (1912), which contains a bibliography.

**CARMARTHEN**, the capital town of the county of that name, on the right bank of the Towy, where the river straightens out after meandering, and turns seawards (pop., 1931, 10,310). Its site on the historic south Wales coast road also commands the main Towy route into central Wales from the south and is the focus of roads from hill-lands to the north. The main part of the town is situated on a hillock with the ruins of a Norman castle (converted into a gaol in the 18th century and now disused) on the south-west side; with the fine parish church of St. Peter, founded in the 12th century but largely of 14th-century construction on the north-east side.

The castle site is undoubtedly of great antiquity and was certainly the Roman station of Maridunum. In the post-Roman centuries Carmarthen became the focus of activity for the Welsh chieftains of south Wales and was associated with the name of Merlin as well. After the town passed into Norman hands in 1123 it became subject to many attacks from the people of the hills around. The castle and church were the nucleus of the mediaeval town and in their neighbourhood there are still traces of the old town wall. Carmarthen was granted its first charter by Edward I. in 1313, a privilege which was renewed and augmented by subsequent sovereigns. The mediaeval history of the town, in virtue of its key position, is a record of attacks, sieges and burnings into which enter the names of Llewellyn, Glyndwr, Edward, John and Sir Rhys ap Thomas. On the lower ground to the east of the town near the banks of the river was the Benedictine priory famous for its literary tastes and the *Black Book of Carmarthen*; while on the western side of the town was the house of the Black Friars. In the middle ages Carmarthen was important for its wool trade, being declared by Edward III. in 1353 the sole "staple" for Wales. As a result of the social changes in Tudor times a guild hall was built in 1583 near the centre of the town. The town grew in size and importance. It had associations with the early Protestants among whom were Bishop Ferrar of St. Davids (burnt in the market place, 1555) and John Penry (1559-1593). During the great Rebellion the castle was held for the king, but soon changed hands on the appearance of Cromwell and his

men. Situated at the highest navigable point of the tide, the town became a busy river port as coastal trade grew during the subsequent centuries. Carmarthen became the social centre for the neighbourhood and was associated with Sir Richard Steele, Bishop Thirlewall, David Williams, Dr. Richard Price, Sir Thomas Picton, etc. It became a printing and literary centre as well. Its importance was further enhanced in 1747 by the building of one of the earliest iron-smelting works in Wales, which later manufactured tinplates. The advent of the railway in 1856 helped the local trade of the town and made it an important railway junction. With the development of the seaboard and the changes that followed the industrial revolution Carmarthen's prosperity declined, although the tinworks continued until 1900.

Carmarthen, together with Lichfield, Poole and Haverfordwest, is one of the old boroughs that remain counties of themselves, a privilege granted to Carmarthen by James I. in 1604. It was created a parliamentary borough in 1536 and since 1832 returned a member jointly with Llanelli, but since 1918 it has been merged in the West Carmarthenshire parliamentary area.

**CARMARTHENSHIRE**, South Wales county, is bounded north by Cardigan, east by Brecon and Glamorgan, west by Pembroke, south by Carmarthen Bay and the Bristol Channel (area 918 square m.; the largest Welsh county). It consists essentially of the plain of the Towy, with its continuation into the Tâf Valley. This line of lowland curving from a south-west to a west direction is a worn anticline mainly floored by black shales of Tremadoc (Cambrian Age) covered at the sides by conglomerates, sandstones and shales, with beds of volcanic ash and lava of Arenig (Ordovician Age). Above these are shales, flags and limestones named from Llandilo where they are remarkably developed. North of the Towy lowland the hills are formed of Ordovician and Silurian shales and mudstones, deeply dissected and divided into two zones, one south of Brechfa with a maximum height of 900 ft., and one north of Brechfa and the Cothi reaching above 1,300 ft. South and southeast of the Towy the Silurian sandstones and mudstones form the first hills; behind and above them comes Old Red Sandstone followed by Carboniferous Limestone and Coal Measures. The Old Red Sandstone gives to the south-east the Black Mountains of Carmarthenshire rising to 2,026 ft., while south of this the scarps and moorlands of the Carboniferous Limestone and "Farewell rock" (Millstone Grit) form the north-west rim of the South Wales coalfield, the rich coal measures of the Gwendraeth Valley and Llanelli district being within the county. The Old Red Sandstone rocks on the south side of the main Towy lowland form only very subordinate hill lines westward from the Black Mountains and the Towy makes its way through the Old Red Sandstone zone to an estuary formed by coastal sinking.

The main drainage follows the line of the denuded anticline occupied by the Towy which is fed by streams dissecting especially the northern uplands; these include the Sawdde, Cothi and Gwili. The Gwendraeth Fach and Gwendraeth Fawr and the Loughor follow north-east to south-west lines which are characteristic of the region and the Loughor divides the county from Glamorganshire on the east. The line of the middle Towy is continued by the Tâf on the west boundary of the county and after passing Whitland it turns south-east to the sea near Laugharne. Most of the hills have been rounded by ice action and deposits of boulder clay are frequent on the lower valley sides, especially west of Carmarthen Town on the lowland area which shows evidences of having been a lake probably in late-glacial times. With the exception of Llyn y fan in the Black Mountains the lakes of the county are inconsiderable in size, the Bishop's Pond, two miles East of Carmarthen is a good example of an ox-bow lake.

The region above the 600 ft. contour is dotted with tumuli and cairns and, especially in the north-west section, with menhirs and other great stone monuments. The distribution of Bronze Age finds seems to indicate the use of the coast and rivers or valley ways at the time. Bronze objects are found especially along the South Coast, and at Conwil in the Gwili Valley. The hill top camps of Romano-British age cap spurs of the high ground and seem to be situated at defensible points that guard ways up from the sea and communications along the valleys. Garn Goch (5 m.

north-east of Llandilo) covers some 15 acres and is enclosed by a stone rampart. The Roman focus of ways across the country lay at Maridunum, later Carmarthen, the present capital of the county. The post Roman centuries saw the civilizing and Christianizing influence of the Celtic Saints on the one hand, leaving its mark to this day in dedications of rural churches, and on the other the numerous raids from the sea and by land of Irish and Scandinavians. The strong reign of Rhodri Mawr (c. 870) is said to have brought a measure of peace and his grandson Howell the Good (Hywel Dda) was the first to codify the ancient laws of Wales at his palace of Ty Gwyn Ar Dâf near modern Whitland. The period subsequent to 1080 saw the beginnings of the Norman intrusion. The Normans first built castles along the coast at Kidwelly, Llanstephan, Laugharne, etc., and then penetrated up the valley ways to Carmarthen, Llandilo, etc. It is interesting to find that many of these castles occupy sites previously chosen for defence by earlier rulers of the country, e.g., the castle at Dinefwr. This had been the seat of the princes of South Wales, the central point of Ystrad Tywi the nucleus of the future county. The campaigns of Edward I. gave the Normans a more unified control of the principality and by the Statutes of Rhuddlan (1284) the counties of Cardigan and Carmarthen were formed out of the districts of Ceredigion and Ystrad Tywi. Nearly a third of the present county, however, still remained under the jurisdiction of the Lords Marchers and it was not until the Act of 27 Henry VIII. that these districts, including the commots of Kidwelly, Iscennen and Carnwillion were added to Edward I.'s original shire. The surrounding hill county made Carmarthenshire famous for its wool in the later Middle Ages. Edward III. by the statute staple of 1353 declared Carmarthen town the sole staple for Wales, ordering every bale of wool to be sealed here before it left the Principality. There are few remains of the mediaeval monastic houses: Talley Abbey (north of Llandilo), founded by Rhys ap Griffith prince of South Wales (late 12th century), for Benedictine monks; Whitland, or Alblanda, also a Benedictine house, probably founded by Bishop Bernard of St. David's (early 12th century), on a site long associated with Welsh monastic life and the celebrated Augustinian Priory of St. John at Carmarthen (12th century). Connections with the house of Tudor through Sir Rhys ap Thomas were important in the 16th century. At Abergwili the then new palace of the Bishops of St. David's Bishop Richard Davies (1505-1581) and William Salesbury of Llanrwst translated the New Testament and the Prayer Book into Welsh and in the early part of the 17th century Rhys Prichard (d. 1644), the Puritan Vicar of Llandovery published his famous "Canwyll y Cymry" (the Welshman's Candle). The castles of Carmarthenshire, especially the southern ones, made a very half hearted resistance to the parliamentary forces. Griffith Jones (1684-1761), vicar of Llanddowror founded Welsh circulating schools, the effective beginning of the modern educational movement in Wales. William Williams of Pantycelyn (1716-91) was the chief hymnologist of the Welsh Methodist revival. Dr. Richard Price, the friend of Priestley, also belonged to the shire. Carmarthen was deeply implicated in the Rebecca riots (1842-43). The markets of Carmarthen, Llandilo and Llandovery received cattle driven on foot in pre-railway days, and Llandovery seems to have been an important focus for cattle being driven to the English Midlands.

Old lead mines at Llangunnor (2 m. S.E. of Carmarthen) and Rhandirmwyn (8 m. N. of Llandilo) are derelict. Stock-marts using the railway still continue. The anthracite coalfield in Carmarthenshire led to growth of Ammanford, Llanelli, Pontardulais, etc., and it has tended to develop industries such as tin-plate and copper smelting. The increasing modern demand for anthracite favours the county and the collieries are now nearly all in a large combine with interests in outside fields as well. Some migration from the Glamorganshire coalfield is taking place. The G.W.R. runs from Loughor, in the south-east, along the coast to the Towy estuary which it follows up to Carmarthen and then leaves, going west via Whitland. Branches go from Llanelli to Ammanford and Llandilo, from Pembrey to the Gwendraeth valley, from Carmarthen to Pencader and Newcastle Emlyn, and from Whit-

land to Cardigan. The L.M.S.R. running from Shrewsbury via Craven Arms enters the north-east of the county and runs to Llandovery and Llandilo, with branches thence to Swansea and to Carmarthen, partly conjoint with the G.W.R. Carmarthen has recently become a considerable centre for road-motors.

The area of the county is 587,816 acres and the population in 1931 was 179,063. The municipal boroughs are Carmarthen (styled County Borough) (pop. 10,310), Kidwelly (pop. 3,161), Llandovery (1,980) and Llanelli (pop. 38,398). Urban districts are Ammanford (7,160), Llandilo (1,886), Burry Port (5,752), Newcastle Emlyn (762). The county is in the South Wales circuit, and assizes are held at Carmarthen. The borough of Carmarthen has a commission of the peace and separate quarter sessions. The county is divided into two parliamentary divisions, the eastern (industrial) and the western (rural) each returning one member to parliament. The ancient county contains 75 parishes and a part of another and is wholly in the diocese of St. David's.

**CARMATHIANS**, a Muhammadan sect named after Hamdān Qarmat, who accepted the teaching of the Ismā'ilites (see ISLAM: *Sects*) from Husayn al-Ahwāzī, a missionary of Ahmad, son of the Persian 'Abdallāh ibn Maimūn, toward the close of the 9th century. For the political history of the Carmathians, their conquests, and their decay, see ARABIA: *History*; CALIPHATE and EGYPT: *History* (Muhammadan period).

In their religious teaching they claimed to be Shi'ites; i.e., they asserted that the imamate belonged by right to the descendants of Ali. Further, they were of the Ismā'ilite branch of these, i.e., they acknowledged the claim to the imamate of Ismā'il the eldest son of the sixth imam. 'Abdallāh taught that from the creation of man there had always been an imam sometimes known, sometimes hidden. Ismā'il was the last known; a new one was to be looked for. But while the imam was hidden, his doctrines were to be taught by his missionaries (*dā'īs*). Hamdān Qarmat was one of these, Ahmad ibn 'Abdallāh being nominally the chief. The adherents of this party were initiated by degrees into the secrets of its doctrines and were divided into seven (afterwards nine) classes. In the first stage the convert was taught the existence of mystery in the Qur'ān and made to feel the necessity of a teacher who could explain it. In the second stage the earlier teachers of Islam were shown to be wrong in doctrine and the imams alone were proved to be infallible. In the third it was taught that there were only seven imams and that the other sects of the Shi'ites were in error. In the fourth the disciple learnt that each of the seven imams had a prophet, who was to be obeyed in all things. The prophet of the last imam was 'Abdallāh. In the fifth stage the uselessness of tradition and the temporary nature of the precepts and practices of Muhammad were taught, while in the sixth the believer was induced to give up these practices (prayer, fasting, pilgrimage, etc.). At this point the Carmathian had completely ceased to be a Muslim. In the remaining degrees there was more liberty of opinion allowed and much variety of belief and teaching existed.

The last contemporary mention of the Carmathians is that of Nāsir ibn Khusrau, who visited them in A.D. 1050. In Arabia they ceased to exercise influence. In Persia and Syria their work was taken up by the Assassins (*q.v.*). Their doctrines are said, however, to exist still in parts of Syria, Persia, Arabia and India, and to be still propagated in Zanzibar.

**BIBLIOGRAPHY.**—L. Massignon, "Esquisse d'une bibliographie qarmate," in *Oriental Studies presented to E. G. Browne*, pp. 329-338 (1922); M. J. de Goeje, *Mémoire sur les Carmathes du Bahraïn* (1880).

**CARMAUX**, a town of southern France, in the department of Tarn, on the left bank of the Cérou, 10 m. N. of Albi, under the south-western slopes of the central plateau. Pop. (1926), 9,799. The town gives its name to a coal-basin and has important glass-works.

**CARMEL**. In Palestine, a well-defined mountain ridge ("garden orchard"; Arab. *Jebel Mār Elyās*, Elijah's Mount), wedge-shaped, running north-west-south-east, with a length of some 15 m. and an extreme breadth of about 8½ m. where it meets the Samarian hills, its thin end projecting into the sea to form a headland south of the Bay of Acre. Of the same limestone formation

as the central range of Palestine it suggests a buttress thrust forth to the Mediterranean plain. In the middle it attains an altitude of about 1,800 feet. On its south-west side it subsides gently in ridges and valleys to the plain of Sharon whilst above Haifa and Esdraelon the descent is more rapid. The line of its ridge against the sky can be seen from sea and land over a wide radius. Carmel is covered with a wild and luxuriant vegetation. Forests of oak, groves of olive trees and extensive vineyards flourished there of old. The hill was a sanctuary and its many caves and thick undergrowth afforded security to robbers and outcasts (Strabo xvi. 759). The mountain is mentioned in the conquest lists of Thutmose III. and in the Amarna letters but its place in history is small. Throughout the ages the waves of innumerable military enterprises have surged past its base to break elsewhere. The route naturally followed led along the sea coast or through the defiles in the lower slopes at its southern end, linking the plains of Sharon and Esdraelon. In 1479 B.C. Thutmose III. led his chariots and horsemen to Megiddo by the same defile through which Lord Allenby thrust cavalry and armoured cars in 1918.

The territories of Asher, Zebulun, Issachar and Manasseh met at Carmel but the possession of the mount was never apparently determined. Somewhere on Carmel's top was the scene of Elijah's dramatic challenge resulting in Yahweh's vindication and the complete discomfiture of Baal and his prophets (I Kings 18). Tradition and a consensus of enlightened opinion have fixed the site at *El-Muhraka* ("the burning") on the southern half of the ridge a short distance south-east of *Esfīya*.

Carmel was evidently sacred both to Yahweh and Baal and according to Scylax (*Periplus*. 42) it was sacred to Jupiter in the days of Darius (6th century B.C.). Tacitus (*Hist.* ii., 78) speaks of its oracle beside an altar and remarks on the absence of any divine image. The philosopher Pythagoras went to "the sacred place of Carmel" to meditate (Iamblichus, *Vit. Pyth.* iii. 5); Vespasian when nourishing secret designs before his aggrandisement was confirmed in his hopes by consulting its oracle (Suetonius. *Vesp.* 5). An ideal retreat, the mount attracted Christian anchorites from early times. As early as 570 there is record of a "Monastery of Elisha the Prophet." The Order of Carmelites was founded in 1156 and the monastery then built, situated at the north-west extremity of the ridge, suffered many changes of fortune during the Crusades. A new monastery to "Our Lady of Mount Carmel" was erected in 1767 and used by Napoleon as a hospital for his soldiers. On his retirement (1799) it was burned down. The present building was erected in 1827. The graveyard, with its memorial to Napoleon's soldiers who died there, was desecrated by the Turks during the World War, but a new monument was set up by the French navy in 1919. The Turks posted guns there for the defence of Haifa. They were taken in a charge along the ridge by the Mysore Lancers and the Sherwood Rangers (Sept. 22, 1918). Carmel is included in the re-afforestation scheme of the Palestine Government.

**CARMELITES**, in England called White Friars (from the white mantle over a brown habit), one of the four mendicant orders. The stories concerning the origin of this order, seriously put forward and believed in the 17th and 18th centuries, are one of the curiosities of history. It was asserted that Elias established a community of hermits on Mount Carmel, and that this community existed without break until the Christian era and was nothing else than a Jewish Carmelite order, to which belonged the Sons of the Prophets and the Essenes. Members of it were present at St. Peter's first sermon on Pentecost and were converted, and built a chapel on Mount Carmel in honour of the Blessed Virgin Mary, who, as well as the apostles, enrolled herself in the order. In 1668 the Bollandist (*q.v.*) Daniel Papenbroek (1628-1714), in the March volumes of the *Acta Sanctorum*, rejected these stories as fables. A controversy arose and the Carmelites had recourse to the Inquisition. In Spain they succeeded in getting the offending volumes of the *Acta* censured, but in Rome they were less suc-

cessful, and so hot did the controversy become that in 1698 a decree was issued imposing silence upon both parties, until a formal decision should be promulgated—which has not yet been done.

The historical origin of the Carmelites must be placed at the middle of the 12th century, when a crusader from Calabria, named Berthold, and ten companions established themselves as hermits near the cave of Elias on Mount Carmel. About 1210 the hermits on Carmel received from Albert, Latin patriarch of Jerusalem, a rule comprising sixteen articles. This was the primitive Carmelite rule. The life prescribed was strictly eremitical: the monks were to live in separate cells or huts, devoted to prayer and work; they met only in the oratory for the liturgical services, and were to live a life of great silence, seclusion, abstinence and austerity. This rule received papal approbation in 1226. Soon, however, the losses of the Christian arms in Palestine made Carmel an unsafe place of residence for western hermits, and so, c. 1240, they migrated first to Cyprus and thence to Sicily, France and England. In England the first establishment was at Alnwick and the second at Aylesford, where the first general chapter of the order was held in 1247, and the institute was adapted to the conditions of the western lands to which it had been transplanted, and for this purpose the original rule had to be in many ways altered: the austerities were mitigated, and the life was turned from eremitical into cenobitical, but on the mendicant rather than the monastic model. The polity and government were also organized on the same lines, and the Carmelites were turned into mendicants and became one of the four great orders of Mendicant Friars, in England distinguished as the "White Friars" from the white mantle worn over the dark brown habit. This change was made and the new rule approved in 1247, and under this form the Carmelites spread all over western Europe and became exceedingly popular, as an order closely analogous to the Dominicans and Franciscans. In the course of time, further relaxations of the rule were introduced, and during the Great Schism the Carmelites were divided between the two papal obediences, rival generals being elected,—a state of things that caused still further relaxations. To cope with existing evils Eugenius IV. approved in 1431 of a rule notably milder than that of 1247, but many houses clung to the earlier rule; thus arose among the Carmelites the same division into "observants" and "conventuals" that wrought such mischief among the Franciscans.

Of all movements in the Carmelite order by far the most important and far-reaching in its results has been the reform initiated by St. Teresa. After nearly thirty years passed in a Carmelite convent in Avila under the mitigated rule of 1431, she founded in the same city a small convent wherein a rule stricter than that of 1247 was to be observed. This was in 1562. In spite of opposition and difficulties of all kinds, she succeeded in establishing a number, not only of nunneries, but (with the co-operation of St. John of the Cross, *q.v.*) also of friaries of the strict observance. The interesting and dramatic story of the movement should be sought for in the biographies of the two protagonists. The idea of the reform was to go behind the settlement of 1247 and to restore and emphasize the austerity and the purely contemplative character of primitive Carmelite life. From the fact that those of the reform wore sandals in place of shoes and stockings, they have come to be called the Discalced, or bare-footed, Carmelites, in distinction to the Calced or older branch of the order. In 1580 the reformed monasteries were made a separate province under the general of the order, and in 1593 this province was made by papal act an independent order with its own general and government, so that there are now two distinct orders of Carmelites. The Discalced Carmelites spread rapidly all over Catholic Europe, and then to Spanish America and the East, especially India and Persia, in which lands they have carried on to this day extensive missionary undertakings. Both observances suffered severely from the various revolutions, but they both still exist, the Discalced being by far the most numerous and thriving. There are in all some 2,000 Carmelite friars, and the nuns are much more numerous. In England and Ireland there are houses, both of men and of women, belonging to each observance.

**BIBLIOGRAPHY.**—Max Heimbucher, *Orden u. Kongregationen* (1897), ii. §§ 92–96; Wetzer u. Welte, *Kirchenlexicon* (ed. 2), art. "Carmelitenorden"; Herzog-Hauck, *Realencyclopädie* (ed. 3), art. "Karmeliter"; and the *Catholic Encyclopedia*, art. "Carmelites." The story of St. Teresa's reform will be found in lives of St. Teresa and in her writings, especially the *Foundations*.

**CARMEN SYLVA:** see ELIZABETH, QUEEN OF RUMANIA.

**CARMINATIVES** are drugs which aid the expulsion of gas from the stomach and intestines. They act chiefly by producing a mild irritation and increased vascularity in the stomach, thus stimulating the gastro-intestinal movements or by diminishing spasm. Probably some effect is due to suggestion and to the pleasant sensation they cause in the stomach. Some of the commonest are certain volatile oils or substances containing them, such as capsicum, ginger, oil of cloves, peppermint, chamomile, caraway, aniseed and dill. The last two are very frequently used for children. Other carminatives are chalk, lime water, sodium carbonate and the vegetable bitters such as gentian, orange-peel, etc. Valerian and asafetida are both occasionally used as carminatives, but the smell of both is unpleasant; camphor is used especially in neurotic persons. Tincture of nux vomica being a bitter, has a carminative action, but it also appears to stimulate the plain muscle in the stomach wall; this enhances its action.

**CARMINE**, a rich crimson-red pigment prepared from cochineal (*q.v.*), the dried bodies of the *Coccus cacti* insects indigenous to Mexico and Central America. The powdered cochineal is digested with a dilute solution of carbonate of soda through which live steam is passed; after boiling for two hours the solution is filtered and the colouring matter precipitated by the addition of a requisite amount of alum and cream of tartar. The "crimson lake" thus formed is brought to the required shade by the addition of freshly prepared hydrate of alumina and the lake is washed, filtered and dried at a low temperature. Scarlet shades are obtained by the addition of genuine vermilion along with the hydrate of alumina, whilst the addition of lime produces lakes possessing a deep purple tone. The use of carmine in water colours is giving way to the aniline dyes.

Chemically, carmine may be said to be an aluminum-calcium compound of carminic acid. As a lake it is used in water colours, in cosmetics and in the preparation of fine coach-body colours, though in this it is being gradually superseded by the more permanent lakes obtained from aniline dyestuffs. (See PAINTS, CHEMISTRY OF.) (R. S. M.; W. E. W.)

**CARMONA, ANTONIO OSCAR DE FRAGOSA** (1859– ), Portuguese general and statesman, was made prime minister and minister of war in June 1926 by a military pronunciamiento. He was virtually dictator of Portugal. Whatever may be said of the irregularity of his accession to power, he undoubtedly commanded general respect. His administration did not make effective the great changes expected in the administration. On Nov. 30 Carmona assumed by decree the position of head of the State, pending the election of a constitutional president. A military revolt against the dictator broke out in Oporto on Feb. 2, 1927, followed by a more serious outbreak at Lisbon. Both were suppressed, Carmona receiving assistance from the monarchical parties. On Aug. 26, 1927, he reconstructed his cabinet. He sought to consolidate his power by breaking up the party system, but his attempt to organize a party of national union, on the lines of the Spanish Patriotic Union, met with only partial success. Nevertheless, in April 1928, he was elected president of the republic by a plebiscite, and reconstituted his Government, including civilian elements. He declined a loan, to be arranged by the League of Nations, for the reconstruction of Portuguese finance, deciding that the terms were too onerous.

**CARMONA**, a city of south-west Spain, in the province of Seville, 27m. N.E. of Seville by rail. It is situated on a ridge overlooking the plain of Andalusia, from the Sierra Morena, on the north, to the peak of San Cristobal on the south. Pop. (1920) 22,095. The district round Carmona produces the best type of olives (*gordales*) and the town trades in oil, wine, grain, fruit and cattle, and makes soap, rough cloth and pottery.

Carmona (Roman Carmo) was the strongest city of Further Spain under Julius Caesar (100–44 B.C.) and a large necropolis

with rock-hewn graves; some with vestibules provided with triclinia, an amphitheatre and a rock-hewn temple have been excavated. The finds have been arranged in the local museum.

Carmona was greatly strengthened by the Moors and the present Seville gate was built by them. The parish church, with its Moorish court, is a converted mosque. In 1247 Ferdinand III. of Castile took the town and Peter the Cruel (1350-69) built the lofty citadel with its palace, now in ruins.

**CARNAC**, a village of north-western France, in the department of Morbihan and arrondissement of Lorient, 9 m. S.W. of Auray. Pop. (1926) 736. It has a church in the Renaissance style of Brittany, but owes its celebrity to the stone monuments in its vicinity. (See **STONE MONUMENTS**.) The most remarkable consists of long avenues of menhirs or standing stones; but there are also dolmens and barrows, throughout the whole district. About half a mile to the north-west of the village is the Ménec system, which consists of eleven lines and extends a distance of 3,376 ft. The terminal circle is broken by the houses and gardens of a little hamlet. To the east-north-east there is another system at Kermario (Place of the Dead), which consists of ten lines about 4,000 ft. in length. Still further in the same direction is a third system at Kerlescan (Place of Burning), composed of thirteen lines, about  $\frac{1}{2}$  m. in length, terminated by an irregular circle. These three systems seem once to have formed a continuous series; the menhirs, many of which have been broken up for road-mending and other purposes, have diminished in number by some thousands in modern times. The alignment of Kermario points to the dolmen of Kercado (Place of St. Cado), where there is also a barrow, explored in 1863; and to the south-east of Ménec stands the great tumulus of Mont St. Michel, which measures 377 ft. in length, and has a height of 65 ft. The tumulus, which is crowned with a chapel, was excavated by René Galles in 1862; and the contents of the sepulchral chambers, which include several jadeite and fibrolite axes and Callais beads, are preserved in the museum at Vannes. About a mile east of the village is a small piece of moorland called the Bossenno, from the *bocenieu* or mounds with which it is covered; and here, in 1874, the explorations of James Miln brought to light remains of a Gallo-Roman town. Similar traces were also discovered at Mané Bras, a height about 3 m. to the east. The rocks of which these various monuments are composed is the ordinary granite of the district, and most of them present a strange appearance from their coating of white lichens. Carnac has an important museum of antiquities (Musée Miln).

### MEGALITHIC MONUMENTS

The famous stone alignments, chambered mounds, dolmens denuded of mounds, and menhirs of the Carnac district of Brittany are more numerous, compactly grouped, and in greater variety than elsewhere in Europe. Serious study and excavation began under the auspices of the Société Polymathique du Morbihan (Museum at Vannes) with Dr. Mauricet and the brothers Galles, Dr. de Closmadeuc, the Rev. W. C. Lukis of Guernsey, and James Miln, the Scots archaeologist. Miln bequeathed his collection to Carnac, and had for a pupil a Carnac boy, Zacharie Le Rouzic, afterwards conservator of the Miln-Le Rouzic museum, to whose patient researches archaeology owes its present exact knowledge of the Carnac monuments. (There are also excellent collections from the Carnac region at the Musée de Saint-Germain.)

The annexed figure shows the denuded dolmens, mounds, stone enclosures ("cromlechs" and "quadrilateral enceintes"), and forts grouped about the alignments, and the relationship of these monuments to the sea-coast and the deep-water inlets. The

theoretical chronology of the monuments deduced from an evolutionary typology in which the "simple dolmen" of the stone age was a development of the primitive stone kist, and the beehived chamber with entrance-passage was the final achievement of the neolithic era degenerating by way of the *allée couverte* to the unchambered mound, and the alignments coeval with the "simple dolmen," has been undermined by Le Rouzic's methodical exca-

BY COURTESY OF V. C. C. COLLUM

vation and strict attention over a period of 35 years to the association data revealed. It has been demonstrated that the megalithic monuments grouped in the Carnac district were constructed by a mixed population, carrying on trade with the megalithic centres of Grand-Pressigny, of the Iberian peninsula, and of north-west Britain and Ireland, and influenced, culturally, at first by the Aegean and later by immigration from the Danube region. The local maritime people were slightly-built and very long-headed, recalling the Cromagnon-Homme-Mort type. They lived largely by fishing and shell-fish collecting, used roughly-fashioned flint, bone and horn implements and microlithic flakes, and buried their dead crouched, either in walled-up rock-shelters or in graves made box-fashion of slabs or dug out and lined with boulders; but they also had domestic animals and grain, pottery and polished stone implements, and these two last included styles that are contemporary with the knowledge of metal. Intermingled and interbred with these long-established natives of France were other people anatomically approximating in varying degrees to the more sturdily-built broad-headed folk which is everywhere associated with a metal-using culture. Alongside of crouched inhumation existed the rite of incineration in association with objects contemporaneous with a metal-using culture, and this incineration rite further co-existed with extended inhumation in the same archaeological association. Both burial rites are found in association with every type of megalithic-grave. The constructors of the Carnac megalithic monuments enjoyed a civilization that had spread over the whole of the more populated

parts of Europe in the age of transition from a hunting and fishing existence (when metal was unknown) to the culture-complex of which pottery, polished hoes, axes and chisels, agriculture and stock-raising, metallurgy, active trade, and organized religion, formed part. In the Carnac region this civilization assumed a characteristically peripheral aspect in which the wealthy and dominant were comfortably supplied with the products of the potter's, goldsmith's and lapidary's arts, alongside of poorer folk furnished generally with more primitive pots, implements, ornaments, and graves—not because they were ignorant of the finer goods but because they could not compass their possession.

Excavation demonstrates that the long, low, extensive mound, indicated by a menhir, covering the rudely walled-in site of numerous funeral hearths, and, as a rule, one or more kists containing votive deposits of flints, pottery, and polished axes, antedates the higher chambered cairns and mounds (more often than not circular in outline) with entrance-galleries (of which numerous "dolmens" are the denuded ruins) as well as the denuded *allées couvertes*, but that these low mounds themselves are contemporaneous with the knowledge of metal. Likewise, that kist burial is coeval with every type of megalithic monument. The alignments have been demonstrated to be later than the long low mounds in which keeled bronze-age type pottery is buried in the principal kist. Zacharie Le Rouzic dates these low mounds from 2,500 to 2,000, and the chambered and galleried mounds and *allées couvertes*, together with alignments and stone enclosures, from 2,000 to 1,200 B.C. Closed chambered mounds he places later still.

Beaker pottery is approximately dateable, and definitely contemporaneous with a knowledge of metal. Analysis of the 49 recorded instances of megalithic monuments included in Le Rouzic's inventory for the Carnac region, in which caliciform beaker pottery of Spanish and Channel islands facies has been found (irrespective of locally excavated beaker pottery in the museums whose provenance is not ascertainable), is enlightening when considered in reference to the type of monument, the associated objects and the burial rites. Characterless flint flakes and quartzite hammer-stones are general, associated with unused polished local fibrolite, diorite, jadeite and chloromelanite axes, many of them obviously copies of bronze prototypes; with unused scrapers, knives, and barbed, tanged and leaf-shaped arrow-heads (in one case with part of a flint saw) in Grand-Pressigny and other imported flint; with callais beads sawn with a metal tool from an evenly bored cylinder, and beads in serpentine, talc, and schist; with rock-crystal; and, in six cases, with fragments of hammered gold ornaments such as head-bands (of identical pattern with those from Ur graves of 3000 B.C.) and button-casing, trampled and crumpled up in circumstances suggesting that finds of this metal would have been more common had scientific excavation of *unrifed tombs* been generally possible, and had there never existed in the department a private company for the exploitation of gold from melted-down treasure from the megalithic tombs. In 15 cases there was hand-made black ware (lead-burnished and unburnished), associated in two cases with bronze ornaments and in one case containing a gold ornament. In one case a lignite bracelet, and in another a segmented blue-green faience bead of the Tan Hill, Wiltshire—Fuente Alamo, Almeria, type was found, the latter in association with a fragment of bronze that is thought likely to have been part of a triangular rivetted dagger. (Such daggers with hilts studded with gold nails have been found in the Loire megalithic district en route to Grand-Pressigny.) Five of these monuments were *allées couvertes*—in two cases bent, and in one having a port-hole (but not the only port-hole known in the region), while in another the entrance was closed. Six of the chambers were corbelled, and in three of these cases the vaulted chamber was enclosed in the same mound with a chamber of the dolmen type consisting of support-stones roofed over by capstones. In some monuments dry masonry was associated with megalithic support-stones, and in one case a natural outcrop of rock had been skilfully used as a support-stone in conjunction with ordinary orthostatic blocks. The ground plan of these 49 megalithic monuments included almost every known European type, sometimes two different types

being contained in one mound (the mounds in this region are frequently multiple-chambered, and 2, 3, or even 4 galleried dolmens, denuded of their mounds, are often found side by side). The horseshoe and circular cromlechs, wherever recent excavation has been undertaken, were enclosures within which there were hearths, as at Erlanic and Kerlescan; hut-foundations, as at Kerlescan; and factory sites for ritual objects, as at Erlanic for hardstone votive axes and the peculiar cylindrical and hollow-footed pot with triangular perforations in the drum or foot, which has been found *in situ*, almost intact, in the chambered mound of La Hougue Bie in Jersey. (See the report on the excavation of this mound by the Société Jersiaise in 1924 published in their *Bulletin* for 1925.) Folklore associates them with assemblies and ritual dancing. The alignments remain dubious in intention, though their relatively late date is proved by the excavation of the low mound at Le Manio, over which the alignments run, though their builders respected the tall menhir (graven, and facing in a different direction) set up as the indicator of the large kist (with an axe sculptured on the lid) in which was deposited chalcolithic carinated pottery. The alignments, therefore, were erected by people to whom metal was already known. Since the Kerlescan group (13 lines) is 880 metres long with 540 stones, the Kermario group (10 lines) 1,120 metres long with 982 stones, and the Ménec group (11 lines) 1,167 metres long with 1,099 stones—leaving aside all other groups—the selection of "pointers" to bolster up the theory that they were elaborate astronomical instruments is arbitrary in the extreme. (See figure for general orientation.) This, the most extensive group, with its prolongations near Le Lac and Sainte-Barbe, when considered in its relation to the silted-up Sainte-Barbe inlet and the ford over the Crach river (see figure), suggests, rather, a memorial intention carried out along a route. The alignments usually lead up to, or past, cromlechs, the tallest stones, reaching a height of 4 or 5 metres, standing nearest the enclosure.

Unequivocal village sites are doubtful, but hill-top camps of refuge adjacent to channels, and promontory forts, in use from dolmenic to iron-age times, are common. The general grouping of the Carnac monuments, the association of the most important alignments with the navigable channel of the Crach river, and the erection of the greater chambered mounds on the heights where they still serve as mariners' marks and are visible one from the other across country, suggest that the Veneti, whose great sailing ships so impressed Caesar's generals, maintained a sea-going tradition dating back to prehistoric times, and followed sea-trails to Britain and Spain blazed in the days of the great stone monuments.

The most imposing mounds are Mont Saint-Michel at Carnac (in which bronze was found), the Butte de Tumiach at Arzon, and Mané-Lud at Locmariaquer; and the most interesting of the chambers with sculptured signs (done partly, at least, with a metal tool) are Mané-Lud, Petit-Mont, Gav'r-Inis, Ile Longue, and Kercado, with the denuded *allée couverte* known as Les Pierres Plates. The mightiest menhir is the indicating granite monolith of the long, closed mound of Er-Grah at Locmariaquer which once stood 20 metres high and appears to have been overthrown and broken in three portions by an earthquake in the 17th century. The progressive worsening of the climate as the dry, warm sub-Boreal (placed by C. E. P. Brooks from 3000 to 850 B.C. in "The Climate of Prehistoric Britain," *Antiquity*, vol. I. iv. 1927, p. 412) merged into the wet, cool sub-Atlantic phase, and the consequent inhospitality of the ocean, were probably contributory factors in the declining importance of this maritime region, though the principal cause must have been the gradual occupation of western France by the warlike bronze and iron-using broad-heads whom we know later under the name of Gauls, together with the changed political conditions in the Mediterranean basin.

See W. C. Lukis, article on the Long Barrow at Kerlescan in *Journal of the British Archaeological Association*, Vol. xxiv., p. 40 (1868); Z. Le Rouzic, *Carnac: Fouilles faites dans la région (Campagnes 1909-22)* a series of reports obtainable from the Carnac museum; M. and St. J. Réquart and Z. Le Rouzic, *Corpus des Signes Gravés des Monuments Mégalithiques du Morbihan* (1927). (V. C. C. C.)

1. The Menec alignments, containing 1,099 stones in 11 lines, oriented E.N.E. 2. The Kermario (place of the dead) alignments. Here are 10 lines of 982 stones, some more than 18 feet high. 3. Mont-Saint-Michel barrow. This mound, 125 mètres long and 10 mètres high, covers a beehived burial vault, a dolmen, 19 kists and a galleried dolmen. Bones, vases, axe-heads, callais beads and bronze bells were found in the graves. 4. The Tumiac chambered barrow, a circular mound constructed of sea-mud. 5. The

Pierres Plates, stone alley, at Loomariaquer. Thirteen of these stones bear shield-like devices resembling an octopus. 6. Sculptured stones from Pierres Plates, stone alley, Loomariaquer. The device suggests the local octopus, still exported by Breton fishermen. 7. Mound of Le Manio, during excavation. An engraved kist and bronze-age pottery were found here. 8. Sculptures from buried foot of menhir, Le Manio (from cast). This mound covers many sacred hearths

BY COURTESY OF (1, 3-8) V.C.C. COLLUM, (2) ZACHARIE LE ROUZIC

### STONE MONUMENTS OF CARNAC, BRITTANY

1. Prehistoric phallic pillar, with a runic inscription, and a Christian cross
2. Sculptured slab in chambered mound of the Mané-er-H'roek, Loomariaquer
3. The isolated menhir Gouhar'h, Conguel, Quiberon, near burial chamber.  
This pillar is 18 ft. high
4. One of 27 stone kists and graves at Inis-Tilleuc, Portiog, Quiberon
5. Human feet sculptured in relief on the wall of the chamber at Petit Mont
6. Sculptured stone (from cast) in megalithic chamber, Mane-Lud, Loomariaquer. In this mound human bones, beaker pottery, gold ornaments and flint arrow heads were found
7. Sculptured stone (from cast), Mané-Lud, Loomariaquer, with signs representing sacred horns, or boats
8. Sculptured stone, part of denuded dolmen, from hill-top camp at Le Lizo. This stone is now in the Carnac Museum

**CARNARVON, EARLDOM OF.** The earldom of Carnarvon was created in 1628 for Robert Dormer, Baron Dormer of Wyng (c. 1610–1643), who was killed at the first battle of Newbury whilst fighting for Charles I., and it became extinct on the death of his son Charles, the 2nd earl, in 1709. From 1714 to 1789 it was held by the family of Brydges, dukes of Chandos and marquesses of Carnarvon, and in 1793 Henry Herbert, Baron Porchester (1741–1811), was created earl of Carnarvon.

His great-grandson, HENRY HOWARD MOLYNEUX HERBERT, 4th earl of Carnarvon (1831–1890), was born on June 24, 1831. He was educated at Eton and Christchurch, Oxford, and succeeded to the title in 1849, on the death of his father, Henry John George, the 3rd earl (1800–1849). In 1858 he was under-secretary for the colonies, and in 1866 secretary of state, and he introduced in 1867 the bill for the federation of the British North American provinces; but before the measure became law he had resigned, owing to his distaste for Disraeli's Reform bill. Resuming office in 1874, he endeavoured to confer a similar boon on South Africa, but the times were not ripe. In 1878 he again resigned, out of opposition to Lord Beaconsfield's policy on the Eastern question; but on his party's return to power in 1885 he became lord-lieutenant of Ireland. He resigned on a question of personal veracity raised by Parnell. He never returned to office, and died on June 29, 1890. He was high steward of the University of Oxford, and president of the Society of Antiquaries. The 4th earl was succeeded by his son, George Edward Stanhope Molyneux (1866–1923), *q.v.*

**CARNARVON, GEORGE EDWARD STANHOPE MOLYNEUX HERBERT**, 5TH EARL OF (1866–1923), English Egyptologist, was born at Highclere, Berkshire, June 26, 1866, and educated at Eton and Trinity college, Cambridge. Always interested in Egyptian archaeology and politics, he began excavations near Thebes with Mr. Howard Carter in 1906 and discovered tombs of the XII. and XVIII. Egyptian Dynasties in the Valley of the Kings. A further concession having been obtained in 1914, operations in another part of the Valley were conducted after the World War, resulting in the discovery by Mr. Carter in Nov. 1922 of the antechamber of the tomb of Tutankhamen (*q.v.*) of the XVIII. Dynasty. On Feb. 16, 1923, the sepulchral chamber was opened, the actual sarcophagus being discovered on Jan. 3, 1924. Meanwhile Lord Carnarvon had died in Egypt on April 5, 1923, from the results of a mosquito bite and pneumonia. See *The Tomb of Tut-ankh-Amen* by Howard Carter and A. C. Mace (1923).

**CARNARVON**, ancient market town, municipal and contributory parliamentary borough, seaport and county town of Carnarvonshire, North Wales, 68½ m. W. of Chester by the coastal L.M.S.R. Pop. (1931), 8,469. It stands near the south-western end of the Menai straits, at the mouth of the Seiont. The settlement dates from mediaeval days; though only ¼ m. away is the site of the Roman Segontium. Its famous castle, begun for Edward I. in 1284, though little more than a shell, is a most imposing monument, occupying some 3 ac. at the angle between the Seiont and the straits. It is now public property, under the care of a constable. The town walls (1284–85), enclosing an area to the north of the castle, are almost intact. To the south-east is Llanbeblig, the mother-church of Carnarvon, with a 14th-century north chapel. From the little harbour a ferry crosses to Anglesey. The slates of the Llanberis district are exported. The town has few industries; it is best known as a tourist centre for the Snowdon country. It is an ancient parliamentary borough contributory to the Carnarvon district of boroughs, returning one member. Near the town is a wireless telegraphy station. The county quarter sessions and assizes are held in the town, which has a separate commission of the peace, but no separate court of quarter sessions.

**CARNARVONSHIRE**, a county of North Wales (Welsh *Caer'narfon*, for *Caer yn Arfon*), bounded north by the Irish Sea, east by Denbigh, south-east by Merioneth, south by Cardigan Bay, south-west by Carnarvon Bay and west by the Menai Straits. Area, 565 square miles. A small detached portion of the county on the north coast of Denbighshire stretches inland some 2½ m. between Old Colwyn and Llanddulas. The south-west of the

county, called Llyn, projects as a peninsula separating Carnarvon and Cardigan Bays.

The denuded Archaean lowland of Anglesey preserves rocks of Devonian and Carboniferous age along a low line that crosses it from north-east to south-west and along parts of the Menai Straits; Carboniferous rocks are also preserved at the north-east corner of Anglesey and along the north coast east of the Conway, with the Great Orme's Head as an outstanding feature. Archaean rocks also form the west side of the south part of Llyn from near Nevin to the point of Braich-y-Pwll, as well as the island of Bardsey beyond. The area immediately south-west of the Menai Straits shows a zone of Cambrian rocks between Bangor and Bethesda on the north and stretching from Aber, near Bangor, south-westward to Clynnog; it includes a belt of Ordovician rocks and two zones of igneous rocks, all elongated in the north-east-south-west direction. The next zone is the highly characteristic mountain range which is the main feature of the county's geography and is almost unique in showing many features that elsewhere are met with only at twice the height or more. In it Ordovician grits and shales, interbedded with, and to a larger extent overlaid by, lavas, and also penetrated by intrusive rocks, occur in folds, the summit of Snowdon being structurally a syncline in the upper Ordovician volcanic rocks which dominate the lower grits and shales in the great rock-wall standing above Llyn ddu Arddu. Mynydd Mawr, west of Snowdon, represents the neck of a volcano.

The north-eastern end of the main range rises from Conway Mountain (808 ft.) and Penmaenmawr (1,550 ft.), near the north coast, south-westward to Carnedd Llewelyn (3,484 ft.) and Carnedd Dafydd (3,426 ft.), and this section of the range is divided by the deep Ogwen Pass (1,000 ft.) from the next in which are Y Glyder Fawr (3,279 ft.) and Y Glyder Fach (3,262 ft.). Elidir Fawr (3,029 ft.) is a western outpost in this section which is bounded on the south-west by another deep zone of faults forming the pass of Llanberis (1,169 ft.). South-west of this is Snowdon (Eryri or Yr Wyddfa, 3,560 ft.). The Snowdon mass again is separated by the pass (651 ft.) above Rhyd ddu from three somewhat radially arranged masses which are also separated from one another by deep lines. The most northern of these three masses is dominated by Mynydd Mawr (2,290 ft.), the median one by Garnedd Goch (2,301 ft.) and the southerly one by Moel Hebog (2,566 ft.). The median one, itself mainly of intrusive igneous rock, may be said to be followed by a series of heights, Gyrn ddu (1,712 ft.), Yr Eifl (1,849 ft.) and Garn Bodfan (918 ft.) stretching down the Llyn peninsula.

The south-east flank of the main range is marked by another deep line, more gentle however than those cross ones which have just been named. This drains eastward to the Conway by the Gwrhyd and Llugwy, on which latter occur the Swallow Falls, and south-westward by the Glaslyn which occupies Nant Gwynant and drains its two lakes, Llyn Gwynant and Llyn Dinas. After receiving a contributor (the Colwyn) from the Rhyd ddu pass on the west of Snowdon, the Glaslyn leaves the mountains by the wild gorge of Aberglaslyn emerging on to the lowland of Traeth Mawr, partly reclaimed from the sea in recent times. South and south-east of the Llugwy, Gwrhyd and Glaslyn valleys is a subordinate range, the directive lines of which are parallel to those of the valleys and are largely determined by zones of basalt, dolerite and diabase. Here are Moel Siabod (2,860 ft.) and Cynicht (2,265 ft.), the latter a very sharp peak.

The deep-cut divisions of the range are one of its most marked features and along these lines there occur numerous elongated lakes typically with a morainic dam at the lower end. Contrasting with these lakes are others higher up the mountain sides occupying deep corries or cwms, that is, glacial cirques. Cwm Glas with its little lake on the east of Snowdon summit, and Llyn Idwal on the north side of Y Glyder Fawr are among the finest of these cirques with great precipices more than half surrounding the lakes. The rivers of the range are mostly swift, draining to the Irish Sea and the Menai Straits for the most part, with the exception of the Glaslyn already mentioned. The Ogwen, Seint (commonly Seiont), and Gwyrfaï drain down the passes north-westwards to

the Menai Straits. The Conway, with its feeders Machno, Lledr and Llugwy (which receives the Gwrhyd), is the chief stream and runs in a remarkably straight valley from Bettws y Coed to the sea; it is navigable for about 12 m. from the sea. This valley separates the Snowdon range with its igneous rocks from the Denbighshire plateau of Silurian rocks without igneous intrusions which, like the Welsh highland plateau generally, remains below the 2,000 foot level.

The contrast between the Welsh Highland Plateau, with its rounded hill-tops, the remains of a peneplain, and the mountain range above the 2,000 foot contour, with its sharp cirques almost against the very heart of the mountains, is a marked feature of Wales repeated in the Cader Idris range and noticeable elsewhere in greater or less degree in West Wales where the land rises above the 2,000 foot level. On the north-west and south-east flanks of the Carnarvonshire range Cambrian rocks outcrop. Their distribution north-west of the range has been mentioned above; on the south-east of the range they occur from Blaenau Ffestiniog nearly to Criccieth and another outcrop forms the Trwyn Cilan promontory between St. Tudwals Roads and Porth Neigwl. This last is doubtless a continuation of the outcrop farther east, the intervening mass having sunk under Cardigan Bay, the coastline of which, low in places, has Ordovician strata with a number of igneous masses. The argillaceous Cambrian rocks were obviously subjected to intense pressure during the uprise of the folds of the mountain range and, especially towards the junctions of Cambrian and Ordovician, finely cleaved slates of economic importance are found, the chief centres being Bethesda, Llanberis and Penygroes on the north-west and Blaenau Ffestiniog on the south-east. It is usually claimed that the last important movement of land has been a downward one of post-Pleistocene date and that this has not only created the waterway of the Menai Straits but has also given the Lavan and Carnarvon sands, large areas of lost land.

The prehistoric relations of Carnarvonshire suggest that the county was of some importance in megalithic times, especially perhaps the zone between Criccieth and Carnarvon. The south-eastern coastal region has yielded considerable bronze finds and the native hill-top fortresses of Penmaenmawr, Tre'r Ceiri, Dinas Emrys (near Beddgelert) etc., apparently dating from Roman times at least in their present forms, as well as the Roman posts at Segontium (Carnarvon, *q.v.*) and Caerhun (Conway, *q.v.*), show the importance of the region in Roman times. As traditional ways to Ireland lay through the county and Anglesey it may be that the early importance of Carnarvonshire was partly connected with this fact. Deganwy on the fertile clay soil of the lower Conway seems to have been of importance in post-Roman times. During the early Middle Ages, Carnarvonshire was divided into four cantrevs, Arfon, the country from the Menai Straits to the heart of the mountains, and the centre of Welsh folk-lore, Arllechwedd from the Ogwen river in the west to Dolgarrog on the lower Conway in the east, a coastal plain with mountains behind, but also including Nant Conway, Lley, the south-western peninsula, marked with old roads and hospices for pilgrims to Bardsey, and Eifionydd in the south of the county at the base of the Lley peninsula.

After the military conquest by Edward I. (1282), the Statute of Rhuddlan converted North Wales, save the lordship of Denbigh, into shire-ground and the king had castles built at several places and notably around the mountain fastnesses at Carnarvon, Conway, Criccieth and Harlech. The 14th century witnessed many disturbances culminating early in the 15th century in the great effort of Owain Glyndwr who made himself master of Wales and tried to develop a policy of an autonomous church and two universities, a policy which failed through military defeat. English influences spread from the castle towns as well as from the enfranchised manors of Nevin and Pwllheli, and Anglesey became strategically important in connection with Ireland, with the result that English attention was focussed on Carnarvon, and Lley lost its Irish links, becoming a region of survival of Welsh speech and old customs. Arfon later became to a large extent Anglican in religion while nonconformity grew strong in Eifionydd and Lley.

**Industries.**—Agriculture, especially sheep farming, is the most important occupation. The Snowdon area is the great sheep farming area, while Eifionydd is noted for its mixed farming with its market focus at Criccieth. Lley centres on Pwllheli and has large farms growing a little wheat and a great deal of barley. Its cattle are specially good and are exported to other areas in Wales as well as to the English Midlands.

North Carnarvonshire is a region of slate and granite quarrying. The chief quarries are at Bethesda, Llanberis and Nantlle, which send their export of roofing slate and slate blocks to Penrhyn, Port Dinorwic and Carnarvon respectively. Many of the quarrymen are small farmers as well. There is also a great deal of road-stone quarrying, Pwllheli being an important centre. There are electrical power works at Dolgarrog and Cwm Dyli, with aluminium works at the former place. Catering for summer visitors is also a feature of the county both in the coast resorts and inland.

**Communications.**—The G.W.R. runs along the Cardigan Bay coast and terminates at Pwllheli. The Welsh Highland Railway (narrow gauge) runs from Dinas, south of Carnarvon, to Portmadoc, Blaenau Ffestiniog and Duffws. The L.M.S.R. main line runs along the northern coast, with branches from Llandudno junction to Blaenau Ffestiniog, along the Denbighshire side of the Conway; from Menai Bridge to Carnarvon (thence continuing to Llanberis, or, by another line, to Afon Wen, 4 m. from Pwllheli). Since 1920 road transport has become very important, especially in Lley and the west of the county, where poor railway facilities have been supplemented by a good motor-bus service.

**Administration.**—The area of the administrative county is 364,108 acres. Pop. (1921) 128,183, (1931) 120,810. The county as a whole returns two members to Parliament, one for the county and the other for the Carnarvon Boroughs, which include the municipal boroughs of Bangor, Carnarvon, Conway and Pwllheli, the urban districts of Criccieth, Llandudno, Llanfairfechan, Penmaenmawr and the civil parish of Nevin. The assizes are held at Carnarvon and are part of the North Wales circuit. Except a few parishes (in and near Llandudno) in St. Asaph diocese, Carnarvonshire is in the diocese of Bangor and contains sixty-one ecclesiastical parishes or districts, with parts of four others.

See Edw. Breese, *Kalendar of Gwynedd* (1874); J. E. Lloyd, *The Story of Carnarvonshire*, Cambridge County Geographies.

**CARNATIC**, a name given by Europeans to a region of southern India, between the Eastern Ghats and the Coromandel Coast, in the presidency of Madras. Properly the name applies only to the country of the Kanarese extending between the Eastern and Western Ghats, over an irregular area narrowing northwards, from Palghat in the south to Bidar in the north, and including Mysore. Administratively the name Carnatic (or rather Karnatak) is now applied only to the Bombay portion of the original Karnata, viz., the districts of Belgaum, Dharwar and Bijapur, and the native states of the Southern Mahratta agency, Jath and Kolhapur.

**History.**—The Carnatic was of great importance historically. It extended along the eastern coast of India about 600 m. in length, and from 50 to 100 m. in breadth. It was bounded on the north by the Guntur circar, and thence it stretched southward to Cape Comorin. The region south of the river Coleroon, which passes the town of Trichinopoly, was called the Southern Carnatic. The Central Carnatic extended from the Coleroon river to the river Pennar. The Northern Carnatic extended from the river Pennar to the northern limit of the country. The Carnatic, as above defined, comprehended within its limits the maritime provinces of Nellore, Chingleput, South Arcot, Tanjore, Madura and Tinnevely, besides the inland districts of North Arcot and Trichinopoly.

At the earliest period of which any records exist the Carnatic was divided between the Pandya and Chola kingdoms, which with that of Chera or Kerala (*q.v.*) formed the three Tamil kingdoms of southern India. The Pandya kingdom practically coincided in extent with the districts of Madura and Tinnevely; that of the Cholas extended along the Coromandel coast from Nellore to Pudukottai, being bounded on the north by the Pennar river and

on the south by the Southern Vellaru. The government of the country was shared for centuries with these dynasties by numerous independent or semi-independent chiefs, evidence of whose perennial internecine conflicts is preserved in the multitudes of forts and fortresses the deserted ruins of which crown almost all the elevated points. In spite, however, of this passion of the military classes for war the Tamil civilization developed in the country was of a high type. This was largely due to the wealth of the country, famous in the earliest times as now for its pearl fisheries. Of this fishery Korkai (the Greek Kolchoi), now a village on the Tambraparni river in Tinnevely, but once the Pandya capital, was the centre long before the Christian era. In Pliny's day, owing to the silting up of the harbour, its glory had already decayed and the Pandya capital had been removed to Madura (*Hist. Nat.* vi. cap. xxiii. 26), famous later as a centre of Tamil literature. The Chola kingdom, which four centuries before Christ had been recognized as independent by the great Maurya king Asoka, had for its chief port Kaveripaddanam at the mouth of the Cauvery, every vestige of which is now buried in sand. For the first two centuries after Christ a large sea-borne trade was carried on between the Roman empire and the Tamil kingdoms; but after Caracalla's massacre at Alexandria in A.D. 215 this ceased, and with it all intercourse with Europe for centuries. Henceforward, until the 9th century, the history of the country is illustrated only by occasional and broken lights. The 4th century saw the rise of the Pallava power, which for some 400 years encroached on, without extinguishing, the Tamil kingdoms. When in A.D. 640 the Chinese traveller Hsüan Tsang visited Kanchi (Conjevaram), the capital of the Pallava king, he learned that the kingdom of Chola (Chu-li-ya) embraced but a small territory, wild, and inhabited by a scanty and fierce population; in the Pandya kingdom (Malakuta), which was under Pallava suzerainty, literature was dead, Buddhism all but extinct, while Hinduism and the naked Jain saints divided the religious allegiance of the people. The power of the Pallava kings was shaken by the victory of Vikramaditya Chalukya in A.D. 740, and shattered by Aditya Chola at the close of the 9th century. From this time onward the inscriptional records are abundant. The Chola kingdom, which in the 9th century had been weak, now revived, its power culminating in the victories of Rajaraja the Great, who defeated the Chalukyas after a four years' war, and, about A.D. 994, forced the Pandya kings to become his tributaries. A magnificent temple at Tanjore, once his capital, preserves the records of his victories engraved upon its walls. His career of conquest was continued by his son Rajendra Choladeva I., self-styled Gangaikonda owing to his victorious advance to the Ganges, who succeeded to the throne in A.D. 1018. The ruins of the new capital which he built, called Gangaikonda Chola-puram, still stand in a desolate region of the Trichonopoly district. His successors continued the eternal wars with the Chalukyas and other dynasties, and the Chola power continued in the ascendant until the death of Kulottunga Chola III. in 1278, when a disputed succession caused its downfall and gave the Pandyas the opportunity of gaining for a few years the upper hand in the south. In 1310, however, the Mohammedan invasion under Malik Kafur overwhelmed the Hindu states of southern India in a common ruin. But though crushed, they were not extinguished; a period of anarchy followed, the struggle between the Chola kings and the Muslims issuing in the establishment at Kanchi of a usurping Hindu dynasty which ruled till the end of the 14th century, while in 1365 a branch of the Pandyas succeeded in re-establishing itself in part of the kingdom of Madura, where it survived till 1623. At the beginning of the 15th century the whole country had come under the rule of the kings of Vijayanagar; but in the anarchy that followed the overthrow of the Vijayanagar empire by the Muslims in the 16th century, the Hindu viceroys (*nayakkas*) established in Madura, Tanjore and Kanchi made themselves independent, only in their turn to become tributary to the kings of Golconda and Bijapur, who divided the Carnatic between them. Towards the close of the 17th century the country was reduced by the armies of Aurangzeb, who in 1692 appointed Zulfiqar Ali nawab of the Carnatic, with his

seat at Arcot. The collapse of the Delhi power after the death of Aurangzeb produced further changes. The nawab Saadatallah of Arcot (1710-32) established his independence; his successor Dost Ali (1732-40) conquered and annexed Madura in 1736, and his successors were confirmed in their position as nawabs of the Carnatic by the nizam of Hyderabad after that potentate had established his power in southern India. After the death of the nawab Mohammed Anwar-ud-din (1744-49), the succession was disputed between Mohammed Ali and Husein Dost. In this quarrel the French and English, then competing for influence in the Carnatic, took opposite sides. The victory of the British established Mohammed Ali in power over part of the Carnatic till his death in 1795. Meanwhile, however, the country had been exposed to other troubles. In 1741 Madura, which the nawab Dost Ali (1732-40) had added to his dominions in 1736 was conquered by the Mahrattas; and in 1743 Hyder Ali of Mysore overran and ravaged the central Carnatic. The latter was reconquered by the British, to whom Madura had fallen in 1758; and, finally, in 1801 all the possessions of the nawab of the Carnatic were transferred to them by a treaty which stipulated that a large annual revenue should be reserved to the nawab, and that the British should undertake to support a sufficient civil and military force for the protection of the country and the collection of the revenue. On the death of the nawab in 1853 it was determined to put an end to the nominal sovereignty, a liberal establishment being provided for the family.

The southern Carnatic, when it came into the possession of the British was occupied, with doubtful right, by military chieftains called poligars. They were unquestionably a disorderly race; and the country, by their incessant feuds and plunderings, was the scene of continued strife and violence. Under British rule they were subdued and their military establishments destroyed.

See INDIA: *History*. For the various applications of the name Carnatic see the *Imperial Gazetteer of India* (1908), s.v.; for the early history of the country see V. A. Smith, *Early History of India* revised by S. M. Edwardes (1924); Robert Sewell, *A Forgotten Empire* (Vijayanagar) (1900); *The Cambridge History of India*, ed. Prof. E. J. Rapson (1922 et seq.).

CARNATION, A HIGHLY PERFUMED FLOWER GROWN EXTENSIVELY IN THE UNITED STATES  
The flower has various forms and colours, its stem supporting grasslike leaves

**CARNATION** (*Dianthus Caryophyllus*, family Caryophyllaceae), a garden flower, a native of southern Europe, but occasionally found in an apparently wild state in England. It is held in high estimation for the beauty and the delightful fragrance of its blossoms. The varieties are numerous, and are ranged under three groups, called *bizarres*, *flakes* and *picotees*.

The true carnations, as distinguished from picotees, are those which have the colours arranged in longitudinal stripes or bars of variable width on each petal, the ground colour being white. The *bizarres* are those in which stripes of two distinct colours occur on the white ground, and it is on the purity of the white ground and the clearness and evenness of the striping that the technical merit of each variety rests. The *flakes* have stripes of only one colour on the white ground. The *sells*, those showing one colour only, as white, yellow, crimson, purple, etc., are commonly called *cloves*.

The *picotee* has the petals laced instead of striped with a distinct colour. The "winter flowering" or "perpetual" race is remarkable for the charming delicacy and colouring of the blossoms and for the length of the flower-stalks. This enables them to be used during the duldest months of the year for floral decorations. These varieties are propagated by layers or cuttings or "pipings."

"Marguerite" carnations are remarkable for their beautifully fringed blossoms. They are easily raised from seeds. "Jacks" are seedling carnations with single flowers of no great value or beauty.

Carnations are usually propagated by "layering" the non-flowering shoots about the second or third week in July, in the open air. The soil for carnations and picotees should be a good turfy loam, as fibrous as it can be obtained; to four parts of this add one part of rotten manure and one of leaf-mould, with sufficient sharp sand to keep it loose.

**CARNEADES** (214-129 B.C.), Greek philosopher, founder of the Third or New Academy, was born at Cyrene. Little is known of his life. He learned dialectics under Diogenes the Stoic, and under Hegesinus, leader of the academy. The chief objects of his study, however, were the works of Chrysippus, opposition to whose views is the mainspring of his philosophy. In 155, together with Diogenes the Stoic and Critolaus the Peripatetic, he was sent on an embassy to Rome to justify certain depredations committed by the Athenians in the territory of Oropus. On this occasion he delivered two speeches on successive days, one in favour of justice, the other against it. His powerful reasoning excited among the Roman youth an enthusiasm for philosophical speculations, and the elder Cato insisted on Carneades and his companions being dismissed from the city.

Carneades, practically a 5th-century sophist, is the most important of the ancient sceptics. Negatively, his philosophy is a polemic against the Stoic theory of knowledge in all its aspects. All our sensations are relative, and acquaint us, not with things as they are, but only with the impressions that things produce upon us; it is impossible to distinguish between false and true impressions; therefore the Stoic *φαντασία καταληπτική* (see STOICS) must be given up. There is no criterion of truth. In answer to the Stoic doctrine of design in nature, he points to the existence of evil; and against the theory of a divine providence he argues that the world cannot be shown to be anything but the product of natural forces. While against Stoic theology he points out that individuality is not consonant with infinity, with Aristotle he argues that virtue, as relative, cannot be ascribed to God; and further that neither intelligence, corporeality nor incorporeality, nor in fact anything can be regarded as attributes of God; thus anticipating much in modern thought.

The positive side of his teaching resembles in all essentials that of Arcesilaus (q.v.). Knowledge being impossible, a wise man should practise *ἐποχή* (suspension of judgment). He will not even be sure that he can be sure of nothing. Ideas or notions are never true, but only probable; nevertheless, there are degrees of probability, and hence degrees of belief, leading to action, according as the impression is merely probable in itself; probable and uncontradicted; or probable, uncontradicted and confirmed by investigation. Carneades left no written works; his opinions seem to have been systematized by Clitomachus.

See A. Geffers, *De Arcesilae Successoribus* (1845); C. Gouraud, *De Carneadis Vita et Placitis* (1848); V. Brochard, *Les Sceptiques grecs* (1887); C. Martha, "Le Philosophe Carnéade à Rome," in *Revue des deux mondes*, xxix. (1878), and the histories of philosophy; F. Alessio, *Carneade* (Mondovi, 1890), also *ACADEMY, GREEK*.

**CARNEGIE, ANDREW** (1835-1919), American manufacturer, was born in Dunfermline, Scotland, on Nov. 25, 1835. In 1848 his father emigrated to America, settling in Allegheny City, Pennsylvania. He worked as a bobbin-boy in a cotton factory, and then as a telegraph clerk and operator. T. A. Scott of the Pennsylvania Railroad employed him as secretary, and in 1859 made him superintendent of the western division of the line. When the Civil War opened he accompanied Scott, then assistant secretary of War, to the front. He introduced sleeping-cars for railways, and purchased (1864) Storey Farm on Oil Creek, where much oil was brought in. Foreseeing the extent to which the demand for iron and steel would grow, he started the Keystone Bridge works, built the Edgar Thomson steel-rail mill, bought out the Homestead steel works, and by 1888 had under his control an extensive plant served by tributary coal and iron fields, a railway 425m. long, and a line of lake steamships. In spite of the depression of 1892, marked by the bloody Homestead strike, the

various Carnegie companies, aided by favourable tariff legislation, prospered to such an extent that in 1901 they were incorporated in the United States Steel Corporation. Mr. Carnegie himself retired from business.

His views on social subjects and the responsibilities which great wealth involved were already known in a book entitled *Triumphant Democracy*, published in 1886, and in his *Gospel of Wealth* (1900). He devoted himself to the work of providing capital for social and educational advancement. Among these the provision of public libraries in the United States and Great Britain (and similarly in other English-speaking countries) was especially prominent, his method being to build and equip, but on condition that the local authority provided site and maintenance. In 1901 he founded the Carnegie Institute of Technology at Pittsburgh, and in 1902 the Carnegie Institution at Washington. In Scotland he established a trust for assisting education at the Scottish universities, a benefaction which resulted in his being elected lord rector of St. Andrews university. He was a large benefactor of the Tuskegee Institute under Booker Washington for negro education. He also established large pension funds—in 1901 for his former employés at Homestead, and in 1905 for American college professors. His benefactions in the shape of buildings and endowments for education and research are too numerous for detailed enumeration, and are noted in this work under the headings of the various localities. But mention must also be made of his founding of Carnegie Hero Funds, in America (1904) and in the United Kingdom (1908), for the recognition of deeds of heroism; his contribution in 1903 for the erection of a Temple of Peace at The Hague, and for a Pan-American Palace in Washington as a home for the International Bureau of American Republics. In 1911 he established the Carnegie Corporation and endowed it liberally for the furtherance of civilization. By the close of 1918 he had erected 2,505 library buildings. He supported the movement for spelling reform. He died at Lenox (Mass.), on Aug. 11, 1919.

Among publications by him are *An American Four-in-hand in Britain* (1883), *Round the World* (1884), *The Empire of Business* (1902), a *Life of James Watt* (1905) and *Problems of To-day* (1908).

**CARNEGIE**, a borough of Allegheny county, Pennsylvania, U.S.A., 6m. S.W. of Pittsburgh, in the beautiful valley of Chartiers creek. It is served by the Pennsylvania, the Pittsburgh, Chartiers and Youghiogheny and the Pittsburgh and West Virginia railways. The population in 1920 was 11,516; and it was 12,497 in 1930. The principal industries are coal-mining and the manufacture of steel and steel products, lead, glass, structural iron and enamelled ware. The factory output in 1925 was valued at \$3,279,952. The borough was formed in 1894 by uniting Chartiers and Mansfield. A few miles south is Bower Hill, the chief scene of violence in the "whisky rebellion" of 1794.

**CARNEGIE TRUSTS**, the second largest, and in some respects the most remarkable, group of charitable foundations in the world. Andrew Carnegie's theory of wealth is summed up in the following sentence: "This, then, is held to be the duty of the man of wealth: to set an example of modest, unostentatious living, shunning display or extravagance; to provide moderately for the wants of those dependent upon him; and, after doing so, to consider all surplus revenues which come to him simply as trust funds, which he is called upon to administer . . . the man of wealth thus becoming the mere trustee and agent for his poorer brethren." In this spirit he founded the following trusts in the United Kingdom and in America.

#### I. TRUSTS IN THE UNITED KINGDOM

**Carnegie Trust for the Universities of Scotland (Edinburgh).**—Founded in 1901 this has a capital of £2,000,000. One half of the income is to be applied to the improvement and expansion of the four Scottish universities, chiefly in the field of research; one half to the payment of the whole or part of the fees of university students of Scottish birth or extraction.

**Carnegie Dunfermline Trust.**—Founded in 1903 with £750,000, this is the counterpart of the Pittsburgh Institute (see below). This trust is limited to the founder's native city of Dun-

fermline, but the income may be spent on anything which tends to bring "sweetness and light" to the community. The trustees are, however, charged to maintain the beautiful park known as Pittencrieff Glen, which was presented by the founder separately. They have established a number of institutes, a clinic, a craft school, a school of music and a physical training college, and have substantially assisted the public library, the baths, and a large number of local societies, educational, literary and artistic.

**Carnegie Hero Fund Trust.**—This fund is administered from Dunfermline by the trustees of the Carnegie Dunfermline Trust.

**Carnegie United Kingdom Trust (Dunfermline).**—Founded in 1913 with a capital of £2,000,000 this is the analogue of the Carnegie Corporation of New York "for the improvement of the well-being of the masses of the people of Great Britain and Ireland by such means as are comprehended within the meaning of the word charitable." This trust has carried on the founder's library policy, having erected a number of public libraries, established more than 100 county libraries and assisted many special libraries. It has published an edition of Elizabethan music and a number of modern compositions. Grants have been made for the erection of six child welfare model centres, to the Old Vic. and Sadler's Wells theatres, London, as the nucleus of a national theatre for England, and to many musical and dramatic enterprises. The trust has also taken a prominent part in rural development by founding county community councils, and in 1927 it set aside the sum of £200,000 over four years to encourage the provision of public playing fields.

## II. TRUSTS IN THE UNITED STATES

**Carnegie Institute of Pittsburgh.**—This consists of a group of cultural and educational departments of the municipal type, library, concert hall, technical college, museum and art gallery. The foundation really dates from 1881 when Carnegie offered to provide a public library; this offer was accepted in 1886. The idea expanded until the institute was finally constituted as such in 1896. It has a capital of \$28,000,000.

**Carnegie Institution of Washington.**—Founded in 1902, with a present capital of \$32,000,000, this is a great combination of research departments, working in collaboration and including experimental evolution (1903), marine biology (1903), historical research (1902), economics and sociology (1904, discontinued 1917), terrestrial magnetism (1904), Mount Wilson observatory (1904), Geophysical laboratory (1905), botanical research, including a laboratory in Monterey, Cal. (1905), nutrition (1906), meridian astrometry (1907), embryology (1914), Eugenics Record office (1917), archaeology (1924). The published reports of the institution constitute a highly valuable library of research and are presented in a liberal spirit to all well-established libraries. The numerous voyages of the non-magnetic ship "Carnegie," designed to test the variations of the magnetic compass, may be specially mentioned.

**Carnegie Hero Fund Commission (Pittsburgh).**—This is a group of foundations, dating from 1904, designed for the purpose of giving suitable recognition to persons engaged in peaceful occupations who risk their lives in heroic efforts to save others. Recognition takes the form of medals, pecuniary grants, pensions, educational help for children, etc. The funds are: U.S.A., Canada and Newfoundland \$5,000,000 (1914), British Isles \$1,250,000 (1908), France \$1,000,000 (1909), Germany \$1,500,000 (1910), Norway \$125,000 (1911), Switzerland \$130,000 (1911), Netherlands \$200,000 (1911), Sweden \$230,000 (1911), Denmark \$125,000 (1911), Belgium \$230,000 (1911), Italy \$750,000 (1911); total \$10,540,000.

**Carnegie Foundation for the Advancement of Teaching (New York).**—This was founded originally in 1905 to provide pensions for teachers in the form of free gifts. The system was at first non-contributory, but after elaborate investigation, a new system was adopted by which colleges and teachers both contribute on a properly calculated actuarial basis. The Foundation has undertaken inquiries in the field of education, and issued reports. Its capital and reserves amount to nearly \$30,000,000.

**Carnegie Endowment for International Peace.**—Founded

in 1910 with a view to "the speedy abolition of international war between the so-called civilized nations," this has a capital of \$10,000,000. It is divided into three sections concerned respectively with "intercourse and education," "economics and history" and "international law." The endowment is very broad in its scope, being free to work in any way for the promotion of good feeling and understanding between the nations. Since the World War one important project has been a series of volumes on European economics in connection with the war and its aftermath. The Division of Economics and History of the Carnegie Endowment is responsible for the Economic and Social History of the World War, under the direction of Dr. James T. Shotwell and Divisional Editors in sixteen countries. An authoritative record is preserved of the displacement caused by the war in the whole structure of civilized society. Some forty war-time cabinet ministers and over two hundred specialists have contributed to its one hundred and fifty volumes. No such study had ever been made of the phenomena of war previously. This wealth of material is deposited in over seven hundred libraries throughout the world for the study of future generations.

**Carnegie Corporation of New York.**—Founded in 1911 this is the largest in size and scope of all the Carnegie foundations, its capital being \$135,000,000. It exists for "the advancement and diffusion of knowledge and understanding among the people of the United States." In 1917 its scope was extended to include Canada and the British colonies, \$10,000,000 of its capital being set aside for this purpose. It may spend its large revenue through the other five American trusts or through any other suitable channels. Its policy is in fact fluid, the founder having said in the deed, "Conditions upon the earth inevitably change. . . . I give my trustees full authority to change policy or causes hitherto aided when this, in their opinion, has become necessary or desirable." The corporation has aided American colleges and universities by grants for endowments and buildings, has made large appropriations in the interests of library training and service, has carried on a programme including encouragement of adult education, fine arts, modern languages, and engineering education. Forty-seven per cent of its income has been devoted to other institutions founded by Andrew Carnegie; its largest outside appropriation was to the National Academy of Sciences (\$5,000,000). It has also encouraged research in law, economics and medicine.

All the above Foundations, except the Carnegie Corporation of New York and the United Kingdom Trust, have functional or local limitations. The two general trusts work largely on the same lines, seeking to promote adult education in the widest sense of the term, to make accessible to the public at large the cultural resources of the community, and especially to finance carefully devised pioneer experiments for which, without practical demonstration, state subsidies and private liberality cannot be expected.

See the *Annual Reports* issued by the various Trusts; *Manual of the Public Benefactions of A. Carnegie* (1920). See also LIBRARIES.

(J. M. M.)

**CARNEIA**, an important Dorian festival (Sparta, Cos, etc.). While many details of it are obscure, the following are the main features, and are tolerably certain. (1) It was held in the month *Karneios* (roughly August). (2) The name is connected with *Karnos* or *Karneios* (probably = Ram), said to have been a favourite of Apollo, unjustly killed by the Heracleidae, and therefore commemorated to appease the god's anger; perhaps an old god of fertility displaced by Apollo (*cp.* *HYACINTHUS*). (3) It contained an agrarian element. Five young men called *καρνεῖται* were chosen out of each tribe; one man, decked with garlands, ran away and the rest followed him; they were called *σταφυλοδρόμοι*, i.e., "grape-cluster-runners," hence they very likely carried bunches of grapes. It was a good omen if they caught the fugitive, bad if they did not. They were under the direction of a priest called *ἀγῆτης*, or leader. It seems reasonable to suppose that the person they chased was the temporary incarnation of some spirit of vegetation; perhaps to catch him signified that fertility was not allowed to go away, but was secured, to be used for the next year's crops. (4) It contained an element apparently

military, since a feast was held by nine groups, each consisting of nine citizens, representing the *ὄβαι* or divisions.

**BIBLIOGRAPHY.**—S. Wide, *Lakonische Kulte* (1893) and his and Höfer's articles in Roscher's *Lexikon der Mythologie* (s.v.) "Karneios"; M. P. Nilsson, *Griechische Feste* (1906); L. R. Farnell, *Cults of the Greek States*, vol. iv. (1907).

**CARNELIAN** or **CORNELIAN**, a variety of chalcedony (q.v.), is most generally of a blood-red colour, though included under this name are specimens of a reddish tint varying in colour from yellow to brown. The colouring matter is probably iron oxide in various stages of hydration, though the particles are so small that only in thin sections under the microscope can they be distinguished from the colourless silica in which they are embedded. Though carnelians are recognized in all shades of red, it is convenient to distinguish three varieties; (1) that coloured flesh-red or burnt-brick—the typical carnelian, (2) the honey coloured and (3) that usually called the sard, which is brown by reflected and deep red by transmitted light and was formerly the most valued, because of its greater transparency and depth of colour.

Among the Greeks and Romans the carnelian was one of the most treasured stones and used especially for intaglios of all kinds, examples of which have retained their high polish to a greater extent than many harder stones. The carnelian was also widely used for signets because, as Pliny says (*Nat. Hist.*, xxxvii; trans. P. Holland, 1634), "it signeth very faire without any of the wax sticking to it."

Carnelians are embellished by various processes, notably burning and dyeing with salts of iron, and for trade purposes the natural colour is of little importance.

The chief localities are Ratanpur, India; Campo de Maia, Brazil; Dutch Guiana; Siberia; Warwick, Queensland; Tampa Bay, Fla., U.S.A., and Chesil Bank, South Dorset. (W. A. W.)

**CARNESECCHI, PIETRO** (1508–1567), Italian humanist, was the son of a Florentine merchant, who enjoyed the patronage of the Medici. At the age of 25 he held several rich livings, had been notary and protonotary to the Curia, and was first secretary to the pope. He accepted Luther's doctrine of justification by faith, though he repudiated a policy of schism. When the movement of suppression began, Carneseccchi found shelter with his friends in Paris. On the accession of Pius IV. (1559) he came to live in Rome. With the accession of Pius V. in 1565 the Inquisition renewed its activities, and Carneseccchi betook himself to Florence, where he was betrayed by Cosimo, the duke, who wished to curry favour with the pope. He was beheaded and then burnt on Oct. 1, 1567.

**CARNIOLA**, a former duchy and crownland of Austria which centred round the town of Laibach (Ljubljana), on a feeder of the Save and in a fertile basin. With the foundation of the Serb, Croat and Slovene State, Carniola ceased to exist as a territorial unit, being merged in Slovenia. (See YUGOSLAVIA.)

**CARNIVAL**, the last three days preceding Lent, which in Roman Catholic countries are given up to feasting and merry-making. Anciently the carnival began on the morrow of Epiphany (Jan. 7) and lasted till Shrove Tuesday. It probably represents the Roman Saturnalia. Rome has ever been the headquarters of carnival, and though some popes made efforts to stem the tide of Bacchanalian revelry, many of the others were great patrons and promoters of carnival keeping; notably Paul II., who instituted a great variety of races. Under Julius III. we have long and vivid accounts of bull-baits in the Forum. Even the austere and rigid Paul IV. (d. 1559) used to keep carnival by inviting all the Sacred College to dine with him. Sixtus V. (1585–1590) set himself to the restraint of excesses and the repression of lawlessness. For the warning of offenders he set up gibbets in conspicuous places.

The later popes mostly restricted the carnival to the last six or seven days before Ash Wednesday. The municipal authorities of the city now allow ten days. The carnival sports at Rome anciently consisted of (1) the races in the Corso (hence its present name, formerly Via Lata); (2) the spectacular pageant of the Agona; (3) that of the Testaccio.

Of other Italian cities, Venice used to be the principal home, after Rome, of carnival. To-day Turin, Milan, Florence, Naples,

all put forth competing programmes. In old times Florence was conspicuous for the licentiousness of its carnival. The carnival in Spain lasts four days, including Ash Wednesday. In France the merry-making is restricted almost entirely to Shrove Tuesday (*mardi gras*) and to the *MI-CARÊME*, Thursday of the third week in Lent.

**CARNIVORES** or **CARNIVORA**, members of the order of flesh-eating mammals which includes the most powerful and ferocious beasts of prey, as the lion, tiger, leopard and jaguar, numerous fur-bearers, as the seal, fox and sable, the domesticated cat and dog and other well-known animals. In general, their teeth, especially the four long, piercing canine teeth, are adapted for tearing flesh, and the toes of many species are provided with strong sharp claws for seizing prey. For the most part, the carnivores are very active, intelligent and courageous animals, with a keen sense of sight and smell. In size carnivores vary greatly, ranging from small weasels to huge bears, which may weigh a ton. There are about 300 species which, in their relationships form four well-marked groups: the catlike, the doglike, the bearlike and the seallike or marine carnivores. Among those comprising the catlike group are the true cats,—the lion, leopard, puma, lynx, domestic cat, etc., and also the civets, genets, mongooses, and hyaenas. In the doglike group are found the dogs, wolves, jackals and foxes. Besides the true bears, the bearlike group includes the raccoons, coatis, weasels, otters, martens, badgers, and the panda. In the seallike group are the true seals, the sea-lions and the walruses. The carnivores are well represented in all parts of the world except the Australian region, which contains only the dingo, a wild dog, doubtfully native. The polar bear and the polar fox range further north than all other land mammals, while sea-lions are found in both arctic and antarctic waters. However, some important groups are restricted in their distribution. The numerous civets, for example, are confined to the Old World; the raccoons, except the panda, occur only in America, while in most of Africa none of the true bears are found. Though some carnivores are destructive to domestic animals, and even to human life, many are valuable fur-bearers, as the sable, otter, marten, mink, fox and fur-seal, and they also hold in check various animals, as rodents, which, if unrestricted in numbers, would become exceedingly injurious to agriculture. Besides, the dog and the cat, which have been household animals since ancient times, the cheeta or hunting leopard, the ferret and the mongoose are domesticated. (See articles on the various animals mentioned.) (X.)

The term Carnivora, suggesting that all the animals so designated are flesh-eaters, is not entirely appropriate. Certain highly organized species of the cat, wolf and weasel kind live almost wholly upon the flesh of warm-blooded animals, for the capture of which their habits and structure are admirably adapted; but others, like most bears, are almost wholly vegetable feeders and quite unfitted for the chase. The great variation in diet and mode of life exhibited by the order is accompanied by a corresponding variation in the limbs and other external organs and by the teeth and skeleton. No single character absolutely distinctive of the group can be named; but by the combination of a number of structural features, it may be distinguished from other orders of mammals.

There are never fewer than four toes on each foot; and the first is never opposable to the rest; the digits are typically armed with compressed claws, never with nails or hoofs; there are typically two tufts of tactile vibrissae on each cheek; the tail is never absent; the anus and genital organs open by separate apertures, and the mammae are never wholly pectoral. The cranial portion of the skull is always tolerably capacious as compared with the facial portion and the brain is well or moderately well convoluted. There are two sets of teeth, milk and permanent, differentiated into incisors, canines and cheek-teeth. The incisors are typically six in number above and below, the centrals never being larger than the laterals. The canines are almost always long and piercing in both jaws. The cheek-teeth are rooted, never of persistent growth, and the enamelled crown is raised into simple or blade-like cusps. The two halves of the uterus are separate and the placenta is deciduate and generally zonary.

## CHARACTERS USED IN CLASSIFICATION

**Soft Parts.**—The *facial vibrissae* consists of a tuft above each eye (superciliary), two tufts on each cheek (genal), half a dozen or more rows on the upper lip (mystacial), a few isolated on the chin and a median tuft (interramal) on the throat. As a rule they are well developed both in number and length in predatory species, especially those which hunt in foliage or undergrowth. In vegetable feeders like the typical bears they are, on the contrary, greatly reduced and apparently functionless.

**Rhinarium.**—The nostrils are typically surrounded by a conspicuous area of naked, glandular skin, the rhinarium, continued in front to the edge of the upper lip as a strip of grooved skin, the philtrum. It is subject, however, to considerable variation with habits.

**Ear.**—There is typically a well-developed erect external ear, or pinna, attached by a broad hollowed base of which the walls are strengthened by cartilaginous ridges. One of these, the supratragus, is sometimes valvular, helping to close the ear orifice. Another character of importance is the bursa, a pocket formed by a supplementary flap low down on the posterior margin of the ear.

**Feet.**—In the generalized, and probably primitive, type there are five digits tolerably evenly spaced and forming with their tips a strongly and fairly evenly curved series, the third and fourth being the longest, the second and fifth shorter and subequal, and the first the shortest. Each is supplied with an inferior digital pad behind the claw; and they are united by a flap of integument, or web, which extends nearly to the digital pads. The sole is provided with a plantar pad composed of four united lobes. Behind the plantar pad there is on the fore-foot a pair of large, lobate carpal pads; and on the hind-foot there is a pair of elongated metatarsal pads, which extend nearly to the heel. This type of foot, called subplantigrade, passes by imperceptible gradations into feet contrasted as digitigrade and plantigrade. The typical plantigrade foot is broad and short, the plantar pad is considerably wider than long, the digits are nearly equal in length and their pads form a lightly curved row. The typical digitigrade foot is longer and narrower than the subplantigrade foot and has the first digit short and raised off the ground or absent; the plantar is three-lobed and the area above it is hairy.

There are two types of claw in the digitigrade foot, the short blunt claw of the dogs and hyaenas and the sharp, retractile claw, found in some civets and most cats, which is modified for laceration of prey. The terminal bone of the digit is retracted by an elastic ligament and the sharp point of the curved claw is protected from wear by lobes of skin which ensheath it. In the seals the feet are converted into paddles, but their structure suggests that they also are modifications of the subplantigrade foot.

**Anal Glands.**—The rectum is typically provided with a pair of glands opening, usually by a single aperture, just within the anal orifice. The secretion probably acts in normal cases as a lubricant or disinfectant; but in some genera, especially of Mustelidae, like the skunks, the secretion is abundant and nauseous and its forcible discharge is an important means of defence. In the bears (Ursidae) the glands are developed to a negligible extent; and they are quite absent in the seals.

**External Genitalia.**—The perinaeal area, lying between anus and generative orifice, varies greatly in extent, especially in the males. It may be small, the penis being short and close to the scrotum. But in most families the perinaeal area is large, the penis being long, with the prepuce remote from the scrotum.

**Skull.**—The skull is very variable in the length, breadth and height of muzzle and brain-case. The length of the muzzle is correlated with the number and size of the teeth. Its nasal chambers are filled with delicate scroll-like bones, the *turbinals*. Of these there are two main groups, the *maxillo-turbinals*, rising from the sides of the inner surface of the maxillae, in front, and the *ethmo-turbinals* behind.

On the palate there is a pair of orifices, the *posterior palatine foramina*, which are typically situated on the maxillo-palatine suture but may be in advance of it.

The bone containing the ear capsule, is covered by the *auditory bulla*, composed either wholly or partly of the tympanic bone,

which always forms its anterior part. The posterior part is occasionally cartilaginous, but it may be ossified from a separate centre, the entotympanic. In this type of bulla its cavity is always divided into two chambers by a bony partition, which passes from the line of junction of the two bones.

Behind the bulla there is an expansion of the occipital bone, the *paroccipital process*, and behind the auditory orifice another process, called the mastoid. Low down on the inner wall of the temporal fossa there is frequently a bony channel, the *alisphenoid canal*, through which passes a branch of the carotid artery. Its incidence is remarkable, and it has been much used in classification.

**Teeth.**—These vary in number and structure in accordance with diet. The primitive number was 44; three incisors, one canine, four premolars and three molars above and below on each side, expressed by the formula  $I_3^3, C_1^1, P_4^4, M_3^3$ . Very seldom, however, is the full complement retained, and numerical reduction takes place mostly from the suppression of one or more of the front and back cheek teeth. It reaches its extreme in predatory forms like the cats and weasels where the formula may be  $P_2^2, M_1^1$ . The number, arrangement and shape of the cusps are also subject to great variation, but the extreme types of dentition are derivable from a more generalized intermediate type in which there is a gradual transition in size, shape and cusp-armature throughout the series. In the upper jaw the cheek-teeth increase in size and complexity from the first to the fourth premolar and decrease from the latter to the last molar. The fourth premolar is triangular in shape and the inner portion or lobe is as broad at the base as the three-cusped blade-like outer portion of the crown. The third premolar and the first molar are also triangular and tolerably similar to the fourth premolar. In the lower jaw the teeth gradually increase in size and complexity from the first premolar to the first molar. The first three premolars have compressed three-cusped blades, with the median cusp the biggest. The fourth premolar is broader than those in front and has supplementary cusps on the inner side of the three-cusped blade, the shape of the tooth and the arrangement of the cusps clearly foreshadowing those of the first molar, in which the crown is differentiated into two subequal portions, an anterior armed with three cusps arranged in a triangle, and a posterior lower portion with an outer and an inner cusp. A first lower molar of this type is found in many genera of Carnivora.

In this type of dentition the fourth upper premolar and the first lower molar, which are opposed in mastication, are approximately similar to the teeth immediately before and behind them in the series, but they are larger, thus attesting the concentration of biting power in the posterior half of the jaw. This difference in size, often accentuated, is found in many terrestrial species and, as a very general rule, these two teeth also differ considerably in shape from the others; and since this modification is an adaptation for shearing raw flesh and is particularly manifest in predatory forms, the teeth in question have been distinguished as the *carnassials*. In the upper carnassial, on the fourth premolar, the modification is brought about by the reduction in size of the inner portion of the crown to a comparatively small lobe and the increase in size and compression of the median and posterior cusps of the outer portion to form a sharp-edged cutting blade. The lower carnassial, or first molar, is still more altered and may, as in the cats, be wholly converted into a cutting blade formed by the enlargement and compression of the anterior median and the adjoining external cusp of the front portion of the primitive type of lower carnassial. High specialization of both carnassials as shearers, seen in the cats, hyaenas, some weasels and others, is accompanied by shortening of the jaws, suppression of the second upper molar and reduction in size of the first and loss of the second lower molar.

## CLASSIFICATION

The Carnivora are usually divided into two sub-orders: the Pinnipedia, or seals, with paddle-like feet and the cheek-teeth all alike, and the Fissipedia, or typical forms with paw-like feet and dissimilar cheek-teeth. And the Fissipedia are further divided into two tribes: the Arctoidea, comprising the dogs, bears, raccoons, weasels and their allies, and the Aeluroidae, or Herpestoidea, com-

prising the cats, hyaenas, civets, mongooses and others. But the feet and the cheek-teeth are too variable and plastic to be used as a basis for the primary division of the order into Pinnipedia and Fissipedia. The whole organization of the seals points to their affinity with and descent from the Arctoid group of carnivores. The old classification must, therefore, be abandoned and the seals referred to the Arctoidea.

The Carnivora, then, may be divided into two sub-orders, the Aeluroidea and the Arctoidea, which are mainly distinguished by cranial characters.

**Aeluroidea.**—In the Aeluroidea the ethmo-turbinals are very large and occupy the greater part of the nasal chambers, extending forwards between and over the smaller maxillo-turbinals almost to the anterior orifice of the chambers. The auditory bulla is composed of two elements, the tympanic and entotympanic, and when completely ossified, its cavity is divided by a partition springing from the line of junction of the two bones that compose its wall. Cowper's glands connected with the generative organs of the male are absent. The Aeluroidea are divisible into the following families:

**Nandiniidae.**—This family contains the African tree civet, *Nandinia*, which differs from the rest of the Aeluroidea in having the cavity of the auditory bulla undivided and the wall of its posterior portion permanently cartilaginous; in the large size and shelf-like form of the mastoid portion of the skull and the backward direction of the paroccipital away from the bulla, two characters in which it resembles many of the typical Arctoidea. In other characters it shows kinship with the Oriental palm civets, *Paradoxurinae*, with which it has been affiliated. The body and tail are long, the muzzle elongate and narrow; the full complement of facial vibrissae is retained; the ear has the bursa and a ridge-like supratragus, the legs are short, with the feet subplantigrade, and with short, curved, partially retractile claws, evenly spaced digits, a four-lobed plantar pad, continuous on the forefoot with the bilobed carpal pad and on the hind foot with the metatarsal area which is naked and has two ridge-like pads. Also, in the skull the palatine foramina are in front of the suture, and the cheek-teeth are  $P\frac{3}{2}$ ,  $M\frac{3}{2}$  and moderately trenchant. But it differs from the *Paradoxurinae* in having abdominal scent glands in front of the genital organs and especially in the shortness of the penis and its close proximity to the scrotum.

The single species of this genus, *N. binotata*, sometimes called the two-spotted palm civet, is a spotted, omnivorous, arboreal animal the size of a small cat, restricted to the forest region of west Africa. It is an extremely interesting primitive type, resembling in many cranial and dental characters, especially in the structure of the bulla, the extinct *Miacidae* of the Eocene.

**Viverridae.**—The civets, genets and their allies composing this family differ from the *Nandiniidae* in having the auditory bulla divided by a partition, the wall of its posterior chamber completely ossified and its posterior surface applied to the paroccipital process, which projects downwards, and in the relatively small size of the mastoid process. Also the scent glands, when present, are either wholly or partly perinaeal, never entirely abdominal in position. The family exhibits great range in structural variation and is divisible into several sub-families.

The *Paradoxurinae*, the Oriental palm civets, closely resemble *Nandinia* in external form and habits, but in the male the prepuce is far in advance of the scrotum, the intervening area being usually occupied by a large but simple scent-pouch, and in the female the vulva is surrounded by the scent-gland. This group, ranging from India to the Philippines and Celebes, is represented by the genera *Paradoxurus*, *Paguma* and *Macrogalidia*. In a related form, *Arctogalidia*, the scent-gland is absent in the male, and in the binturong (*Arctictis*) the tail is prehensile and the teeth, as in *Arctogalidia*, are not so trenchant as in the typical palm civets.

In the three Oriental genera of *Hemigalinae* (*Hemigalus*, *Diplogale*, *Chrotogale*) the teeth are sharper cusped than in the last, the feet are more digitigrade and the scent-pouch is reduced in size in both sexes.

The otter-civet (*Cynogale*), the type of the *Cynogalinae*, is a fish-eater adapted for aquatic life. The vibrissae are numerous

and rigid, the rhinarium is on the summit of the muzzle, which is very wide, and the tail is short. The scent-gland is reduced and the teeth are modified for holding fish and crushing the shells of crabs and mussels. The genus ranges from the Malay States to Borneo.

The *Viverrinae*, represented in tropical Asia by the civets (*Viverra*, *Viverricula*) and in Africa by the typical civet cat (*Civettictis*) and the genets (*Genetta*, *Poiana*), differ from the *Paradoxurinae* in being digitigrade, generally with retractile claws, in having more elaborate scent-glands and more trenchant teeth.

In the *Galidictinae* or Madagascar mongooses (*Galidia*, *Galidictis*, *Hemigalidia*), the scent-gland is restricted to the female, the feet are narrow with non-retractile claws, the jaws are short, the teeth sectorial and the bulla has a bony tubular meatus not found in the other sub-families.

In the preceding groups the scent-gland is present in one or both sexes. In the following three it is absent: *Fossa*, the sole representative of the *Fossinae*, is a civet-like animal inhabiting Madagascar; digitigrade but with non-retractile claws; *Eupleres*, the only known form of the *Euplerinae*, also comes from Madagascar, is remarkable for the degenerate character of the teeth and feeble jaws, and the feet are subplantigrade and fossorial; and the linsangs (*Prionodon* and *Pardictis*), representing the *Prionodontinae*, elegant genet-like animals found in south-eastern Asia, with digitigrade feet and retractile claws, are the only members of the *Viverridae* in which the penis is small and close to the scrotum.

**Herpestidae.**—The mongooses differ from the *Viverridae* in possessing a glandular circumanal sac into which the anus and anal glands open by separate orifices, and in the absence of the bursa on the ear. They have no perinaeal glands, the penis is short and close to the scrotum and there is a tubular auditory meatus in the skull. The feet are digitigrade or subplantigrade with fossorial non-retractile claws and the toes may be reduced to four on each foot. The teeth also vary, sometimes being bluntly, sometimes sharply cusped and trenchant. The family contains a large number of genera and species found mostly in India and Africa. The best known are *Herpestes*, the typical mongoose; *Mungos*, the banded mongoose; *Ichneumia*; *Suricata*, and others.

**Cryptoproctidae.**—The fossa (*Cryptoprocta*), found in Madagascar, externally somewhat resembles the palm civets of Asia, but differs in the absence of perinaeal scent-glands, the possession of a capacious circumanal sac and of a large bone in the penis, this organ being highly complex in structure. The jaws of the skull are short and the teeth are sectorial, closely resembling those of the *Felidae*.

**Hyaenidae.**—The hyaenas (*Hyaena*, *Crocota*) differ from all the other families of Aeluroidea in the large size of the tympanic bone which composes nearly the whole of the bulla, the partition of the cavity lying far back. The feet are digitigrade, like those of a dog, but there is no pollex. The anal glands open into a capacious subcaudal pouch. There are no perinaeal glands and the prepuce is far in advance of the scrotum. The skull is massive and the teeth which are sectorial in type are very powerful. The genus *Hyaena* is represented by the striped hyaena of south-western Asia and northern Africa and by the brown hyaena of south-western Africa. *Crocota*, the spotted hyaena, which differs in the structure of the teeth and genital organs, is restricted to Africa. Hyaenas are mostly scavengers, feeding upon the carcasses of big game.

**Protelidae.**—The aard-wolf (*Proteles*) of tropical and southern Africa, resembles a small striped hyaena in external characters, except for the presence of a pollex on the forefoot. It differs, however, from the hyaenas in the normal structure of the bulla and from all the land carnivores in its remarkable dentition, the cheek-teeth being widely spaced, all alike and peg-like, with the jaws correspondingly weak. It eats carrion and white ants.

**Felidae.**—The cats are distinguished by the position of the posterior palatine foramina on the maxillo-palatine suture and the invariable absence of the interramal tuft of vibrissae. As in the linsangs (*Viverridae*), the penis is small and close to the scrotum, the vulva close to the anus, and there are no perinaeal

glands or glandular pouch above or around the anus; but although the feet have retractile claws, they are more digitigrade than in the linsangs, the pollex being more elevated, the hallux absent and the plantar pad three-lobed. In the skull the jaws are short and the teeth highly sectorial, the important cheek-teeth being the two blade-like carnassials. There are three sub-families:—the *Pantherinae*, containing the lion (*Panthera leo*), the tiger (*P. tigris*), the leopard (*P. pardus*), the jaguar (*P. onca*), and the snow-leopard (*P. uncia*), which have the larynx loosely attached to the skull by the largely ligamentous suspensorium of the hyoid; the *Felinae*, containing a large number of genera, *Neofelis*, the clouded leopard (*N. nebulosa*); *Leopardus*, the ocelot (*L. pardalis*); *Puma*, the puma (*P. concolor*); *Felis*, the wild cat (*F. sylvestris*); *Lynx*, the lynx (*L. lynx*); and many others which have the suspensorium of the hyoid normally ossified; and the *Acinonychinae*, containing the cheetah (*Acinonyx jubatus*), which is distinguished by the absence of integumentary sheaths to the claws, the hyoid being as in the *Felinae*.

**Arctoidea.**—In the sub-order Arctoidea, containing the rest of the existing carnivores, the ethmo-turbinals are excluded from the anterior orifice of the nasal chambers by the enlarged maxillo-turbinals. The wall of the auditory bulla is composed solely of the tympanic bone and its cavity is typically undivided. Cowper's glands are present in the male.

The families fall into two series, the Fissipede arctoids, containing the dogs, bears, raccoons, weasels and their allies, and the Pinnipede arctoids, containing the sea-lions, walruses and seals.

In the Fissipede arctoids the feet and the teeth are structurally and functionally similar to those of the Aeluroidea. Only in the sea otter are the hind-feet paddle-like.

**Canidae.**—The dogs, wolves and foxes differ from the rest of the Arctoids in possessing a caecum and a duodeno-jejunal flexure in the intestine, as in the Aeluroids. Also they are completely digitigrade and typically the formula of the cheek-teeth is  $P_4^1, M_3^2$ , with the carnassials large and secant. The teeth, however, vary. The genus *Canis*, containing the dogs, wolves and jackals, many related genera from South America, and the foxes (*Vulpes*) have the teeth as recorded above; but the Asiatic dholes (*Cuon*) and the South American bush dog (*Speothos*) have lost the third lower molar. The most aberrant dentition, however, is found in the fox-like African genus *Otocyon* in which there are not only four lower and three, occasionally four, upper molars, but the carnassial teeth are not differentiated from the rest either in size or function. Another somewhat aberrant type is the African hunting-dog (*Lycaon*) in which the ears are large and rounded and the pollex is absent.

**Ursidae.**—Although the bears and the dogs are shown by fossil forms to be modified descendants of the same stock, the living representatives of these families are widely divergent. The bears are heavily built, with broad, plantigrade feet, short tails, protrusible lips, reduced vibrissae and no bursa on the ear. The cheek-teeth, although numerically as in the typical *Canidae*, are widely different in function and form, being adapted primarily for crushing hard vegetable fibre. The first three premolars above and below are practically functionless, closely crowded or widely spaced, and one or more often deciduous. The upper carnassial is small and not trenchant, and the molars have large flat tuberculated crowns. There are several well-defined genera: *Ursus*, containing the brown bear (*U. arctos*), the grizzly (*U. horribilis*), and the black bear (*U. americanus*); *Thalarctos*, the polar bear (*Th. maritimus*); *Selenarctos*, the Asiatic black bear (*S. tibetanus*); *Helarctos*, the Malayan sun-bear (*H. malayanus*); *Melursus*, the sloth bear (*M. ursinus*); and *Tremarctos*, the spectacled bear (*T. ornatus*).

**Ailuropodidae.**—The giant panda (*Ailuropoda melanoleuca*), inhabiting Tibet and southern China, resembles a black and white bear in appearance, but differs from all the *Ursidae* in the presence of a digit-like bone rising on the inner side of the fore-foot, and associated with a corresponding expansion of the plantar pad, and in the absence of the alisphenoid canal and the structure of the teeth. The premolars are not reduced and the molars are even larger and supplied with numerous supplementary cusps.

**Ailuridae.**—The common panda (*Ailurus fulgens*), which occurs in southern China and north-eastern India, is a small, long-tailed, arboreal species, with subplantigrade, sharp-clawed, hairy feet with greatly reduced pads, the supplementary bone on the fore-foot being quite small. It also differs from the giant panda in the loss of the third lower molar, in the cheek teeth forming graduated series and being simpler in pattern and in the presence of the alisphenoid canal. The anus is encircled by a glandular pouch and the penis is small and close to the scrotum as in some Aeluroids.

**Procyonidae.**—This family, confined to America, differs from the *Ailuridae* in having the penis long, the prepuce remote from the scrotum and the anal sac and alisphenoid canal absent, in the normally developed pads on the feet and the differentiation of the upper carnassial from the third premolar. There are several sub-families.

The *Potosinae* or kinkajous (*Potos*) are arboreal vegetable feeders, with a prehensile tail and ventral scent glands; the jaws are massive and the molars flat-crowned.

The *Procyoninae* or raccoons (*Procyon*) have long unwebbed digits, a shortish tail and a mobile snout; the crowns of the molars are broad and tubercular, recalling those of *Ailurus*.

The *Nasulinae* or coatis (*Nasua*) have webbed feet, with fossorial claws, a very long tail, an exceedingly mobile probing snout, slender jaws and smaller cheek-teeth than the raccoons but larger tusk-like canines.

The *Bassariscinae*, the cacomistles (*Bassariscus*) are active, predacious, genet-like animals with small paws, a long tail and trenchant dentition.

The *Bassaricyoninae* (*Bassaricyon*) closely resemble the kinkajous superficially but the tail is not prehensile and the cranial and dental characters are more like those of the raccoons.

**Mustelidae.**—This family differs from the *Procyonidae* in the invariable absence of the second upper molar and in the presence, except in the sea-otter, of a wide angular emargination, instead of a notch or slit, between the median and posterior cusps of the upper carnassial. The genera of this family exhibit greater range in structural variation and habits than any family of Carnivora. They are referred to many sub-families, which, setting the otters on one side, may be conveniently assigned to two series.

In the first the upper carnassial is not larger than the molar and has a large inner lobe and a more bluntly cusped blade, and the feet are fossorial.

The *Melinae*, or badgers, are heavily built, with short legs and tail and a glandular subcaudal pouch. The upper molar is much larger than the carnassial, and the bulla is undivided and does not open into the mastoid. The true badgers (*Meles*) are found in temperate Europe and Asia and the hog-badgers (*Arctonyx*) in Burma and southern China.

The *Mydainae*, containing the teledu (*Mydaus*), found in Java, Borneo, etc., differs from the badgers in the absence of the subcaudal pouch, the skunk-like development of the anal glands, the disc-like rhinarium, divided upper lip, united toe-pads, reduced ear and the opening of the bulla into the mastoid.

The *Taxideinae*, or American badgers (*Taxidea*) are shown by the structure of the skull to be unrelated to the *Melinae*. The upper carnassial is larger than the molar, the bulla opens into the mastoid, the metatarsus has no pads, the carpal pad is single and peculiar glands are associated with the external genital organs in the male and female.

The *Mephitinae*, or skunks, restricted to America and represented by three genera (*Mephitis*, *Conepatus*, *Spilogale*), are peculiar in having the mesopterygoid fossa long and the penis without a bone. There are no special cutaneous glands but the anal glands are excessively developed and their nauseous defensive discharge, associated with the conspicuous pattern and fearless behaviour of the skunks, has made these mammals the stock instance of warningly coloured species.

The *Helictidinae*, or ferret-badgers (*Helictis*, *Melogale*), found in south-eastern Asia, are long-tailed like the skunks, but the upper carnassial, as in *Taxidea*, is larger than the molar. There are no special glands and they further differ from the preceding

sub-families in retaining the bursa on the ear and in having the bulla divided.

In the second series the upper carnassial is never smaller than the molar and has a cutting blade and a small inner lobe.

The *Mellivorinae*, or ratels (*Mellivora*), occurring in tropical Asia and Africa, are badger-like in build and habits, but the anus is sunk in a pouch, and its glands are developed as in the skunks, the ear is reduced and the teeth are sectorial.

The *Ictonychinae*, or African zorillas (*Ictonyx*, *Poecilictis*), resemble skunks superficially and differ from *Mellivora* in being long-tailed, lightly built, more digitigrade, and in having a well developed ear, less sectorial dentition and no circumanal pouch.

The *Grisoninae*, containing the American *Grison* and *Grissonella*, differ from the two preceding sub-families in having the bulla low with the tympanic ring in contact with its roof, and its cavity small and divided. They are superficially like polecats and the offensive discharge of their anal glands is associated with warning coloration.

The *Tayrinae*. The South American marten-like *Tayra* differs essentially from the grisons in having the cavity of the bulla inflated, undivided and not communicating with the mastoid. The ear has no marginal bursa, and the feet are naked with confluent tarsal and metatarsal pads in contact with the plantar pad.

The *Martinae*, containing the martens and sables (*Martes*, *Charronia*), are found in Europe, Asia and North America. They differ principally from *Tayra* in having the metatarsus hairy, the carpal pads separated from the plantar pad, small claws and a well developed marginal bursa on the ear. The wolverene (*Gulo*) is a modified type of this group (*q.v.*).

The *Mustelinae*, or stoats (*Mustela*), weasels (*Ictis*), polecats (*Putorius*, *Vormela*) and other genera occurring in Europe, Asia and America, closely resemble the martens in the structure of their feet but differ from them in the shortness of the muzzle, more sectorial and numerically reduced dentition and in the spongy texture of the wall of the auditory bulla with which the tympanic ring is in contact.

The *Lutrinae*, or typical otters, represented by many genera (*Lutra*, *Aonyx*, *Pteromura*, etc.), differ from the preceding sub-families mainly in their structural adaptations to aquatic life, and particularly in having the hind-feet larger than the fore-feet, with long distensible digits. The kidneys also are lobulate. The skull in shape resembles that of the *Mustelinae*, but the upper molar is as large as the carnassial. The family ranges all over the world apart from Madagascar and Australia.

The *Enhydrinae*, or sea-otter (*Enhydra*), which is restricted to the North Pacific, differs from the *Lutrinae* in the structure of the feet. The fore-feet have the digits very short and tightly fused, and the hind-feet very large and paddle-like with the digits progressively increasing in length from the first to the fifth. Also the cusps of the teeth are all bluntly rounded.

The pinnipede arctoids are characterized by the shortness of the upper portion of the limbs and the development of the feet as swimming paddles, especially the hind-feet, which have the first and fifth digits stouter and longer than the rest. The cheek-teeth also are all alike. There are three families.

*Otariidae*.—This family comprises the sea-lions and fur seals; these have small external ears and progress on land in quadrupedal fashion by applying the naked soles of all four feet to the ground. The incisor teeth are present, the canines are of normal size and the cheek-teeth have compressed crowns with one main cusp. They feed mostly on fish. There are seven well-marked species, each of which has received a generic name based on cranial characters. Steller's sea-lion (*Eumetopias stelleri*) and the northern fur seal (*Callorhinus ursinus*) are found in the north Pacific; the Californian sea-lion (*Zalophus californianus*) ranges from California to Japan; the Australian sea-lion (*Neophoca cinerea*) inhabits Australia; the Patagonian sea-lion (*Otaria jubata*) frequents the coasts of South America; the southern fur seal (*Arctocephalus pusillus*) occurs in the South American, South African and Australian seas; and Hooker's sea-lion (*Phocarcos hookeri*), also in the Australian seas. The family is thus restricted to the Pacific and southern oceans.

*Odobenidae*.—This family contains the walrus (*Odobenus*), restricted to the northern oceans. Its limbs are like those of the *Otariidae*, but the external ear is absent and the skull is remarkably modified to carry the huge tusk-like upper canines, while the cheek-teeth are flat-crowned for crushing the shells of mussels and oysters upon which the walrus mainly feeds.

*Phocidae*.—This family comprises true seals. They are also without external ears, but the hind-limbs are stretched backwards to act as a tail-fin and their soles, which like those of the fore-limb are hairy, are incapable of being applied to the ground. The variation in cranial and dental characters is greater than in the *Otariidae*, the common seals (*Phoca*) and the elephant seals (*Macrorhinus*) exhibiting the extremes. In *Phoca* the claws are all well developed, the digits of the fore-flippers are subequal and the first and fifth of the hind-flippers only slightly exceed the rest and the integument is not produced beyond their tips; the incisors are  $\frac{3}{2}$ , the cheek-teeth are cusped and mostly two-rooted, the muzzle is normal, its orifice is small and encircled by the long nasals and premaxillae which are in contact. In *Macrorhinus* the digits of the fore-flippers decrease in length from the first to the fifth, those of the hind-flippers have no claws and the fourth and fifth digits greatly exceed the rest and are lengthened by skin-lobes; the muzzle of the male is developed into a distensible proboscis; the incisors are  $\frac{2}{1}$ , the small cheek-teeth have simple crowns and one root, and the premaxillae and nasals are short and widely separated and do not surround the dilated nasal aperture. *Phoca* and its allies, e.g., *Halichoerus*, the grey seal, are found in the northern oceans. *Macrorhinus*, the largest of the pinnipeds, reaching a length of 20 ft., ranges from the Antarctic to California; but there are many structurally intermediate genera occurring in the northern and southern oceans.

(R. I. P.)

#### EXTINCT FORMS

Fossil remains of the majority of the common modern genera of Carnivora are found in the Pleistocene formations along with a number of extinct types which were known to prehistoric man. Among these the most remarkable are the sabre-tooth tigers or machaerodonts (see MACHAERODONT), the *Arctotherium* or short-faced bear of South America. The great cave-bear of Europe and the giant tiger *Felis arrox* of North America much exceeded any living species of *Ursus* and *Felis* in size; and the geographic range of hyaenas, lions, *Cyon*, was then extended to northern Europe, while conversely the wolverine and other northern Carnivora have been found as far south as Arkansas.

All of the families of modern Carnivora are represented in the formations of the later Tertiary epochs, most of them by a wider variety of types than those that survive to-day, and the ancestry of many of the modern genera can be traced back through the Pliocene, Miocene and Oligocene into or towards a common ancestral stock which appears to be fairly represented by the Eocene family *Miacidae* of the Primitive Carnivora or Creodonta (see CREODONTA). The *Miacidae*, alone among the creodont families, have acquired the true carnassial or shearing teeth of the fissiped Carnivora,  $p^4$  in the upper and  $m_1$  in the lower jaw being enlarged and specialized for this purpose; and on this account they are transferred by some authorities to the Fissipedia. But they have not acquired the consolidated scapholunar bone of the wrist nor the completely ossified auditory bulla of the Fissipedia, and for these and other reasons may best be regarded as pro-fissiped creodonts. (See Matthew, 1909, *Memoirs Amer. Mus. Nat. Hist.*, vol. ix., part vi., pp. 339-340.)

In the Oligocene numerous genera of primitive fissiped Carnivora are known from Europe, North America and Central Asia. They all appear to be rather nearly related, but the beginnings of the distinctions between viverroid, musteloid and cynoid groups can be perceived and the felids are already distinct. The faunas of the three regions have much in common and these Oligocene fissipeds are evidently descended from Holarctic *Miacidae* of the Eocene. They had apparently not yet reached Africa, although the Creodonta had preceded them into that region, at least as far as Egypt. Neither creodonts nor fissiped Carnivora are found in South America at this time; the Carnivora did not reach the

Neotropical region until the Pliocene, their place being taken by carnivorous marsupials in the older Tertiary of South America.

All of these Oligocene Carnivora have the scaphoid and lunar bones united. Most of them have the tympanic ring expanded into a complete bulla, but the bulla is not infrequently loosely articulated to the skull and is then usually lost in the fossil specimens.

The cynoid group has the dentition  $\frac{3.1.4-3-2}{3.1.4-3}$ ; the teeth behind

the carnassial moderately reduced and of crushing type. *Cynodictis* with only two upper molars leads through a number of intermediate stages (*Nothocyon*, Upper Oligocene, *Cynodesmus*, Lower Miocene, *Galeocynus* and *Tephrocyon*, Upper Miocene) into the modern Canidae; while *Daphaenus* with three upper molars leads (through *Daphaenodon* of the Lower Miocene) into the Miocene *Amphicyons* or bear-dogs with enlarged crushing and reduced shearing teeth. These equalled the modern bears in size, but were still largely digitigrade with legs of moderate length and long heavy tail. They are connected with the true bears through *Hemicyon* (Miocene), *Hyaenarctos* and *Indarctos* (Pliocene) in which the teeth progressively assume the fully specialized crushing type of the true bears, the limbs become long and straight, the feet plantigrade and the outer digit of *manus* and *pes* the largest. How near this series comes to being a direct line of ancestry is not yet settled, but it unquestionably indicates that the bears are derived from primitive Oligocene cynoids. The raccoons also appear to be derived from this primitive cynoid stock, through *Cynodon* of the Oligocene and *Phlaocyon* of the Lower Miocene, but it is probable that the modern Procyonidae are several independent parallel branches from this stock rather than a single group.

The Oligocene musteloids have the post-carnassial teeth more reduced than in the cynoids and of more or less cutting type.

Their dental formula is  $\frac{3.1.4-3.2-1}{3.1.4-3.2}$ . None of them have acquired

the expansion of the inner half of  $m^1$  nor the flattened tympanic bulla that characterize modern Mustelidae; these characters appear in a very rudimentary stage in most of the Lower Miocene and more fully developed in the Middle and Upper Miocene mustelines, but are assumed independently in a number of separate series that lead up more or less directly into the martens, weasels, wolverines, otters, skunks and badgers.

The viverrid group is hardly distinguishable in the Oligocene by tooth characters, but it shows in contradistinction to the cynoids and musteloids a certain tendency to extend the bulla backward and expand the paroccipital process over its posterior end. The well-developed parastyle on the upper carnassial, characteristic of most modern Viverridae and Felidae, is small and inconsistent in their Oligocene ancestors, and is moreover not uncommonly found in Tertiary cynoids and musteloids (*Aeluroidon*, etc.). In the Miocene Viverridae the limitation of the post-carnassial teeth to two above and one (the second true molar) below, both well developed, becomes more definite, the bulla more characteristic and the division between viverrine and herpestine genera begins to be distinguishable.

A number of intermediate genera in the Miocene and Lower Pliocene (*Ictitherium*, *Lepthyaena*, *Palyaena*) are transitional to the hyaenas, which are fully developed in the Lower Pliocene and are clearly derivable from primitive civets, although the known species of these intermediate genera are not directly ancestral. Hyaenas and civets are found only in the Old World Tertiaries, although fragmentary remains of hyaenoid Canidae from the Tertiary of North America have several times (*Aeluroidon*, *Borophagus*, "*Prohyaena*," *Chasmoporthetes*) been mistakenly referred to these Old World families. The Tertiary canids, on the other hand, are chiefly North American, while the Mustelids and ursids are Holarctic.

The Felidae are quite distinct in the Oligocene, and all of them show, but in differing degree, an enlarged and compressed upper canine, reduced lower canine and flanged or angulate chin. They appear to fall into two series; in one these characters and associated special adaptations in skull and skeleton are decidedly more marked and are progressively increased in the Lower and

Upper Miocene to culminate in the Sabre-tooth Tigers of the Pliocene and Pleistocene (see *MACHAERODUS*). In the other series the above noted peculiarities, already much less developed, are progressively reduced to the nearly normal condition of the modern Felidae in which upper and lower canines are nearly equal, and the chin has lost its flange. The clouded tiger of Malaysia is the most primitive living species in these as in some other particulars. *Dimictis* of the Oligocene, *Nimravus* and *Archaelurus* of the Lower Miocene, *Pseudaelurus* of the later Miocene, are the successive stages in the ancestry of the Felidae, while *Hoplophonus* and *Eusmilus* of the Oligocene and *Machaerodus* of the Miocene lead into the more highly specialized sabre-tooths *Smilodon* and *Megantheron* of the Pliocene and Pleistocene. In both the feline and machaerodontine series there is also a progressive specialization of the shearing teeth and reduction of the premolars, these teeth in *Dimictis* being not far beyond the stage reached in the modern viverrid genus *Cryptoprocta*. (W. D. M.)

**CARNIVOROUS PLANTS:** See INSECTIVOROUS PLANTS.

**CARNOCK, ARTHUR NICOLSON**, 1ST BARON (1849-1928), British diplomatist, was born in London on Sept. 19, 1849, the son of Admiral Sir Frederick W. E. H. Nicolson, 10th Bart. (1815-99). He was educated at Rugby and Brasenose College, Oxford, and in 1870 entered the Foreign Office as assistant private secretary to Lord Granville. In 1874 he was attached to the British Embassy in Berlin, and after occupying a succession of minor diplomatic posts, became in 1885 *chargé d'affaires* at Tehran. From 1888 to 1904 he held posts in Constantinople, Bulgaria, and Morocco, where he was minister. In 1899 he succeeded his father as 11th baronet. In 1906 Sir Arthur Nicolson went as ambassador to Russia, returning in 1910 to the Foreign Office as Under-secretary for Foreign Affairs. He retired in 1916, when he received a peerage. He published in 1873 a *History of the German Constitution*. He died on Nov. 5, 1928.

**CARNOT, LAZARE HIPPOLYTE** (1801-1888), French statesman, the second son of L. N. M. Carnot (q.v.), was born at Saint-Omer on Oct. 6, 1801. Hippolyte Carnot lived at first in exile with his father, returning to France only in 1823. He wrote, in 1830, an *Exposé de la doctrine Saint-Simonienne*, and collaborated in the Saint-Simonian journal *Le Producteur*. In March 1839, after the dissolution of the chamber by Louis Philippe, he was elected deputy for Paris (re-elected in 1842 and in 1846), and sat in the group of the Radical Left. At the revolution of 1848 he became minister of education in the provisional Government. In proposing a law for free and obligatory primary education he declared himself against purely secular schools, holding that "the minister and the schoolmaster are the two columns on which rests the edifice of the republic." By this attitude he alienated both the Right and the Republicans of the Extreme Left, and was forced to resign on July 5. Under the Empire he refused to sit in the *Corps Législatif* until 1864, in order not to have to take the oath. From 1864 to 1869 he was in the republican opposition, taking a very active part. He was a member of the Constituent Assembly of 1871, and in 1875 was nominated a senator for life. He died on March 16, 1888, three months after the election of his elder son, M. F. S. Carnot, to the presidency of the republic. He had published *Le Ministère de l'instruction publique et des cultes du 24<sup>e</sup> février au 5<sup>e</sup> juillet 1848* (1849), *Mémoires sur Lazare Carnot* (2 vols. 1861-64, new ed., 1907), *Mémoires de Barère* (with David Angers, 4 vols., 1842-43).

A notice by Lefèvre-Portalès in vol. xxxviii. of the *Séances* of the Academy of Moral and Political Sciences.

**CARNOT, LAZARE NICOLAS MARGUERITE** (1753-1823), French general, was born at Nolay, Côte d'Or, on May 13, 1753. He entered the corps of engineers, becoming captain in 1783, just after the publication of his first work, an *Essai sur les machines en général*. In 1784 he wrote his *Éloge* of Vauban. But as the result of a controversy with Montalembert, Carnot abandoned the official, or Vauban, theories of the art of fortification, and went over to the "perpendicular" school of Montalembert. He was consequently imprisoned, on the pretext of having fought a duel, and only released when selected to accompany Prince Henry of Prussia in a visit to Vauban's forti-

fictions. The Revolution drew him into political life, and he was elected a deputy for the Pas de Calais. Carnot was a stern and sincere republican, and voted for the execution of the king. In the campaigns of 1792 and 1793 he was continually employed as a commissioner in military matters, his greatest service being in April, 1793, on the north-eastern frontier, where the disastrous battle of Neerwinden and the subsequent defection of Dumouriez had thrown everything into confusion.

Carnot was the real organizer of victory for the revolutionary armies. He was a military genius who cast aside the hampering traditions of the Prussian military school, at that time blindly followed by other European armies. He abandoned the idea of seeking to defend all points, and formed the French armies into large masses able to strike deadly blows at the enemy. The successes of Jourdan, Hoche and Pichegru were largely due to the new conceptions of strategy inculcated by Carnot. The changes he made in army tactics were equally important. Deployment in line gave way to the older system of attack in columns formation, under which full use could be made of the superior quality and intelligence of the French soldier. Side by side with these changes in the art of fighting, Carnot carried out other important administrative changes, notably in the organization of the food supply. Under his new system the French soldier was fed, clothed, and supplied with munitions far more efficiently than before.

After his reorganization of the army front Carnot returned to Paris and was made a member of the Committee of Public Safety. He was charged with duties corresponding to those of the modern chief of the general staff and adjutant-general. As a member of the committee he signed its decrees. His whole attention was given to the defence of the frontiers. He organized 14 armies, which included over a million men, in the course of a single year. His labours were incessant; practically every military document in the archives of the committee was Carnot's own work, and he was repeatedly in the field with the armies. His part in Jourdan's great victory at Wattignies was so important that the credit of the day has often been assigned to Carnot. The winter of 1793-94 was spent in new preparations, in instituting a severe discipline in the new and ill-trained troops of the republic, and in improvising means and material of war. He continued to visit the armies at the front, and to inspire them with energy. He acquiesced in the fall of Robespierre in 1794, but later defended Barère and others among his colleagues, declaring that he himself had constantly signed papers without reading them, as it was physically impossible to do so in the press of business. When Carnot's arrest was demanded in May, 1795, a deputy cried "Will you dare to lay hands on the man who has organized victory?"

Carnot was elected one of the five Directors in November, 1795, and continued to direct the war department during the campaign of 1796. Late in 1796 he was made a member (1st class) of the Institute, which he had helped to establish. He was for two periods president of the Directory, but in its later stages found himself at variance with Barras and his adherents. On the *coup d'état* of the 18th Fructidor (1797) he was warned in time and took refuge abroad. The ridiculous accusations of conspiracy against the republic drew from him a *Réponse au rapport de J. C. Bailleul*, which gives an admirable account of the working of the constitution of 1795.

Carnot returned to France after the 18th Brumaire (1799) and was re-elected to the Institute in 1800. Early in 1800 he became minister of war, and he accompanied Moreau in the early part of the Rhine campaign. His chief work was, however, in reducing the expenses of the armies. Contrary to the usual custom he refused to receive presents from contractors, and he effected much-needed reforms in every part of the military administration. He tendered his resignation later in the year, but it was long before the First Consul would accept it. From 1801 he lived in retirement with his family, employing himself chiefly in scientific pursuits. As a senator he consistently opposed the increasing monarchism of Napoleon, who, however, gave him in 1809 a pension and commissioned him to write a work on fortification for the school of Metz. In these years he had published *De la*

*corrélation des figures de géométrie* (1801), *Géométrie de position* (1803), and *Principes fondamentaux de l'équilibre et du mouvement* (1803), all of which were translated into German.

His great work on fortification appeared at Paris in 1810 (*De la défense de places fortes*), and was translated for the use of almost every army in Europe. He took Montalembert as his groundwork. Without sharing Montalembert's antipathy to the bastioned trace, and his predilection for high masonry caponiers, he followed out the principle of retarding the development of the attack, and provided for the most active defence. To facilitate sorties in great force he did away with a counterscarp wall, providing instead a long gentle slope from the bottom of the ditch to the crest of the glacis. This, he imagined, would compel an assailant to maintain large forces in the advanced trenches, which he proposed to attack by vertical fire from mortars. Along the front of his fortress was built a heavy detached wall, loop-holed for fire, and sufficiently high to be a most formidable obstacle. This "Carnot wall," and, in general, Carnot's principle of active defence, played a great part in the rise of modern fortification.

He did not seek employment in the field in the aggressive wars of Napoleon, remaining a sincere republican, but in 1814, when France itself was once more in danger, Carnot at once offered his services. He was made a general of division, and Napoleon sent him to the important fortress of Antwerp as governor. His defence of that place was one of the most brilliant episodes of the campaign of 1814. He joined Napoleon during the Hundred Days, and was made minister of the interior, the office carrying with it the dignity of count, and on June 2, he was made a peer of France. On the second Restoration he was proscribed. He lived thenceforward in Magdeburg, and died there on Aug. 2, 1823. His remains were solemnly removed to the Panthéon in 1889. Long before this, in 1836, Antwerp had erected a statue to its defender of 1814. In 1837 Arago pronounced his *éloge* before the Académie des sciences. The memory of his military career is preserved in the title, given to him in the Assembly, of "The organizer of victory."

**CARNOT, MARIE FRANÇOIS SADI (SADI)** (1837-1894), 4th president of the 3rd French Republic, son of L. Hippolyte Carnot, was born at Limoges on Aug. 11, 1837. He was educated at the École Polytechnique and the École des Ponts et Chaussées, and then obtained an appointment in the public service. He was entrusted in 1870 with the task of organizing resistance in the departments of the Eure, Calvados and Seine Inférieure, and made prefect of the last named in Jan. 1871. In the following month he was elected to the National Assembly by the department Côte d'Or. In Sept. 1880 he became minister, and again in April 1885, passing almost immediately to the Ministry of Finance, which he held under both the Ferry and the Freycinet administrations until Dec. 1886. When the Wilson scandals (*see* GRÉVY) occasioned the downfall of Grévy in Dec. 1887, Carnot became a candidate for the presidency, with the support of Clemenceau and others who desired to see a president who had no connection with the politics of the market place. He was elected by 616 votes out of 827. The internal situation was a critical one, the stability of the State being threatened by the Boulangist agitation, but Boulanger was exiled in 1889. Carnot had but one other serious crisis to surmount, the Panama scandals of 1892, which, if they greatly damaged the prestige of the State, increased the respect felt for its head, against whose integrity none could breathe a word. On

June 24, 1894, after speaking at a public banquet at Lyons he was stabbed by an Italian anarchist named Caserio and expired almost immediately. The horror and grief excited by this tragedy were boundless, and the president was honoured with a splendid funeral in the Panthéon, Paris.

See E. Zevort, *Histoire de la Troisième République*, tome iv., "La Présidence de Carnot" (Paris, 1901); A. A. G. Hanotaux, *Histoire de la Troisième République* (1904, etc.).

**CARNOT, NICOLAS LÉONHARD SADI** (1796–1832), French physicist, elder son of L. N. M. Carnot, was born at Paris. He was admitted to the École Polytechnique in 1812, and late in 1814 he left with a commission in the Engineers and with prospects of rapid advancement in his profession. But Waterloo and the Restoration led to a second and final proscription of his father; and though not himself cashiered, Sadi was purposely told off for the merest drudgeries of his service. In 1819 he presented himself at the examination for admission to the staff corps (*état-major*) and obtained a lieutenancy. He then studied mathematics, chemistry, natural history, technology and even political economy. He was an enthusiast in music and other fine arts, and practised all sorts of athletic sports, including swimming and fencing. He became captain in the Engineers in 1827, but left the service altogether in the following year. He died of cholera in Paris on Aug. 24, 1832. He was an original and profound thinker. The only work he published was his *Réflexions sur la puissance motrice du feu et sur les machines propres à développer cette puissance* (1824). This contains but a fragment of his scientific discoveries, but it is sufficient to put him in the very foremost rank, though its full value was not recognized until pointed out by Lord Kelvin in 1848 and 1849. Fortunately his manuscripts had been preserved, and extracts were appended to a reprint of his *Puissance motrice* by his brother, L. H. Carnot, in 1878. These show that he had not only realized for himself the true nature of heat, but had noted down for trial many of the best modern methods of finding its mechanical equivalent, such as those of J. P. Joule with the perforated piston and with the friction of water and mercury. Lord Kelvin's experiment with a current of gas forced through a porous plug is also given. "Carnot's principle," that the efficiency of a reversible engine depends on the temperatures between which it works, is fundamental in the theory of thermodynamics (*q.v.*).

**CARNOUSTIE**, police burgh and watering-place, Forfarshire, Scotland. Pop. (1931) 4,806. It lies on the North Sea, 10½ m. E.N.E. of Dundee by the L. & N.E.R. Bathing and golfing are good. Barry Links, a triangular sandy tract occupying the south-eastern corner of the shire, is used as a military camping and manoeuvring ground. Its extreme point is called Buddon Ness, off which are the dangerous shoals locally known as the Roaring Lion. On the ness two lighthouses have been built at different levels.

**CARNUNTUM**, an important Roman fortress (*Kapvoûs* in Ptolemy), originally belonging to Noricum, but after the 1st century A.D. to Pannonia. It was a Celtic town, the name, which is nearly always found with K on monuments, being derived from *Kar*, *Karn* ("rock," "cairn"). Its extensive ruins may still be seen near Hainburg in lower Austria. It was a very old mart for the amber brought to Italy from the north. During the reign of Augustus (A.D. 6), Tiberius made it his base in the campaigns against Maroboduus (Marbod). Later it became the centre of the Roman defences of the Danube from Vindobona (Vienna) to Brigetio (O-Szőny), and (under Trajan or Hadrian) the permanent quarters of the XIV. legion. It was created a *municipium* by Hadrian (*Aelium Carnuntum*). Marcus Aurelius resided there (172–175) during the war against the Marcomanni, and wrote part of his *Meditations*. Septimius Severus, governor of Pannonia, was proclaimed emperor there (193). In the 4th century it was destroyed by the Germans, and though it was partly restored by Valentinian I, Vindobona became now the chief military centre. It was finally destroyed by the Hungarians in the middle ages.

See J. W. Kubitschek and S. Frankfurter, *Führer durch Carnuntum* (3rd ed., 1894); Pauly-Wissowa's *Realencyclopädie s.v.*; *Corpus Inscriptionum Latinarum*, iii., part i. p. 550.

**CARNUTES**, a Celtic people of central Gaul, between the Sequana (Seine) and the Liger (Loire). Their territory included the greater part of the modern departments of Eure-et-Loir, Loiret, Loir-et-Cher. The chief towns were Cenabum (Orléans) and Autricum (Chartres). In the time of Caesar they were dependents of the Remi, but joined in the rebellion of Vercingetorix. As a punishment for the treacherous murder of some Roman merchants and one of Caesar's commissariat officers at Cenabum, the town was burnt and the inhabitants put to the sword or sold as slaves. They sent 12,000 men to relieve Alesia, but shared in the defeat of the Gallic army. Having attacked the Bituriges Cubi (*see* BITURIGES), who appealed to Caesar for assistance, they were forced to submit.

Under Augustus, the Carnutes were raised to the rank of *civitas foederata*, retaining their own institutions, and only bound to render military service to the emperor. Up to the 3rd century Autricum was the capital, but in 275 Aurelian changed Cenabum into a *civitas* and named it Aurelianum or Aurelianensis urbs (whence Orléans).

For ancient authorities see Caesar, *Bell. Gall.* v. 25, 29, vii. 8, 11, 75, viii. 5, 31; Strabo iv. pp. 191–193.

**CARO, ANNIBALE** (1507–1566), Italian poet, was born at Civita Nuova, in Ancona, in 1507. He became tutor in the family of Lodovico Gaddi, a rich Florentine, and then secretary to his brother Giovanni, by whom he was presented to a valuable ecclesiastical preferment at Rome. At Gaddi's death, he entered the service of the Farnese family, and became confidential secretary in succession to Pietro Lodovico, duke of Parma, and to his sons, duke Ottavio and cardinals Ranuccio and Alexander. Caro's most important work was his translation of the *Aeneid* (Venice, 1581; Paris, 1760). He is also the author of *Rime* (1569), *Canzone* (1553) and sonnets, a comedy named *Gli Straccioni* (1582), and two clever *jeux d'esprit*, one in praise of figs, *La Fichiede* (1539) and another in eulogy of the big nose of Leoni Ancona, president of the Academia della Vertù. Caro's poetry is distinguished by the freedom and grace of its versification; indeed he may be said to have brought the *verso sciolto* to the highest development it has reached in Italy. His prose works consist of translations from Aristotle, Cyprian and Gregory Nazianzen; and of letters, written in his own name and in those of the cardinals Farnese, which are remarkable both for the baseness they display and for their euphemistic polish and elegance. His fame is defaced by the virulence with which he attacked Lodovico Castelvetro in one of his canzoni, and by his meanness in denouncing him to the Holy Office as translator of some of the writings of Melanchthon. He died at Rome about 1566.

**BIBLIOGRAPHY.**—Caro's works are published in the *Classici Italiani Series*, vols. 74–81 (Milan, 1807–12), and in *Scrittori d'Italia*, vol. xli. (ed. V. Turri, 1912); G. Cantalamessa Carboni, *Ricerche sulla vita del Commendatore Annibal Caro* (Ascoli, 1858); F. Bernette, *Annibal Caro* (Porto Civitanova, 1907); V. Cian, *La vita e le opere di Annibal Caro* (1912); *Le più belle pagine di Annibal Caro* (ed. F. Pastonchi, Milan, 1903).

**CARO, ELME MARIE** (1826–1887), French philosopher, was born at Poitiers. He was educated at the Stanislas college and the École Normale, where he graduated in 1848. He came to Paris in 1858 as master of conferences at the École Normale. In 1861 he became inspector of the Academy of Paris, in 1864 professor of philosophy to the Faculty of Letters, and in 1874 a member of the French Academy. He married Pauline Cassin, the novelist who wrote the *Péché de Madeleine* and other popular novels. In his philosophy he was mainly concerned to defend Christianity against modern positivism. The philosophy of Cousin influenced him strongly, but his strength lay in exposition and criticism rather than in original thought. Besides important contributions to *La France* and the *Revue des Deux Mondes*, he wrote *Le Mysticisme au XVIII<sup>e</sup> siècle* (1852–54), *L'Idée de Dieu* (1864), *Le Matérialisme et la science* (1868), *Jours d'épreuve* (1872), *Le Pessimisme au XIX<sup>e</sup> siècle* (1878), *La Philosophie de Goethe* (2nd ed., 1880), *M. Littré et le positivisme* (1883), *George Sand* (1887), *Mélanges et portraits* (1888).

See E. V. Maumus, *Les Philosophes Contemporains i. E. M. Caro* (Paris, 1891).

**CARO, NIKODEM** (1871— ), German chemist, was born May 23, 1871, at Łódź. He studied at Berlin University and at the technical high school, Charlottenburg, and founded a public chemical laboratory. He was engaged in agricultural research work, and experimented on peat as a source of power. He interested himself in the problems of calcium carbide and acetylene, and in the liquefaction of water gas for the production of hydrogen, also in ammonia oxidation. In conjunction with Frank, he devoted himself to the development of a process for the fixation of nitrogen (cyanamide) and organized the cyanamide industry founded thereon. Large works for this industry were also erected at Piesteritz and Chovzow. Dr. Caro made a special study of the question of Bavarian sources of water-power with a view to utilizing them in the chemical industry.

**CAROL**, a hymn of praise, especially such as is sung at Christmas in the open air. Diez suggests that the word is derived from *chorus*. Others ally it with *corolla*, a garland, circle or coronet, the earliest sense of the word being apparently "a ring" or "circle," "a ring dance." Stonehenge, often called the giants' dance, was also frequently known as the carol. The crib set up in the churches at Christmas was the centre of a dance, and some of the most famous of Latin Christmas hymns were written to dance tunes. These songs were called *Wiegenlieder* in German, *noëls* in French, and carols in English. Strictly speaking the word "carol" should be applied to lyrics written to dance measures; in common acceptance it is applied to the songs written for the Christmas festival. Carolling, i.e., the combined exercise of dance and song, found its way from pagan ritual into the Christian church, and the clergy, however averse they might be from heathen survivals, had to content themselves in this, as in many other cases, with limiting the practice. The third council of Toledo (589) forbade dancing in the churches on the vigils of saints' days, and secular dances in church were forbidden by the council of Auxerre in the next year. Even as late as 1209 it was necessary for the council of Avignon to forbid theatrical dances and secular songs in churches. Religious dances persisted longest on Shrove Tuesday, and a castanet dance by the choristers round the lectern is permitted three times a year in the cathedral of Seville. The Christmas festival, which synchronized with and superseded the Latin and Teutonic feasts of the winter solstice, lent itself especially to gaiety. The "crib" of the Saviour was set up in the churches or in private houses, in the traditional setting of the stable, with earthen figures of the Holy Family, the ox and the ass; and carols were sung and danced around it. The singing of the carol has survived in places where the institutions of the "crib," said to have been originated by St. Francis of Assisi to inculcate the doctrine of the incarnation, has been long in disuse, but in the West Riding of Yorkshire the children who go round carol-singing still carry "milly-boxes" (My Lady boxes) containing figures which represent the Virgin and Child. That carol-singing early became a pretext for the asking of alms is obvious from an Anglo-Norman carol preserved in the British Museum ms. (Reg. 16 E, viii.), *Seigneurs ore entended nus*, which is little more than a drinking song.

There are extant numerous carols dating from the 15th century which have the characteristic features of folksong. The famous cherry-tree carol, "Joseph was an old man," is based on an old legend which is related in the Coventry mystery plays. "I saw three ships come sailing in," and "The Camel and the Crane," though of more modern date, preserve curious legends. Among 18th century religious carols perhaps the most famous is Charles Wesley's "Hark, how all the welkin rings," better known in the variant, "Hark, the herald angels sing." The modern revival of carol-singing has produced a quantity of new carols, the best of which are perhaps mostly derived from mediaeval Latin Christmas hymns.

The earliest printed collection of carols was issued by Wynkyn de Worde in 1521. It contained the famous Boar's Head carol, *Caput apri deifero, Reddens laudes Domino*, which in a slightly altered form is sung at Queen's college, Oxford, on the bringing in of the boar's head. Among the numerous collections of French carols is *Noël Borguignon de Gui Barôzai* (1720), giving the words and the music of 34 *noëls*, many of them very free in character. The term *noël* passed into the English carol as a favourite refrain, "nowell," and seems to have been in common use in France as an equivalent for *vivat*.

In architecture, the term "carol" (also wrongly spelled "caryl" or "carrol") is used, in the sense of an enclosure, of a small chapel or oratory enclosed by screens, and also sometimes of the rails of the screens themselves. It is more particularly applied to the separate seats near the windows of a cloister (*q.v.*), used by the monks for the purposes of study, etc. The term "carol" has, by a mistake, been sometimes used of a scroll bearing an inscription of a text, etc.

**BIBLIOGRAPHY.**—Among the more important collections of Christmas carols are: *Songs and Carols* (1847), ed. by T. Wright for the Percy Society from Sloane ms. 2593; W. Sandys, *Christmastide, its History, Festivities and Carols* (1852); T. Helmore and J. M. Neale, *Carols for Christmastide* (1853-54), with music; *Christmas with the Poets* (1872); R. R. Chope, *Carols* (1894), a tune-book for church use, with an introduction by S. Baring-Gould; H. R. Bramley, *Christmas Carols, New and Old*, the music by Dr. Stainer; A. H. Bullen, *Carols and Poems* (1885); J. A. Fuller Maitland and W. S. Rockstro, *Thirteen Carols of the Fifteenth Century*, from a Trinity college, Cambridge, ms. (1891); Edith Rickert, *Ancient English Christmas Carols* (1910). See also Julian's *Dictionary of Hymnology*, s.v. "Carol"; E. Cortet, *Essai sur les fêtes religieuses* (1867).

**CAROLINE AMELIA ELIZABETH** (1768-1821), queen of George IV. of Great Britain, second daughter of Charles William Ferdinand, duke of Brunswick-Wolfenbüttel, was born on May 17, 1768. In 1795 she was married to the then prince of Wales (see GEORGE IV.), who disliked her and separated from her after the birth of a daughter, Princess Charlotte Augusta, in Jan. 1796. The princess resided at Blackheath; and as she was thought to have been badly treated by her profligate husband, the sympathies of the people were strongly in her favour. About 1806 reports reflecting on her conduct were circulated so openly that the king appointed a commission to inquire into the circumstances. The princess was acquitted of any serious fault, but improprieties in her conduct were pointed out and censured. In 1814 she left England and travelled on the Continent, residing principally in Italy. On the accession of George IV. in 1820, orders were given that the English ambassadors should prevent the recognition of the princess as queen at any foreign court. Her name was also formally omitted from the liturgy. These acts stirred up a strong feeling in favour of the princess among the English people generally, and she at once made arrangements for returning to England and claiming her rights. She rejected a proposal that she should receive an annuity of £50,000 a year on condition of renouncing her title and remaining abroad, and arrived in England on June 6. One month later a bill to dissolve her marriage with the king on the ground of adultery with an Italian, Bartolomeo Bergami, whom she had taken into favour in Milan, was brought into the House of Lords. The trial began on Aug. 17, 1820, and on Nov. 10 the bill, after passing the third reading, was abandoned. The public excitement had been intense, the boldness of the queen's counsel, Brougham and Denman, unparalleled, and the ministers felt that the smallness of their majority was virtual defeat. The

"good king Wenceslas" in St. Vitus  
Cathedral, Prague

queen was allowed to assume her title, but she was refused admittance to Westminster Hall on the coronation day, July 19, 1821. Mortification at this event seems to have hastened her death, which took place on Aug. 7 of the same year.

See *A Queen of Indiscretions, the Tragedy of Caroline of Brunswick, Queen of England*, trans. by F. Chapman from the Italian of Graziano Paolo Clerici (1907), with numerous portraits, etc.; *The Trial at large of Her Majesty . . . containing the evidence . . . speeches . . . etc. . . . printed from the Journals of the House*, 2 vols., 1821. Of contemporary authorities the *Creevey Papers* (1905) throw the most interesting sidelights on the subject.

**CAROLINE WILHELMINA** (1683-1737), wife of George II., king of Great Britain and Ireland, was a daughter of John Frederick, margrave of Brandenburg-Ansbach (d. 1686). Born at Ansbach on March 1, 1683, the princess passed her youth mainly at Dresden and Berlin, where she enjoyed the close friendship of Sophia Charlotte, wife of Frederick I. of Prussia; she married George Augustus, electoral prince of Hanover, in Sept. 1705. The early years of her married life were spent in Hanover. She took a continual interest in the approaching accession of the Hanoverian dynasty to the British throne, was on very friendly terms with the old electress Sophia, and corresponded with Leibnitz, whose acquaintance she had made in Berlin. In Oct. 1714 Caroline followed her husband and her father-in-law, now King George I., to London. As princess of Wales she was accessible and popular, filling a difficult position with tact and success. In the quarrel between the prince of Wales and his father Caroline naturally took the part of her husband, and matters reached a climax in 1717. Driven from court, ostracized by the king, deprived even of the custody of their children, the prince and princess took up their residence in London at Leicester House, and in the country at Richmond. They managed, however, to surround themselves with a distinguished circle; Caroline had a certain taste for literature, and among their attendants and visitors were Lord Chesterfield, Pope, Gay, Lord Hervey and his wife, the beautiful Mary Lepel. A formal reconciliation with George I. took place in 1720. In Oct. 1727 George II. and his queen were crowned. During the rest of her life Queen Caroline's influence in English politics was chiefly exercised in support of Sir Robert Walpole; she kept this minister in power and in control of Church patronage. She was exceedingly tolerant, and the bishops appointed by her were remarkable rather for learning than for orthodoxy. During the king's absences from England she was regent of the kingdom on four occasions, in 1729, 1732, 1735 and 1736-37. Caroline's relations with her husband, to whom she bore eight children, were satisfactory. A clever and patient woman, she was very complaisant towards the king, flattering his vanity and acknowledging his mistresses, and she retained her influence over him to the end. She died on Nov. 20, 1737.

Caroline appears in Scott's *Heart of Midlothian*; see also Lord Hervey, *Memoirs of the Reign of George II.*, ed. by J. W. Croker (1884); W. H. Wilkins, *Caroline the Illustrious* (1904); and A. D. Greenwood, *Lives of the Hanoverian Queens of England*, vol. i. (1909).

**CAROLINE ISLANDS**: see PACIFIC ISLANDS.

**CAROLINGIANS**, the name of a family (so called from Charlemagne, its most illustrious member) which gained the throne of France A.D. 751. It appeared in history in 613, its origin being traced to Arnulf (Arnoul), bishop of Metz, and Pippin, long called Pippin of Landen, but more correctly Pippin the Old or Pippin I. Albeit of illustrious descent, the genealogies which represent Arnulf as an Aquitanian noble, and his family as connected—by more or less complicated devices—with the saints honoured in Aquitaine, are worthless, dating from the time of Louis the Pious in the 9th century. Arnulf was one of the Austrasian nobles who appealed to Clotaire II., king of Neustria, against Brunhilda, and it was in reward for his services that he received from Clotaire the bishopric of Metz (613). Pippin, also an Austrasian noble, had taken a prominent part in the revolution of 613. These two men Clotaire took as his counsellors; and when he decided in 623 to confer the kingdom of Austrasia upon his son Dagobert, they were appointed mentors to the Austrasian king, Pippin, with the title of mayor of the palace. Before receiving his bishopric, Arnulf had had a son Adalgiselus, afterwards called Anchis; Pippin's daughter,

called Begga in later documents, was married to Arnulf's son, and of this union was born Pippin II. Towards the end of the 7th century Pippin II., called incorrectly Pippin of Heristal, secured a preponderant authority in Austrasia, marched at the head of the Austrasians against Neustria, and gained a decisive victory at Testry, near St. Quentin (687). From that date he may be said to have been sole master of the Frankish kingdom, which he governed till his death (714). In Neustria Pippin gave the mayoralty of the palace to his son Grimoald, and afterwards to Grimoald's son Theodebald; the mayoralty in Austrasia he gave to his son Drogo, and subsequently to Drogo's children, Arnulf and Hugh. Charles Martel, however, a son of Pippin by a concubine Chalpaïda, seized the mayoralty in both kingdoms, and he it was who continued the Carolingian dynasty. Charles Martel governed from 714 to 741, and in 751 his son Pippin III. took the title of king. The Carolingian dynasty reigned in France from 751 to 987, when it was ousted by the Capetian dynasty. In Germany descendants of Pippin reigned till the death of Louis the Child in 911; in Italy the Carolingians maintained their position until the deposition of Charles the Fat in 887. Charles, duke of Lower Lorraine, who was thrown into prison by Hugh Capet in 991, left two sons, the last male descendants of the Carolingians, Otto, who was also duke of Lower Lorraine and died without issue, and Louis, who after the year 1000 vanishes from history.

See P. A. F. Gérard and L. A. Warnkönig, *Histoire des Carolingiens* (Brussels, 1862); H. E. Bonnell, *Anfänge des Karoling. Hauses* (1866); J. F. Böhm and E. Mühlbacher, *Regesten d. Kaiserreichs unter d. Karolingern* (Innsbruck, 1889, seq.); E. Mühlbacher, *Deutsche Gesch. unter d. Karolingern* (Stuttgart, 1896); F. Lot, *Les Derniers Carolingiens* (1891). (C. F.)

**CAROLUS-DURAN**, the name adopted by the French painter, CHARLES AUGUSTE EMILE DURAND (1837-1917), who was born at Lille on July 4, 1837, and died in Paris on Feb. 17, 1917. He studied at the Lille Academy and then went to Paris, and in 1861 to Italy and Spain for further study, especially devoting himself to the pictures of Velasquez. His subject picture "Murdered," or "The Assassination" (1866), one of his first successes, is now in the Lille museum; but he became best known afterwards as a portrait-painter and as the head of one of the principal ateliers in Paris, where some of the most brilliant artists of a later generation were his pupils. His "Lady with the Glove" (1869), a portrait of his own wife, was bought for the Luxembourg. In 1905 he was appointed director of the French academy at Rome in succession to Eugène Guillaume.

**CARORA**, an inland town of the State of Lara, Venezuela, on the Carora, a branch of the Tocuyo river, about 45m. W. by S. of the city of Barquisimeto, and 1,128ft. above sea-level. Pop. (1926), 11,200. The town is comparatively well-built and possesses a fine parish church, a Franciscan convent and hermitage. It was founded in 1754, and its colonial history shows considerable prosperity, its population at that time numbering 9,000 to 10,000. The neighbouring country is devoted principally to raising horses, mules and cattle; and in addition to hides and leather, it exports coffee, rubber and other forest products.

**CAROTO** or **CAROTTO**, GIOVANNI FRANCESCO (c. 1480-1555), Italian painter of the Veronese school. He was a pupil of Liberale and worked for some time, so Vasari says, under Mantegna at Mantua. His later works betray the influence of Leonardo da Vinci, and of Raphael and the Roman school. In spite of plagiarisms, however, his art is essentially Veronese in colour, in the character of the figures and in the treatment of landscape, in which he was something of an innovator, for he seems to have loved trees and fields and flowing waters for their own sakes, and not merely as a background to human interests. Vasari says that Caroto, after having established a certain reputation at Verona, went to Milan in 1505, and was there engaged on work for Antonio M. Visconti. Between 1513 and 1518 he was employed at Casale Monferrato. But the greater part of his life was spent at Verona, where he decorated the churches with frescoes and painted altar-pieces and smaller pictures, some of which are now in the Pinacoteca Comunale.

His early work recalls the style of his masters, Liberale and Mantegna; "The Madonna in a Landscape with Lemon Trees,"

dated 1501 in the gallery at Modena; the "Madonna" in the Staedel at Frankfurt, and a "Madonna" in the Louvre at Paris. A fresco signed and dated 1508 of the "Annunciation" reveals Caroto as a follower of Leonardo, whose work he must have seen at Milan. Another Leonardesque picture is the fine "Madonna and Child flanked by two Angels carrying Lilies," at Dresden, received at that gallery with a forged signature of Leonardo until Morelli identified it as a work of Caroto. In his later work the artist becomes Raphaellesque in his design. This is the case in the fine frescoes in the church of S. Eufemia at Verona, representing stories of the angel Raphael, and in the altarpiece painted for the same church, of which the central panel, with large figures of three archangels, is now in the Pinacoteca. Another masterpiece is the picture in S. Fermo Maggiore (1528) with the Virgin and St. Anne in the clouds and four saints standing beneath in a fine landscape. "The Raising of Lazarus" (1531) in the Palazzo Arcivescovile and the St. Ursula (1535) in S. Giorgio in Braida, are among his last pictures. Outside Verona there are works by the master at Milan (Castello), Mantua (Chiesa Virgiliana), Florence (Offizi, Pitti), Fiesole (Villa Doccia), Modena, Bergamo, Paris, Dresden and Budapest. Caroto also decorated the façades of houses, and it is said that his work can still be seen on one of the houses on the Piazza Erbe. He modelled some medals of fine quality (medal for Bonifazio Palaeologo of Monferrato).

GIOVANNI CAROTO (1488-1555?) the younger brother of Giov. Francesco, was an architect and painter. According to Vasari, who knew him personally, he was a pupil of Liberale. He published a book on the antiquities of Verona, with woodcuts after his own drawings.

(1912); Morelli, *Italian Masters in German Galleries*; Alethea Wiel, *The Story of Verona* (1910); J. P. Richter, *A Descriptive Catalogue of the Old Masters in the Villa Doccia* (1907); Luigi Simeoni, *Verona* (1910).

**CARP**, the typical fish of the family Cyprinidae of the order Ostariophysi, in which the air-bladder is connected with the internal ear by a chain of ossicles. The Cyprinidae are scaly soft-rayed fishes with abdominal pelvic fins, with a toothless protractile mouth, and with falciform lower pharyngeal bones bearing a small number of teeth that bite against a horny plate attached to a process of the basal part of the skull. The form, number and arrangement of these teeth are of great importance in classification.

About 1,500 species are known from the rivers and lakes of Europe, Asia, Africa and North America, but there are no Cyprinidae in South America, in Madagascar, or in the Australian region (including Celebes). Most feed on weeds or on insects, crustaceans, worms, etc. The Catostomidae (Suckers) of North America, the Cobitidae (Loaches) of Eurasia, and the Homalopteridae of southern Asia and China are related families. Other Cyprinids than the Carp are described under the headings BARBEL, BITTERLING, BLEAK, BREAM, CHUB, DACE, GOLDFISH, GUDGEON, MAHSEER, MINNOW, ROACH, RUDD, TENCH.

The carp (*Cyprinus carpio*) is characterized by large scales, a long dorsal fin, and a mouth with four barbels. It is a native of eastern Asia, but has been introduced into Europe and North America. It inhabits lakes, ponds, and slow-running rivers, especially frequenting weedy places with a muddy bottom; it is mainly a vegetarian. It attains a weight of 25 lb. in England, but is said to reach 100 lb. on the continent of Europe. In Germany varieties wholly or partly scaleless are bred and are esteemed for the table. The Crucian carp is smaller and without barbels; it inhabits Europe, Turkistan, Siberia and Mongolia. The goldfish is closely related to the Crucian carp; it is a native of China and Japan.

**CARPACCIO, VITTORIO** or **VITTORE** (c. 1465-c. 1522). Italian painter, was born in Venice, of an old Venetian family. The facts of his life are obscure, but his principal works were executed between 1490 and 1519; and he ranks as one of

the finest precursors of the great Venetian masters. The date of his birth is conjectural. He is first mentioned in 1472 in a will of his uncle Fra Ilario, and Dr. Ludwig infers from this that he was born c. 1455, on the ground that no one could enter into an inheritance under the age of fifteen; but consideration of the youthful style of his earliest dated pictures ("St. Ursula" series, Venice, 1490) makes it improbable that at that time he had reached so mature an age as thirty-five; and he was more probably about 25 in 1490. What is certain is that he was a pupil (not, as sometimes thought, the master) of Lazzaro Bastiani, who, like the Bellini and Vivarini, was the head of a large *atelier* in Venice, and whose own work is seen in such pictures as the "S. Veneranda" at Vienna, and the "Doge Mocenigo kneeling before the Virgin" and "Madonna and Child" (formerly attributed to Carpaccio) in the National Gallery, London. In later years Carpaccio appears to have been influenced by Cima da Conegliano (e.g. in the "Death of the Virgin," at Ferrara). Apart from the "St. Ursula" series his scattered series of the "Life of the Virgin" and "Life of St. Stephen," and a "Dead Christ" at Berlin, may be specially mentioned.

See Pompeo Molmenti and Gustav Ludwig, *Life and Works of Vittorio Carpaccio*, Eng. trans., R. H. Cust (1907); and Roger Fry, "A Genre Painter and his Critics," in the *Quarterly Review* (April, 1908).

**CARPATHIAN MOUNTAINS.** These form the eastern wing of the central mountain axis of Europe, though they are not so impressive nor so widely known as the Alps. They begin near Bratislava and extend in a huge arc, concave towards the southwest to Orsova on the Danube with a total length and area nearly equal to that of the Alps, but with a much lower mean height and a maximum height (Gerlsdorfspitze—8,737 ft.) of little more than half that of the Alpine chain. They lack the rugged peaks, the extensive snowfields, the imposing glaciers, the high waterfalls and the numerous lakes characteristic of the Alps though allied to the latter in age and origin. The middle of the arc is marked by a significant decrease in width (from an average of 180 to 60 miles) and height and at this point a number of easy passes connect the headwaters of the Dniester and the Tisza. Here fracture and subsidence have carried the Hungarian plain into the heart of the highlands and it is possible to use this as a convenient division of the system into the Northern and Southern Carpathians. Across this constricted zone have passed many human influences, notably that of the Magyars, from the southern plains of Eastern Europe and Asia while through the passes here contact is made with the climatic and vegetational types of southern Russia.

**Ranges.**—The Northern Carpathians present the appearance of a very broken mountain mass in which numerous detached blocks are separated by wide and shallow basins. The outer belt, known as the Beskid Mountains, extends from the river Morava to the sources of the river Visó and the Golden Bistritza, in the form of a dissected peneplain of Miocene age and is composed of Cretaceous and early Tertiary sandstones and shales, the so-called Carpathian Sandstone. The surface of this peneplain is dotted with settlements and cultivated tracts but upon it rise parallel lines of monadnock ridges whose steep slopes are heavily wooded, often to the summits though the highest reach several hundred feet above the tree-line and provide summer pastures for the stock of the plateau farms. Among these ridges the best known are the White Carpathians (Javornik, 3,325 ft.), the Beskids proper (Smrk—4,395 ft., and Ossus—5,106 ft.), and the Arva Magura group (Babia Gora—5,650 ft.); east of the river Poprad the ridges are generally lower and more forested with firs and beeches. The inner belt of the Northern Carpathians has a very complicated structure, of which overthrusts are the keynote, and still awaits detailed interpretation. It is seen in its most complex form between the Morava and the Hernad, where, against a core of old crystalline rocks, Carboniferous and older strata have been considerably crushed and folded. On the outer edge of this shattered nucleus rest highly-disturbed Permian and Mesozoic beds but in the inner portion of the belt similar formations show little disturbance. East of the Hernad river the crystalline complex is absent and the Permian and Mesozoic beds are little folded. The

COMMON CARP, INTRODUCED FROM  
ASIA INTO AMERICA AND EUROPE

southern borderland of the Northern Carpathians is in the region of greatest disturbance where faulting and fracture are complicated by the occurrence of extensive volcanic outpourings of Miocene and later date, whereby the folded character of the ranges is almost entirely obscured. This region has also participated in the subsidence that originated the Hungarian plain. Throughout this inner belt dissected massifs of varying heights alternate with broad, terraced depressions having a general east-west grain. The formation of these basins and the neighbouring peneplains appears to be closely connected with the periodic fluctuations of level associated with the formation of the Hungarian plain. The highest massif, the High Tatra (*see* TATRA MOUNTAINS) has been strongly glaciated and closely resembles the Alpine ranges in its lakes, peaks, cirques and hanging valleys. South of this, the Fatra group and the Low Tatra (Djumbir—6,700 ft.) still show small cirques and minor traces of glaciation. Farther south the ranges decrease in height and continuity and, though still good pasture lands, are more important for their wealth of ores and the fertility of their volcanic soils. Thus the Slovakian Ore Mountains which include the Schemnitz, the Ostrowsky and other groups and the Zips-Gömör Ore Mountains are rich in iron, copper and other metallic ores while the Matra, Bükk and Tokaj groups are famed for their scenery and vineyards.

The structure of the Southern Carpathians is better known. Extending from the neighbourhood of the Jablonica Pass they widen rapidly to surround the Transylvanian Basin, the southern border of which is formed by the Transylvanian Alps, the most decided range of the whole system. In geological build they differ widely from the Northern Carpathians and only the outer *fylsch* belt is common to both sections. Three subdivisions may be recognized, viz.:—the Moldavian Carpathians, the Transylvanian Alps and the massifs that fringe the Transylvanian Basin. The Moldavian Carpathians appear to bear a physiographical resemblance to the Beskids in the occurrence of conglomerate relict ridges upon a sandstone peneplain. The Transylvanian Alps extending from Orsova to the Prahova river are broken up by youthful transverse streams above which rise mature flat-topped ridges belonging to three topographical cycles. Here the rocks are mainly schistose in type with small outcrops of Mesozoic strata. Folding, fracturing and overthrust are common and the mode of origin of the present scenery approximates to that of the Alps. Traces of past glaciation are frequent and though the average height is a little less than 6,000 ft. the highest ridges, *e.g.*, the Fagaras, exceed 8,000 ft. The bordering mountains of the Transylvanian Basin are less well understood. Though lower they appear to be closely allied in rock composition and morphology to the Transylvanian Alps and this is especially true of the Bihar Mountains to the west. They differ, however, in one important feature for volcanic masses and debris are widespread, more particularly in the Harghitei complex which forms the eastern boundary of the basin.

**Climate.**—The climate is transitional from central to eastern European type but varies considerably according to altitude and exposure. The higher-lying ridges have raw winters, coldest on the eastern side where winds from the Russian plain are frequent; on the other hand these act as extraordinary heating influences in the summer, especially in the Bukovina district. The enclosed basins suffer great extremes, *e.g.*, Sibiu 1,360 ft., Jan. 24° F, July, 67° F. Precipitation varies from an average of 24 ins. in the Transylvanian Basin to 56 in. in parts of the Northern Carpathians. Summer is the wettest season when some 40% of the total precipitation occurs while a smaller secondary maximum due to Mediterranean influences appears in October. Vegetation varies with these climatic conditions. The edges of the mountain zone fringing the plains are often treeless but oak and beech soon appear, the latter dominating, to a height of about 4,000 ft., above which fir and pine succeed to 6,000 ft. The loess-covered depressions are generally treeless.

**Population.**—The contrasts in structure between the Northern and Southern Carpathians are repeated in their human and economic conditions and for this there are three causes, viz.:—differences in accessibility, climate and ethnography. The Northern

Carpathians are peopled mainly by Slavs, pastoralists and foresters, with, however, a strong penetration of Magyars along the valleys opening southwards where topography, climate and a fertile loess soil favour the cultivation of wheat and vine. Commercial routes of continental importance avoid these highlands so that traffic is limited to local movements along the valleys, notably those of the Waag and Hernad; life is therefore very parochial in nature and outlook. Poor communications and lack of coal have restricted the development of the mineral wealth that exists while agriculture and even pastoral and forestry activities reflect in their backwardness the evils of isolation and the long domination of the Slav peoples and their interests by Magyars. Energetic efforts on the part of the Czechoslovak Government to attract tourists and winter sportsmen to the spas and mountains of Slovakia are breaking down the isolation and increasing the prosperity of the southern slopes of this division of the Carpathians.

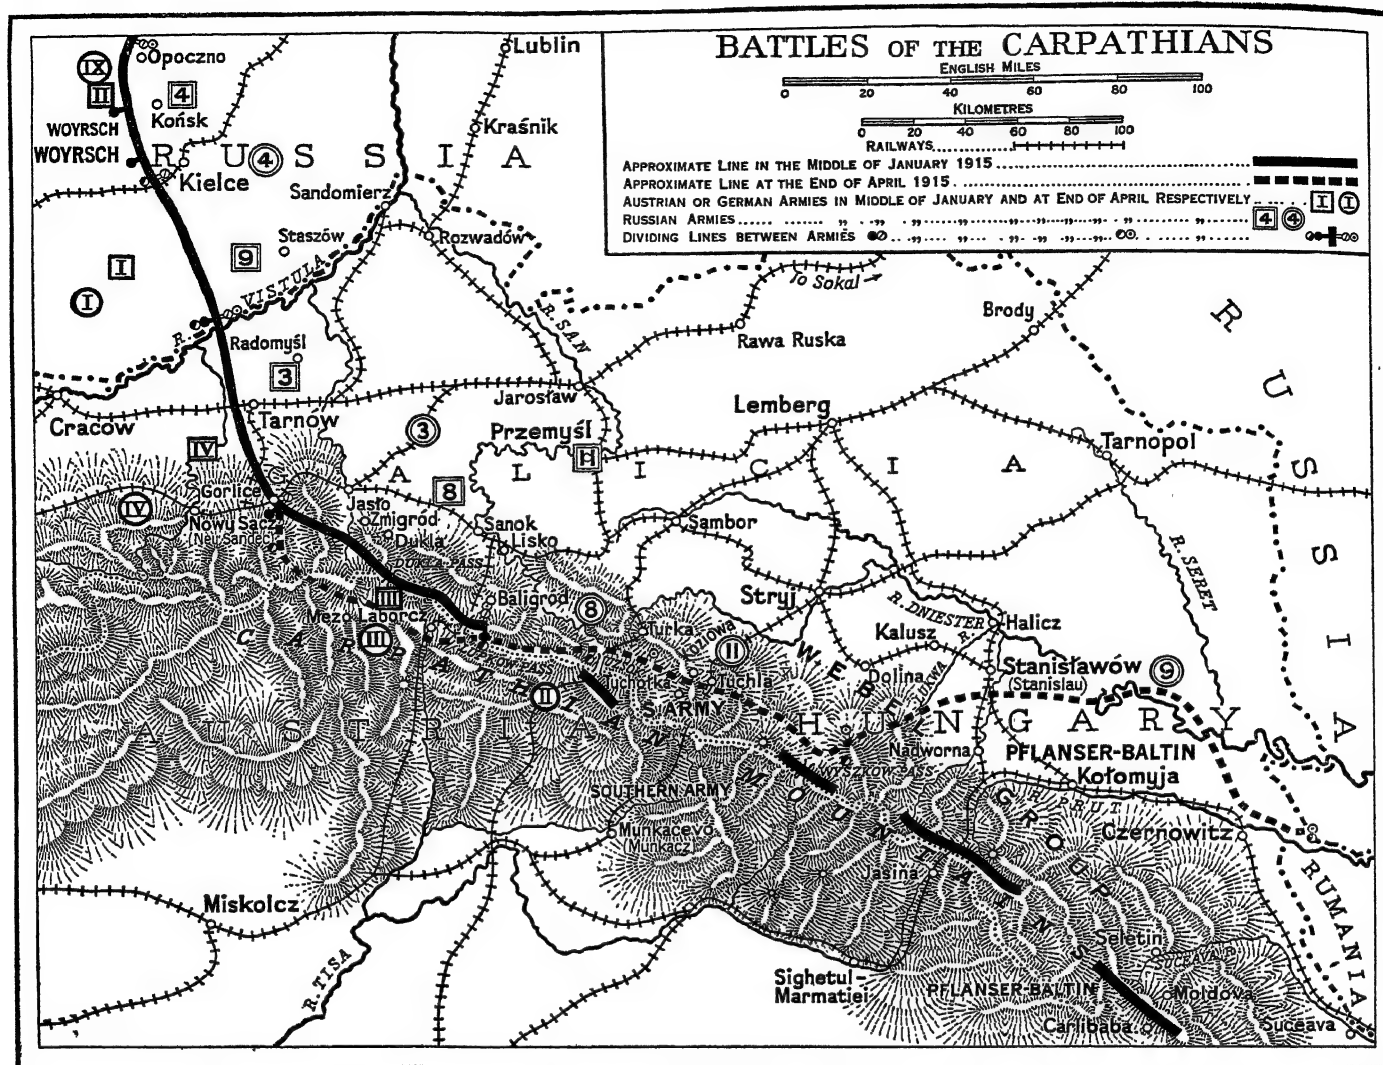

The Southern Carpathians, lying in Rumania, are settled mainly by Rumanians and have the advantage of being crossed by railways through several passes, viz.:—at the Iron Gates, the Vulcan Pass, the Roteturm Pass of the Oltu valley, the Predeal Pass, the Gyimes Pass and the Jablonica Pass. Further large minorities of Magyars and Germans, cattle breeders and mixed farmers, have contributed to the development of this region, particularly in its large loess-covered basins and in such mineral areas as that of the Bihar Mountains. The discovery of coal and petroleum, too, have stimulated human progress so that the lowlands are studded with flourishing farms and agricultural villages with occasional large towns engaged in manufactures of local importance. Contrasted with the large, solid Saxon and Magyar villages are the scattered, wooden homesteads of the Rumanian pastoralists. Sheep-rearing is the dominant form of pastoral industry and seasonal movement to high pastures is on a much more extensive scale than in the Northern Carpathians owing to the proximity of the Wallachian plains. So, too, a more genial climate raises the limit of human settlement here about 1,000 ft. higher than in the northern division (*i.e.*, to over 3,000 ft.).

Though in the remote fastnesses of the Carpathians bears, wolves, lynxes and birds of prey still persist and peasant life clings to the dress and habits of past centuries these highlands have never offered a serious obstacle to human movement, which has been especially easy at the point where the great bow is nearly severed through the Lupkov, Uzok and Verecze Passes, now crossed by railways. By these passes waves of invasion from Asia effected penetration, while during the World War crossings were made with little difficulty by both combatant groups. The spread of Rumanians into Transylvania is another proof of the weakness of the system as a barrier, while only between Czechoslovakia and Poland does it serve as a frontier. Its broad and fertile depressions have rather acted as nuclei for the development of individual peoples and as refuges for the neighbouring plainsmen in times of strife.

Little scientific knowledge of the Carpathians existed until the 19th century when organized survey and mapping was undertaken by the Austrian army. Since then the formation of Carpathian societies in Hungary, Galicia and Transylvania has stimulated investigation while the studies of de Martonne have contributed much to our knowledge of the Southern Carpathians.

**CARPATHIANS, BATTLES OF THE.** Under this heading is recorded the fighting of the first four months of 1915 in the wooded Carpathians, from the Dukla pass, south of Jaslo, to the Rumanian border. The average height of the crest of the main ridge in this section of the range is between 2,500 and 3,000 ft. The slopes are steep on the Galician side, gentler on the

Hungarian side. The winter climate is extremely severe, the temperature being often many degrees below zero; snowstorms and blizzards are frequent. Why both sides chose these inhospitable highlands for a winter battle—for each side in turn attacked in great strength—invites some examination.

**Object of the Operations.**—For Austro-Hungary the main motives were the relief of the fortress of Przemyśl and the security of the threatened plains of Hungary. But Conrad von Hotzen-dorf, Chief of the Austrian General Staff, hoped for more; the attacks, if successful, would develop into a large scale offensive against the southern flank of the whole Russian battle line. On the Russian side, the Grand Duke Nicholas sought during this winter to secure his flanks as the necessary preliminary to a direct advance from the Polish salient aimed at the heart of Germany. The undisputed possession of the Carpathian passes, with freedom to debouch at will into the Hungarian plains below, would go far towards breaking the resistance of Austro-Hungary and so safeguarding the Russian southern flank. The grand duke trusted to the greater endurance of his men under winter conditions to give them the advantage over enemies bred in less rigorous climates. He forgot that the Russian is a plainsman, and that hill fighting requires a special aptitude and training.

By the end of 1914 a continuous front had been established in the Carpathians only as far east as Baligród. Thence to the Rumanian frontier the conditions were those of open warfare; detachments on either side attacked and defended points of strategic importance, but no solid battle line had been formed.

**Disposition of Troops.**—The disposition of the opposing forces when the campaign opened in mid-January were approxi-

mately as follows: The Russian III. Army (Radko-Dimitriev) extended from the Vistula, north-east of Cracow, by Tarnów to about Gorlice; on its left came Brusilov's VIII. Army, which stretched from Gorlice to Baligród and held the important Dukla pass. Farther east, Webel's Dniester group (second-line infantry divisions and Cossacks) had pushed up the slopes of the Eastern Carpathians, capturing the Uzsok and Wyszkow passes and overrunning the Bukovina. The XI. Army was besieging Przemyśl. On the Austrian side, the IV. Army (Grand Duke Joseph Ferdinand) faced Radko-Dimitriev, and Boroievich's III. Army was opposed to Brusilov. Farther east, Linsingen's newly formed Southern German Army (four German and two Austrian divisions and two cavalry divisions) had assembled at Munkacs and was moving forward. Farther east still, beyond the Wyszkow pass, the group of Pflanser-Baltin extended up to Dorna-Vatra on the Rumanian border.

**Austrian Offensive.**—The Austrian offensive, which opened the campaign, was made by the right of Boroievich's III. Army, by Linsingen's Southern Army and by Pflanser-Baltin's group. The offensive began on Jan. 23, 1915. The attack of the III. Army, after an initial success which carried it to the line of the Upper San, soon lost its impetus. The Russians retaliated with a counter-offensive which began on Jan. 26 against the left of Boroievich's Army astride the Mezö Laborcz railway; from now to the end of the battle the Russians maintained the initiative in this part of the field, to which both sides began to transfer forces from other sectors of the front. Linsingen's Southern Army recaptured the Uzsok and Wyszkow passes and pushed slowly forward on Tuchla, but with the III. Army on its left fall-

ing back before the Russian counter-attacks could accomplish little. Meanwhile, Pflanzer-Baltin, whose group had been reinforced in the last week of January by a fresh corps, drove the Russians out of the Bukovina with his right wing, while his left wing reached in succession Kolomea, Nadworna, and finally, on Feb. 20, Stanislaw. He now purposed to wheel to the left, to come in on the flank and rear of the Russian forces facing Linsingen. This move was checked by the assembly to the north and west of Stanislaw of Lechitski's IX. Army, which had been transferred from the Russian front in Poland.

**Attempt to Relieve Przemysl.**—During the first half of February the Austrians transferred the II. Army (Bohm-Ermolli) from the Polish to the Carpathian front, with the intention of making a last attempt to relieve Przemysl. By the end of February, when this II. Army was ready to advance, the situation of the Austrian forces in the Carpathians seemed critical, in spite of their numerical superiority. The left of Boroevich's III. Army had almost reached breaking point under the continual pressure of Brusilov's forces, which had captured Mezö Laborcz and the Lupkow pass; Linsingen's Army held its ground, but could make no headway; Pflanzer-Baltin's Army was threatened by Lechitski's concentration; and Przemysl was in sore straits. The offensive of the II. Army, if it was to restore the situation, required a rapid and striking success. The principal offensive was made in the direction of Baligrod, astride the shortest road to Przemysl. At no time did the attack meet with any great measure of success; and by the middle of March it was stopped as hopeless, the Austrians being completely exhausted by the weather and their heavy losses. The formations which had borne the brunt of the assaults had lost over 50% of their strength. Przemysl was now abandoned to its fate.

Meanwhile, during the first fortnight in March, Lechitski's forces had driven Pflanzer-Baltin some 20 m. back from Stanislaw and had reached the line of the Prut in northern Bukovina. An opportune reinforcement enabled Pflanzer-Baltin to check the Russian advance. There was some further fighting; but little material change took place in this eastern portion of the battlefield up to the end of April.

**Russian Offensive.**—On March 20 the Russians, now sure of the fortress of Przemysl (it actually fell on March 22) launched a final great offensive against the Austrian III. and II. Armies. The attack was made by the left wing of Radko-Dimitriev's III. Army, which had been extended eastwards, and by Brusilov's VIII. Army. For a month their effort lasted. Both the Austrian Armies were driven over the crest of the main ridge. But both managed to maintain their positions on the other side of it, though it was only the arrival of fresh German divisions (the Beskiden corps) which saved the III. Army from breaking. Linsingen's Southern Army obstinately withstood all shocks and indeed made some ground forward. It held fast to the important Uzsok pass. By April 20 the Russians paused, breathless. They had appreciably enlarged their gains south of the Dukla pass, but their effort to break through the Austrian front had failed.

**Conclusions.**—It is a little difficult to arrive at a just balance of profit and loss between the two antagonists in this long drawn-out struggle. The Austrians seem to have attached undue importance to their fortress of Przemysl; their obstinate efforts to relieve it brought them to the verge of collapse and cost them heavier losses in men than did the eventual surrender of the garrison. The Russians, though they secured a "bridge-head" over the barrier of the Carpathians, did not succeed in forcing the obstacle, and squandered valuable resources in men and munitions by their persistence.

The result showed in fact that both commanders had been ill-advised to embark on this winter battle. On the whole the consequences were more disastrous for the Russians, whose obsession with this Carpathian struggle induced them to withdraw two corps from the right wing of their III. Army, and was thus a direct cause of its crushing defeat by Mackensen at the beginning of May (see DUNAJEC-SAN). No special lessons of tactics can be drawn from the fighting. The conditions of weather and ground were against elaboration of manoeuvre. Hill fighting re-

quires a degree of individual skill and of tactical leadership which neither side possessed.

**CARPATHUS: see KARPATOS.**

**CARPEAUX, JEAN BAPTISTE** (1827-1875), French sculptor, the son of a mason, was born at Valenciennes, France, on May 11, 1827, and died at the Château de Bécon, near Courbevoie, on Oct. 12, 1875. In 1842 he went to Paris, and after working for two years in a drawing-school was admitted to the École des Beaux-Arts on Sept. 9, 1854, where he was a pupil of Rude. The Grand Prix de Rome was awarded to his statue of "Hector bearing in his arms his son Astyanax." At Rome he was fascinated by Donatello, and yet more influenced by Michelangelo, to whom he owes his feeling for vehement and passionate action. In his last year in Rome he sent home a dramatic group, "Ugolino and his Sons," which made his reputation. It was cast in bronze and erected in the garden of the Tuileries. This work was a reaction against the prevailing pseudo-classicism. Carpeaux received many important commissions from the imperial family and others. He executed in 1869 one of the four groups for the façade of the new opera house, this representing "Dancing."

See Ernest Chesneau, *Carpeaux, sa vie et son oeuvre* (1880); Paul Foucart, *Catalogue du Musée Carpeaux, Valenciennes* (1882); Jules Claretie, *J. Carpeaux* (1882); François Bournand, *J. B. Carpeaux* (1893).

**CARPENTARIA, GULF OF**, a relic, to all appearances, of the inland sea which occupied much of east central Australia in Triassic and Jurassic times, though the Great Artesian Basin appears to have no extensive outlet in this direction and the portion from Cloncurry northwards to the coast may be a separate basin. The gulf occupies a depression in the north-north-east portion of the continental block and is c. 480 m. from north to south and c. 420 m. (max.) from east to west. Except in the north-west, where the edges of the Arnhem Land plateau have sunk to form a drowned coast with numerous inlets and islands (groote Eylandt: c. 36 m. long, max. elev., 520 ft.), the gulf floor shelves up from shallow depths (average 30-40 fathoms) to form an unindented lowland fringe—perhaps a raised sea-floor—50 to 100 m. wide in the south-south-west and 100-150 m. in the south and east, with a few off-lying islands (Sir Edward Pellew Group; Wellesley islands). Behind the often dead-flat plains the land rises gradually to the Barkly Tableland (c. 1,000 ft.) in the south and to the highlands of Cape York Peninsula in the east. The plains—the "gulf country" proper—are largely floored with silts and muds washed down by the numerous rivers, some of which (Roper, McArthur, Flinders, Batavia) are fine streams navigable for varying distances inland. They have, however, markedly seasonal régimes: in summer wide areas are flooded and in winter the sea penetrates far up their courses. The soils, except in the alluvial flats and pockets, are perhaps poorer than would be expected and climatic conditions lead to grass-lands—Mitchell grass covers extensive areas—with occasional forest clumps, dense palm groves and mangrove belts near and along the coasts. The rivers abound in crocodiles and game and the gulf waters are said to afford good fishing. The climate is tropical (Mean ann. temp.: 85°-65°; average ann. rainfall 20"-40") and there are only two seasons—the wet (November to April) and the dry. The gulf country is at present, apart from mining in the Croydon area and a little alluvial gold-washing in the Batavia river, devoted entirely to pastoral farming. There are a good many blacks, but the scanty white population lives mainly in the inland cattle stations, in mission stations (e.g., at some river-mouths) and at such settlements as Normanton (pop. c. 500), Burketown and Borrooloola. Normanton, 23 m. up the Norman river, is the port for a large and rich pastoral area, as well as for the mining (gold and silver) field of Croydon, with which it is linked by a railway (94 m.). There is also a weekly air-service to Cloncurry (220 m.).

Proposals are entertained for constructing a port on one of the Sir Edward Pellew islands to serve, by means of a railway, the valuable Barkly Tableland pastoral area.

**CARPENTER, EDWARD** (1844-1929), English author, was born at Brighton on Aug. 29, 1844, the son of Charles Carpenter, a barrister who had begun life in the navy. Edward Carpenter received a conventional education at Brighton college and at Trinity Hall, Cambridge, where he graduated 10th wrangler in 1868, and then became a fellow and lecturer of his college. He took holy orders and acted as curate in a Cambridge church, but the stirrings of revolt against the existing social and religious order were already at work in his mind, and he left Cambridge in 1874, having relinquished both his college appointments and holy orders. The revolutionary change which eventually led to a complete alteration in his conception of life was due to the reading in 1868 or 1869 of Walt Whitman's *Leaves of Grass* and then of his *Democratic Vistas*. From that moment he felt, to use his own words, that "my life deep down was flowing out and away from the surroundings and traditions amid which I lived—a current of sympathy carrying it westward across the Atlantic." A holiday in Italy and the revelation of the significance of Greek art confirmed his desire for a life more in conformity with nature. But when he left Cambridge he was to spend some years in uncongenial surroundings in a series of dingy lodgings before he was able to fulfil his dream. He became a university extension lecturer, and in the course of his visits to the industrial towns of Yorkshire and the Midlands got into touch with working people and with some of the Socialist leaders. His early volumes of verse were still-born, but *Towards Democracy* (1883) and *England's Ideal and other papers on Social Subjects* (1887) found many readers. In 1884 he visited the United States, spent some time with Whitman (see his *Days with Walt Whitman*, 1906), and met Lowell, Emerson, Charles Norton and others. Shortly afterwards he relinquished his lecturing to lead the simple life at Bradway, near Sheffield, occupying himself with market-gardening, handicrafts, and his literary work and Socialist propaganda. His Socialism was of the school of William Morris, and he was concerned with a revolution in industrial, social and family life rather than with political issues. The second great influence in his life was that of Havelock Ellis, and some of his later writings are concerned with the question of an "intermediate sex." Although he was something of a recluse at Bradway and later in his Surrey home, many people belonging to "advanced" movements sought him out. Among his works are *Love's Coming of Age* (1896); *The Intermediate Sex* (1908); *The Drama of Love and Death* (1912), and *My Days and Dreams*, an autobiography (1916). He died in England on June 28, 1929.

**CARPENTER, JOHN ALDEN** (1876- ), American composer, was born at Park Ridge (Ill.), on Feb. 28, 1876. He was educated at Harvard university, graduating in 1897, and joined his father in business in Chicago. Subsequently he studied music in Europe under Elgar, and in Chicago under Ziehn. His compositions include *Gitanjali*, a song-cycle with words by Tagore (1914); *Adventures in a Perambulator* and *Concertino* for orchestra and piano (1915); a symphony (1917); *The Birthday of the Infanta*, a ballet pantomime, produced by the Chicago Opera Company, Dec. 23, 1919; *Krazy-Kat*, a ballet, produced Dec. 23, 1921; and *Skyscrapers*, a ballet produced at the Metropolitan Opera House, New York, Feb. 19, 1926, which was also given five times the following season. His published works also include a sonata for violin and piano and a number of songs. As a composer of modern tendencies he has displayed great skill in his handling of the orchestra.

**CARPENTER, LANT** (1780-1840), English Unitarian minister, was born at Kidderminster on Sept. 2, 1780, the son of a carpet manufacturer. In 1805 he became a pastor of a church in Exeter, removing in 1817 to Bristol. At both Bristol and Exeter he was also engaged in school work, among his Bristol pupils being Harriet and James Martineau. Carpenter did much to broaden the spirit of English Unitarianism. The rite of baptism seemed to him a superstition, and he substituted for it a form of infant dedication. He was drowned on the night of April 5, 1840.

**CARPENTER, MARY** (1807-1877), educational and social reformer, was born on April 3, 1807, at Exeter, the daughter of Dr. Lant Carpenter. She was educated in her father's school for boys, learning Latin, Greek and mathematics, and other subjects at that time not generally taught to girls. In 1829 she and her sisters opened a school for girls at Bristol, but the life-work of Mary Carpenter began with her activities in organizing, in 1835, a "Working and Visiting Society," of which she was secretary for 20 years. In 1846 she started a school for poor children in Lewin's Mead and a night-school for adults. She published a memoir of Dr. Joseph Tuckerman of Boston, and a series of articles on ragged schools, which appeared in the *Inquirer* and were afterwards collected in book form. This was followed in 1851 by *Reformatory Schools for the Children of the Perishing and Dangerous Classes, and for Juvenile Offenders*, which advocated: (1) good free day-schools; (2) feeding industrial schools; (3) reformatory schools. This book drew public attention to her work. She was consulted in the drafting of educational bills, and invited to give evidence before House of Commons committees. To test her theories, she herself started a reformatory school at Bristol, and in 1852 published *Juvenile Delinquents, their Condition and Treatment*, which largely assisted the passing of the Juvenile Offenders Act (1854). Miss Carpenter now returned to her plea for free day-schools, contending that the ragged schools should receive a parliamentary grant. At the British Association meeting of 1860 she read a paper on this subject, and mainly owing to her instigation, a conference on ragged schools in relation to Government grants for education was held at Birmingham (1861). In 1866 Miss Carpenter made the first of her visits to India, and drew up a memorial to the governor-general dealing with female education, reformatory schools and the state of gaols. With the co-operation of native gentlemen, she established a model school for Hindu girls. At the meeting of the prison congress in 1872 she read a paper on "Women's Work in the Reformation of Women Convicts." Her work now began to attract attention abroad. Princess Alice of Hesse summoned her to Darmstadt to organize a women's congress. Thence she went to Neuchâtel to study the prison system of Dr. Guillaume, and in 1873 to America, where she was enthusiastically received. She died on June 14, 1877.

**CARPENTER**, a worker in wood. Carpenters are commonly classified according to the work which they do, e.g., ships' carpenters, rough carpenters (rough carpentry, an obsolescent phrase, meaning the erection of the framework of a wooden house), cabinet makers, etc. Wood-cutting machinists are more properly classed as mill-sawyers. In the 18th century carpenters, being still chiefly master carpenters or journeymen, worked by the piece, but with the growth of general building firms master carpenter piecework practically ceased. Carpenters are very strongly organized both in the United States, in the United Brotherhood of Carpenters, and in Great Britain, in the Amalgamated Society of Woodworkers, which has also powerful branches in the dominions, where the older name of Amalgamated Society of Carpenters and Joiners (A.S.C.J.) is often retained. (See BUILDING.)

**CARPENTRAS**, a town of south-eastern France, capital of an arrondissement in the department of Vaucluse 16 m. N.E. of Avignon. Pop. (1926) 8,438. It lies in a hilly region bordering the wide valley of the lower Rhone.

Carpentras is identified with *Carpentoracte*, a town of Gallia Narbonensis mentioned by Pliny. Its mediaeval history is full of vicissitudes; it was captured and plundered by Vandal, Lombard and Saracen. In later times, as capital of the Comtat Venaissin, it was frequently the residence of the popes of Avignon, to whom that province belonged from 1228 till the Revolution. Carpentras was the seat of a bishopric from the 5th century till 1805. The highest part of the town is occupied by the church (and former cathedral) of St. Siffrein, a late Gothic building (1405-1519) which preserves remains of a previous Romanesque church. The richly sculptured Flamboyant south porch is noteworthy. The adjoining law-court, built in 1640 as the bishop's palace, contains in its courtyard a small but well-preserved triumphal arch of the

Gallo-Roman period. The former palace of the papal legate dates from 1640. Of the 14th century fortifications the only survival is the Porte d'Orange, a gateway surmounted by a fine machicolated tower. Water is brought to the town by an aqueduct of forty-eight arches, completed in 1734.

Carpentras is the seat of a sub-prefect and of a court of assizes, and has a tribunal of first instance. Confectionery, honey, wax, fruit, preserved fruits, tin-ware and nails are produced, and there are silk-works and tanneries. There is trade in silk, wool, fruit, oil, etc. The irrigation-canal named after the town flows to the east.

FIGS. 1-5.—LAPPED, FISHED AND SCARF JOINTS, THREE OF THE MOST USEFUL EMPLOYED IN CARPENTRY

**CARPENTRY**, the art and work of a carpenter (from Lat. *carpentum*, a carriage), a workman in wood, especially for building purposes. Carpenters' work has been divided into three principal branches—descriptive, constructive and mechanical. The first shows the lines or method for forming every species of work by the rules of geometry; the second comprises the practice of reducing the timber into particular forms, and joining the

forms so produced in such a way as to make a complete whole according to the intention or design; and the third displays the relative strength of the timbers and the strains to which they are subjected by their disposition. Here we have merely to describe the practical details of the carpenter's work in the operations of building. The carpenter differs from the joiner since his skill is directed to the carcass of a building, to things which have reference to structure only. Almost everything that the carpenter

FIGS. 6-10

does to a building is necessary to its stability and efficiency, whereas the joiner does not begin his operations until the carcass is complete, and every article of joiners' work might at any time be removed from a building without undermining it or affecting its most important qualities.

The carpenter frames or combines separate pieces of timber by scarfing, notching, cogging, tenoning, pinning and wedging, etc. The tools he uses are the rule, axe, adze, saws, mallet, hammers, chisels, gouges, augers, pincers, set squares, bevel, compasses, gauges, level, plumb rule, jack, trying and smoothing planes, rebate and moulding planes, and gimlets and wedges. The carpenter has little labour to put on to the stuff; his chief work consists in fixing and cutting the ends of timbers, the labour in preparing the timber being largely done by machinery.

**Joints.**—The joints in carpentry are various, and each is designed according to the thrust or strain put upon it. Those principally used are the following: lap, fished, scarf, notching, cogging, dovetailing, housing, halving, mortice and tenon, stub tenon, dovetailed tenon, tusk tenon, joggle, bridle, foxtail wedging, mitre, birdsmouth, built-up, dowel. Illustrations are given of the most useful joints in general use, and these, together with the descriptions, will enable a good idea to be formed of their respective merits and methods of application.

The lapped joint is used for temporary structures in lengthening timbers and is secured with iron straps and bolts; a very

FIGS. 11-19

common use of the lap joint is seen in scaffolding secured with cords and wedges.

The fished joint is used for lengthening beams and is constructed by butting the ends of two pieces of timber together with an iron plate on top and bottom, and bolting through the timber; these iron connecting-plates are usually about 3ft. long and  $\frac{1}{2}$ in. and  $\frac{3}{4}$ in. in thickness. This joint provides a good and cheap method of accomplishing its purpose.

The scarf joint is used for lengthening beams, and is made by cutting and notching the ends of timbers and lapping and fitting and bolting through. This method cuts into the timber, but is very strong and neat.

The ends of floor joists and rafters are usually *notched* over plates to obtain a good bearing and bring them to the required levels. Where one timber crosses another as in purlins, rafters, wood floor girders, plates, etc., both timbers are notched so as to fit over each other; this *cogging* serves instead of fastenings. The timbers are held together with a spike. In this way they are not weakened, and the joint is a very good one for keeping them in position.

Dovetailing is used for connecting angles of timber together, such as lantern curbs or linings, and is the strongest form. When an end of timber is let entirely into another timber it is said to be *housed*. Where timbers cross one another and require to be flush on one or both faces, sinkings are cut in each so as to fit over each other (*halving*); these can either be square, bevelled or dovetailed sinkings. The end of one piece of timber cut so as to leave a third of the thickness forms a *tenon*, and the piece of timber which is to be joined to it has a mortice or slot cut through it to receive the tenon; the two are then wedged or pinned with wood pins.

A stub tenon or joggle is used for fixing a post to a sill; a sinking is cut in the sill and a tenon is cut on the foot of the post to fit into the sinking to keep the post from sliding.

The purpose of a dovetailed tenon is to hold two pieces of

wood together with mortice and tenon so that it can be taken apart when necessary. The tenon is cut dovetail shape, and a long mortice permits the wide part of the tenon to go through, and it is secured with wood wedges. Where the floor joists or rafters are trimmed round fires, wells, etc., the tusk tenon joint is used for securing the trimmer joist. It is formed by cutting a tenon on the trimmer joist and passing it through the side of the trimming joist and fixing it with a wood key. Where large timbers are tusk tenoned together, the tenons do not pass right through, but are cut in about 4in. and spiked.

A bridle joint or birdsmouth is formed by cutting one end of

FIG. 20.—CENTRING FOR CONCRETE

FIG. 21.—DIAGRAM SHOWING CENTRING FOR AN ARCH IN BRICKWORK The centring, constructed of wood, is removed when the bricks are thoroughly set

timber either V-shape or segmental, and morticing the centre of this shaped end. Similar sinkings are cut on the adjoining timber to fit one into the other; these are secured with pins and also various other forms of fastenings. Foxtail wedging is a method very similar to mortice and tenon. But the tenon does not go through the full thickness of the timber; and also on the end of

the tenon are inserted two wedges, so that when the tenon is driven home the wedges split it and wedge tightly into the mortice. This joint is used mostly in joinery. The mitre is a universal joint, used for connecting angles of timber as in the case of picture frames. Built-up joints involve a system of lapping and bolting and fishing, as in the case of temporary structures, for large spans of centering for arches, and for derrick cranes. Dowels

FIG. 22.—CENTRING OF VERY STRONG CONSTRUCTION FOR A STONE ARCH

are usually 3 or 4 in. long and driven into a circular hole in the foot of a door frame or post; the other end is let into a hole in the sill.

**Centering.**—Centering is temporary timber or framing erected so as to carry concrete floors or arches of brick or stone, etc.; when the work has set the centering is removed gradually. The centering for concrete floors is usually composed of scaffold boards resting on wood bearers. One wood bearer rests along on top of the steel joists; through this bearer long bolts are suspended, and to the bottom of these bolts a second bearer is fixed, and on the bottom bearer the scaffold boards rest.

Turning piece is a name given to centering required for turning an arch over; it is only 4½ in. wide on the soffit or bed, and is generally cut out of a piece of 3 or 4 in. stuff, the top edge being made circular to the shape of the arch. It is kept in position whilst the arch is setting with struts from ground or sills and is

FIG. 23.—SINGLE FLOOR, IN WHICH THE FLOOR BOARDS REST ON ONE ROW OF WOOD JOISTS

nailed to the reveals, a couple of cross traces being wedged between. In the case of a semicircular or elliptical arch with 4½ in. soffit this turning piece would be constructed of ribs cut out of 4 in. stuff with ties and braces. Or the ribs could be cut out of 1 in. stuff, in which case there must be one set of ribs outside and one inside secured with ties and braces; each set of ribs when formed of thin stuff is made of two thicknesses nailed together so as to lap the joints. For spans up to 15 ft. the thin ribs would be used, and for spans above 15 ft. ribs out of 4 in. stuff and upwards. For arches with 9 in. soffit and upwards, whether segmental or semicircular or elliptical, the centres are formed with the thin ribs and laggings up to 15 ft. span; above 15 ft. with 4 in. ribs and upwards.

The lower member of centres is called the tie, and is fixed so as to tie the extremities together and to keep the centre from spreading. Where the span is great, these ties, instead of being fixed straight, are given a rise so as to allow for access or traffic underneath. Braces are necessary to support the ribs from buckling in, and must be strong enough and so arranged as to withstand all stresses. Laggings are small pieces or strips of wood nailed on the ribs to form the surface on which to build the arch, and are spaced 1 in. apart for ordinary arches; for gauged arches they are nailed close together and the joints planed off.

FIG. 24.—SOUND-RESISTING SINGLE FLOOR, SHOWING HOW THE FLOOR IS "PUGGED" WITH SLAG WOOL

When centres are required to be taken down, the wedges upon which the centre rests are first removed so as to allow the arch to take its bearing gradually.

**Floors.**—For ordinary residential purposes floors are chiefly constructed of timber. Up to about the year 1895 nearly every modern building was constructed with wood joists, but because of evidence adduced by fire brigade experts and the serious fires that have occurred fire-resisting floors have been introduced.

FIG. 25.—DOUBLE FLOOR WITH STEEL BINDERS. THE JOISTS, OF FIR, ARE TRIMMED INTO STEEL GIRDERS

These consist of steel girders and joists, filled in with concrete or various patented brick materials in accordance with such by-laws as those passed by the London County Council and other authorities. The majority of the floors of public buildings, factories, schools, and large residential flats are now constructed of fire-resisting materials. There are two descriptions of flooring, single and double.

**Single Flooring.**—This consists of one row of joists resting on a wall at each end without intermediate support, and receiving the floor boards on the upper surface and the ceiling on the

underside. Joists should never be less than 2 in. thick, or they are liable to split when the floor brads are driven in; the thickness varies from 2 to 4 in. and the depth from 5 to 11 in.; the distance between each joist is usually 12 in. in the clear, but greater strength is obtained in a floor by having deep joists and placing

FIG. 26.—DOUBLE FLOORING, SHOWING THE WOOD PLATES BOLTED TO THE STEEL JOISTS TO RECEIVE THE ENDS OF THE SINGLE WOOD JOISTS

them closer together. These floors are made firm and prevented from buckling by the use of strutting as mentioned hereafter.

The efficiency of single flooring is materially affected by the necessity which constantly occurs in practice of trimming round fire-places and flues, and round well holes such as lifts, staircases, etc. Trimming is a method of supporting the end of a joist by tenoning it into timber crossing it; the timber so tenoned is called the trimmer joist, and the timber morticed for the tenon

FIG. 27.—MEDIAEVAL FLOOR, IN WHICH STRONG GIRDERS OF WOOD BORE THE JOISTS, AND ALL THE WORK WAS WROUGHT

of the trimmer is called the trimming joist, while the intermediate timbers tenoned into the trimmer are known as the trimmed joists. This system has to be resorted to when it is impossible to get a bearing on the wall.

A trimmer requires for the most part to be carried or supported at one or both ends by the trimming joists, and both the trimmer and the trimming joists are necessarily made stouter than if they had to bear no more than their own share of the stress. In the usual practice the trimmer and trimming joists

are 1 in. thicker than the common joists, but there are special regulations and by-laws set out by local authorities to which attention must be given.

The principal objection to single flooring is that the sound passes through from floor to floor, so that, in some cases, conversation in one room can almost be understood in another. To stop the sound from passing through floors the remedy is to pug them.

FIGS. 28 AND 29.—TYPES OF STRUTTING FOR STRENGTHENING FLOORS. The top figure shows herring-bone strutting; the lower figure shows solid strutting of 1 1/2 in. boards, fitted tightly between the joists

This consists in using rough boarding resting on fillets nailed to the sides of the joists about half-way up the depth of the joists, and then filling in on top of the boarding with slag wool usually 3 in. thick. Also further to prevent sound from passing through floors the flooring should be tongued and the ceiling should have a good thick floating coat; in poor work the stuff on ceilings is very stinted. In days gone by, ceiling joists were put at right angles to the floor joists, but this took up head room and was costly, and the arrangement is obsolete.

**Double Flooring.**—This consists of single fir joists trimmed into steel girders; in earlier times a double floor consisted of fir

FIG. 30.—A COMMON WOOD PARTITION, BUILT OF 4 IN. X 3 IN. HEAD AND SILL, AND 4 IN. X 2 IN. UPRIGHT STUDS, WITH NAGGING PIECES

joists called binding, bridging and ceiling joists, but these are very little used now and the single fir joists and steel girders have taken their place. Steel girders span from wall to wall, and on their flanges are bolted wood plates to receive the ends of the single joists which are notched over plates and run at right angles

FIGS. 31-32.—QUEEN POST AND KING POST TRUSSED PARTITIONS

to the girders. The bearings of the joists on the wall also rest on wall plates, so as to get a level bed, and are sometimes notched over them. Wall plates, which are usually  $4\frac{1}{2}$  in. x 3 in. and are bedded on walls in mortar, take the ends of joists and distribute the weight along the wall. The plates bolted on the side of girders are of sizes to suit the width of the flanges.

The mediaeval floor consisted of the framed floor with wood girders, binding, bridging and ceiling joists, and the underside of all the timbers was usually wrought, the girders and binders being boldly moulded and the other timbers either square or stop chamfered.

Flooring is strengthened by the use of strutting, either herring-bone or solid. Herring-bone strutting consists of two pieces of timber, usually 2 in. x 2 in., fixed diagonally between each joist in continuous rows, the rows being about 6 ft. apart. Solid strutting consists of  $1\frac{1}{2}$  in. boards, nearly the same depth as the joists and fitted tightly between the joists, and nailed in continuous rows 6 ft. apart. Where heavy weights are likely to be put on floors

long bolts are passed through the centre of joists at the side of strutting; since this draws the strutting tightly together and does not produce any forcing stress on the walls, it is undoubtedly the best method.

Floors are usually constructed to carry the following loads (including weight of floor):

Residences,  $1\frac{1}{2}$  cwt. per foot super of floor space.

Public buildings,  $1\frac{1}{2}$  cwt. per foot super of floor space.

Factories,  $2\frac{1}{2}$  to 4 cwt. per foot super of floor space.

**Partitions.**—Partitions are screens used to divide large floor spaces into smaller rooms and are sometimes constructed to carry the floors above by a system of trussing. They are built of various materials; those in use now are common stud partitions, brick-nogged partitions, and solid deal and hardwood partitions,  $4\frac{1}{2}$  in. brick walls or bricks laid on their sides, so making a 3 in. partition, and various patent partitions such as coke breeze concrete or hollow brick partitions (*see BRICKWORK*), iron and wire partitions, and plaster slab partitions (*see PLASTERWORK*).

There are two kinds of stud or quarter partitions, common and trussed.

Common partitions simply act as a screen to divide one room from another, and do not carry any weight. They weigh about 25lb. per foot superficial including plastering on both sides, and are composed of 4in. x 3in. head and sill and 4in. x 2in. upright studs; 4in. x 2in. nogging pieces are fitted between the studs to keep them from bending in, and are placed parallel with the head, usually 4ft. apart. Where door-openings occur in these partitions the studs next the opening are 4in. x 3in. Should the floor boards have been laid, the sill of the partition would be laid direct on them, but if the partitions are erected at the time of building the

FIG. 33.—A TRUSSED WOOD PARTITION, CAPABLE OF BEARING A CONSIDERABLE WEIGHT

structure the sill should either rest directly over a joist, if parallel with it, or at right angles to the joists; should the position of the sill come between two joists, that is, parallel with them, then short pieces called bridging pieces of 4in. x 2in. stuff are wedged between the two joists and nailed to carry the sill.

Trussed partitions are very similar to the last, but they are so built as to carry their own weight and also to support floors, and in addition have braces; the head and sill are larger, and calculated according to the clear bearing and the weight put upon them. There are two forms of trussing, namely, queen post and king post.

Bricknogged partitions are formed in the same manner as the common stud partition, except that the studs are placed usually 18 or 27in. apart in the clear instead of 12in., and the 18 and 27in. widths being multiples of a brick dimension, they are filled in with brickwork 4½in. thick and always built in cement. These are used to prevent sound from passing from one room to another, and also to prevent fire from spreading, and are vermin-proof. Another method is to fill the space between the studs with coke breeze concrete instead of brickwork.

**Timber Work.**—Half-timber work consists of a framework of timber; the upper storeys of suburban and country residences are often thus treated, and the spaces between the timbers are filled in with brickwork and plastered inside, and rough cast outside, though sometimes tiles are hung on the outside. In some instances in country places there is no filling between the timbers, and both sides are lath-and-plastered, and in others the timbers are solid, or facing pieces are simply plugged to the walls, the joints being pinned with hardwood pins. Half-timber work is still frequently employed in domestic and even in commercial architecture because of its aesthetic qualities. The best and most durable wood to use is English oak worked smooth

on the external face and usually painted; the by-laws of various authorities differ considerably as to the method of construction and in the restrictions as to its use. Some very fine early examples are to be seen in England, as at Holborn Bars, London, in the old parts of Bristol, and at Moreton Old Hall, near Congleton, Cheshire. A notable modern commercial example of half-timbered

FIG. 34.—HALF TIMBER CONSTRUCTION IN WHICH A FRAMEWORK, PROPERLY OF OAK, IS FITTED IN WITH BRICKWORK. MODERN BY-LAWS OFTEN REQUIRE A SOLID BRICK BACKING TO THE TIMBERS

work is the fine building erected in Regent street, London, by Messrs. Liberty and Co.

Timber-framed permanent buildings are not used in the towns of England, not being allowed by the by-laws. In some English villages timber bungalows are allowed, plastered inside, and either rough cast outside, or with tiles, or with sheet iron painted.

In America and the British colonies this class of building is very largely erected on the outskirts of the cities. In American

FIG. 35.—BRACED FRAME, SHOWING THE POSTS, GIRTS AND PLATES, WHICH ARE OF HEAVY TIMBER, MORTICED AND TENONED TOGETHER, AND BRACED STRONGLY

practice in framing the walls of wooden buildings two distinct methods are used and are distinguished as "braced" and "balloon."

The braced was the only kind in use before about the year 1850. In this method of framing the sills, posts, girts and plates are made of heavy timber morticed and pinned together and braced with 4in. x 4in. or 4in. x 6in. braces and common studding.

To frame a building in this way it is necessary to cut all the pieces and make all the mortice holes on the ground, and then fit them together and raise a whole side at a time or at least one storey of it. The common studs are only one storey high.

The balloon frame is composed of much smaller scantlings and is more rapidly erected and less expensive. The method is to first lay the sill, generally 4in. x 6in., halved at the angles. After

FIG. 36.—CARPENTERS' BALLOON FRAME, A FORM OF FRAMED WORK LIGHTER AND LESS EXPENSIVE THAN THE BRACED FORM

the floor is laid, the corner posts, usually 4in. x 6in., are erected and temporarily secured in place with the aid of stays. The common studs are then set up and spiked to the sill, and a temporary board nailed across their face on the inside. These common studs are the full height from sill to roof plate, and the second tier of floor joists are supported by notching a 1½in. x 7in. board, called a false girt or ribbon, into their inside edge at the height to receive the floor joists. The ends of the joists are also placed against a stud and spiked. The tops of the studs are cut to a line, and a 2in. x 4in. plate is spiked on top, an additional 2in. x 4in. plate being placed on the top of the last breaking joint. Should the studs not be long enough to reach the plate, then short pieces are fished on with pieces of wood spiked on both sides. The diagram shows a portion of the framework of a two-storey house constructed in the manner described. In the balloon frame the timbers are held together entirely by nails and spikes, thus permitting them to be put up rapidly. The studs are doubled where windows or openings occur. In both these methods dwarf brick

foundations should be built, upon which to rest the sill. For buildings of a superior kind a combination of the braced and balloon frames is sometimes adopted.

The sides of frame buildings are covered with siding, which is fastened to a sheathing of rough boards nailed to the studs. The siding may consist of matched boards placed diagonally, or of clapboards or weather boards—which are thin boards thicker at one edge than the other, and arranged horizontally with the thick edge downwards and overlapping the thin edge of the board below. Shingles or wooden tiles are also employed.

Gwilt, *Encyclopædia of Architecture*; Rivington, *Building Construction* (elementary and advanced); E. L. Tarbuck, *Encyclopædia of Practical Carpentry and Joinery*; A. W. Pugin, *Details of Ancient Timber Houses*; Beresford Pite, *Building Construction*; J. P. Allen, *Building Construction*; H. Adams, *Notes on Building*; C. F. Mitchell, *Building Construction* (elementary and advanced); Burrell, *Building Construction*; F. E. Kidder, *Building Construction* (U.S.A.); E. E. Viollet le Duc, *Dictionnaire*; J. K. Krafft, *L'Art de la charpente*; *Building Construction*, ed. by F. M. Simpson. (J. Br.)

**CARPET.** For the history of carpet-making, see RUGS AND CARPETS. For present methods of manufacture, see CARPET MANUFACTURE.

**CARPET-BAGGER**, a political slang term for a person who stands as a candidate for election in a locality in which he is a stranger. It is particularly used of such a candidate sent down by the central party organization. The term was first used in the western states of America of speculative bankers who were said to have started business with no other property than what they could carry in a carpet-bag, and absconded when they failed. The term came into general use in American politics in the reconstruction period after the Civil War, as a term of contempt for the northern political adventurers in the South who, by the help of the negro vote, gained control of the administration.

**CARPET-KNIGHT**, one who has been knighted in time of peace, on the carpet before the king's throne, not on the battlefield as a reward for valour. It is a term of reproach for a soldier who stays at home and avoids active service.

**CARPET MANUFACTURE.** Modern carpet manufacture involves the use of machinery and of many different materials, such as woollen and worsted yarns for the surface of the carpet, and cotton, linen and jute for the back. The wool which is most suitable for carpet yarn is generally fairly long in the staple and rather coarse than fine. It is obtained from Scotland, China, Tibet, India, Russia, Australia, New Zealand, Egypt, Iceland and the East Indies. It can be spun into yarn of any required thickness, dyed to any shade, and woven into any fabric; therefore it is an ideal material for the surface of carpets, especially as it retains its appearance and withstands reasonably hard wear.

Silk carpets are very beautiful, possessing a wonderful sheen, but they get soiled more quickly and have less resilience than wool carpets of a similar quality; and this, combined with their high cost, makes them luxuries for the few.

Cotton is used for chain warps in all kinds of carpeting, and forms the chain of Axminster and weft of Wilton and Brussels carpets. Flax yarn is sometimes used as a weft yarn in Brussels and Tapestry. Jute and hemp are used in considerable quantities as a filling, to give body or weight to the carpet, and as a weft in Axminster.

Other materials used occasionally in the manufacture of carpets are mohair, cowhair and horsehair for the surface of the carpet and ramie for the back. Twisted paper yarn has been tried for weft, chain or "stuffer."

**Dyeing.**—Dyeing plays a most important part in carpet manufacture, as practically all yarns used on the surface have to be dyed; and fast colors are essential.

The yarns are impregnated with the oil or grease which they received during the process of spinning. Washing is then a necessary preliminary to dyeing, as the presence of grease would prevent the dye permeating the fibers. Scouring is effected by soap and hot water, and passes, without being fully dried, to the dyeing machine.

The process of dyeing the yarn in skeins is generally effected by

mechanical means and is similar to that adopted in other branches of the textile trade. (See DYEING.)

**Hand-made Carpets.**—The main classification of carpets is between those which are made by hand and those which are made by machine; and of these classes, especially of the latter, there are many subdivisions.

Hand-made carpets are the oldest type, and are the historical parents of all modern carpets. This kind of carpet is made to-day in the United Kingdom, on the Continent, and in the East in almost exactly the same manner in which it has been made by the Orientals for several hundred years. The principle is extremely simple. The warp threads, or chain, are wound on two horizontal beams, between which they are stretched vertically. The beams are carried by upright posts on which they can revolve, the space between the posts determining the width of the rug or carpet. The weavers sit side by side in front, the carpet as it is woven being gradually wound on to the lower beam and the warp correspondingly unwound from the upper beam. The yarn for the pile is cut about 2 in. in length and is knotted round two warp threads, tuft by tuft, according to the paper design, in front of the weaver. As each row, or part of a row is finished, two weft threads are put in, one in the shed formed between the front and back halves of the chain, and a second in an alternate shed, which is formed by the weaver pulling forward the back half of the chain temporarily in front of the front half. The second weft is put in straight, the first one loose, zig-zag or vandyked, so as to fill up the back of the carpet and to avoid the tendency towards lateral contraction. The weft is beaten down into its place by a heavy fork or beater. This interlocking of warp and weft with the tuft forms the weave of the carpet, and has been imitated more or less in all mechanically woven carpet fabrics. There are two different kinds of knot employed, the Ghiordes or Turkish, and the Senne or Persian; the tufts of yarn in the former coming in pairs between the two warp threads (fig. 1, A) and in the latter coming singly between each warp thread (fig. 1, B). In either case the tufts do not stand up vertically to the plane of the fabric but lie over obliquely towards the starting end of the carpet. This presents to the eye and foot of the user partly the ends and partly the sides of the tufts, and is a very characteristic feature of hand-made carpets.

FROM MURPHY, "TEXTILE INDUSTRIES" (GRESHAM)  
FIG. 1.—A. GHIORDES, OR TURKISH KNOT. B. SENNE, OR PERSIAN KNOT

Another kind of hand weaving is the tapestry method, wherein the weft colours, wound upon wooden needles, are threaded round and between the warp ends, leaving a flat or slightly ribbed surface, not unlike that of an ingrain carpet. The absence of a tufted pile does not make this a luxurious carpet, but it enables a fine pitch to be employed and the richest and most delicate effects of design and colour to be obtained. Carpets of this type have long been made at Les Gobelins, Paris, Aubusson and Beauvais in France, and Tournai in Belgium. The work is slow and highly skilled, and the product is naturally very expensive.

There is no better carpet than that made by hand; though this is far from implying that all hand-tufted carpets are superior to all machine-made ones. The hand-tufted carpet possesses an individuality, even in its faults, which no product of a machine can attain; and which, after all, is an attribute of a work of art.

Hand-made carpets have a further advantage in their adaptability to requirements. A single carpet, for instance, can be made to any specified shape, size, design, colour and quality. It is possible to produce in one piece carpets of oval, circular or L-shaped form, or to conform to irregular curves and angles.

Qualities are numerous, but they may be said to vary between about 9 and 400 tufts to the sq. inch. The average European hand-made carpet will not run to more than from 16 to 30.

The principal seats of the Oriental hand manufacture of carpets are India, Persia, Egypt, Turkey-in-Asia and China; to which countries may perhaps be added Greece, to where, since the World War, a certain amount of the Turkish carpet industry has been transferred.

In Persia the chief centres are Kerman, Feraghan and Kurdi-

stan; each of which produces carpets of characteristic patterns and qualities.

Turkish carpets are, broadly speaking, of coarser texture than Persian. The typical Turkey carpet comes from Ushak, but the industry extends over many parts of Asia Minor.

Carpets are also made in Tripoli, Tunis and Algiers.

The manufacture of carpets is widely distributed throughout India in the localities of Mirzapore, Benares, Masulipatam, Kashmir, Multan, Amritsar and Peshawar; while rugs of a cheaper type are made in Bengal. Indian carpets generally are less fine in fabric, as well as in design and colour, than Persian.

The European, or Occidental, branch of the trade is located in Maffersdorf (Czechoslovakia), Holland, Donegal, Carlisle, Wilton and the Balearic islands.

European hand-tufted carpets may be regarded upon a different footing from Asiatic, inasmuch as, although in the localities named, carpets of characteristic Eastern design and colouring are produced, their staple trade has always been rather along the lines of specialties; and the makers have catered rather for architects, decorators and public bodies than for the average consumer.

In the East, the weaving of carpets has long been and is still largely a family affair. The women and children sit in front of the loom, and work under the supervision of the matriarch. Obviously the degrees of skill employed will vary; and this leads to some of the irregularities in Eastern carpets. It is not to be implied, however, that all Oriental carpets are still the product of family or tribal industry. Western methods have penetrated even to the "unchanging East"; organization of the industry has been set up; and carpet dealers' and importers' syndicates in New York, London and Paris have their agents in the East and even control their own factories.

It is a common fallacy that the yarns of Oriental carpets are dyed solely with vegetable dyes, and that those dyes are intrinsically superior to aniline and alizarine dyes such as are employed for yarns for machine-made fabrics. The latter have been used for many years now by European carpet manufacturers, not because they are cheaper than vegetable dyes, but because they are easier to use, more accurate for matching purposes and faster to light. There are, of course, good and bad synthetic dyes; but the best are immeasurably superior to dyes made from plants, barks and berries. This fact has long been recognized by those who control the production of Oriental carpets, for the yarns for which aniline and alizarine dyes are now extensively employed.

The subject of dyeing naturally leads to that of the so-called "washing" or "faking," to which a large proportion of Eastern carpets are submitted. The object of this is two-fold; to soften the colours and to give an appearance of age, and to obtain a gloss which the wool does not naturally possess. The process involves the use of chlorine or acetic acid to give the faded effect, while glycerine and ironing are employed to get the glossiness. It can hardly be supposed that this treatment does not detract to some extent from the life of the carpet; but this consideration appears to be outweighed by that of the more attractive appearance. The process has been tried upon Wilton carpet, but with doubtful success.

**Brussels Carpets.**—Of machine made carpets, Brussels is naturally first to be mentioned, as it was the first to be made in Europe. It is a loop-pile fabric, having a strong foundation of linen, jute and cotton yarns, together with that portion of worsted yarn which is not utilized on the surface to form the pattern. The pattern itself is formed by differently coloured threads of worsted yarn looped over a wire. The body and back of the carpet is provided for normally by two warp beams, called the chain and the stuffer. The chain is usually of cotton, and its object is to form, in combination with the weft, the woven base of the fabric. The threads of the two chains are led through eyelets mounted on head-frames or gears, which rise alternately in such a way as to allow the shuttle carrying the weft to be shot through the opening thus formed. The purpose of the stuffer or "dead" warp is solely to give body or weight to the fabric.

The stuffer threads are carried on eyelets in a frame, similar to the chain, but are not divided, and remain practically in the middle

of the fabric. The worsted yarn, which forms the pile warp, is arranged on bobbins, in frames (generally five in number), and the threads are drawn through the harness, which consists of cords carrying eyelets, and kept taut by the weight below while connected with the Jacquard mechanism above.

The Jacquard principle is well known throughout the textile trades, and is a device for selecting and raising the threads re-

A FROM MURPHY, "TEXTILE INDUSTRIES" (GRESHAM); B, C AND D FROM "CARPET MANUFACTURE" (BRADBURY)

FIG. 2.—A. LONGITUDINAL SECTION OF FIVE-FRAME BRUSSELS CARPET WITH SINGLE STUFFER WARP. B. LONGITUDINAL SECTION OF THREE-FRAME BRUSSELS CARPET WITH DOUBLE STUFFER WARP. C. quired to form the pattern. All the warp threads are drawn through the sley or reed in such a way that there will be in each reed-space five threads of worsted (for a "five-frame" carpet), two of cotton chain, and one of stuffer. When the loom is running the Jacquard mechanism lifts one worsted thread in each reed, thus forming a shed under which the wire is introduced from the side. Underneath the wire lies the body of the fabric, consisting of the four other worsted threads in each course, the stuffer warp, and one-half of the cotton chain warp. Below the body of the fabric is the lower shed formed by the other half of the cotton chain, and through this the shuttle passes, carrying the weft at the same time as the wire is being inserted. Then the lathe, which has been lying back to allow the passing of the shuttle and the entrance of the wire, comes forward with the sley and beats up the wire and the last shot of weft against the breastplate of the loom and the last part of the woven fabric. At the same time the Jacquard allows the harness carrying the ends selected for the last lash to drop back on to a level with the others, and the gears carrying the cotton chain begin to change. Next, the lathe goes back again; one half of the chain is brought up to form a shed, under which and over the rest of the threads the shuttle passes back, thus effectively tying in the worsted threads which are looped over the wire.

Brussels and Wilton carpets are described as being 5, 4 or 3 frames, according to the number of sets of creol bobbins carrying worsted warp threads. (See fig. 2.)

The demand for all qualities of Brussels carpeting has declined steadily for many years, as the fabric has suffered from the competition of Axminster and of Tapestry; being essentially less economic in manufacture than either of these. A good Brussels, however, is an excellent carpet, and will last for many years.

After leaving the loom the roll of carpet is measured, dried, "picked" or mended, shorn, inspected, and sometimes pressed.

**Wilton Carpets.**—Wilton carpet is similar in manufacture in many respects to Brussels, and the looms are in practice convertible from one fabric to the other without much difficulty. The preparation of yarn is substantially identical, and the weaving and finishing operations very similar.

The essential differences are:—

In weaving Wilton the loops of worsted yarns are cut, so that the surface is velvety instead of being ribbed. This is effected

by the use of a flat narrow wire ending in a knife blade, which stands outside the fabric when the wire is inserted but severs the loops of worsted as it is withdrawn. Many makes of Wilton, for the sake of holding down the pile more securely, have three shots of weft to each row of pile instead of two. The cutting of the yarn, which has the effect of exposing the ends instead of the sides of the wool fibre, gives a richer "plush-like" surface effect both in appearance and to the touch; while the treble weft makes a firmer fabric. (Fig. 3.)

The standard Wilton quality has a pile of about  $\frac{3}{8}$  in. high and contains about 90 points to the sq.in.; but the fabric lends itself readily to fine and luxurious effects, and there are qualities made with a deeper pile and of a fineness of about 120 to the sq. inch. Cheaper qualities are also made with a woolen pile yarn of a coarseness of about 60 to the sq.in., but these qualities do not compete very effectively with the more attractive Axminster at about the same cost.

Wilton carpets, like Brussels, have two limitations—one economic and one artistic. For every square of the pile warp showing on the surface there are two to five parts uneconomically used in the body of the fabric; and the number of "frames" that can be worked one over the other to form the pattern is limited to six. These limitations, however, are not serious ones; and the Wilton carpet in its higher grades is regarded by many as the best of all machine-made carpets. It is certainly the finest; and the closeness of texture, broadly speaking, means both finer effects and better wear.

The higher grades of Wilton are made from 95 to 128 points to the sq.in.; so that, in the matter both of delicacy of design and of texture, effects can be produced in Wilton which surpass those of any other carpet fabric, with the exception of the finest Persians.

**Axminster Carpets.**—An Axminster carpet presents a somewhat similar appearance to a Wilton carpet, but the essential difference between the two fabrics is that the surface of the former is composed of tufts inserted in the fabric, while the surface of the latter is formed by cutting the pile warp threads.

Axminster carpets, though in point of time a comparatively recent development of the industry, may claim to be, in point of structure, the nearest related of all machine-made carpets to the Oriental ancestor. The similarity lies in the fact that they are tufted; and the tuft, though inserted in the fabric mechanically and bound down without being knotted, undoubtedly represents the knotted tuft of the original hand-made carpet. The essential feature of a tufted Axminster carpet is that the tufts are inserted row by row between the warp threads, either before or after being

FROM MURPHY, "TEXTILE INDUSTRIES" (GRESHAM)

FIG. 3.—LONGITUDINAL SECTION OF FIVE-FRAME WILTON CARPET WITH TREBLE STUFFER WARP. A. CHAIN; B. PILE WARP; C. STUFFER WARP; E. WEFT

cut off, and are then bound down by the weft, and so woven into the ground of the texture. Each tuft is used on the surface and forms part of the design; none of the tuft material is buried or wasted in the body of the fabric, beyond what is needed for attachment to the weft.

As in other carpet fabrics, there are various qualities of Axminster carpeting, the most popular is made in a pitch of 7 to the inch, with a beat-up of about  $6\frac{1}{2}$ ; giving 45 tufts to the sq.in., each tuft being about  $\frac{7}{8}$  in. high. Fig. 4 gives the transverse section through the weft of the weave ordinarily employed, though there

are several variations, of which another is shown in the same figure. The figure forms a flat back and gives the tuft a distinct inclination out of the vertical, adding a point of similarity to the hand-tufted carpet; and the latter figure gives the back a ribbed appearance, the tuft in this case remaining vertical.

Each of these two named weaves has its merits. The former gives better cover with its sloping tuft, while the latter claims

FIG. 4.—LONGITUDINAL SECTIONS OF IMPERIAL AXMINSTER. A. CHAIN; B. TUFTS; C. STUFFER WARP; D. DOUBLE WEFT

increased resiliency and immunity from the shading in made-up carpets, so noticeable with the first-named weave.

Axminster manufacture consists of two processes, the pile yarn being arranged to form the design before it is put into the loom. The dyed yarn of the various colours for the design is first wound on to a 6in. bobbin. The yarn from this bobbin has then to be wound on to a series of wide spools, the number of which will be the number of the rows of tufts in one complete repeat of the design to be woven, while each spool contains as many ends of yarn as there are squares in the width of the design. This operation is called setting, or sometimes reeding-in. The 6in. bobbins are arranged on a frame on vertical or horizontal pegs in their various colours, corresponding to those of the first row of the design. The yarn is then wound off the bobbins on the 27in. spool, and when the spool is full the operation is repeated as often as is necessary

of the chain warp. In this position they are tied down by the passing of a weft shot, and are then cut off by a pair of broad knives working at the level of the surface of the carpet. The spool and carriage are then replaced on the chains, and the succeeding spool brought into position (fig. 5).

Another method of the Axminster principle of inserting tufts into the weave of the fabric is that of conveying tufts already cut by means of gripper or nippers. This is sometimes worked in combination with the wide spools, but more satisfactorily in combination with yarn carriers operated by a Jacquard with a differential lift mechanism for selecting the colours. In this case the yarns are

FROM MURPHY, "TEXTILE INDUSTRIES" (GRESHAM)

FIG. 6.—A. CHENILLE DESIGN PAPER CUT-UP. B. CHENILLE CLOTH BEFORE CUTTING

placed on bobbins in frames as in the Brussels or Wilton looms, and then led into carriers which are grooved and slotted metal strips. The slots are fitted with springs which hold the threads of yarn one above another, presenting their ends to the front of the

FROM MURPHY, "TEXTILE INDUSTRIES" (GRESHAM)

FIG. 5.—TUFTING MECHANISM FOR AXMINSTER LOOM

for weaving the required quantity. Then the bobbins are rearranged for the second row of the design and so on.

The yarn on the wide spools is then threaded through a series of tin tubes, the number of which corresponds with the number of ends on each spool. The tufting carriages are then placed, in the correct rotation to form the pattern, upon a pair of endless chains, which are actuated by the mechanism of the loom. The wide spools and carriages are then successively detached from the chains and carried down to the fell of the cloth in such a way that the ends of the tuft yarns are inserted between the upper shed

loom. The Jacquard mechanism causes the colour required for each square of the pattern to be lifted to a certain height. The grippers, mounted on a shaft, are operated so as to seize the ends of the tufts, which are then cut off and inserted at the fell of the cloth between the chain warp threads, where they are tied down by weft shots.

**Chenille Carpets.**—Chenille Axminster carpeting possesses features which differentiate it from the other kinds of carpets. Like Orientals, it can be woven to any width, up to 33ft., any reasonable length, any shape, and of any design or number of

7. Weft loom weaving the woolen blanket to form chenille fur
8. Loom on which chenille may be woven up to 30 feet in width

colours. It is the product of two distinct processes; the formation of the chenille fur, and the weaving of that fur, which is the weft, into a carpet. It is, in fact, about the only cut-pile carpet fabric in which the pattern is distinctively formed by the weft; for in almost all other makes the weft only performs the function of combining with the chain to form the woven fabric.

The dyed yarn, which is generally woollen, is wound on to cops which fit inside shuttles for the weft looms. The paper design to

FROM "CARPETS" (PITMAN AND SONS)

FIG. 7.—A. CHENILLE FUR AFTER CUTTING. B. CHENILLE FUR CUT AND FOLDED. C. TRANSVERSE SECTION SHOWING FUR INSERTED

which the weaver has to work is cut up into strips two squares wide (fig. 6a), and the weaver attaches this strip to the fabric as it is woven and changes the shuttles carrying yarn of various colours in accordance with the colours on the design paper. The warp of the loom consists of sets of ends of fine cotton at intervals of from half-an-inch to an inch, according to the pile desired. Thus the woven fabric consists of a woollen weft of various

colours held together at intervals by a fine cotton warp (fig. 6b). The next process is the fur-cutting. The roll of cloth with its horizontal stripes is taken to the cutting machine, where it is cut into strips by a series of knives set upon a revolving cylinder and spaced so that they sever the woollen weft-threads between the cotton warps as the fabric passes over the cutting bed, and leave the independent strips of fur held together by the fine cotton warp. Immediately after being cut free these strips of fur pass over a jet of steam and steam-heated cylinder, whose surface is formed with a series of V-shaped grooves. This has the result of folding upwards the cut ends of the woollen yarn and giving a permanent V-shape in section to the fur. The object of this is that when the fur comes to be woven its pile shall be turned in one direction. The damping of the fur just before passing over the grooved cylinder is sometimes effected by rollers revolving in a trough filled with water (fig. 7). The newly formed fur is then reeled off into individual skeins. It is marked both with its pattern number and series number and sorted into its proper sets.

The second part of Chenille manufacture is the weaving of the fur into the carpet, which is done on what is known as a setting loom. The warp of a setting loom consists of chain and stuffer, as in the Brussels and Wilton looms, while sometimes an additional one is used, called the float warp. There is also the catcher warp, which is of fine strong cotton. Its function is merely to hold down the fur weft when it is inserted into the fabric. Be-

sides the fur weft, there is the jute or coarse woolly filling weft, of which there are four shots to each one of fur. (See fig. 8.)

When a carpet is to be woven the fur is wound into cops, which are served out to the weaver in their proper order. The shuttle carrying the fur weft is shot across the loom below the catcher warp but above all other warps. The loom stops automatically, and the weavers (two to each wide loom) set the fur with combs, taking care that the design matches correctly with the previous shot, and that the catcher threads settle down neatly through the pile. The loom is restarted and the four shots of filling weft in-

serted. Alternatively the fur may be inserted by a travelling arm, operated between the catcher and the other warps, which leads the fur from a basket or can. Chenille carpets have become very popular since their introduction, partly of course owing to this fabric being the first with a cut pile to be applied to the manufacture of wide carpets in one piece; partly to the wide range of colours that can be employed; and partly to its comparative cheapness.

**Tapestry Carpets.**—Tapestry is a fabric made alternatively with a looped pile or a cut pile, called Velvet, which possesses a close affinity to Brussels and Wilton respectively in its appearance and texture. In its method of manufacture, however, it has something in common with Chenille, inasmuch as it is essentially a two-process fabric, while the pattern is wholly in the surface and is the direct result of the preliminary and not of the weaving process. No Jacquard is used.

The underlying principle of the fabric is the attainment of economy by the use of one frame of worsted yarn on which the pattern is printed in its various colours instead of dyeing five frames of yarn, each of a different colour. The worsted can be coloured before or after the weaving, and in the former case, which is the standard method, it is printed in an elongated form to allow for the reduction caused by the insertion of the wires in weaving (fig. 9).

The yarn is wound on to a large drum from 12ft. to 40ft. in circumference and with a face of from 18in. to 72in.; and the colour is applied by means of a carriage bearing a colour-roller, which is drawn across the face of the drum pressing upon the yarn threads. The printer changes the colours in accordance with the design paper and the "scale-board." When the printing is finished the yarn is scraped, removed from the drum, looped and ticketed in rotation to show the place each thread occupies in the design. The colour is then fixed by being steamed, and the yarn is rinsed and dried. The yarn is wound on to large bobbins, duly numbered, and thence on to a warp beam of the width of the fabric to be woven. The "setters" arrange the threads so as to form the pattern, which is still in its elongated form (fig. 10a), but which assumes its correct shape when woven (fig. 10b).

FROM MURPHY, "TEXTILE INDUSTRIES" (GRESHAM)

FROM MURPHY, "TEXTILE INDUSTRIES" (GRESHAM)

FIG. 9.—A. REPEAT OF DESIGN IN A TAPESTRY CARPET, ELONGATED AS PRINTED. B. SAME DESIGN AS IT WILL APPEAR WHEN WOVEN

The method of weaving is substantially the same as with Brussels and Wilton, the wires being round for Tapestry or provided with knives for the Velvet (fig. 11).

The demand for Tapestry and Velvet carpets has changed, as with other fabrics, from piece goods to breadth squares and on to seamless squares, with a corresponding increase in the cost of manufacture, for the Tapestry and Velvet carpet can only be produced economically if in large quantities.

The chief disadvantage of these fabrics is that the transition from one colour to another in the same length of worsted cannot be made quite suddenly, so that in the design the colour will ap-

pear to have run, and the clearly defined pattern effect of Brussels and Wilton is unobtainable. Apart from that, Tapestry and Velvet have much to commend them. They can be sold at moderate prices, and are capable of a wide range of effects in design and colour, circumstances which have given them a considerable measure of popularity with the public.

**Ingrain Carpets.**—The kind of carpet that is variously called Kidderminster, Scotch or Ingrain differs considerably from any of the carpets hitherto described. Perhaps essentially, and in regard to texture, it is most akin to hand-woven Tapestry, having a flat ribbed surface, without tufts like Axminster or loops like Brussels.

The original type of this carpet was the Ingrain or "Two-ply Super." It was made with a worsted warp and a woollen weft in 36in. width (fig. 12a).

Developments have been made in various directions, but principally in those of heavier fabrics and wider looms. Additional colour effects are obtained by increasing the number of warps and of wefts, while heavier fabrics are made "three-ply." (See figs. 12b, c, d.)

The yard wide Ingrain is now almost extinct, and the modern form of the fabric is the so-called Art Square, a fairly heavy seamless carpet, generally produced in bold and simple effects of design and colour.

Compared with some carpet fabrics, Ingrain must take a modest place. It cannot be regarded as luxurious to tread upon, its flat surface lacking the resiliency which the looped or cut pile gives to even a cheap Brussels or a Tapestry velvet. On the other hand, it is capable of giving artistic effects, within its limits, and the fabric is clean in wear and easily handled.

**Modern Developments: Wide-Looms.**—The exact date cannot be fixed; but from about the first decade of the 20th century a demand began to be evinced in the carpet markets of the world for carpets made without seams, and manufacturers began to set themselves to meet the demand. Hitherto, seamless carpets had, broadly speaking, only been available in hand-tufted fabrics, in Art Squares, and in Chenille; but thereafter there was a speedy development in other machine-made fabrics.

**Wilton.**—Looms of 9ft. in width and upwards were constructed in both the United States and in Great Britain on the same principles as the 27in. loom, and worked with fair success; although the expense, both of construction and of operations, made the fabric costly out of proportion to the narrow goods. In particular, the withdrawing of the wire at the side necessitated the total width of the loom being more than double the width of the fabric woven and slowed down the rate of production considerably. To overcome these objections a loom was devised in the United States in which the cutting of the loops was effected by a series of knives placed across the carpet parallel to its length. Looms on this principle have been brought to something like perfection and are being operated in Great Britain and in the United States with success; while other wide looms are being run both in these countries and on the Continent.

**Axminster.**—Similarly, the tube principle has been extended from the 27in. width to widths of 9ft. and more, and the gripper principle, combined with the Jacquard, has had a like development. The most striking departure, however, of the Axminster principle has been a wide loom which produces mechanically a

FIG. 11.—A. TAPESTRY CARPET WITH ROUND WIRE. B. TAPESTRY VELVET CARPET WITH CUT PILE. A. CHAIN. B. PILE WARP. C. STUFFER WARP. E. WEFT

fabric in which the tufts are tied with a Ghiordes knot, exactly as in the Oriental hand-loom. This loom was introduced into Kidderminster in 1910, and has been brought to a high pitch of efficiency. The fabric is made in various qualities up to 49 tufts per inch.

**Tapestry.**—This fabric has followed the same lines of development, and many wide printed fabrics, especially with the cut pile velvet, are being produced on the same principle as the narrow weave.

**Design and Colour.**—There was a time when the phrase "flaming Brussels carpet" was not entirely undeserved, but this has long passed. The naturalistic and geometrical styles, both brightly coloured, passed away, partly under the influence of William Morris, who introduced, and of others who developed, the conventional style of decoration in carpets.

The carpet trade then passed into an era of reproduction, the masterpieces of Oriental and, in particular, of Persian art being studied and carefully copied. The next stage in the development of carpet design was the drawing of inspiration from the char-

acteristic decorative styles of other countries and ages; first China and Japan, then France; the periods of Louis XIV., Louis XVI., and of Rococo, Renaissance, Empire. The ancient art of Egypt, Crete, Greece, Assyria and Rome was laid under contribution, and with creditable and interesting results which have proved healthy and stimulating for the industry. Finally, the Cubist or Futurist or

Modern movement in the world of art has not been without its influence on carpet design, to which indeed the flat and bold treatment of decoration is very suitable. In the result, therefore, it may be said that there is a cosmopolitanism and an eclecticism of taste in carpet design at the present day; and a good pattern of whatever style, provided that it be true to the style and that it be well coloured, whether quietly, brightly or richly, is sure of acceptance.

**Carpet Statistics.**—In Germany the industrial census of 1925 gives the number of carpet factories as 1,016, and of workers as

A.—MITRED RUG, OR SEAMED RUG MADE FROM ROLL-GOODS  
B.—SEAMED RUG (MADE FROM RUG PARTS)  
C.—SEAMLESS RUG (WOVEN WHOLE)

15,265, of whom 6,297 were female. The chief localities of the industry are Barmen, Elberfeld, Dären, Chemnitz, Leipzig, Berlin and Cottbus; but there are many small concerns scattered throughout the country.

A large number of carpet factories is given in a French trade directory of 1926, but the majority of these are small concerns making hand-tufted carpets. The most important centres are Roubaix and Tourcoing for machine-made goods, and Aubusson, Beauvais and Felletin for hand-tufted. Nîmes, Halluin, Lannoy and Persan are also centres.

In 1913 the value of production was estimated at 25,000,000frs. No post-war figures are available, but in 1926 France exported 16,925sq.in. of knotted woollen carpets to the value of 5,747,000frs. and 23,124 metric cwts. of other woollen carpets, to the value of 101,061,000frs. No reliable figures are obtainable as to the number of workers now engaged in the industry.

The principal centres of the carpet trade in Great Britain are in the south of Scotland (about 25%), the north of England (20%), and Kidderminster (40%). There are about 4,500 looms of var-

DIAGRAM OF THE INTERIOR MECHANISM OF MODERN CARPET SWEEPER

ious kinds and widths in the whole trade, of which number Wilton, Chenille, Tapestry and Axminster contribute together equally about 95%, the balance being ingrain and hand-tufted looms. The total number of employees in 1927 was about 37,000, of whom rather more than one quarter were male.

The total production in the United Kingdom in 1924 was 21,617,000sq.yd., in the following proportions:—Tapestry 31%, Brussels and Wilton 16%, Axminster (tufted and chenille) 45%, hand-tufted and other n.e.s. 6%. The value was £9,844,000 in the following proportions:—Tapestry, 16%, Brussels and Wilton 22%, Axminster 55%, ingrain 1%, hand-tufted and others 6%.

The imports have increased from 605,181sq.yd. of the value of £1,168,055 in 1919 to 5,684,859sq.yd. value £3,043,914 in 1927; figures which are ominous for the future of the British carpet manufacturing industry. The exports in 1920 were 6,921,400sq.yd. valued at £4,544,376; and in 1926, 6,757,200sq.yd., valued at £3,063,148.

In the United States there are 62 carpet factories. In 1927 the production amounted to 65,628,740sq.yd., and the number of workers employed was 32,290. The chief centres of manufacture are Philadelphia, Pa., Amsterdam and Yonkers, N. Y., Worcester and Clinton, Mass., Freehold, N. J., and Thompsonville, Conn. The imports of oriental carpets into the United States in 1928 were 2,294,865sq.yd.

See R. S. Brinton, *Carpets* (1919).

(R. S. B.)

In 1927 production in the American carpet and rug industry, according to the U.S. bureau of census, used 88,159,995 lb. of wool and purchased 34,705,995 lb. of woollen and worsted yarn from independent spinners. The square yardage produced that year was: carpets 16,228,421, rugs, 49,400,310. This yardage was divided as follows:

|                    | Yd.        |                      | Yd.        |
|--------------------|------------|----------------------|------------|
| Chenille . . . . . | 329,176    | Axminster . . . . .  | 24,831,411 |
| Velvet . . . . .   | 16,079,418 | Tapestry . . . . .   | 6,410,441  |
| Smyrna . . . . .   | 473,169    | Ingrain . . . . .    | 265,609    |
| Wilton . . . . .   | 10,266,199 | All others . . . . . | 6,973,317  |

Sixty-two manufacturers reported a total of 9,771 looms and a total production value of \$164,709,290.00. For the calendar year 1928 the U.S. tariff commission reported 3,184,520 sq.yd. of woven floor coverings imported—mostly oriental rugs from Persia, Turkey and China. The exports have always been negligible and in 1928 the total yardage shipped, mainly to Mexico and Canada, was 124,600.

**CARPET-SWEEPER.** The first mechanical carpet-sweeper seems to have made its appearance sometime in the sixties. About 1865, a satisfactory sweeper was manufactured which consisted of a substantial cast-iron box, carried upon a pair of transverse rollers, containing a roller-brush which derived its motion from a belt pulley which was fixed upon the projecting end of the rearward roller. The brush, by its rotation, was assumed to throw its sweepings into the box, which would subsequently be turned upside down and emptied. Owing to the weakness of the belt drive and the extreme resistance offered by the brush due to its compact formation as a roller, this machine swept imperfectly. Other carpet-sweepers followed during the next decade, all designed with a brush of the same close formation, and each creating for its driving apparatus the same difficulty of overcoming the frictional resistance of the carpet. In some, however, came the germ of the modern system which discards the belt pulleys and secures rotation by the friction of four rubber faced carrying wheels against the peripheries of drums which are fixed upon the brush.

MODERN CARPET SWEEPER

There was still, however, the problem of the fully filled brush, and the sluggish movement which arose from its grip on the carpet. Succeeding designers, therefore, abandoned the brush with the roller surface and introduced one bearing somewhat the appearance of a paddle wheel, the bristle being set in four rows and so arranged in a waved or serpentine form, that while not more than five knots of bristle could grip the pile at any one time, the carpet was as fully covered in the course of a complete revolution as if the brush retained its former mass of closely packed material. Now, driven with less resistance and turned more swiftly by means of the rubber faced "friction drive," the brush at last swept successfully, and thus gave an acceptable foundation for all the developments which have followed.

After 1889 improvements came rapidly. Among them must be counted the introduction of the ball-bearing brush, an innovation which established antifriction bearings at the point most vital to assured rotation of the essential sweeping element: also the automatic comb, by means of which the revolving brush is cleaned while working and so relieved of any entwining hair or thread which otherwise would tie the bristle; the resilient india-rubber cushions which guard salient parts of the machine to neutralize the effects of hurried sweeping. (See also *HOUSEHOLD APPLIANCES*.) (J. L. P.)

**CARPI, GIROLAMO DA** (1501-1556), Italian historical and portrait painter, born at Ferrara, was one of Benvenuto Garofalo's best pupils. He spent several years in copying the works of Correggio, succeeding so well as to be able to dispose of his own works as originals by the master. Da Carpi's best paintings are a "Descent of the Holy Spirit," in the church of St. Francis at Rovigo; a "Madonna," an "Adoration of the Magi," and a "St. Catharine," at Bologna; and the "St. George" and the "St. Jerome" at Ferrara.

**CARPI, UGO DA**, Italian 15th-century painter, was long held the inventor of the art of printing in chiaroscuro, later brought to such perfection by Parmigiano and by Baltasar Peruzzi of Siena. The researches of Michael Huber (1727-1804) and Johann Gottlob Immanuel Breitkopf (1719-94) have proved, however, that this art was known and practised in Germany by Johann Ulrich Pilgrim (Wächtlin) and Nikolaus Alexander Mair (1450-c. 1520), at least as early as 1499, while the date of the oldest of Da Carpi's prints is 1518. Printing in chiaroscuro is performed by using several blocks. Da Carpi usually employed three—one for the outline and darker shadows, another for the lighter shadows, and a third for the half-tint. By means of them he printed engravings after several pictures and after some of the cartoons of Raphael. Of these a "Sybil," a "Descent from the Cross," and a "History of Simon the Sorcerer" are the most remarkable.

**CARPI**, a Dacian tribe established upon the lower Danube from the 1st century B.C. They rose to considerable power during the 3rd century A.D., and, claiming to be superior to the Goths, demanded that their incursions into Roman territory should likewise be bought off by tribute. When this was refused they invaded in force, but were beaten back. After this; they joined with the Goths in their successful inroads until both nations were defeated by Claudius Gothicus. Later, after repeated defeats under Diocletian and Galerius, they were taken under Roman protection and the greater part established in the provinces of Pannonia and Moesia; some were left beyond the Danube, and they are last heard of as allies of the Huns (q.v.) and Sciri in the time of Theodosius I.

**CARPI**, a town and episcopal see of Emilia, Italy, in the province of Modena, gm. N.N.W. by rail from the town of Modena. Pop. (1921) 11,272 (town), 30,675 (commune). It is the centre of a fertile agricultural district. Carpi contains several Renaissance buildings of interest, the façade of the old cathedral (an early Romanesque building), the new cathedral (after 1513), the nave of S. Niccolò and a palace, all by Baldassare Peruzzi: while the prince's palace (with a chapel containing frescoes by Bernardino Loschi of Parma, 1489-1540) and the colonnades opposite the theatre are good. These, and the fortifications, are all due to Alberto Pio of Carpi, a pupil of Aldus Manutius.

See *Memorie Storiche e documenti su Carpi* (Carpi, 1905).

**CARPINI, JOANNES DE PLANO**, the first noteworthy European explorer of the Mongol empire (in the 13th century), and the author of the earliest important Western work on northern and central Asia, Russian Europe and other regions of the Tatar dominion. He appears to have been born at Piano della Magione (formerly Pian del Carpine) near Perugia. He was one of the companions and disciples of his countryman, St. Francis of Assisi, and can hardly have been younger than the latter, born in 1182. Joannes took a foremost part in Franciscan teaching in northern Europe, holding successively the offices of warden (*custos*) in Saxony, and of provincial (*minister*) of Germany, and afterwards of Spain, perhaps of Barbary and of Cologne. He was in Cologne

at the time of the great Mongol invasion of eastern Europe and of the disastrous battle of Liegnitz (April 9, 1241). The dread of the Tatars was still on men's minds four years later, when Pope Innocent IV. despatched the first formal Catholic mission to the Mongols (1245), partly to protest against the latter's invasion of Christian lands, partly to gain trustworthy information regarding the hordes and their purposes; behind there may have lurked the idea of opening diplomatic intercourse with a power whose alliance might be invaluable against Islam.

At the head of this mission the pope placed Friar Joannes, at this time certainly not far from 65 years of age; and to his discretion nearly everything in the accomplishment of the mission seems to have been left. The legate started from Lyons, where the pope then resided, on Easter day (April 16, 1245), and was joined at Breslau by another Minorite, Benedict the Pole, appointed to act as interpreter. The onward journey lay by Kiev; the Tatar posts were entered at Kanev; and thence the route ran across the Dnieper (*Neper*, *Neper*, in Carpini and Benedict) to the Don and Volga (*Ethil* in Benedict; Carpini is the first Western to give us the modern name). Upon the last-named stood the *Ordu* or camp of Batu, the famous conqueror of eastern Europe, and the supreme Mongol commander on the western frontiers of the empire, as well as one of the most senior princes of the house of Jenghiz. Here the envoys, with their presents, had to pass between two fires, before being presented to the prince (beginning of April 1246). Batu ordered them to proceed onward to the court of the supreme khan in Mongolia; and on Easter day once more (April 8, 1246) they started on the second and most formidable part of their journey—"so ill," writes the legate, "that we could scarcely sit a horse; and throughout all that Lent our food had been nought but millet with salt and water, and with only snow melted in a kettle for drink." Their bodies were tightly bandaged to enable them to endure the excessive fatigue of this enormous ride, which led them across the Jaec or Ural river, and north of the Caspian and the Aral to the Jaxartes or Syr Daria (*quidam fluvius magnus cuius nomen ignoramus*), and the Mohammedan cities which then stood on its banks; then along the shores of the Dzungarian lakes; and so forward, till, on the feast of St. Mary Magdalene (July 22), they reached at last the imperial camp called *Sira Orda* (i.e., Yellow Pavilion), near Karakorum and the Orkhon river—this stout-hearted old man having thus ridden something like 3,000 m. in 106 days.

Since the death of Okkodai the imperial authority had been in *interregnum*. Kuyuk, Okkodai's eldest son, had now been designated to the throne; his formal election in a great *Kurultai*, or diet of the tribes, took place while the friars were at Sira Orda, along with 3,000 to 4,000 envoys and deputies from all parts of Asia and eastern Europe, bearing homage, tribute and presents. They afterwards, on Aug. 24, witnessed the formal enthronement at another camp in the vicinity called the Golden Ordu, after which they were presented to the emperor. It was not till November that they got their dismissal, bearing a letter to the pope in Mongol, Arabic and Latin, which was little else than a brief imperious assertion of the khan's office as the scourge of God. Then commenced their long winter journey homeward; often they had to lie on the bare snow, or on the ground scraped bare of snow with the traveller's foot. They reached Kiev on June 9, 1247. There, and on their further journey, the Slavonic Christians welcomed them as risen from the dead, with festive hospitality. Crossing the Rhine at Cologne, they found the pope still at Lyons, and there delivered their report and the khan's letter.

Not long afterwards Friar Joannes was rewarded with the archbishopric of Antivari in Dalmatia, and was sent as legate to St. Louis. He died on Aug. 1, 1252; hence it is clear that the priest did not long survive the hardships of his journey.

He recorded the information that he had collected in a work variously entitled in the mss. *Historia Mongalorum quos nos Tartaros appellamus*, and *Liber Tartarorum*, or *Tatarorum*. This treatise is divided into eight ample chapters on the country, climate, manners, religion, character, history, policy and tactics of the Tatars, and on the best way of opposing them, followed

by a single (ninth) chapter on the regions passed through. Friar Joannes' *Historia* is in many ways the chief literary memorial of European overland expansion before Marco Polo. It first revealed the Mongol world to Catholic Christendom; its account of Tatar manners, customs and history is perhaps the best treatment of the subject by any Christian writer of the middle ages. We may especially notice, moreover, its four name-lists: of the nations conquered by the Mongols; of the nations which had up to this time (1245-47) successfully resisted; of the Mongol princes; and of the witnesses to the truth of his narrative, including various merchants trading in Kiev whom he had met. All these catalogues, unrivalled in Western mediaeval literature, are of the utmost historical value.

For a long time the *Liber Tartarorum* was known chiefly through an abridgment in the vast compilation of Vincent of Beauvais (*Speculum Historiale*) made in the generation following the traveller's own, and printed first in 1473. Hakluyt (1598) and Bergeron (1634) published portions of the original work; but the complete and genuine text was not printed till 1838, when it was put forth by M. D'Avezac as an editorial masterpiece embodied (1839) in the 4th volume of the *Recueil de voyages et de mémoires* of the Geographical Society of Paris. It was edited by C. R. Beazley for the Hakluyt Society in 1913. Joannes' companion, Benedictus Polonus, also left a brief narrative taken down from his oral relation. This was first published by M. D'Avezac in the work just named.

The following four mss. may be noticed: (1) "Corpus," i.e., Corpus Christi college, Cambridge, No. 181; (2) "Petau," i.e., Leyden university, 77 (formerly 104)—both these are certainly earlier than 1300; (3) "Colbert," i.e., Paris, National Library, Fonds Lat. 2,477, of about 1350; (4) "London-Lumley," i.e., London, British Museum mss. Reg. 13 A xiv., of late 13th century. Three other mss. certainly exist; yet six more are perhaps to be found, but none of these possesses the value of those given above. Besides the editions referred to in the body of the article, we may also mention (1) P. Girolamo Golubovich, *Biblioteca bio-bibliografica della Terra Santa e dell' Oriente Francese* (1906), vol. i. (1215-1300), pp. 190-213; (2) *William of Rubruck . . . with . . . John of Pian de Carpine*, edit. by W. W. Rockhill, Hakluyt Society (1900), especially pp. 1-39; (3) C. Raymond Beazley, *Dawn of Modern Geography*, ii. (1901), 279-317, 375-380; iii. 85, 544, 553; and *Carpini and Rubruquis*, Hakluyt Society (1903), especially pp. 7-18, 43-144, 249-295.

**CARPZOV** (Latinized *Carpzovius*), the name of a family, many of whose members attained distinction in Saxony in the 17th and 18th centuries as jurists, theologians and statesmen. The family traced its origin to Simon Carpzov, who was burgo-master of Brandenburg in the middle of the 16th century, and who left two sons, Joachim (d. 1628), master-general of the ordnance in the service of the king of Denmark, and BENEDIKT (1565-1624), an eminent jurist.

BENEDIKT CARPZOV was born in Brandenburg on Oct. 22, 1565, and after studying at Frankfurt and Wittenberg, and visiting other German universities, was made doctor of laws at Wittenberg in 1590. He was admitted to the faculty of law in 1592, appointed professor of institutions in 1599, and promoted to the chair *Digesti infortiati et novi* in 1601. In 1602 he was summoned by Sophia, widow of the elector Christian I. of Saxony, to her court at Colditz, as chancellor, and was at the same time appointed councillor of the court of appeal at Dresden. After the death of the electress in 1623 he returned to Wittenberg, and died there on Nov. 26, 1624, leaving five sons. He published a collection of writings entitled *Disputationes juridicae*.

BENEDIKT CARPZOV (1595-1666), second of the name, was the second son of the preceding, and like him was a great lawyer. He was born at Wittenberg on May 27, 1595, was at first a professor at Leipzig, obtained an honourable post at Dresden in 1639, became ordinary of the faculty of jurists at Leipzig in 1645, and was named privy councillor at Dresden in 1653. Among his works which had a very extensive influence on the administration of justice, even beyond the limits of Saxony, are *Definitiones forenses* (1638), *Practica nova Imperialis Saxonica rerum criminalium* (1635), *Opus decisionum illustrium Saxoniae* (1646), *Processus juris Saxonici* (1657), and others. He did much, both by his writings and by his official work, to systematize the body

of German jurisprudence which had resulted from the intersection of the common law of Saxony with the Roman and Canon laws. His last years were spent at Leipzig, and his time was entirely devoted to sacred studies. He died at Leipzig on Aug. 30, 1666.

JOHANN BENEDIKT CARPZOV (1607-1657), fourth son of the first Benedikt, was born at Rochlitz in 1607. He became professor of theology at Leipzig in 1643, made himself chiefly known by his *Isagoge in Libros Ecclesiarum Lutheranarum Symbolicos* (pub. in 1665), and died at Leipzig on Oct. 22, 1657, leaving five sons, all of whom attained some literary eminence.

AUGUST CARPZOV (1612-1683), fifth son of the first Benedikt, distinguished himself as a diplomatist. Born at Colditz on June 4, 1612, he studied at the universities of Wittenberg, Leipzig and Jena, and in 1637 was appointed advocate of the court of justice (*Hofgericht*) at Wittenberg. Entering the service of Frederick William II., duke of Saxe-Altenburg, he took part in the negotiations which led to the peace of Westphalia in 1648, and was appointed chancellor by the duke in 1649. From 1672 to 1680 he was chief minister of Ernest I. and Frederick I., dukes of Saxe-Coburg-Gotha, and died at Coburg on Nov. 19, 1683. August, who was a man of earnest piety, wrote *Der Gekreuzigte Jesus* (1679) and some treatises on jurisprudence.

JOHANN GOTTLÖB CARPZOV (1679-1767), grandson of Johann Benedikt, was born at Dresden in 1679. He was educated at Wittenberg, Leipzig, and Altdorf, became a learned theologian, and in 1719 was appointed professor of oriental languages at Leipzig. In 1730 he was made superintendent and first pastor at Lübeck. His most important works were the *Introductio in libros canonicos bibliorum Veteris Testamenti* (1721), *Critica sacra V. T.* (1728), and *Apparatus Historico-criticus Antiquitatum V. T.* (1748). He died at Lübeck on April 7, 1767.

JOHANN BENEDIKT CARPZOV (1720-1803), great-grandson of the first Johann Benedikt, was born at Leipzig, became professor of philosophy there in 1747, and in the following year removed to Helmstädt as professor of poetry and Greek. In 1749 he was named also professor of theology. He was author of various philological works, wrote a dissertation on Mencius, and published an edition of Musaeus. He died on April 28, 1803.

On the family of Carpzov, see Dreyhaupt, *Beschreibung des Saalkreises*, supp. to pt. 2, p. 26.

**CARQUINEZ STRAIT BRIDGE**, in California, about 25m. N. of San Francisco, begun April 1923 completed May 1927, is the second largest cantilever bridge in the United States and the fourth largest in the world. The Carquinez bridge is notable also for its deep-water pier foundations, 132ft. below water-level, and for the consideration which was given in designing the structure to provide special protective details against possible earthquake forces.

The main bridge has two anchor arms of 500ft., two cantilever spans of 1,100ft. and a central tower span of 150ft. At the southern end the bridge has a steel viaduct approach 1,132ft. long, making the total length of the bridge 4,482ft. between abutments. The trusses are spaced 42ft. centre to centre, providing space for a roadway 30ft. wide between curbs and two sidewalks 4ft. wide. The floor is a reinforced-concrete slab and was designed for a loading of three lines of 20-ton trucks, or two lines of 20-ton trucks with a track for electric trains. Silicon steel (80,000-95,000lb. ultimate strength, 45,000lb. minimum yield-point) was adopted for the main material of the towers and for compression members and built tension members in the trusses of the suspended spans, cantilever arms and anchor arms. For the principal tension members in the main trusses (and for some tension members in the viaduct trusses) heat-treated carbon steel eyebars were adopted, specified to have a minimum elastic limit of 50,000 and a minimum ultimate resistance of 80,000lb. per square inch. Provision for longitudinal expansion of the main structure is made at the shore end of each anchor arm and at the shore end of each suspended span. For greater security against longitudinal forces (including possible earthquake effects), each suspended span is fixed to the tower cantilever arm, the entire 11-in. expansion of the 1,100ft. span being provided for at the shore end of the suspended

span. Stops are provided at the ends of the main structure to limit the longitudinal movement to the necessary temperature expansion. Six hydraulic buffers are provided at the expansion joints between the suspended spans and the shore cantilever arms, also between the main structure and the viaduct, in order to check longitudinal vibrations or any other sudden longitudinal movement. Their valves close and arrest the motion of the main piston whenever force is applied with a velocity exceeding 0.4 in. per second. The horizontal earthquake force assumed in the investigation of the structure and in the proportioning of the buffer details corresponds to an assumed maximum acceleration of 15 in. per second. (D. B. S.)

**CARRACCI, LODOVICO, AGOSTINO and ANNIBALE**, three celebrated Italian painters, were born at Bologna in 1555, 1557, and 1560 respectively. They were the founders of the so-called eclectic school of painting,—the principle of which was to study in the works of the great masters the several excellences for which they had been respectively pre-eminent, and to combine these in the productions of the school itself.

Lodovico, the eldest, son of a butcher, was uncle to the two younger, Agostino and Annibale, sons of a tailor, and had nearly finished his professional studies before the others had begun their education. He studied under Tintoretto in Venice, and ultimately projected the opening of a rival school in his native place. He then sent for his two nephews, and induced them to abandon their handicrafts (Agostino being a goldsmith, and Annibale a tailor) for the profession of painting. Agostino he first placed under the care of Fontana, retaining Annibale in his own studio; but he afterwards sent both to Venice and Parma to copy the works of Titian, Tintoretto and Correggio. On their return, the three relatives, assisted by an eminent anatomist, Anthony de la Tour, opened, in 1589, an academy of painting under the name of the Incamminati. The affability and zeal of the Carracci rapidly lifted their academy in popular estimation. They continued together till, at the invitation of Cardinal Farnese, Annibale and Agostino went to Rome in 1600 to paint the gallery of the cardinal's palace. Thence the latter went to Parma to paint the great salon of the Casino. Here he died in 1602, when on the eve of finishing his renowned painting of "Celestial, Terrestrial and Venal Love." Annibale continued to work alone at the Farnese gallery till the designs were completed, when he retired to Naples, where he died in 1609. Lodovico always remained at his academy in Bologna. He died in 1619, and was interred in the church of Santa Maria Maddalena. The works of Lodovico are numerous in the chapels of Bologna. The most famous are:—the "Madonna standing on the moon, with St. Francis and St. Jerome beside her, attended by a retinue of angels," "John the Baptist," "St. Jerome," "St. Benedict," and "St. Cecilia"; and the "Limbo of the Fathers." With skill in painting Agostino combined the greatest proficiency in engraving (which he had studied under Cornelius de Cort). Annibale's chief works are: the "Dead Christ in the lap of the Madonna," the "Infant and St. John," "St. Catherine," "St. Roch distributing alms" (now in the Dresden gallery), and the "Saviour bewailed by the Maries."

See A. Venturi, *I Carracci e la loro scuola* (1895).

**CARRANZA, BARTOLOMÉ** (DE MIRANDA) (1503–1576), Spanish theologian, was born at Miranda d'Arge, Navarre. He studied at Alcalá, entered (1520) the Dominican order, and then studied (1521–25) at Salamanca and at Valladolid, where he was teacher of theology. No Spaniard save Melchior Cano rivalled him in learning. In 1530 he was denounced to the Inquisition as limiting the papal power and leaning to opinions of Erasmus, but the process failed. In 1540 he declined the sees of Canaria and of Cusco, Peru. Charles V. chose him an envoy to the Council of Trent (1546) where he insisted on the duty of bishops and clergy to reside in their benefices, publishing at Venice (1547) his *De necessaria residentia personali*, which he treated as *juris divini*. His Lenten sermon to the council, on justification, caused much comment. In 1550, he was made provincial for Castile. Charles sent him to England (1554) with his son Philip on occasion of the marriage with Mary. He became Mary's confessor, and laboured earnestly for the old religion, especially in Oxford.

In 1557 Philip appointed him archbishop of Toledo. In 1558 he was again denounced to the Inquisition, on the ground of his *Comentarios sobre el Catechismo* (Antwerp, 1558), which in 1563, however, was approved by a commission of the Council of Trent. Philip now imprisoned him for nearly eight years, and the book was placed on the Index. Carranza appealed to Rome and after ten years confinement, the final judgment found no proof of heresy, but compelled him to abjure 16 errors, and suspended him from his see for five years, and secluded him to the Dominican cloister of Sta. Maria sopra Minerva. He died on May 2, 1576. His *Summa Conciliorum et Pontificum* (Venice, 1546) has been often reprinted (as late as 1821), and has permanent value.

See P. Salazar de Miranda, *Vida* (1788); J. A. Llorente, *Hist. Inquisition in Spain* (English abridgment, 1826); Hefele in I. Goschler's *Dict. encyclopédique de la théol. cath.* (1858); H. Laugwitz, *Bartholomäus Carranza* (1870).

**CARRANZA, VENUSTIANO** (1859–1920), president of Mexico, was born in Cuatro Ciénegas, Coahuila, in 1859. He was educated in Mexico City but later returned to his native State where he took part in public life from 1887 to 1900. He was a senator from 1901 to 1911. In 1910 he joined the revolution of Francisco I. Madero against President Porfirio Díaz. Upon Madero's triumph Carranza was elected governor of Coahuila, and was acting in that capacity when President Madero was overthrown and assassinated in 1913. Carranza protested against the murder and became the leader of the revolution against Gen. Victoriano Huerta, being recognized by all revolutionists under the title of "first chief." While the revolution was going on Carranza initiated important social and economic reforms, such as the nationalization of petroleum and coal subsoil, the endowment of commons (*ejidos*) to townships and laws protecting industrial and country labour. These reforms were later embodied in the constitution of 1917.

After Gen. Huerta had been forced to leave the country, Francisco Villa and other military leaders turned against Carranza, but he succeeded in defeating them. Carranza, thereupon, gathered in Querétaro a constituent assembly to support the new constitution of Mexico, which was promulgated on Feb. 5, 1917. He was elected president of Mexico, and remained in power from May 1, 1917, until his death. While in the presidency his efforts were primarily directed towards the reconstruction of his country. When the United States entered the World War, Mexico remained neutral mainly on account of Carranza's firm decision to keep his country outside the influence of the United States, which he feared would have been the result of entrance into the World War.

Carranza's name is chiefly known in South America on account of his constant efforts towards a closer co-operation between the Latin-American countries, and his attempts to lay down the foundations for a permanent understanding between the South American States.

At the beginning of 1920, when presidential elections were approaching, the two foremost military leaders, Alvaro Obregón and Pablo González, both candidates, revolted against the Government, charging Carranza with giving official support to Ignacio Bonillas, a civilian candidate. Carranza, feeling unsafe, left Mexico City and attempted to reach Vera Cruz in order to organize his followers; but he was defeated at Aljibes, Puebla, and fled towards the north with a handful of faithful partisans. A few days afterwards he fell into a snare set by Obregón's generals, and was murdered at Tlaxcalaltongo, Puebla, on May 21, 1920.

(L. CA.)

**CARRARA or CARRARESI**, a powerful family of Longobard origin which ruled Padua in the 14th century. They take their name from the village of Carrara near Padua, and the first recorded member of the house is Gamberto (d. before 970). In the wars between Guelphs and Ghibellines the Carraresi at first took the latter side, but they subsequently went over to the Guelphs. This brought them into conflict with Ezzelino da Romano; Jacopo da Carrara was besieged by Ezzelino in his castle of Agna, and while trying to escape was drowned. Another Jacopo led the Paduans in 1312 against Cangrande della Scala, lord of Verona, and though taken prisoner managed to negotiate a peace in 1318. To put an end to the perpetual civil strife the

Paduans elected him their lord, but at his death (1324) his nephew and heir, Marsiglio, was forced to give Padua over to Cangrande and was appointed its governor. When Cangrande died in 1319, and was succeeded by his nephew Martino, Marsiglio negotiated with the Venetians in 1336, and in 1337 secretly introduced Venetian troops into Padua, and regained the lordship. He died in 1338, and was succeeded by his relative Ubertino, a typical mediaeval tyrant, but a patron of the arts, who built the Palazzo dei Principi, the castle of Este. He died in 1345. His distant kinsman Marsiglietto da Carrara succeeded him, but was immediately assassinated by Jacopo da Carrara, a prince famed as the friend of Petrarch. In 1350 Jacopo was murdered by Guglielmo da Carrara, and his brother Jacopino succeeded, reigning together with his nephew Francesco.

In 1355 Francesco (il Vecchio) rose against his uncle and imprisoned him. Francesco changed the traditional policy of his house by quarrelling with the Venetians, in the hope of obtaining more advantages from the Visconti of Milan. He refused help to the Venetians, at war with Hungary over Dalmatia in 1356, and his mediation between them and Hungary, at the instance of the pope, was unfavourable to the republic. He received Feltre, Belluno and Cividale from the Hungarian king, but in 1369 a frontier dispute led to war between him and Venice, in which Carrara was defeated and had to pay a huge indemnity (1373). In 1378 he joined the league against Venice formed by Genoa, Hungary and the Scala and took part in the siege of Chioggia. In 1385 the Venetians set the Scala against Carrara, who thereupon allied himself with the treacherous Gian Galeazzo Visconti. The Scala were expelled from Verona, but Carrara and Visconti quarrelled over the division of the spoils. Visconti was determined to capture Padua as well as Verona, and made an alliance with Venice and the house of Este for the purpose. Francesco surrendered to Visconti, in whose hands he remained a prisoner until his death in 1392.

Francesco Novello, his son, was compelled to surrender owing to dissensions in Padua itself. He was forced to renounce his dominions and received a castle near Asti; but he escaped to France and, after a series of romantic adventures, succeeded in making peace with Venice, which was becoming alarmed at the restless ambition and treachery of Visconti; in 1390 he raised a small armed force and seized Padua, where he was enthusiastically welcomed by the citizens, and for several years reigned there in peace.

At the death of Visconti in 1402 Carrara allied himself with Guglielmo Scala, seized Verona, and tried to capture Vicenza. But the Vicentini had always hated the Carraresi, and after a short siege gave themselves over to Venice. This led to a war between that republic and Padua, for now that Visconti was dead the Venetians had no longer any reason to protect Carrara. Padua and Verona were besieged; the latter, defended by Novello's son Jacopo, was soon captured. Novello himself, besieged in his capital, although repeatedly offered favourable terms, held out until Nov. 1405, hoping for help from Florence and also from certain Venetian nobles with whom he was intriguing. He and his sons Francesco III. and Jacopo were conveyed to Venice, and when their intrigues with Venetian traitors for the overthrow of the republic came to light they were tried and strangled in prison (1406). Novello's other son Marsiglio made a desperate attempt to recover Padua in 1435, but was discovered and killed.

(Bologna, 1920, etc.), a very full account.

**CARRARA**, a town of Tuscany, Italy, in the province of Massa e Carrara, 390ft. above sea-level, 3m. by rail N.N.E. of Avenza, which is 16m. E.S.E. of Spezia. Pop. (1921) 23,951

(town), 52,743 (commune). The cathedral (1272–1385) is a fine Gothic building dating from the period of Pisan supremacy; the other churches, and indeed all the principal buildings of the town, are constructed of the local marble, to which the place owes its importance. The Accademia di Belle Arti contains several Roman antiquities (including workmen's tools) found in the quarries, and some modern works by local sculptors. Some of the quarries were worked in Roman times (*see* LUNA), but were abandoned after the downfall of the western empire, until the growth of Pisan architecture and sculpture in the 12th and 13th centuries created a demand for the marble. The quarries now extend over almost the whole of the Alpi Apuane. The amount exported in 1912 was 234,000 and in 1926, 600,000 tons. The quarries are served by a separate railway.

**CARREL, ALEXIS** (1873– ), surgeon and biologist, was born at Ste. Foy-les-Lyon, France, June 28, 1873. He graduated at the University of Lyons in 1890, received his medical degree in 1900, and for two years was prosecteur à la Faculté de Médecine. He began there his experimental researches, and continued them in 1905 at the University of Chicago. In 1906 he was appointed to the staff of the Rockefeller Institute for Medical Research in New York, becoming a member in 1912. He developed a new method for suturing blood-vessels, which made it possible to perform blood transfusion safely, and to transplant arteries, veins and organs. He also studied the preservation of tissues outside the body and its application to surgery. This work led him in 1911 to investigate the conditions of tissues when they are living actively outside the organism. He was awarded the Nobel Prize in physiology and medicine in 1912 for his contributions to the surgery of blood-vessels. On the outbreak of the World War he returned to France and devised the Carrel-Dakin treatment for wounds, by means of which many lives were saved and countless amputations were avoided. At the same time, with Dr. du Noüy and other collaborators he studied the laws of the cicatrization of wounds. In 1919 he resumed his work at the Rockefeller Institute for Medical Research, and developed new techniques for the cultivation of tissues *in vitro*. With these techniques, he and other investigators in Europe and America have made extensive studies in physiology and pathology.

**CARRERA, JOSÉ MIGUEL** (1785–1821), leader in the early struggle for the independence of Chile, and first president of the country, was born in Santiago, Chile, on Oct. 15, 1785. He received a military education in Spain, and served in the Spanish army against Napoleon. In July 1811 he returned to Chile, where, supported by his brothers, Juan José and Luis, he based a successful revolution against Spain upon the ineffectual beginnings of Martínez de Rozas. By a *coup d'état* in 1812 he placed himself at the head of the nationalist government and later in the same year made himself dictator. He reorganized the nationalist army and the public finances, created the National institute, and inaugurated the first newspaper. He forced Martínez de Rozas to seek refuge in Mendoza (1813); and but for the common danger of invasion from Peru in 1813, his rivalry with Bernardo O'Higgins would have culminated in civil war. In the same year his military incompetence caused the national junta to displace him in favor of O'Higgins, but early in 1814 he headed a fresh revolt and regained control. During the ensuing invasion of Spanish forces from Peru, he and O'Higgins were defeated at Rancagua (Oct. 1814) and fled to Mendoza. When San Martín sided with O'Higgins, Carrera sought aid against his opponents, first in Buenos Aires, and then in 1815 in the United States. On his return to Argentina in 1816, he was forbidden entrance to Chile. This and the death of his brothers at the hands of the followers of San Martín moved him to lend his military experience to the provincial chiefs in their sporadic revolts against Buenos Aires. He was eventually betrayed by his own men, captured, and shot at Mendoza on Sept. 4, 1821. In 1864 the Chilean government erected a bronze statue to his memory in the Alameda at Santiago.

**CARRHAE, BATTLE OF**, 53 B.C. Not since Cannae (*q.v.*) had the Romans suffered a defeat which made such a deep impression upon them as this, at the hands—or, more truly, the arrows

—of the Parthians. And four centuries were to pass before they sustained such another, at Adrianople (*q.v.*), this time irreparable in its more profound aspects. But as the damage wrought at Adrianople was more permanent than at Carrhae, so Carrhae was never retrieved as Cannae had been. For not only was the immediate effect of Carrhae to turn back the tide of Roman conquest, its ebb taking it as far back as the Aegean, but only one of their subsequent expeditions against Parthia achieved practical success, and that even was not long-lived. Crassus, triumvir with Caesar and Pompey, invaded Parthia with seven legions, totalling some 35,000 foot and 4,000 cavalry. On reaching the plains of Mesopotamia he was met by the Parthian general, Surena, with an army composed entirely of horse-archers, mainly light cavalry but with a nucleus of heavy. To the foot-marching Roman legions they were an intangible foe, and not until he had penetrated several days' march beyond the Euphrates, through the desert, did Crassus make contact with them, and then apparently with only a detachment of light cavalry, who served to screen the concentration of the main body. Crassus is said to have accepted the advice of his son for an immediate attack in contradiction to that of his other subordinates who urged that the army should encamp and rest, on the banks of the river Balissus. Upon the Roman advance the Parthians opened and, wheeling outwards, encircled the Roman army, and from a distance kept it under a continuous shower of arrows. Whenever the Romans sought relief by a charge of their own light troops, the Parthians fell back, only to close again and renew the arrow-storm as soon as these retired. Moreover, its moral and material effect was sustained by the battle drill which, as with the Mongols later, was the basis of the Parthian tactics. This comprised a repeated "leap-frogging" by which the forward troops were relieved by successive echelons in rear, while those relieved replenished their quivers from camel-borne reserves. The younger Crassus ultimately attempted a powerful charge with a mixed body of some 6,000 cavalry and foot to ease the pressure. But the Parthians lured it into a continued pursuit which drew it far from the main body, and then, holding it in front with a line of heavy cavalry, surrounded it with light horse, and kept it under fire until its ranks withered and died—all but a few hundred taken prisoners. The return of the victors to the main battlefield strained still more the morale of the sorely harassed Roman army, and although still unbroken when nightfall brought temporary relief, its dissolution was only postponed. During the night it made a short retreat to the shelter of the walls of Carrhae, where it stayed during the day following. A further retreat was attempted the next night, but at daybreak it was assailed afresh and had to take refuge on a hill. Here Crassus was killed during negotiations for surrender and only an exhausted remnant of his army succeeded ultimately in recrossing the Euphrates. Carrhae saw the first great failure of the flexible infantry legion evolved from the Hannibalic war and from the reforms of Marius. The instrument of its downfall was the mobile horse-archer, and it is noteworthy that the eastern Roman empire came later to adopt this instrument in place of the legionary infantry as the staple of its military organization. This fact has all the more significance since the introduction in modern armies of the armoured fighting vehicle (*see* TANKS), for between this and the horse-archer, especially the armoured horse-archer, there is a close historical parallel just as there is between the campaign of Carrhae and the effects seen in the early exercises of experimental armoured forces. The parallel has struck the imagination of many of the advocates of the tank, but there is still greater significance in the sequel to Carrhae seen in the military organization of the Byzantines.

**CARRIAGE**, a vehicle which is designed for animal traction and is provided with accommodation for the driver and those travelling. A carriage may have seats for the passengers only, such as when it is driven by one or more mounted postilions. A trotting sulky, used for racing, is an example of a conveyance which has a seat for the driver only.

**The Primitive Vehicle.**—The earliest type of vehicle was the sledge, having no wheels and mounted on runners. From the sledge was evolved the rude cart with wheels made of wooden

discs, used for agricultural and other purposes for many centuries with few modifications. Such carts are still to be seen in Spain, Portugal and Mexico drawn by a pair of yoked oxen.

The requirements of war and hunting had a marked effect on the general design of the vehicle, for as early as 1500 B.C. the Egyptian two-wheeled chariot had reached a high state of perfection. These chariots, and those of the Assyrians, Greeks and Romans may be regarded as the first carriages, since they were

STATE CARRIAGE OF THE 14TH CENTURY, AFTER THE LOUTERELL PSALTER  
This carriage was pulled by a team of 5 horses in single file, two of them ridden by grooms

made for carrying man, rather than as a means for helping him to move his belongings more easily. The chariot was without seats or springs, the horses were yoked to a central pole, but the wheels had spokes and the various parts were well finished and often elaborately decorated. The chariot was entered from behind, an exception being the British chariot which had a front entrance and also a seat, a pattern developed by the Romans for dispatch riding and civil uses.

**Early Types of Four-wheeled Wagons.**—Equally important as the chariot, from the historical standpoint, was the four-wheeled Grecian agricultural wagon. The Romans adopted this wagon and many were used for carrying baggage. They also used the *reda* which came from Hungary. These wagons, modified and made more luxurious, were utilized for carrying persons of rank, a practice copied, perhaps, from the Persian triumphal cars. The evolution of the vehicle has consisted of improvements as much in the design of the under-carriage and suspension of the body as in the body itself. The wagon which had a direct influence on the design of the first coaches had its front and hind axles connected by long wooden poles, later called the perch. The front

FIG. 1.—THE "CHARIOT," THE FASHIONABLE CARRIAGE OF THE EARLY 19TH CENTURY

This model has 6 springs, leather braces, combined wood and iron perch, and a swan neck for turning in narrow places. There is a front boot with high driving seat. The swelling at the back of the body is the sword case

of this perch was inserted into a transom, a piece of timber lying directly above and parallel with the front axle. The back of the perch was held between the upper and lower portions of the hind axle. Above the transom and hind axles respectively further cross pieces were mounted, on which any type of body could be built by joining these cross pieces with longitudinal poles and planks to form a floor. Uprights were inserted at the ends of the cross pieces allowing body sides to be erected. The front of the perch was not fastened to the front axle as at the rear, because it was necessary that the front axle should be able to turn about its

centre. For this purpose a pin was inserted right through the transom and front axle. In modern times when trees are cut down the logs are carted away on a vehicle fundamentally the same as that just described.

From A.D. 300 to 1350 was largely a period of stagnation. The war chariot had gone out of use. The two-wheeled cart was used for husbandry, and, as a decorated car, occasionally for ceremonial purposes, while the four-wheeled wagon was still employed in agriculture and for carrying goods of various kinds. The roads made by the Romans had fallen into disuse and riding in any sort of vehicle, instead of on horseback, was denounced as unmanly.

**Rise of the Coach.**—The contemporary horse litter was a bed or couch mounted on poles harnessed to a horse at either end. The litter was provided with a cover or tilt supported on a wooden framework. The first coach bodies were similar to the litter, but later had four corner posts supporting a canopy which took the place of the tilt, while the door was merely an apron hung on a cross bar. Such was the coach used by Queen Elizabeth. The next step was the suspension of the body on leather braces and the building in of the roof as part of the structure of the body, a type of coach used by Charles II. Carriage building may now be considered as an established industry; hackney carriages appeared early in the 17th century and stage coaches towards the latter half of the same century. About 1660 the coach body was panelled and had a hinged door, while in 1669 Pepys mentions in his diary that his coach had glass windows and that experiments were being

FIG. 2.—POSTING CHARIOT, USED FOR JOURNEYS IN THE EARLY 19TH CENTURY  
It had a hind rumble and the body was equipped with pistol holder and sword case

made with steel springs. These were first introduced between the body and the ends of the leather suspension braces.

**Carriages of the 18th Century.**—Improved craftsmanship was now in evidence. The four-wheeled chariot appeared in 1744. The body was similar to the sedan chair (introduced in 1634 into England from France) in outline and had a single seat, whereas the coach had two seats facing one another. The post chaise was like the chariot but driven by postilions. By the end of the 18th century the landau, which became very popular, was coming into use. This was similar to the coach but with the upper quarters made to open and fold back in opposite directions. There was also the barouche which had a folding head to the back seat only. Amongst two-wheeled carriages were the curricle provided with a pole and yoke, recalling the harnessing of the ancient chariot, and also various types of gigs, both varieties being self-driving carriages, showing that a new pastime had been inaugurated. Another self-driving carriage was the high perch phaeton which afforded much material for contemporary caricaturists. Between 1700 and 1800 the small elbow spring had given place to larger whip springs which formed the connection between the hind axle and the upper ends of the braces. Later the C spring was used, but still the perch under-carriage was maintained in all its essential features, as in the days before steel springs or braces were used. Wheels had iron tyres both mounted as separate pieces or as a continuous hoop. In 1792 the Collinge axle was invented which carried two or three months' supply of oil instead of a day's grease, as with the old type of axle.

**The Perfection of the Art.**—The increasing use of vehicles drew attention to the bad state of the roads, but improvements in this direction were slow. The first mails had been carried by coach in 1786. A much larger number of stage coaches were running and private carriages from now until the establishment of railways were being much used for long journeys as well as for town work (Figs. 1 and 2). In 1804 the elliptic spring was invented

FIG. 3.—BROUGHAM, INTRODUCED IN THE MID 19TH CENTURY AND STILL IN USE

This carriage is called after Lord Brougham, to whose design it was made in 1838. It has the elliptical springs invented by Elliot in 1804

which allowed a rigidly made body to be connected directly to the axles, so that the perch was no longer required, although the traditional type of under-carriage was improved by the addition in 1818 of an under-spring to the existing C springs and fitted to the best class of carriages. In 1838 the brougham was introduced, the idea being to provide a compact closed carriage which could be drawn by one horse. By 1850 various patterns of both two- and four-wheeled dog carts had appeared, as well as wagonettes which had longitudinal vis-à-vis seats. From the middle until the end of the 19th century the railway was performing the work of the carriages formerly used for extended travelling. (Figs. 3 and 4.) Carriages were designed to give greater ease of access, and being unencumbered with travelling equipment, more attention could be given to elegance and the reduction of weight. Various sizes of

FIG. 4.—SQUARE LANDAU, WHICH STILL SURVIVES FOR CEREMONIAL PURPOSES

This landau of the late 19th century possessed the advantages of three distinct vehicles—a close carriage, a barouche or half headed carriage, and one entirely open. The dotted lines show the position of the head when up

pony phaetons appeared between 1850 and 1860; then about 1870 the victoria phaeton, which was essentially a park carriage, came into fashion. For the next thirty years no new styles of carriages were invented. Within a few years of the inception of the motor car the building of horse carriages fell away rapidly, the trade adapting itself to the construction of motor bodywork.

**American Carriages.**—Although European styles were adopted in the United States, a distinctive type of vehicle began to be built about 1860. Extreme lightness of construction was the leading characteristic. The slender under-carriage consisted of

comparatively high wheels, with the axles connected by a thin perch. The American industry developed into the largest in the world and a considerable number of buggies and other types were exported to South America, Australia and other countries.

**BIBLIOGRAPHY.**—John Philipson, M. Inst. M.E., *The Art and Craft of Coachbuilding* (1897). A well arranged and illustrated concise text book for the student, dealing with the design and construction of modern horsed carriages; Ralph Straus, *Carriages and Coaches* (1912), written for the general reader and describing the history of carriages from the earliest time, fully illustrated. (H. J. B.)

**CARRICKFERGUS**, a seaport and watering-place of Co. Antrim, Ireland, on the northern shore of Belfast Lough, 9½ m. N.E. of Belfast by the Northern Counties (Midlands) railway. Pop. of urban district (1921) 4,608. In 1182 John de Courci fixed a colony in the district. The castle came in the 13th century into the possession of the De Lacy family who, being ejected, invited Edward Bruce to besiege it (1315). He took it and again in 1386 the town fell to the Scots and in 1400 was destroyed by the combined Scots and Irish. Subsequently it suffered by famine and the occasional assaults of neighbouring Irish chieftains, to whom the townsmen were at length forced to pay annual tribute. Under Charles I. many Scottish Covenanters settled here to avoid persecution. In the Civil wars, from 1641, Carrickfergus was one of the chief places of refuge for the protestants of Antrim; and in 1642 the first presbytery held in Ireland met here. It was later held by partisans of James II., but surrendered in 1689 to Schomberg and in 1690 William III. landed here on his expedition to Ireland. In 1760 it was surprised by a French squadron which held it for a few days.

Elizabeth gave the town a charter, which was confirmed by James I., who added the privilege of sending two burgesses to the Irish parliament. The corporation, however, was superseded in 1840 by a board of municipal commissioners. Carrickfergus was a parliamentary borough until 1885; and a county of a town till 1898. It was the county town of Co. Antrim until 1850. The castle keep is still in good preservation and the town walls, built by Sir Henry Sidney, are still visible on the west and north; the north gate also remains. Trade is in leather and linen goods, and there are flax spinning-mills and bleach works. Distilling is carried on. Oyster fisheries are valuable. At Duncrue, rock salt is found in the Triassic sandstone.

**CARRICKMACROSS**, market town, Co. Monaghan, Ireland, 68 miles N.N.W. of Dublin on the Great Northern railway. Pop. of urban district (1926) 2,000. There are remains of an Elizabethan castle, destroyed in 1641. It is an agricultural centre and manufactures lace.

**CARRICK-ON-SHANNON**, market and county town, Co. Leitrim, Ireland. Pop. (1926) 1,026. It is situated on the upper Shannon near the confluence of the Boyle, and is on the Great Southern railway 90 m. N.W. of Dublin. It is an assize town and has some river trade.

**CARRICK-ON-SUIR**, market town, Co. Tipperary, Ireland, on the north bank of the Suir, 14 m. W.N.W. from Waterford on the Great Southern railway. Population of urban district (1926) 4,675. The castle dates from 1309. The suburb of Carrickbeg, connected by a 14th century bridge, has remains of a 14th century abbey. Trade is in agricultural produce and slate is quarried.

**CARRIER, JEAN BAPTISTE** (1756-1794), French Revolutionist and Terrorist, was born at Volet, in Upper Auvergne. In 1792 he was chosen deputy to the National Convention. He was already known as one of the influential members of the Cordeliers club and of that of the Jacobins. At the close of 1792 he was sent by the Convention to Flanders as their commissioner. In the following year he took part in establishing the Revolutionary Tribunal. After a mission into Normandy, Carrier was sent, early in Oct. 1793, to Nantes, under orders from the Convention to suppress the revolt which was raging there. He established a revolutionary tribunal, and formed a body of desperate men, called the Legion of Marat, to destroy in the swiftest way the masses of prisoners heaped in the jails. The form of trial was soon discontinued, and the victims were sent to the guillotine or shot or cut down in the prisons *en masse*. He also had large numbers of prisoners put on board vessels with trap-doors for

bottoms, and sunk in the Loire. These, the *Noyades* of Nantes, made Carrier notorious. He was recalled by the Committee of Public Safety on Feb. 8, 1794, took part in the attack on Robespierre on the 9th Thermidor, but was himself brought before the Revolutionary Tribunal on the 11th and guillotined on Nov. 16, 1794.

See Comte Fleury, *Carrier à Nantes* (1897, 2nd ed. 1901); Lallié, *J. B. Carrier . . . 1756-1794*, etc. (1901); G. Martin, *Carrier et sa mission à Nantes* (1924). See also, *Correspondence of Jean-Baptiste Carrier . . . during his mission in Brittany, 1793-1794*, collected and translated by E. H. Carrier (1920).

**CARRIER**, a term of general application to any person who undertakes to carry the goods of another for hire, whether by land, air or water, irrespective of the method of transit. The principle of law imposing responsibility upon the carrier for the safety of the goods carried is derived from a praetorian edict of the civil law contained in the ninth title of the fourth book of the Pandects. This states: "*nautae, caupones, stabularii, quod cujusque saluum fore receperint, nisi restituent, in eos iudicium dabo*." The simplicity of the rule so enunciated has swept away, throughout most civilized nations, all secondary questions or discussions as to the measure of culpability or negligence on the part of the carrier for loss or damage to the goods carried and imposes upon him the obligation of an insurer of the goods, leaving any limitation of this general responsibility to be separately adjusted by special contract.

The law of England recognizes a distinction between common and private carriers. The former is one who holds himself out to the public as ready to carry for hire from place to place the goods of such persons as choose to employ him. The owner of a stage-wagon, a railway company, the master of a general ship, and a wharfinger carrying goods on his own lighters are common carriers, and, at common law, it makes no difference that one of the *termini* of the journey is out of England. A person who carries only passengers is not, however, a common carrier; nor is a person who merely engages to carry the goods of particular individuals or to carry goods of a particular description or upon any particular occasion. A common carrier is subject at law to peculiar liabilities. He is bound to carry the goods of any person who offers to pay his hire unless there is good reason to the contrary; as, for example, when his carriage is full or the article is inherently dangerous. He ought to carry the goods in the usual course without unnecessary deviation or delay.

Liability commences upon due delivery of the goods to him in the known course of his business. His charge must be reasonable; and he must not give undue preference to any customer or class of customers. The latter principle, as enforced by statute, is of great importance in the law of railway companies. In respect of goods entrusted to him, the carrier's liability, unless limited by special contract, is that of an insurer. There is no question of negligence as in the case of injury to passengers, for the warranty is simply to carry safely and securely. The law, however, excepts losses or injuries occasioned immediately "by the act of God or the king's enemies"—which words have a strict technical signification. It would appear that concealment without fraud, on the part of the customer, relieves the carrier from liability for negligence, though not for actual misfeasance. Fraud or deceit by the customer (e.g., misrepresentation of the real value of the goods) will relieve the carrier from his liability.

The responsibility of the carrier ceases only upon delivery of the goods to the proper consignee. By the Carriers Act, 1830, the liability of carriers for "articles of great value in small compass" is determined. Should the article or parcel exceed £10 in value, the carrier is not liable for loss unless such value is declared by the customer. Where the value is thus declared, the carrier may, by public notice, demand an increased charge, for which he must, if required, sign a receipt. Failing such notice or receipt, the carrier must refund the increased charge and remains liable as at common law. Except as above no mere notice or declaration affects a carrier's liability; but he may make special contracts with his customers. The carriage of goods by sea is subject to special regulations. (See **AFFREIGHTMENT**.) The carriage of goods by railway and canal is subject to the law of com-

mon carrier except where varied by particular statutes. The effect of these acts is to prevent railway companies as common carriers from limiting by special contract their liability to receive, forward and deliver goods, unless the conditions embodied in the special contract are reasonable, and the contract is in writing and signed by, or on behalf of, the sender.

A railway company must provide reasonable facilities for forwarding passengers' luggage. Where luggage is taken into the carriage with a passenger, the company is not responsible for loss or damage due to the passenger's interference with the company's exclusive control of it. As carriers of passengers, companies are bound to exercise due care and diligence and are responsible for personal injuries occasioned by negligence or want of skill. Where there is a special contract or there has been contributory negligence on the part of the passenger, *i.e.*, where he might by the exercise of ordinary care have avoided the consequences of the defendants' negligence—he is not entitled to recover. By the Act of 1846 (commonly called Lord Campbell's Act), when a person's death has been caused by such negligence as would have entitled him to an action had he survived, an action may be maintained against the negligent party on behalf of the wife, husband, parent or child of the deceased. (*See INTER-STATE COMMERCE for special American problems and practices.*)

**CARRIÈRE, EUGÈNE** (1849–1906), French painter, born at Gournay (Seine-Inférieure) on Jan. 17, 1849, son of a Flemish father and an Alsatian mother, passed his early youth at Strasbourg and moved with his parents to Saint Quentin in 1868. His enthusiasm for art was roused on seeing the pastels of La Tour. He went to Paris in 1870 to study at the École des Beaux Arts. The war with Germany, however, interrupted his work; he enlisted as a volunteer, was made a prisoner and taken to Dresden. Here he had opportunity of studying the works of art in the gallery, and felt especially attracted to Rubens. On his return to Paris he resumed his studies under Cabanel (1872–76). In 1877 he married the woman who was henceforth to figure in his famous pictures of "maternity," and of family groups. He developed gradually a distinctive style by suppressing local colour and outline, and by modelling in planes by means of delicate contrasts of light and dark. The figures seem to be enveloped in a grey mist. His portrait renderings are alive and sensitive; and he painted some distinguished personalities of his literary and artistic circle of friends: Alphonse Daudet, Anatole France, Paul Verlaine, Louis Henri, Devillez and others. He undertook to decorate the town hall of the X. Arrondissement in Paris with a series of large panels (Palais des Beaux Arts), a work which remained uncompleted at his death in Paris on March 27, 1906. The Luxembourg has several of his pictures; but most of his work is in private ownership (Paul Gallimard and Madame Montagne Devillez). Eugène Carrière also practised lithography and sculpture. He was an enthusiastic teacher, taking an active part in the artistic life of Paris as one of the founders of the Société Nationale des Beaux Arts and of the Salon d'Automne. His writings and letters were published by the *Mercure de France* (1909).

*See also* Gabriel Seailles, *E. Carrière* (1901) and *E. Carrière, Essai de biographie psychologique* (1910); Gustave Geffroy, *L'œuvre de E. Carrière* (1901); Ch. Morice, *E. Carrière* (1906); Elie Faure, *E. Carrière, peintre et lithographe* (1908).

**CARRIÈRE, MORITZ** (1817–1895), German philosopher and historian, was born at Griedel in Hesse Darmstadt. He studied at Giessen, Göttingen, and Berlin, taught philosophy at Giessen, and in 1853 was appointed professor at the University of Munich, where he lectured mainly on aesthetics. An avowed enemy of Ultramontanism, he helped to make the idea of German unity more palatable to the South Germans. He belonged to the theistic school of the younger Fichte, whose aim was to reconcile deism and pantheism, and he upheld the fundamental truths of Christianity. His most important works are: *Aesthetik* (Leipzig, 1859; 3rd ed., 1885), supplemented by *Die Kunst im Zusammenhang der Kulturentwicklung und der Ideale der Menschheit* (3rd ed., 1877–86); *Die philosophische Weltanschauung der Reformationszeit* (Stuttgart, 1847; 2nd ed., Leipzig, 1886), and *Die sittliche Weltordnung* (Leipzig, 1877; 2nd ed., 1891), in which he

recognized both the immutability of the laws of nature and the freedom of the will. He described his view of the world and life as "real-idealism." His essay on Cromwell (in *Lebensskizzen*, 1890), which may be considered his political confession of faith, also deserves mention. His complete works were published at Leipzig in 1886–94.

*See* S. P. V. Lind in *Zeitschrift f. Philos.* (cvi. 1895, pp. 93–101); W. Christ in *Allgemeine deutsche Biographie* (1903).

**CARRIERS.** Normally when an individual recovers from an infective disease he rids himself of the causal organisms so that when he is convalescent or recovered he ceases to be infective. It has been found that a certain proportion of individuals, however, do not rid themselves of the disease-causing germs, but retain them for varying periods of time. These persons—termed carriers—have recovered completely from the disease and are apparently healthy. They exhibit no signs of infection whatsoever, and, although the bacteria are tolerated by the carriers harbouring them, the germs are capable of giving rise to disease in susceptible individuals.

The first direct evidence of the existence of carriers was brought forward by Dr. Robert Koch in 1902, who showed that in typhoid fever the convalescent patient harbours the specific germ and is the most fruitful source of further infection.

The existence of urinary carriers had previously been shown by Horton Smith in England in 1900, while repeated outbreaks of typhoid fever in Folkestone, due to contaminated milk, were described by Dr. Theodore Thomson in 1901. In these epidemics it was noticed that a certain milker had worked on the three different farms associated with the outbreaks of enteric fever in the years 1896, 1897 and 1899. The importance of this observation was not realized until the work of Koch appeared, when it was found that this milker constantly excreted large numbers of typhoid germs.

A certain number of individuals may harbour pathogenic or disease-causing organisms during convalescence, but these bacteria rapidly disappear, and the case is termed a *temporary carrier*. If pathogenic organisms persist for more than three months, the individual is termed a *chronic carrier*.

The following diseases are maintained and spread by carriers: typhoid and paratyphoid fevers, bacillary and amoebic dysentery, cholera, diphtheria, cerebro-spinal meningitis, scarlet fever, anterior poliomyelitis (infantile paralysis), malaria. (*See* MALARIA.)

**Typhoid and Paratyphoid Carriers.**—The carrier state is much more common in women than in men. Carriers may be (a) faecal; (b) urinary. In faecal carriers the typhoid germs remain in the upper part of the alimentary tract, and particularly in the gall bladder whence they reach the intestine in the bile. These carriers are very liable to periodic attacks of inflammation of the gall bladder and to gall stones. Typhoid bacilli may appear only intermittently in the excreta so that at times a carrier is non-infective.

Typhoid and paratyphoid carriers are usually very chronic and may harbour the organisms for many years or even a lifetime. The diseases are spread by the direct contamination of food or water-supply with the specific germ due to the uncleanness of the carrier. That typhoid is much less common than previously is due to the great improvement in sanitation and provision of pure water-supplies, and the detection and isolation of carriers.

**Treatment.**—The typhoid carrier presents a difficult problem to the health authorities. The carrier must be isolated, must observe rigorous personal cleanliness, and not have anything to do with the preparation of food. Treatment is of little avail, although removal of the gall bladder, particularly when it contains gall stones, brings about the disappearance of the typhoid germs in a number of cases, but even this is often ineffectual. Urinary carriers show no response to treatment and these are more dangerous than faecal carriers owing to the greater difficulty of strict cleanliness and disinfection. Some carriers show spontaneous cure.

**Dysentery.**—In bacillary dysentery the organisms persist in the lower part of the intestine. They are excreted intermittently as a rule and may only be found when the carrier has a mild dysenteric attack. In amoebic dysentery carriers the parasites

pass into a resistant resting state termed cysts. These cysts do not multiply but remain quiescent until they are carried by food or water into the intestinal canal of another individual, when the actively growing stage is resumed with the resultant attack of dysentery. Treatment of amoebic dysentery carriers with emetine is usually effective.

**Cholera.**—The cholera germ persists in the upper part of the intestine and in the gall bladder, and the condition is similar to the typhoid carrier. The germs are excreted from the bowel only, and food or water is infected as in typhoid. The treatment of cholera carriers is similar to that for typhoid carriers, and as frequently disappointing.

**Diphtheria.**—In this disease the germs are present in the throat and nose, and infection is spread direct from one throat to another, either in talking, sneezing, etc., or by contamination of drinking vessels. In diphtheria, carriers are not so persistent as in typhoid fever, and usually become free of infection within a year or two, although in some cases the diphtheria organisms may persist for a long time. Young children are more likely to become carriers than adults. In the throat the germs are found in the tonsils, while in the nose they are associated with a chronic inflammatory condition.

When diphtheria bacilli are found in the nose or throat of a supposed carrier, it is necessary to test the organisms bacteriologically to prove that they are capable of causing disease. It has been shown that about 9% of all cases of diphtheria become carriers. Usually the carriers are in good health and show nothing abnormal beyond a tendency to nasal catarrh. Outbreaks of diphtheria occur where many persons are congregated together as in schools, institutions, camps, barracks, etc., and the duty of the health authorities is to examine bacteriologically the nose and throat of all contacts in order to discover and isolate the carrier.

In fever hospitals all recovered cases are carefully examined by bacteriological methods for diphtheria bacilli, and cases are not discharged until all virulent germs have disappeared.

**Treatment.**—When found the carrier must be segregated. There is a tendency to spontaneous cure. When the germs are present in the throat removal of the tonsils usually brings about a cure, but when the nose is infected this treatment has no effect. Nasal carriers are very refractory to treatment, but recently it has been found that nasal douching with a mild alkaline fluid, and the administration of autogenous vaccines frequently bring about a rapid disappearance of the diphtheria organisms.

**Cerebro-spinal Fever.**—As in diphtheria the germs of the disease—meningococci—are found in the throat, and direct infection takes place through talking, sneezing, etc., particularly where many individuals are congregated together as in schools, camps, etc. Not every person infected, however, takes the disease, but the meningococci may multiply in the throat and be transmitted to a third person who may either contract the disease or transmit the infection to others. Thus, where an outbreak of cerebro-spinal fever has taken place many healthy persons may have meningococci in the throat, but comparatively few may take the disease. The germs in the throat of the healthy persons usually do not persist more than a very short time and disappear spontaneously. Chronic carriers do occur and the germs may be found over long periods. Gargles and sprays with antiseptic materials often cure the carrier condition.

**Scarlet Fever.**—It has recently been shown that scarlet fever is due to a haemolytic streptococcus. Patients recovered from scarlet fever may still contain these streptococci in their throats and it appears that scarlet fever is spread by these carriers in a similar manner to diphtheria. Up to the present, however, the examination of convalescent scarlet fever patients before discharge is not done as a routine as in the case of diphtheria. Gargles and antiseptic sprays of the nose and throat tend to shorten the period during which streptococci may be found.

**Anterior Poliomyelitis (Infantile Paralysis).**—It has been shown that during an epidemic of this disease the infective virus may be present in the throats of healthy contacts.

(J. E. M.)

**CARRINGTON, RICHARD CHRISTOPHER** (1826–1875), English astronomer, son of a brewer at Brentford, was born in London on May 26, 1826, and educated at Trinity college, Cambridge. He was astronomical observer in the University of Durham (1849–52), and in 1853 established an observatory of his own at Redhill. Here he devoted three years to a survey of the zone of the heavens within 9° of the North Pole, the results of which are contained in his *Redhill Catalogue of 3,735 Stars*. He investigated the motions of sun-spots, by which he determined the elements of the sun's rotation and made the important discovery of a systematic drift of the photosphere, causing the rotation-periods of spots to lengthen with increase of solar latitude. He died on Nov. 27, 1875.

See *Monthly Notices Roy. Astr. Society*, vols. xiv., xviii., xix., xxxvi.; *Memoirs Roy. Astr. Soc.*, xxvii.; *The Times*, Nov. 22 and Dec. 7, 1875; *Roy. Society's Cat. Scient. Papers*, vols. i. and vii.

**CARROCCIO**, a war chariot drawn by oxen, used by the mediaeval republics of Italy. It was a rectangular platform on which the standard of the city and an altar were erected; priests held services on the altar before a battle, and the trumpeters beside them encouraged the fighters to the fray. In battle the carroccio was surrounded by the bravest warriors in the army and its capture was regarded as an irretrievable humiliation. The Florentine carroccio was usually followed by a smaller car bearing the *martinella*, a bell to ring out military signals. When war was regarded as likely the *martinella* was attached to the door of the church of Santa Maria in the Mercato Nuovo in Florence and rung to warn both citizens and enemies. In times of peace the carroccio was in the keeping of some great family which had distinguished itself by signal services to the republic. It was first employed by the Milanese, in 1038.

**CARRODUS, JOHN TIPLADY** (1836–1895), English violinist, was born on Jan. 20, 1836, at Keighley, in Yorkshire. He made his first appearance as a violinist at the age of nine, and afterwards studied at Stuttgart with Molique. He made his début as a solo player at a concert given by the Musical Society of London in 1863 and succeeded Sainton as leader at Covent Garden in 1869, acting in the same capacity also for the Philharmonic and other leading orchestras.

**CARROLL, CHARLES** (1737–1832), American political leader, of Irish ancestry, was born at Annapolis, Md., on Sept. 19, 1737. He was educated abroad in French Jesuit colleges, studied law at Bourges, Paris and London, and in Feb. 1765, returned to Maryland, where an estate known as "Carrollton," in Frederick county, was settled upon him; he always signed his name as "Charles Carroll of Carrollton." Before and during the Revolutionary War, he was a whig or patriot leader, and as such was naturally a member of the various committees of correspondence, committees of observation, council of safety, provincial convention (1774–76) and Constitutional Convention (1776). From 1777 until 1800 he was a member of the Maryland senate. In April–June 1776 he, with Samuel Chase and Benjamin Franklin, was a member of the commission fruitlessly sent by the Continental Congress to Canada for the purpose of persuading the Canadians to join the 13 revolting colonies. From 1776 to 1779 he sat in the Continental Congress, rendering important services as a member of the board of war, and signing on Aug. 2, 1776, the Declaration of Independence, though he had not been elected until the day on which that document was adopted. He outlived all of the other signers. He was a member of the U.S. Senate from 1789 to 1792. From 1801 until his death, at Baltimore, on Nov. 14, 1832, he lived in retirement, his last public act being the formal ceremony of starting the construction of the Baltimore and Ohio railway (July 4, 1828). In politics, after the formation of parties, he was a staunch Federalist. Of unusual ability, high character and great wealth, he exercised a powerful influence, particularly among his co-religionists of the Roman Catholic faith, and he used it to secure the independence of the colonies and to establish a stable central government.

See the *Life* by Kate Mason Rowland (1898); Lewis A. Leonard, *Life of Charles Carroll of Carrollton* (1918); and "Charles Carroll; the Catholic 'Signer'," in *Catholic Mind*, vol. xxii., p. 126–130 (1924).

**CARROLL, JOHN** (1735–1815), American Roman Catholic prelate, was born at Upper Marlborough, Prince George's county (Md.), Jan. 8, 1735, the son of wealthy Catholic parents. He was educated at St. Omer's in Flanders, becoming a novitiate in the Society of Jesus in 1753, and then at the Jesuit college in Liège, being ordained priest in 1769 and becoming professor of philosophy and theology. In 1771 he became a professed father of the Society of Jesus and professor at Bruges. As tutor to the son of Lord Stourton, he travelled through Europe in 1772–73. Shortly after the papal brief of July 21, 1773, suppressed the Society of Jesus, he returned to America, and set to work at a mission at Rock Creek, Montgomery county (Md.), where his mother lived. He shared the feeling for independence growing among the American colonists, foreseeing that it would mean greater religious freedom. In 1776, at the request of the Continental Congress, he accompanied Benjamin Franklin, Charles Carroll and Samuel Chase on their mission to secure the aid or neutrality of the French-Canadians. In 1783 he took a prominent part in the petition to Rome to take the control of the American Church away from London; and after the recognition of the American Church as a distinct body, he was named prefect apostolic. In the summer of 1785 he began his visitations; in 1786 he induced the general chapter to authorize a Catholic seminary (now Georgetown university); and in 1788 he was chosen first American bishop. He was consecrated at Lulworth Castle, England, Aug. 15, 1790, and his first synod met Nov. 7, 1791. At this period, although busy with administrative matters, he was an outstanding leader in the educational and cultural life of Baltimore. Already in 1802 he was pressing for the creation of new sees in his diocese, and the Louisiana Purchase of 1803 gave added weight to this request; in Sept. 1805 the Propaganda made him administrator apostolic of the diocese of New Orleans, to which he appointed John Olivier as vicar-general; and in 1808 Pius VII. divided Carroll's great diocese into four sees, Boston, New York, Philadelphia and Bardstown (Ky.), suffragan to the metropolitanate of Baltimore, of which Carroll actually became archbishop by the assumption of the long-delayed *pallium* on Aug. 18, 1811, having consecrated three suffragans in the autumn of 1810. In 1811 ecclesiastical jurisdiction over the Danish and Dutch West Indies was bestowed upon him. Carroll was now an old man, and the shock of the War of 1812, together with the action of the Holy See in appointing to the sees of Philadelphia and New York other candidates than those of his recommendation, weighed on his mind. He died in Georgetown, Dec. 3, 1815. By many he is reckoned the greatest figure in the Roman Catholic Church of the United States.

See Daniel Brent, *Biographical Sketch of the Most Rev. John Carroll, ... with Select Portions of His Writings*, edited by J. C. Brent (1843); J. G. Shea, *History of the Catholic Church in the United States* (vol. ii., 1888).

**CARROLL**, a city of western Iowa, U.S.A., on Federal highways 30 (the Lincoln) and 71, at an altitude of 1,270 ft.; the county seat of Carroll county. It is served by the Chicago and North-western and the Chicago Great Western railways. The population in 1930 Federal census was 4,691. It is the trade centre of a rich agricultural district, ships grain, flour, produce and livestock, and manufactures farm implements and toys. The city was founded about 1867 and incorporated in 1868.

**CARROLLTON**, a city of western Georgia, U.S.A., 45m. west-south-west of Atlanta; on the Little Tallapoosa river, Federal highway 78S and the Central of Georgia railway; the county seat of Carroll county. The population was 4,363 in 1920 (20% negroes), and was 5,052 in 1930 by the Federal census. The city ships large quantities of cotton and has textile factories and other manufacturing industries. It was founded about 1827 and incorporated in 1829.

**CARRONADE**: see ORDNANCE.

**CARROT**. Wild carrot, *Daucus Carota*, a member of the family Umbelliferae, grows wild in fields and on roadsides and sea-shores in Britain and the north temperate zone generally of the Old World. It has become naturalized as a weed in the United States, where it is a pest in many sections. It is an annual and resembles the cultivated carrot, except in the root, which is thin

and woody. It is the origin of the cultivated carrot, which can be developed from it in a few generations. In the cultivated carrot, during the first season of growth, the stem remains short and bears a rosette of graceful, long stalked, branched leaves with deeply cut divisions and small, narrow ultimate segments. During this period the plant is storing food, chiefly sugar, in the so-called root which consists of the upper part of the true root and the short portion of the stem between the root and the lowest leaves. A transverse section of the "root" shows a central core, generally yellow in colour, and an outer red or scarlet, yellow or orange rind. The core represents the wood of an ordinary stem and the outer ring the soft outer tissue (bast and cortex). In the second season the terminal bud in the centre of the leaf-rosette grows at the expense of the stored nourishment and lengthens to form a furrowed, rather rough, branched stem, 2 or 3 ft. high, and bearing the flowers in a compound umbel. The umbel is characterized by the fact that the small leaves (bracts) which surround it resemble the foliage leaves on a much reduced scale, and ultimately curve inwards, the whole inflorescence forming a nest-like structure. The flowers are small, the outer white, the central ones often pink or purplish. The fruit consists of two one-seeded portions, each portion bearing four rows of stiff spinous projections, which cause the fruits when dropped to cling together, and in a natural condition help to spread the seed by clinging to the fur of animals. As usual in the Umbelliferae, the wall of the fruit is penetrated lengthwise by canals containing oil.

Carrots vary considerably in the length, shape and colour of their roots, and in the proportion of rind to core. The White Belgian, which gives the largest crops, has a very thick root, which is white below, pale green above, where it projects above ground. For nutritive purposes it is inferior to the red and yellow varieties. The carrot is suited by a deep sandy soil, which should be well drained and deeply trenched. Soil is not trenched in the United States, but ploughed and harrowed as for other crops. A good, well-decomposed peat soil is considered ideal in the United States.

See J. Percival, *Agriculture Botany* (1926).

**CARRYING CHARGES**, in the United States, interest charges made by brokers for money supplied by them to carry the accounts of customers who have purchased securities on margin. The rate of such interest is generally slightly higher, 1 to 2%, than the prevailing call loan rate. The term is also used in the grain and commodity markets, in which case it means the cost of warehouse, storage, insurance and haulage on the commodities involved, plus loss of interest on the investment. Equivalents in England are "carrying over," "settlement," etc.

**CARRYING OVER OR CONTINUATION**, a stock exchange term for the operation by which the settlement of a bargain transacted for money or for a given account, may for a consideration (called either a "contango" or a "backwardation") be postponed from one settling day to another. Such a continuation is equivalent to a sale "for the day" and a repurchase for the succeeding account, or to a purchase "for the day" and a resale for the succeeding account. The price at which such transactions are adjusted is the "making-up" price of the day. (See STOCK EXCHANGE.)

**CARSIOLI**, an ancient city of Italy (mod. CARSO), on the Via Valeria, 42m. E. by N. of Rome. It was founded in the country of the Aequi between 302 and 298 B.C., just after the establishment of Alba Fucens, no doubt as a stronghold to guard the road to the latter. It was sacked in the Social War. The old site does not seem to have been abandoned until the 13th century. It is now occupied only by vineyards, and lies about 2,100 ft. above sea-level, in a plain surrounded by mountains, now called Piano del Cavaliere. The line of the city walls can be traced, and so can the scanty remains of several buildings, including the base of a temple.

See the monograph by G. J. Pfeiffer and T. Ashby in *Supplementary Papers of the American School in Rome*, i. (1905), 108 seq.

**CARSO**, a limestone plateau, extending south-eastwards from the east bank of the Isonzo to the Gulf of Fiume, and south-westwards from the valley of the Vipacco to the gulf of Trieste. Its

general level is about 300 ft. above the Isonzo, but it increases to 1,500 ft. above sea-level as it goes south-eastward, and even in its western portion isolated summits are higher still with frequent cavities, originally formed by surface erosion, but gradually enlarged when they find a fissure which gives a subterranean outlet. They then come to resemble small craters and are called *doline*; their average diameter is about 50 yards. In other cases caves are formed often traversed by subterranean streams. (See POSTUMIA-GROTTE; MONFALCONE.)

On the outbreak of the World War the Austrians withdrew across the Isonzo, after flooding the plain by means of dykes, and fortified themselves on the Carso whose rocky formation lent itself admirably to defence. The Italians advanced from Ronchi and Monfalcone, and delivered attack after attack on the rock-bound fastness but it was not until the fall of Gorizia (*q.v.*) in August 1916, and at the cost of terrible losses that the whole ridge was conquered. In June the trenches east of Selz and Hill 46 above Vermeigliano were captured, and on July 26 the summits of Sei Busi; the highest point (Hill 118), after being taken and lost more than once, was finally captured on April 23, 1916, but remained exposed to heavy fire until August following. The village of Doberdò, east of Sei Busi, was the centre of the Austrian supply services until it fell to the Italians after the fall of Gorizia, but it was subsequently reduced to a heap of ruins by bombardment. Close by is the little lake of Doberdò. The rocky plateau east of Doberdò was fought over from Sept. 1916 to Sept. 1917, and conquered after five desperate attacks; the chief positions occupied are Sangrado di Merna (Sept. 1916), Nova Vas (Oct. 1916), the Veliki Kribak, Loquizza, the Pecinka and part of Castagnevizza (Nov. 1916), Boscomalo, Jamiano and the heights east of Flondar (May 1917). The approaches to the Hermada were attacked at the end of May and in August, but some of the positions captured were subsequently lost. North of Sei Busi is the vast war cemetery of Redipuglia, where 30,000 dead lie buried. East of Doberdò is the Vallone del Carso, a depression 8 or 9 km. long, 80 to 100 m. deep and some 100 m. wide, cutting through the plateau from north to south. It was occupied by the Italians in August 1916, and as it was well sheltered from enemy fire, was used as a large depot for munitions and supplies. Further north is another ridge extending along the Isonzo from Sagrado to the Vipacco, with Monte S. Michele as its culminating point (275 metres) which was also the scene of very heavy fighting between June 1915 and August 1916. Bosco Lancia, Bosco Cappuccio, S. Martino del Carso (197 metres) and S. Michele were the chief positions fought on. On San Michele a great monument to the Italian infantrymen who fell in the war has been erected. The whole Carso area had to be evacuated after the enemy had broken through at Caporetto in October 1917, but the retreat was carried out in orderly fashion by the III. Army which had conquered it and held it. The villages of the Carso which were completely destroyed during the war, are now nearly all rebuilt, and roads traverse the whole of the area, which is visited every year by thousands of pilgrims, and where the various episodes of the war are frequently commemorated. Many of the trenches are still preserved intact.

See E. Barbaridi, *La Carsia Giulia nella Geografia nella storia e nell'Arte militare* 1925.

**CARSON, CHRISTOPHER** ("KIT") (1809-1868), American hunter and scout, was born in Madison county, Ky. on Dec. 24, 1809, but was raised on the Missouri frontier. For a brief period a saddler's apprentice and teamster in the southwest, after 1826 he became a professional trapper, hunter and guide. He accompanied John C. Frémont on his exploring expeditions of 1842 and 1843-44, and on his California expedition in 1845-6. Carson took part in the Mexican War, and in 1854 he became Indian agent at Taos, N.M., in which position, through his knowledge of the Indian traits and language, he was able to exercise for many years a restraining influence over the warlike Apaches and other tribes. During the Civil War he rendered valuable aid to the Federal cause in the Southwest. In March 1865 he was breveted brigadier-general of volunteers "for important services in New Mexico, Arizona and the Indian Territory"; after the war he re-

sumed his position as Indian agent, which he held until his death at Fort Lyon, Col., on May 23, 1868. "Kit" Carson, often called "the Nestor of the Rocky Mountains," occupied in the later period of American pioneer history a position somewhat similar to that held by Daniel Boone earlier, as the typical frontier hero and Indian fighter, and his hairbreadth escapes, resourcefulness, and personal prowess are the subject of innumerable stories.

The chief biographies are by DeWitt C. Peters (1858), Charles Burdett (1859), J. S. C. Abbott (1873), E. S. Ellis (1899) (the most reliable) E. L. Sabin (1914) and Stanley Vestal (1928); *Kit Carson's Own Story of His Life*, used as the basis of the Peters narrative, ed. Blanche C. Grant (1926).

**CARSON, EDWARD HENRY CARSON, BARON** (1854- ), British politician and lawyer, son of Edward Henry Carson, a civil engineer of Dublin, was born Feb. 9, 1854 and educated at Portarlinton School and Trinity College, Dublin. He became an Irish barrister and made his reputation as crown prosecutor in the difficult years when A. J. Balfour was Chief Secretary for Ireland. During this period he was continually in danger. Yet it is probable that even then he was never really unpopular. He became a Q.C. at the Irish bar in 1889, was called to the English bar, and took silk there in 1894.

Meanwhile he had been returned to the British Parliament in 1892 as Unionist member for his own University of Dublin and was for a few months solicitor-general for Ireland. He entered Parliament just when Mr. Gladstone was about to make a second effort to pass an Irish Home Rule bill, and he helped to defeat the measure. During the next 20 years he was occupied with his professional work. Having risen to a leading place at the bar in Ireland, he achieved an even more striking success at the English bar (he was successful with a jury to a degree rarely known) and in 1900 became solicitor-general, a post which he held till the fall of Balfour's Government in Dec. 1905.

It was not until 1911, when another Irish Home Rule bill was imminent, that Carson, who had gradually become the spokesman of the Irish Unionists in Parliament, emerged as a political figure of importance. He strenuously resisted the Parliament bill, which was to curtail the power of the Lords and enable a measure of Home Rule to be passed without a direct appeal to the people.

Feeling against the Home Rule-for-Ireland policy was bitter in Protestant Ulster. Carson went to Ulster, and at an enormous Unionist demonstration at Craigavon, near Belfast, endorsed the threats of armed opposition against Home Rule which previous speakers had made. Belfast, he said, was the key of the situation; Ulster would never submit to a Parliament in Dublin. They must be prepared, if necessary, to take over the administration of those districts which they were entitled to control. Practical measures were immediately taken in this direction, though Liberals and Nationalists scoffed. His position was that he and his Ulster friends were loyal to the constitution as it existed; they were rebels, he said, in the sense that they desired to remain under the King and the Imperial Parliament.

In anticipation of the introduction of the Home Rule bill in the spring of 1912, he presided over a gigantic gathering in Belfast in Easter week, which Mr. Bonar Law, the newly appointed Unionist leader, came to address; and he made those present repeat after him, "We will never in any circumstances, submit to Home Rule." He himself, in a speech instinct with passion, moved the rejection of the bill on its introduction, and took a leading part in opposition during its subsequent stages. But his activity was mainly outside Parliament. During this period he sacrificed a very lucrative practice and devoted himself to the anti-Home Rule Party strong in Ulster.

His principal work was in the organization of resistance in Ulster itself, including the formation of a local volunteer force, which speedily assumed large proportions. At Belfast on Sept. 28, 1912, he took the lead in signing a solemn covenant, by which the men of Ulster bound themselves to stand by one another in defending their position of equal citizenship in the United Kingdom, and in using all necessary means to defeat the proposal to set up Home Rule, and further pledged themselves to refuse to recognize an Irish Home Rule Parliament. He followed this up by moving

(unsuccessfully) in Parliament on New Year's Day 1913 the exclusion of Ulster from the bill.

In the autumn of 1913 the Ulster Unionist Council organised itself, under his supervision, into a provisional government, of which he was the leading member, and a guarantee fund of £1,000,000 was started to which he himself contributed £10,000. He reviewed the Volunteers, who were rapidly becoming a formidable military force, approaching in number 100,000 men. But when ministers, who had refused to prosecute him or to interfere with his activities, began to realise the determination of his followers in six northeastern counties, he did not repulse their overtures for a settlement but said that it must not establish a basis for separation. His advice during the following winter to his Ulster friends was "peace but preparation." He entirely declined to accept Asquith's offer, in the early spring of 1914, of a county option of exclusion for six years. That was "sentence of death with a stay of execution." There was only one policy possible, he told the House of Commons: "Leave Ulster out until you have won her consent to come in." He became a member of the abortive Buckingham Palace Conference convened by the King, and when that broke down, at the end of July, it looked as if he and his Ulster friends would have to make good in action their policy of force.

The World War intervened and switched off his activity into another direction. He went to Belfast in order to stimulate Ulstermen to join the British Army, and had considerable success. He joined Asquith's coalition ministry of 1915 as attorney-general, resigning however in October because he thought that the policy of the Cabinet, after the defection of Greece, involved the desertion of Serbia, in whose fate he took a profound interest. He accepted office as First Lord of the Admiralty under the coalition Government formed in Dec. 1916. Outside his departmental duties he warmly promoted the Irish Convention which the Government assembled in 1917. In July he quitted the Admiralty to become a member of the War Cabinet without portfolio, a position which he resigned at the beginning of 1918 because the Irish question arose again. But, in or out of office, his activity was directed wholeheartedly to the vigorous prosecution of hostilities.

After the War was over Ulster and Ireland regained the first place in his thoughts. At the General Election of 1918 he left Dublin University in order to represent one of the divisions of Ulster's capital, Belfast. On the anniversary, in July 1919, of the battle of the Boyne, he restated, speaking near Belfast, Ulster's position and claims, and threatened to call out the Volunteers if any attempt were made to change her status. When, however, Mr. Lloyd George proposed in the winter his bill for the reform of the government of Ireland, establishing parliaments and executives both in Dublin and in Belfast, and a Federal council for all Ireland, he modified his attitude. Though he would have preferred no change, yet, as this bill gave the six Protestant counties of Ulster a Parliament of their own, besides representation in the Imperial Parliament, he would not oppose it.

After it had passed, he exerted himself with success to secure a strong Unionist majority in the elections in May 1921 for the first Parliament of Northern Ireland. He had thus achieved his main political object of saving Protestant Ulster from domination by the Roman Catholic majority of the south and west.

After the Ulster elections he accepted a lordship of appeal and a life peerage as Baron Carson of Duncairn. He bitterly denounced the treaty which constituted the Free State, both at the time of its conclusion and when the bill to carry it into effect was before his House. He also protested in 1924 against the bill which empowered the British Government to appoint, owing to Ulster's default, a third commissioner on the Irish Boundary Commission. But he cordially welcomed the agreement, made at the close of 1925, between the British Government, the Government of the Irish Free State, and that of Northern Ireland, which finally settled this question. He was twice married—in 1879 to Sarah A. F. Kirwan, who died in 1913, and in 1914 to Ruby Frewen.

**CARSON CITY**, the capital of Nevada, U.S.A., and the county seat of Ormsby county, 12m. from Lake Tahoe, which lies at the crook in the western boundary of the State. It is on

Federal highway 50, and is served by the Virginia and Truckee railway, which has repair shops there. It is picturesquely situated in Eagle valley, near the eastern base of the Sierra Nevada, 4,720ft. above sea-level. In 1890 the population was 3,950; in 1930, 15,966. The city is Federal headquarters for Nevada, as well as the seat of the State Government. In Carson City there is a branch of the United States mint, a Federal school for Indians, a State orphans' home and the State prison, and a museum with a series of mastodon skeletons and prehistoric remains found in the neighbourhood. A trading-post was established there in 1851. The town was laid out in 1858, was made the capital in 1861 and was chartered as a city in 1875. It was named after Christopher ("Kit") Carson, frontier hero and guide.

**CARSTARES or CARSTAIRS, WILLIAM** (1649–1715), Scottish clergyman, was born in Cathcart manse, near Glasgow, on Feb. 11, 1649, and was educated at the University of Edinburgh and at Utrecht. He became a close friend of the prince of Orange. The British Government disliked Carstares for several reasons. He was the intimate of William; he had been the bearer of messages between the disaffected in Scotland and Holland; and he was believed to be concerned with Sir James Steuart (1635–1715) in the authorship of a pamphlet, *An Account of Scotland's Grievances by reason of the D. of Lauderdale's Ministrie, humbly tendered to his Sacred Majesty*. On his return to England, at the close of 1674, he was committed to the Tower; the following year he was transferred to Edinburgh castle, and only released in Aug. 1679. During 1682 he was in Holland, but in the following year he was again in London, and was implicated in the Rye House Plot. He was examined before the Scottish Council and put to the torture. Although he was assured that his admissions would not be used in evidence, they were in fact used against Baillie of Jerviswood. On his return to Holland he became court chaplain to the prince of Orange; and after the Revolution he continued to hold this office, under the title of royal chaplain for Scotland. He was the confidential adviser of the king, especially with regard to Scottish affairs. On the accession of Anne, Carstares retained his post as royal chaplain, but resided in Edinburgh, having been elected principal of the university. During Anne's reign, the chief object of his policy was to frustrate the measures which were planned by Lord Oxford to strengthen the Episcopalian Jacobites—especially a bill for extending the privileges of the Episcopalians and the bill for replacing in the hands of the old patrons the right of patronage, which by the Revolution settlement had been vested in the elders and the Protestant heritors. He died on Dec. 28, 1715.

See *State-papers and Letters addressed to William Carstares, to which is prefixed a Life by M'Cormick* (1774); *Story's Character and Career of William Carstares* (1874).

**CARSTENS, ARMUS JACOB** (1754–1798), German portrait and historical painter, was born in Schleswig, and in 1776 went to Copenhagen to study. In 1783 he went to Italy, where he was much impressed by the work of Giulio Romano. He settled in Lübeck, but visited Rome again in 1792. His fine subject and historical paintings, e.g., "Plato's Symposium" and the "Battle of Rossbach" made him famous. He was appointed professor at Berlin, and in 1795 a great exhibition of his works was held in Rome, where he died in 1798. Carstens ranks as a leader of the later school of German historical painting.

**CART.** A general term for various kinds of vehicles, in some cases for carrying people, but more particularly for transporting goods, for agricultural or postal purposes, etc., or for carriers. Though constructed in various ways, the simplest type for goods is two-wheeled, topless and springless; but as a general term "cart" is used in combination with some more specific qualification (dog-cart, donkey-cart, road-cart, polo-cart, etc.), when it is employed for pleasure purposes. The "dog-cart," so called because originally used to convey sporting dogs, is a more or less elevated two-wheeled carriage, generally with seats back to back, in front and behind; the "governess-cart" (presumably so called from its use for children), a very low two-wheeled pony-carriage, has two side seats facing inwards; the "tax-cart," a light two-wheeled

farmer's cart, was so called because formerly exempted from taxation as under the value of £21. (*See CARRIAGE and HORSE-DRAWN VEHICLES.*)

**CARTAGENA** or **CARTHAGENA**, a city of south-eastern Spain, in the province of Murcia, on the Mediterranean sea, and terminus of a branch railway from Murcia. Pop. (1920) 96,891. Cartagena stands at the head of a splendid natural harbour whose easy defence has made it the chief naval base of Spain, with arsenal and dockyards ranking with those of Ferrol and San Fernando near Cadiz. The city occupies a small lowland at the north end of the bay; is fairly modern and uninteresting except for remnants of old walls and castle overlooking the harbour. It is an episcopal see. On the north-east a fertile valley gives access to the interior but on the west, south-west and south-east the port is surrounded by high mountains. The harbour, the largest in Spain after that of Vigo, and the finest on the east coast, is a deep spacious bay, dominated, on the seaward side, by four hills, crowned with forts, and approached by a narrow entrance guarded by batteries and a torpedo station. The outer bay is sheltered by the island of La Escombrera, the ancient Scombraria (*i.e.*, "mackerel fishery") 2½ m. S., and the harbour by a breakwater on its eastern side. On the north-west lies the Arsenal basin, often regarded as the original harbour of the Carthaginians and Romans, and the naval shipbuilding yards, with a dry and a floating dock. There are valuable mines near the town, producing lead, silver-lead, zinc, iron, copper and sulphur, and a mineral railway from Los Blancos, passing through the chief mining and smelting district of La Unión, 6 m. E. of the town, runs on to the quay in Cartagena harbour. The city exports the ores, but also has important smelting works, chiefly located in the Santa Lucia suburb east of the bay. Glass and esparto fabrics are other manufactures. The industrial and commercial progress of Cartagena was much hindered, during the first half of the 19th century, by the prevalence of epidemic diseases, the abandonment of the arsenal, and rivalry with the neighbouring port of Alicante. Its sanitary condition, though still defective, was improved by the drainage of the adjacent Almajar marsh, and after 1870 Cartagena advanced rapidly in size and wealth. The opening of the railway enabled it to compete for a time with Alicante, and revived the mining and metallurgical industries, while the coast and land defences were modernized and new quays, docks and other harbour works were added. As a naval station, Cartagena suffered severely in 1898 from the maritime disasters of the Spanish-American War, but since the decree of 1908 for bringing the Spanish navy up to date considerable naval construction has gone on in the port. As a general commercial port Cartagena has been adversely affected since the beginning of the 20th century by the increasing importance of Barcelona, Málaga and Alicante on the same coast. It exports some olive oil, dried fruits and esparto grass, and imports coal, coke and machinery from Great Britain, timber from the United States and dried cod-fish from Norway and Newfoundland, but it is above all a mineral port. Even this activity has been somewhat reduced since the establishment in 1898 of Portman, a mining village on a sheltered bay 11 m. E., an independent port which, connected by rail with La Unión, imports coke and coal, and exports iron ore and lead.

Cartagena was founded about the year 243 B.C. by the Carthaginian, Hasdrubal, probably on the site of a much older town, and was called Carthago Nova or New Carthage, to distinguish it from the African city of Carthage. It was conveniently situated opposite to the Carthaginian territory in Africa, and was early noted for its harbour. Its silver and gold mines were the source

of great wealth both to the Carthaginians and to the Romans. In 210 B.C. this important place, the headquarters and treasure city of the Punic army, was taken with great slaughter by P. Scipio (*see below*). The city continued to flourish under the Romans, who made it a colony, with the name Colonia Victrix Iulia Nova Carthago. In A.D. 425 it was pillaged and nearly destroyed by the Goths. Cartagena was a bishopric from about 400 to 1289, when the see was removed to Murcia. Under the Moors it became an independent principality, which was destroyed by Ferdinand II. of Castile in 1243, restored by the Moors, and finally conquered by James I. of Aragon in 1269. It was rebuilt and fortified by Philip II. of Spain (1527-98) for the sake of its harbour. In 1585 it was sacked by an English fleet under Sir Francis Drake. In the War of the Spanish Succession it was occupied by Sir John Leake in 1706 and by the duke of Berwick in 1707. On Nov. 5, 1823, it capitulated to the French. Cartagena took part in the revolutionary movement of 1844 and in 1873 was bombarded by the Spanish fleet under Admiral Lobos. The city was occupied by the Government troops on Jan. 12, 1874.

Díaz Casson, *Serie de los obispos de Cartagena* (1895); I. M. Ibáñez García, *Biblioteca de la Santa Iglesia Catedral de Cartagena en Murcia* (Cartagena, 1924).

**Capture by Scipio Africanus.**—In military history it is, above all, famous in its capture by Publius Cornelius Scipio (*q.v.*), who later earned the surname of Africanus, an event which paved the way first to the overthrow of the Carthaginian power in Spain, and later, to the destruction of that power in Africa. After the disaster to his father and uncle, Scipio, although only 24, was appointed to the command in Spain, and, sailing with reinforcements, reached the Roman base at Tarraco (modern Tarragona) in 209 B.C. The acute strategical instinct which marked him in a day when strategy, as distinct from battle-tactics, had hardly been born evidently showed him that as Spain was the key to the whole struggle against Hannibal, who was then in Italy, so "New Carthage" was the key to Spain. It was the Carthaginians' chief naval base, the direct sea connection with Africa, their treasury and their depot of war material. Thus, after taking steps to restore the shaken confidence of the troops and the allies of Rome in the peninsula, he decided upon a surprise coup against the Carthaginian base—which was also Hannibal's life line. Spreading misleading rumours, and keeping his plans secret from all except Laelius, who was despatched thither with the fleet, he concentrated all his available force, left a small detachment to safeguard Tarraco, and with about 25,000 foot and 2,500 horse crossed the Ebro.

He had learned that New Carthage itself was weakly garrisoned—both because of its supposed impregnability and because "no one dreamt that while the Carthaginians were masters of nearly the whole of Spain it would enter any one's head to besiege the city" (Polybius). The main Carthaginian forces were distributed in three armies, one in central Spain, one near Gibraltar, one near modern Lisbon, and none of them within less than ten days' march of New Carthage, while the Romans, as the event proved, were within seven days' forced marches of it, and had an additional interval of grace in the time that news would take to reach them.

On the seventh day from the start of the march Scipio arrived before the city and encamped, the fleet arriving simultaneously in the harbour, thus cutting off communication on all sides. This harbour formed a circular bottle, its mouth almost corked by an island, while Cartagena itself was like a candle stuck in the bottom of the bottle, the city standing on a narrow rocky spit of land protruding from the mainland. This small peninsula bore a distinct resemblance to Gibraltar, and the isthmus joining it to the mainland was only about 400 yd. across. The city was guarded on two sides by the sea, and on the west by a lagoon. Here was a hard nut to crack, seemingly impregnable to any action save a blockade, and of this time did not permit. The Carthaginian commander, Mago, armed 2,000 of the sturdiest citizens and posted them by the landward gate for a sortie. The rest he distributed to defend the walls to the best of their power, while of his own regulars he disposed 500 in the citadel on the top of the peninsula, and 500 on the eastern hill.

GATE IN THE OLD CITY WALL AT  
CARTAGENA

Next day Scipio encircled the city with ships, throwing a constant stream of missiles, and about the third hour—the Roman day began at sunrise—sent forward along the isthmus 2,000 picked men with ladder bearers, for its narrowness prevented a stronger force being deployed. Appreciating the handicap of their cramped position if counter-attacked by the yet unshaken defenders, he astutely designed to turn this handicap to his own advantage. The expected sortie came as soon as Scipio sounded the bugle for assault, and a close-matched struggle ensued. "But as the assistance sent to either side was not equal, the Carthaginians arriving through a single gate and from a longer distance, the Romans from close by and from several points, the battle for this reason was an unequal one. For Scipio had purposely posted his men close to the camp itself in order to entice the enemy as far out as possible"—Livy says the Roman advanced troops retired, according to orders, on the reserves—"well knowing that if he destroyed those who were, so to speak, the steel edge of the population he would cause universal dejection, and none of those inside would venture out of the gate" (Polybius). The Carthaginian sortie was driven back, the pursuit being pressed so promptly that the Romans nearly succeeded in forcing an entrance on the heels of the fugitives. Even as it was, the scaling-ladders were put up in full security, but the great height of the walls hampered the escaladers, and the assault was beaten off. Polybius gives a picture of the Roman commander during this phase which reveals how he combined personal influence and control with the duty of avoiding rash exposure: "Scipio took part in the battle, but studied his safety as far as possible, for he had with him three men carrying large shields, who, holding these close, covered the surface exposed to the wall, and thus afforded him protection." ". . . thus he could both see what was going on, and being seen by all his men he inspired the combatants with great spirit."

Scipio had achieved his first object of wearing down the defenders and checking the likelihood of further interference with his plans from Carthaginian sorties. The way was thus paved for his next and decisive move. While at Tarraco, from enquiries among fishermen who knew Cartagena, he had learnt that at certain times the lagoon was fordable. For this project he assembled 500 men with ladders on the shore of the lagoon, and meanwhile reinforced his contingent in the isthmus with both men and ladders, enough to ensure that in the next direct assault "the whole extent of the walls should be covered with escaladers"—an early example of the modern tactical axiom that a "fixing" attack should be on the broadest possible front in order to occupy the enemy's attention. He launched this assault simultaneously with a landing attack by the fleet, and when it was at its height "the water gradually receded from the edge of the lagoon, a strong and deep current setting in through the channel to the adjoining sea, so that to those who were not prepared for the sight the thing appeared incredible. But Scipio had his guides ready, and bade all the men told off for this service enter the water and have no fear. He possessed a particular talent for inspiring confidence and sympathy in his troops when he called upon them. "Now when they obeyed and raced through the shallow water, it struck the whole army that it was the work of some god . . . and their courage was redoubled" (Polybius). Of this episode Livy says: "Scipio, crediting this discovery, due to his own diligence and penetration, to the gods and to miracle . . . ordered them to follow Neptune as their guide"; but it is interesting to see that, while exploiting the moral effect of this idea, he made practical use of less divine guides. The 500 passed without difficulty through the lagoon, reached the wall, and mounted it without opposition, because all the defenders "were engaged in bringing succour to that quarter in which the danger appeared." "The Romans having once taken the wall, at first marched along it, sweeping the enemy off it." They were clearly imbued with the principle that a penetration must be promptly widened before it is deepened. Next they converged on the landward gate, already assailed in front, and, taking the defenders in rear and by surprise, overpowered the resistance and opened the way for the main body of the attackers. The walls thus captured, Scipio at once exploited his success. For while the mass of those who had by now scaled the walls set about the cus-

tomary massacre of the townsmen, Scipio took care to keep in regular formation those who entered by the gate, and led them against the citadel. Here Mago, once he "saw that the city had undoubtedly been captured," surrendered.

Leaving New Carthage strongly garrisoned, Scipio himself fell back on Tarraco, allowing the moral influence of his success to sink into the minds of the Spanish and thus gain their support before taking the offensive anew.

For ancient authorities see Polybius x. 2-20; Livy xxvi. 42. Modern Works: B. H. Liddell Hart, *A Greater than Napoleon—Scipio Africanus* (1926); Kromayer Veith, *Schlachtenatlas* (1922) for topography.

**CARTAGENA**, a city, seaport, and the capital of the department of Bolívar, Colombia, South America, on the Caribbean coast. Pop. (1905, official estimate) 14,000; (1918) 51,382. The population of Cartagena is largely composed of blacks and mulattos, which form the predominant type on the lowland plains of northern Colombia. The well-to-do whites of Cartagena usually have country houses on the Turbaco hills, where the temperature is much lower than on the coast. The mean annual temperature in the city is 82°, and the port is classed as very unhealthy, especially for unacclimatized foreigners. The harbour is formed by an indentation of the coast-line shut in by two long islands lying parallel to the mainland. There were formerly two entrances to the harbour—the Boca Grande (large mouth) between the low sandy island or peninsula on which the city stands and the island of Tierra Bomba, and the Boca Chica (small mouth) at the south end of the latter island. The Boca Grande was filled with stone after the city had been captured three times, because of the ease with which an enemy's ships could pass through it at any time, and the narrow and more easily defended Boca Chica, 7m. farther south, has since been used.

The city occupies a part of the upper island or peninsula facing the northern end of the harbour, and is separated from the mainland on the east by a shallow lagoon-like extension of the bay which is bridged by a causeway passing through the extra-mural suburb of Xiximani on another island. The old city, about ½m. long, north and south, and ¼m. wide, is enclosed by a heavy wall, in places 40ft. thick, and is defended by several formidable looking forts, which have long been dismantled, but are still in a good state of preservation. At the mainland end of the causeway leading from the city is the fort of San Felipe, about 100ft. above sea-level, adapted as a distributing reservoir in the city's water-works; and behind it are verdure covered hills rising to an elevation of 500ft., forming a picturesque background to the grey walls and red-tiled roofs of the city. The streets are narrow, irregular and roughly paved, but are lighted by electricity; tramway lines run between the principal points of the city and suburbs. The houses are built with thick walls of stone and brick round open courts, in the Moorish style, and their iron-barred doors and windows give them the appearance of being a part of the fortifications. Among the numerous churches, the largest and most imposing is the Jesuit church of San Juan de Dios, with its double towers and celebrated marble pulpit; an old monastery adjoins. Cartagena is an episcopal see, and its cathedral dates from colonial times. The city was once the headquarters of the Inquisition in South America, and the edifice which it occupied, now private property, is an object of much interest. The water-supply of the city was formerly obtained from rainwater tanks on the walls or by carriage from springs a few miles inland, but in 1906 a British company received a concession to bring water by pipes from springs on the Turbaco hills, 300ft. above the sea.

The commercial importance of Cartagena declined greatly during the period of civil disorders which followed the war for independence, but in later years has revived. In the reign of Philip II. the Spaniards had opened a canal ("El Dique") through some marshes and lagoons into a small western outlet of the Magdalena, which gave access to that river at Calamar, about 8m. above the bar at its mouth. During Cartagena's decline this was allowed to fill up; it was reopened in 1846 for a short time and then was obstructed again by river floods, but it is being reopened for steam navigation. Towards the end of the 19th century a railway, 65m.

long, was built between Cartagena and Calamar. With the development of oil exploitation in the Middle Magdalena basin pipe-lines have been laid to Cartagena and oil is being refined and shipped in considerable quantities. The exports of Cartagena consist chiefly of rubber, hides and skins, medicinal forest products, gold, silver and platinum. The aggregate value of the exports in 1925 was \$11,931,282.

Cartagena was founded in 1533 by Pedro de Heredia. In 1544 it was captured by pirates, who plundered the town; in 1585 by Sir Francis Drake, who exacted a large ransom; and in 1697 by the French, who obtained from it more than £1,000,000. It was taken by Bolívar in 1815, but was surrendered to the royalists in the same year. It was recaptured by the republicans on Sept. 25, 1821, and thereafter remained in their possession.

**CARTAGO**, the second city of Costa Rica, Central America, 12m. E. of San José on the main line of the Costa Rica railway at an altitude of 4,930ft. above sea-level. The population in 1925 was 37,275. Cartago lies on the plateau of San José at the base of the Irazú volcano (11,200ft.) and is the first city reached by the traveller after leaving the Caribbean coast at Port Limón, 92m. to the east. The climate is subtropical; the temperature averages about 68°. The town is in the heart of the coffee region of Costa Rica and is one of the oldest cities in Central America. It has been visited by various earthquakes and almost destroyed a number of times, the last disturbance in 1920 being accompanied by fire. In 1723 water in the crater of Irazú was loosed on the city by an earthquake and in 1841 a severe earthquake destroyed many of the oldest buildings. The ancient churches are still in existence, however, and some of the older government buildings. The town was founded by the Spaniard Vazquez de Coronado in 1522, the present name dating from 1563. It was the capital of Costa Rica until 1823 when the seat of the government was transferred to San José. The town lies on the main highway to the Caribbean coast, not always passable by automobiles, but one of the oldest highways in Central America, and it is also on the main line of the Costa Rica railway which was built to Cartago from San José in 1871. Famous hot mineral springs are situated in Bella Vista, a suburb of Cartago. The chief industry is coffee growing in the volcanic soil, the type of land in which the most famous of the Central American coffees are cultivated.

**CARTE, RICHARD D'OYLY** (1844-1901), English impresario, was born in Soho, London, on May 3, 1844, the son of a flautist, who was a partner in the firm of Rudall, Carte and Co., instrument makers. Young Carte matriculated at University college, London, in 1861, and then entered his father's business, using his spare time for the composition of operettas. In 1870 he set up in business for himself as a concert and lecture agent, and soon had many famous names on his list. His first important theatrical venture was the production of Gilbert and Sullivan's *Trial by Jury* (March 25, 1875). He then formed a small syndicate to rent the Opéra Comique for the production of other Gilbert and Sullivan operas. The enterprise was a huge success. After the production of *H. M. S. Pinafore* (1878) the syndicate was dissolved, and Carte, Gilbert and Sullivan conducted the enterprise as partners, Carte being manager of the theatre. Carte then built a permanent home for light opera in the Savoy Theatre, where for many years the Gilbert and Sullivan operas enjoyed unlimited popularity, making the fortunes of all concerned. For the subsequent course and eventual termination of the partnership see the articles GILBERT and SULLIVAN. The last work which they wrote together was *The Grand Duke* (1896). After that date Carte relied partly on revivals, and on new combinations of authors and composers. At the same time he organized touring companies which performed the Savoy works all over the country. A less successful venture on his part was the building of what was called in the first instance the English Opera House, with the object of establishing grand opera on a permanent basis in London. For the undertaking, after making a promising start with Sullivan's *Ivanhoe* (Jan. 31, 1891), followed by an English version of Messager's *La Basoche*, proved a failure, and Carte sold the house to Augustus Harris who turned it into the Palace Theatre. Carte did not long survive his friend Sullivan,

dying on April 3, 1901, but the operations of the touring companies which he had founded continued to be carried on with success by his widow, Mrs. Stanley Carr Boulter.

**CARTE, THOMAS** (1686-1754), English historian, was born at Dusmoon, near Clifton. He was secretary to Atterbury, and spent some time in exile after Atterbury's disgrace. His *General History of England* (4 vols. 1747, 1750, 1752 and 1755) has some value as a storehouse of facts. He also published *A Life of James, duke of Ormond*, containing a collection of letters, etc. (3 vols. 1735-36; new ed., in 6 vols., Oxford, 1851), and a *History of the Revolutions of Portugal*, with letters of Sir R. Southwell during his embassy there (London, 1740). His papers became the property of the university of Oxford, and were deposited in the Bodleian library.

**CARTEL** or **KARTEL**, a form of combination among manufacturers, by which the independent firms and establishments in a particular trade or process contract to regulate their output and, in certain cases, their prices.

During the last decade before the World War, in Germany and in other countries cartels were gaining great importance. They were by no means confined to the so-called heavy industries, which are most suited for the formation of cartels owing to their large scale; industries with smaller units, especially the textile industries, were also increasingly organized in such groups. The increasing formation of cartels in merchanting, partly under the influence of the great industrial cartels, may also be mentioned.

During the World War the Government of the German Reich made use of cartels for supplying the enormous requirements of the army. As the output capacity of the individual undertakings was known, it was possible to allocate orders amongst them in a satisfactory way. It is true that the sudden demand, even apart from the scarcity of raw materials, which soon set in, necessitated the grant of higher profits, but the price increases were often much higher where application had to be made to individual firms.

Many cartels, especially the so-called contracts cartels, were formed during the war for the exploitation of urgent army requirements, and, later, associations of traders were formed to exploit the increasing scarcity of goods; but the great and well known cartels were moderate in their price-fixing. The fixing by the State of maximum prices was not so often necessary in their case, and was, in any case, more easily effected. Nevertheless the Government soon found themselves compelled to intervene in the cartel system, because many cartels failed to show proper consideration to consumers. The textile cartels, in particular, were compelled to reduce prices to the consumer.

**State Interference.**—But State interference with the cartels went further, as a rule, in the form of maintaining existing cartels or of compulsory amalgamation. It was recognized that dissolution of the cartels and return to unregulated competition was economically undesirable, and would render impossible the economic utilization of raw material and labour. Following the precedent created in the case of the potash syndicate, which in 1910 was compulsorily reconstituted in order to prevent its collapse, the German Governments have created compulsory syndicates, especially in mining. Under the threat of such action the Rhenish-Westphalian coal syndicate was reconstituted just before the contracts expired. The State justly feared that if this great organization fell to pieces the maintenance of a regular supply to the consumers and a uniform control, both of export and of internal consumption, would not be possible.

The industrialists have, for the most part, not been opposed to such compulsory cartels, because the accompanying rationing of production, raw materials and marketing also facilitated future monopolistic combination. Herein, however, lies the danger of these methods, which the State endeavours to counter by granting the consumer and also the workers certain rights in these organizations, and by consulting with their representatives.

The power of the State in relation to industry, which had grown extraordinarily during the war, was still further strengthened in Germany when the Socialists came into power after the collapse in 1918, and demanded the socialization of these industries. In practice, however, the existing compulsory syndicates for potash,

coal and iron were merely further extended, and far-reaching powers for the regulation of prices were given to the Federal coal council and the Federal potash council, on which workers and consumers were represented. In the iron and steel federation (*Eisenwirtschaftsbund*) State intervention was not carried so far. On the other hand, in the electrical industry, where the so-called "mixed undertakings" (whose capital was raised jointly by public and private bodies) had played a great rôle in the production and delivery of power over large areas before the war, the attempt was made to increase the influence of the Reich and of its constituent states.

### TRUSTS IN GERMANY

Even before the World War cartels were far from the only form of combination of several undertakings. After the strong cartels in coal-mining had come into being, it was more advantageous for the large iron and steel works to possess their own coal-mines. The so-called "pure" rolling-mills, which had to buy their raw material from the combined steel works, which were also their competitors in the sale of the manufactured products, were likewise at a disadvantage. Thus the association of raw material producing and manufacturing concerns in a single undertaking became increasingly common. Great combined undertakings arose, above all in the mining industry and in the electrical and other metal industries, which extended far into the finishing industries. The term "trust" made its appearance; but real trusts—the amalgamation of a whole industry into a single monopolistic undertaking—these were not. Such trusts only arose in a few specialized industries: in the dynamite trade, and also in regard to the amalgamation of all German rice-mills in a holding company, and in the accumulator industry.

With the increase in the number of joint-stock companies in many industries, the tendency to fusion, and still more to the acquisition of participations in other industries, was very active. In banking, the linking of provincial banks to the great Berlin banks had been going on for a long time. Participation and the formation of subsidiary companies was most extensive in the electro-technical industry and in large constructional undertakings. A substitute for cartels is provided in a smaller category of undertakings by the *Interessengemeinschaften*. These consist chiefly in a pooling of profits to secure an equalization and distribution of risk; they are mostly formed for long periods, and practically exclude competition between those concerned. As a rule there is also an interchange of directors and members of control boards (*Aufsichtsräte*), and often participation by the acquisition of shares. After the crisis of 1900 the first important *Interessengemeinschaft* was the agreement concluded in 1902 for 20 years between the two largest German shipping companies and the International Mercantile Marine Company, which ended at the outbreak of the war.

**The Chemical Industry.**—Of still greater importance were the two great *Interessengemeinschaften* formed in 1904 in the chemical industry. The first, between the Höchster Farbwerke and the firm of Cassella & Co., took the form of an exchange of shares, the second, between the Badische Anilin und Soda Fabrik, the Elberfelder Farbenfabriken and the Berliner A.G. für Anilin-Fabrikation, took the form of pooling profits in the proportion of 43 : 43 : 14. In 1916 these groups combined to make common cause against the fierce foreign competition expected after the war, and two other large factories also came into the combine.

### CARTELS AFTER THE WAR

In the post-war period, with its economic insecurity and its colossal inflation, financial forms of organization became more prominent, while the cartels lost for the time being in importance. With the shortage of goods and the apparent prosperity due to inflation, high prices could be obtained without cartels. These played a larger rôle in local industry and trade, where it was important to make prompt adjustments to the daily price increases. In large-scale industries, however, certain traders and speculators took advantage of the opportunity of buying up whole groups of undertakings with cheap credits. There arose the great vertical combines (*Konzerne*), such as had already existed in the electrical

and mining industries, whose scope was now greatly extended.

By the dissociation of the Lorraine and Luxembourg works many of the greatest undertakings had lost their economic basis, and had to be completely reconstructed. Thus Hugo Stinnes created in the Siemens-Rhine-Elbe-Schuckert Union a close *Interessengemeinschaft* of three great mining undertakings with the electro-technical Siemens-Schuckert-Konzern. At the same time he built up a great private combine with a number of very distinct undertakings. Other mining combines also, such as the Phönix, Klöckner, Lothringen, etc., were further extended. In the potash, cotton and cement industries great vertical combines were also created. The penetration of wholesale trade, which had made very large profits during the war, into industry is worthy of note; often even very large undertakings suddenly came into the hands of a large trader or speculator. In many cases undertakings were thus grouped together which stood in no organic relation to one another, and which were only kept united by the financial transactions of the founders. In 1926 about 75% of the German coal output, 75% of the coke output, and about 79% of the steel output was produced in the great vertical combines of the mining industry.

With the stabilization of the mark in 1924 and the great scarcity of capital consequent on the destruction of all liquid capital, many of these artificial combines broke down, with great losses for those concerned. On the other hand the shortage of capital and the unfavourable economic outlook demanded a great reduction of costs and the most efficient technical and commercial organization. Thus many new amalgamations came into being, mostly in the more rational form of a complete fusion. The seven chemical firms already mentioned as being associated in an *Interessengemeinschaft* were absorbed by the oldest and largest of them, the Badische Anilin und Soda Fabrik, which increased its capital for this purpose from 176,000,000 marks to 646,000,000 marks, and took the name of Interessengemeinschaft Farben-Industrie A.G. In 1926 the capital was raised to 1.1 milliards marks, and the great explosives ring of the Cöln-Kottweil A.G. and Dynamit Nobel A.G. were taken into it, through which the I.G. dye-stuffs industry came into yet closer relation with the artificial silk industry. There are also relations existing with other German and English artificial silk producers, with the Imperial Chemical Industries, Ltd., with the two great oil rings (through the German Gasolin Gesellschaft) and with many more German and foreign chemical enterprises. This group had already a monopoly position in many products, so that here we may speak of a real trust.

An equally great concentration of capital is found in the union of several of the greatest vertical combines of the Rhine-Westphalian iron and steel industry, namely, the Phönix A.G., the Thyssen undertakings, the combine of the Gelsenkirchen and German-Luxembourg Mining Company, to which the Bochum Cast Steel Union also belongs, and of the Rheinische Stahlwerke. These transferred their production plants to the newly founded Vereinigten Stahlwerke A.G. (capital 800 million marks common shares, and 125 millions preference shares). They themselves remained in existence, however, as holding companies. The construction is here somewhat different from that of the great chemical industry. Although other large steelworks have been acquired (Stinnes Trust), the Vereinigten Stahlwerke (United Steelworks) have no monopolistic position. Their share in the various federations amounts only to 22–53%. In Upper Silesia and Central Germany also there have come about great fusions of steelworks.

In other industries, the striving for the greatest possible cheapening of costs of production makes fusion very prevalent. Many great fusions are to be found in the linoleum industry, in jute, cement, and mill construction, and in the watch, clock and photographic industries.

In spite of these great amalgamations, the number of cartels has not become less; the desire of employers to restrict competition was further increased by the severe economic crisis. The saying that cartels are children of necessity holds good.

**The Cartel Court.**—For a long time a cartel act was demanded in Germany. In July, 1922 a cartel advisory committee was formed, including members of the *Reichstag*, the *Reichsrat* and the

Federal Economic Council. On Nov. 2, 1923, the Government issued an "order against the misuse of monopoly power." A cartel court was erected which can be set in motion by the Government as well as by the contracting parties. The chief provisions are as follows:

Section 1: "Contracts and regulations which lay down obligations in regard to production and marketing, conditions of business, the nature of price fixing or price lists (syndicates, cartels, conventions and similar agreements) must be made in writing." Verbal contracts and the like are invalid.

Section 4 is the most important: "If a contract or regulation of the type described in Section 1 . . . endangers the economic system as a whole or the well-being of the community, the Federal minister of economics can (1) appeal to the cartel court to declare the contract or regulation to be invalid . . . (2) decree that all parties to the contract or regulation can at any time cancel the contract or withdraw from the regulations, (3) demand the submission of copies of all agreements. The welfare of the community is to be regarded as endangered when production or marketing are restricted in an economically unjustified manner, when prices are raised or kept high, or when price increases are made to cover the risk of currency depreciation, or when economic freedom is inequitably restricted by embargoes on purchase or sale or by discriminating prices or conditions."

These provisions are only permissive, since power is merely given to the Federal minister of economics under certain circumstances to apply for a declaration rendering the contract null and void. Section 8 goes much further. It runs:

"Contracts or regulations of the type described in Section 1 can be cancelled without notice where an important reason exists." An important reason is always to be held to exist if the economic freedom of the cancelling party is inequitably restricted in regard to production, marketing or the determination of prices.

Section 9 runs: "Guarantees may not be demanded, nor embargoes or similar prejudicial measures be imposed, in virtue of contracts and regulations of the type described in Section 1, without the consent of the chairman of the cartel court. Those concerned can appeal within a week of the decision to the cartel court."

Hitherto Sections 8 and 9, which are directed against the so-called exclusive contracts (obligations to trade exclusively with members of the cartel, boycotts, embargoes on delivery and the like) have been mainly enforced. But in the summer of 1925 the Government resolved, in connection with its endeavours to bring about a fall in prices, to proceed more energetically against the cartels, and a number of them have been dissolved, while others have been compelled to alter their trading conditions. (See TRUSTS; COMBINES.)

**CARTER, ELIZABETH** (1717–1806), English poet and translator, daughter of the Rev. Nicholas Carter, was born at Deal, Kent, on Dec. 16, 1717. Dr. Carter educated his children, boys and girls, alike; but Elizabeth's slowness tired his patience, and it was only by great perseverance and hard work that she acquired her learning. She learned Greek and Latin, and Dr. Johnson said concerning a celebrated scholar that he "understood Greek better than any one whom he had ever known except Elizabeth Carter." She learned also Hebrew, French, German, Italian, Spanish, Portuguese, and Arabic, besides studying astronomy, ancient geography, and ancient and modern history; and yet Johnson commended her housewifery no less than her learning. In 1734 some of her verses, signed "Eliza," appeared in the *Gentleman's Magazine*, to which she contributed for many years. In 1738 Cave published her *Poems upon Particular Occasions*; in

1739 she translated Algarotti's *Newtonianismo per le Dame*, as *Sir Isaac Newton's Philosophy explained for the use of the Ladies, in six Dialogues on Light and Colour*. Her translation of Epictetus (1758) was undertaken in 1749 to please her friends, Thomas Secker (afterwards archbishop of Canterbury) and his niece, Catherine Talbot, to whom the translation was sent, sheet by sheet, as it was done. In 1762 Miss Carter printed a second collection of *Poems on Several Occasions*. She died in Clarges street, Piccadilly, on Feb. 19, 1806.

Her *Memoirs* were published in 1807; her correspondence with Miss Talbot and Mrs. Vesey in 1809; and her letters to Mrs. Montagu in 1817. See also *A Woman of Wit and Wisdom* (1906), a biography by Alice C. C. Gausson.

**CARTER, HOWARD** (1873– ), Egyptologist, was born in Norfolk, and educated privately. After receiving special training in archaeological surveying under Professor Flinders Petrie and others, Carter joined the staff of the Egyptian Exploration Fund in 1890 and engaged in excavations on their behalf until 1899. Later he became inspector-general under the Antiquities Department of the Egyptian Government and found the tomb of King Mentuhetep. Subsequently, when working in collaboration with the earl of Carnarvon (d. 1923), Carter discovered many tombs, among them that of Tutankhamun, during the years 1907–23. He has given an account of his discoveries in *The Tomb of Tut-ankh-Amen*, *The Tomb of Thothmes IV.*, and in contributions to various archaeological journals.

**CARTERET, SIR GEORGE** (c. 1610–1680), English politician, born between 1609 and 1617, on the island of Jersey, was the son of Helier de Carteret of St. Ouen. In 1639 he was made comptroller of the English navy, and during the Civil War was active on the king's side. Succeeding his uncle, Sir Philip Carteret, as bailiff of Jersey in 1643, he was appointed lieutenant-governor of the island in the same year. After subduing the Parliamentary party in the island, he was commissioned (1644) a vice-admiral of Jersey, and as such carried on an active privateering campaign in the Royalist cause. Under his rule Jersey was a refuge for Royalists, among them Prince Charles (1646 and 1649–50), who created Carteret a knight and baronet. Parliament branded him as a pirate and excluded him from any future amnesty. In 1651 Carteret, after a seven weeks' siege, surrendered Jersey to a Parliamentary force, and, joining the Royalist exiles in France, for a time held a command in the French navy.

He returned to England at the Restoration, became a privy councillor, sat in parliament for Portsmouth, and served as vice-chamberlain of the royal household. From 1661 to 1667 he was treasurer of the navy, but was censured by parliament for his lax method of keeping accounts. In 1667 he became a deputy treasurer for Ireland, and was later appointed a commissioner of the Admiralty and a member of the committee of trade and plantations. Carteret was one of the eight to whom Charles II. granted the country of the Carolinas by the charters of 1663 and 1665, while in 1664 James, duke of York, granted his American territory between the Hudson and Delaware rivers to Carteret and to John, Lord Berkeley; this tract was called New Jersey in Carteret's honour. In 1674 Lord Berkeley disposed of his share of the grant, which finally fell under the control of William Penn and his associates. With them Carteret agreed (1676) upon a division of the colony into East and West Jersey. He died in Jan. 1680, and two years later his heirs disposed of his New Jersey holdings to Penn and other Quakers.

Sir George Carteret married Elizabeth George Carteret, daughter of his uncle, Sir Philip Carteret. George, son of his eldest son Philip, was created Baron Carteret of Hawnes in 1681.

**CARTERET**, a borough of Middlesex county, New Jersey, U.S.A., 5 m. S. of Elizabeth; served by the Central railroad of New Jersey. Pop. (1920) 11,047 (46% foreign-born white, the majority from Austria and Hungary); 1930, Federal census, 13,339. It has important industries, notably the refining of metals and the manufacture of iron, steel, fertilizer and chemicals. Carteret was founded (under the name of Roosevelt, later changed in honour of Philip Carteret, the first governor of the colony) in 1906 and incorporated in 1907.

**CARTERSVILLE**, a city of Georgia, U.S.A., 45m. north-west of Atlanta, on the Etowah river and Federal highway 41; the county seat of Bartow county. It is served by the Louisville and Nashville, the Nashville, Chattanooga and St. Louis and the Seaboard Air Line railways. The population was 4,350 in 1920 (34% negroes), and was 5,250 in 1930 by the Federal census. It is in a productive agricultural and mining region, and ships cotton, lime and limestone rock, iron ore, manganese, barytes, slate, potash and manufactured ochre. The city was founded in 1760 and incorporated in 1859.

**CARTESIANISM** signifies the philosophy of René Descartes and his followers, more especially Antoine Arnauld, Arnold Geulincx and Nicolas Malebranche. The most characteristic views of this whole school of thought are (1) its Dualism, that is, the view that minds (or souls) and material bodies are absolutely distinct substances incapable of any interaction, and (2) its Occasionalism, that is, the view that all apparent interaction between mind and matter is really due to the direct intervention of God, who produces a change in the one kind of substance on the occasion of the occurrence of a change in the other kind of substance.

See DESCARTES; CARTESIANS, and the literature given there.

**CARTESIANS**, the name by which the followers of the French philosopher, Descartes, and his school are now generally known. The word was taken from the last syllable of the founder's name, and although Spinoza and Leibnitz are sometimes included among Cartesians, their modifications ultimately exclude them. The accomplishments of Descartes' followers cannot be properly understood or estimated apart from a survey of the deficiencies in his philosophy that remained to be made good. These may be reduced to five. (1) Descartes concludes that physical bodies and particular selves or minds form two separate classes of substances. Their existential independence and complete qualitative dissimilarity is guaranteed by the fact that we can have a clear and distinct idea of each of them without having to think of the other. But man is, in some sense, "a unity" of the two, an embodied mind. In him, these two independent substances co-exist. So one task Descartes leaves for completion is that of explaining how, if these substances are disparate in existence and nature, their unity is to be conceived. Arnauld questioned the validity of this conclusion, but Geulincx, admitting it, supplies an answer to the problem. (2) Minds and bodies being disparate, it followed, Descartes thought, that there was no causal interaction between them. States of mind could not cause bodily changes, nor could the latter cause the former. Descartes restricts himself to this negative conclusion, offering no account of the causation of mental or physical events. The theory of Occasionalism, in the "restricted" form invented by Geulincx, and in the "complete" form of Malebranche, supplements this defect by an extension of Cartesian principles. (3) If body and mind are separate substances, what is their relation to God? For God also is a substance, and one that is infinite and complete. But a substance is that which depends on nothing else for its existence, so it should follow that mind and body are independent of God. But Descartes had previously argued that their nature and existence depended on God. The contradiction is not removed by his subsequent distinction between God as genuine substance, and body and mind as "secondary" ones. This verbal emendation is without logical efficacy and simply amounts to a piece of theological etiquette. It is the Occasionalism of Geulincx and Malebranche which removes this difficulty, though only at the cost of introducing a new one. (4) Descartes' statements about the nature of ideas were deficient in detail. Malebranche considers himself to supplement them by his theory of ideas and his "vision in God." This emendation is the subject of a controversy with Arnauld, which, though violent, had fruitful consequences for all subsequent philosophy. (5) Descartes developed no strictly ethical theory, though his *Passions of the Soul* would have constituted its psychological basis, if he had done so. He writes to Chanut (1646), prior to his unfortunate visit to the Queen of Sweden, that ethics was a province on which he dared not enter, for professors had fallen into a passion even on account of his harmless principles of physics; they would give him no rest if he wrote on ethics. This

prediction seems to have been fully borne out in the unhappy and persecuted life of his follower, Geulincx, who completed the Cartesian system with an important treatise on Ethics.

**Minor Cartesians.**—The new Rationalistic philosophy speedily became a subject of admiration for the best scholars of the time, and a ground of persecution for its ecclesiastical detractors. Descartes himself stood aloof from the *mêlée* of enthusiasm and vituperation so far as was humanly possible. Regius (Henry le Roy) had introduced Cartesian physiology into his lectures in medicine at the University of Utrecht, but the worth of his zeal is dubious. His text-book on physics (*Fundamenta physicae*) contained so many unproved assertions and reduced the Cartesian dualism of body and mind to a materialism, that Descartes had publicly to disclaim responsibility for it. More important is Sylvain Régis, whose *System de philosophie* (1690) shows the first definite move towards an Occasionalism. God is the only substance, therefore the only genuine cause. Physical and mental events have only "secondary" causes, bodies and minds are merely instruments which manifest God's causality. The self is not independently active though it does independently determine the character which the communicated activity shall manifest; thus it is a "director" but not a "producer" of changes. Body and mind, however, are still conceived as separate, events in one occurring collaterally with those in the other. Louis de la Forge maintains substantially the same view, but with this significant difference. The self is a genuine cause of all changes voluntarily and consciously initiated, God causing only those changes that are involuntary and unconsciously brought about. Géraud de Cordemoy reaffirms (*Dissertations philosophiques sur le discernement de l'âme et du corps*) the contention of Régis, that God alone is genuinely causative. Bodies, not being possessed of volition, cannot cause changes either in other bodies or in minds. Movement is not imparted from one body to another, but from God to each. The self can cause its own volitions, though again, their occurrence is only the occasion on which God causes an external change to occur, corresponding to the purpose willed. So the efficient cause of a movement in our body, whether willed by us or not, is never our own self, but God. We neither produce nor "direct" physical changes or events. For this reason, John Clauberg inferred the uniform correspondence between the two orders of events to be a standing miracle. But the self can "direct" (determine the character of) the physical activity resulting in its own body on the occasion of particular volitions, though the body cannot likewise determine the character of mental events occurring in the self it embodies. In this way, Clauberg combines the views of de la Forge and Régis, but deviates from those of Cordemoy. These are brought to their logical completion by Geulincx.

#### GEULINCX

So far then, only hesitant moves towards Occasionalism are traceable. But with Arnold Geulincx of Antwerp (1625-69), the doctrine is for the first time definitely elaborated. It is no longer merely proposed as an hypothesis, but an attempt is made to formulate it strictly and demonstrate it with certainty. His Metaphysics falls into three divisions, viz., Autology, or Knowledge of Self; Somatology or Rational Physics; and Theology, though it is generally agreed that his finest work lies in moral philosophy, viz., the *Τὴν δὲ σεαυτὸν, sive Ethica*. Like Descartes, Geulincx sets himself methodically to doubt every belief which can be doubted, with the object of discovering one whose truth being self-evident constitutes a piece of certain knowledge. This he too finds in the *Cogito, ergo sum*; his own existence is the one thing with which he can be directly and indubitably acquainted. Descartes' constructive use of the *Cogito* was to infer from it the epistemological principle that any other proposition which is equally clear and distinct is likewise true and certain, though he did not always respect the principle in practice. Geulincx's constructive use of the *Cogito* is to infer from it the principle that all activity of the self is conscious activity, no unconscious activity can be an activity of the self, and to this he does always strictly adhere. But interrogation of the self so disclosed to inspection elicits seven clear and distinct beliefs, which are true, viz., (i.) that we conceive an external world, (ii.) of which we form a part, (iii.) that our self is related

to our body, (iv.) that we did not produce the world, (v.) nor any of the movements in it, (vi.) that we did not produce our own body, (vii.) nor any of the changes in it. They are ordinary beliefs of common sense, except (v.) and (vii.), which follow by the principle inferred from the *Cogito*. But self-examination further discloses the presence to mind of very various sorts of thoughts, other than these beliefs, also the occurrence of different kinds of mental events. Hence, two fields of enquiry open out, viz., what is the character of our thoughts, volitions and mental activities generally, and of that which thinks and wills on such occasions? Now the former are of indefinite variety, but the latter is single and simple (i.e., without parts and unchanging). Further examination of the infinite variety of thoughts, volitions and other mental activities shows that though they are all "ours," they are so in two quite distinct senses. Some mental activities are "ours," since it is our own self that wills them, or causes their occurrence; hence, they are dependent on our self for their existence. Other mental activities are "ours," in another sense, viz., that they occur "in" us, but are not caused by us. This distinction among our mental activities, according as they are, or are not, caused by us, is vital for Geulincx. We are the cause of all our mental states of which we know, not merely that they occurred, but also how they occurred. "If you do not know the means by which a thing is produced, it is not you who produced it"; i.e., if you are not acquainted with the entire course of events which led up to the occurrence of the state in question, it is a state causally independent of yourself. This fundamental principle of Geulincx is taken along with the *Cogito*, as being self-evidently true, and therefore a piece of certain knowledge. Now the mode of production of all activity that is not caused by our self is to be conceived by analogy with that which is so caused. From which it follows that our independent states or activities are caused in us by some other individual who knows and wills them, and this can only be God. But although the causation of independent states can be assigned to God, the diversity of their characteristics cannot be so explained, for God, like the self, is simple, and thus not the ground of diversity. So, since everything which exists is either God or a self, or a body, and neither God nor a self can be the ground of diversity, it must be due to bodies. Hence the diversity of the extended world is the ground of the diversity in my experiences. So God's activity accounts for the fact of the occurrence, and Matter for the character, of our independent states or of external events. Pure thought and volition are the two properties of the self, extension and mobility those of matter or bodies.

But among the many bodies in the world, one I recognize as being "mine." It is "mine" in the sense, not that my self can directly cause changes in it, but that it is through this body, and it alone that I come to have my "independent" experiences. What then is the relation of "my body" to me; what is meant by speaking of "my" body? Strictly, Geulincx replies, it is meaningless to speak of my mind or self being "united" with my body. Had I no body, I should still have the idea of movement, though I should not experience those sensations that are aroused in me on the occasion of movement in the outer physical world. A self is related to its body in being active or passive in respect of the changes that occur in it. This relationship between self and body, which constitutes the two a human individual, is not initiated by any volition of that self. And when that relation ceases to relate its terms, i.e., at death, the self ceases, not from existing, nor from exercising its essential activity of thinking and willing, but only from experiencing sensations and memories, for these depend on bodily changes. Hence, to be a man is not to be a self united to a body, but to be a self which is active and passive, relatively to some one and the same material body.

**Occasionalism.**—Geulincx reaffirms that materiality and mentality are completely disparate qualities. A physical change cannot cause a mental change, nor *vice versa*. Neither can matter, being only extended, cause changes among its parts (i.e., motion). But changes, both physical and mental, do appear to occur; what then causes them? Changes in our sense organs and nervous system consequent upon physical stimulation, are, it is true, followed by mental changes, but the bodily changes are only the

occasions on which a subsequent mental change occurs; they do not cause it. Physical events and mental events form two closed systems that are not causally related. The occurrence of an event in one order is simply the occasion on which God causes the occurrence of another event, either in that order or in the other. So all "external" and "internal" physical events are caused by divine volitional activity. And all occurrences of "independent" experiences, since they depend on the body, are similarly caused. But what causes the occurrence of the self's "dependent" experiences? Here two views are possible; the one (Complete Occasionalism), that these experiences too (i.e., volitions and pure thought activity) are caused by divine activity; the other (Restricted Occasionalism), that they, though no other kinds of mental events, are the spontaneous and essential activity of the self, and therefore caused by it. The former was held by Malebranche, the latter by Geulincx. Thus, when I perceive a bodily change and will to perform a certain action in consequence, an action of that kind then ensuing in the physical world, according to Malebranche all these events, physical and mental, are successive effects of divine volition; for Geulincx, though the occurrence of the perceptual act and the physical action are effects of divine volition, the volitional act is caused by myself and not by God, the perception God caused being the occasion on which my self caused its own volition to occur, and this in turn being the occasion on which God caused the external change to occur. My own causal efficacy then is limited to volitional acts. But I may will to *do* something, or to *know* something. Hence two sorts of problems arise at this juncture, those of epistemology and of ethics. My empirical knowledge, being dependent on my perception of events in my own or in other bodies, is due to divine causation. But knowledge of *a priori* truths (e.g., mathematical propositions) is a knowledge of ideas in the divine mind. In so far as we can acquire a systematic knowledge of such *a priori* ideas, we attain to a knowledge of the world independently of sense experience, and so to a knowledge of the world and its parts as a system of bodies uncharacterized by sensible qualities (Rational Mechanics).

**Ethics.**—My own effective causation is limited to my volition. But it is possible for me to will, not merely changes whose occurrence is not caused by me, but changes which do not occur at all. Of all possible volitions, some only are effectual, and of these again, some only are permissible. And our knowledge of which effectual volitions are permissible depends on discovering the nature of divine thought and will. Hence virtuous conduct is the result of making our volitions conform to the divine reason, which is the expression of perfect rationality. Virtue is therefore defined as "the unique love of right reason" (cf. Spinoza's "Intellectual Love of God"). There are three kinds of love, viz., the determination to benefit (1) oneself, or (2) another, and (3) the love of reason. Love of self is the root of all moral evil, and the attainment of virtue involves both of the self's proper activities; reason, to ascertain what is the will of God, and volition, so as to will accordingly. Our volition so conformed will be the good will; we shall will to do what we see to be right simply because we see it to be right. So the source of all virtuous conduct is the good will, which is simply the determination to will only those actions which conform to reason. It is evinced in four classes of action, each of which manifests a specific or cardinal virtue, viz., diligence, obedience, justice and humility. Diligence consists in withdrawing our love from the external things of sense and, by means of self-examination, in becoming attentive to reason, which is conceived as an inward disclosure of which actions are right and which are wrong. These discovered, it remains to act in conformity with them, and such action expresses the virtue of obedience. Our actions are just in proportion to the exactness with which our volitions conform to the requirements of reason, which sets the standard or mean. Failure to realize this virtue in our conduct shows that we have erred, by excess or defect, through yielding to non-rational motives or impulses. But the sum and complete realisation of all virtues is humility; if this be attained nothing is lacking. Humility in conduct is the manifestation through it of a true recognition and conception of self, and is the outcome of adequate self-examination. To know ourselves as we really are

renders self-assertion impossible, for we see the futility of worldly desires which, issuing only from self-love, now cease from tormenting us. We realize our dependence on God. We recognize that the performance of our duty is required of us unconditionally, and not because it will conduce to happiness or protect us from harm or suit our convenience in any other way or confer any benefit upon us.

The good, which is the end of all action, is defined as that which we rationally love, and evil, as that which we rationally dislike. The useful is only instrumental; the pleasant can only be the aim of self-love, but love of the good is an imperative of reason. Emotions and desires are really neither good nor bad. When we call them so, we mean simply that they are pleasant or painful. They have no ethical significance except in relation to the love of reason, when, as hindrances to its expression, they are bad. Self-knowledge, then, brings resignation. He who is good and wise in his life renounces the world, its pleasures, honours and riches, and submits to the rational or divine order of life. So the connection between the nature of self and its place in the world, the relation between the autology and the ethics, becomes clear. Where we can do nothing we ought to will nothing. Now we cannot produce changes in our own body any more than in the world at large. Hence we should *desire* nothing for our body; our relation to the body is one of knowledge, not one of action. So renunciation of "the world and the flesh" follows: *despectio sui* is the consequence of *inspectio sui*.

#### ARNAULD

The first philosophical contribution of worth from Antoine Arnauld (1612-94) is his *Objections* to the *Meditations* which Descartes had circulated for criticism prior to publishing. Discussion centres in the main around the distinction between the human body and the human mind. Descartes had maintained that we can infer with certainty from our direct acquaintance with the self that its essential nature was unlike that of physical bodies. His critic admits this may be so but denies Descartes to have proved it. All that his argument establishes is that *some* trustworthy knowledge of the self is possible independently of any knowledge of the body. This does not warrant his asserting that the quality of being conscious exhausts the nature of the self, therefore he has no right to conclude that the self is not corporeal as well as conscious. Arnauld expresses himself satisfied with Descartes' reply, though later he seems to return to a view in all essentials similar to that of his *Objections*.

But his principal work in philosophy is undoubtedly the treatise *Des vraies et fausses idées* (1683), a most detailed and incisive refutation of the doctrine of Representative Ideas contained in Malebranche's *De la Recherche de la Vérité*. Malebranche follows Descartes in dividing all existents into two qualitatively exclusive orders, the mental and the physical, and concludes that neither the senses nor imagination can yield us knowledge of external bodies, since the senses can only acquaint us with states of our own mind that occur collaterally with certain physiological changes in the brain. So when we say that we are aware of certain physical objects before us, what our mind is directly related to, Malebranche argues, is not physical objects at all, but certain ideas of them. Physical objects cannot under any conditions cause our minds to know them for four reasons, (i.) because they are inferior in nature to mind, and (ii.) different from our minds in quality. Further, (iii.) causal action between finite existents is in any case impossible (*cf.* Occasionalism), and (iv.) the "local" difference, or spatial distance of physical objects from minds, renders direct knowledge of the former impossible, for "to know" is "to be intimately connected with" what is known, and "intimate" connection is impossible at a distance. So whilst Descartes required four ultimate terms with which to account for our knowledge of the material world (*viz.*, God, selves, external objects and ideas) Malebranche, eliminating external objects, requires only three. Ideas are the only objects we can directly know (though we can be acquainted with our "feelings" and purely subjective states without "ideas"); "God is the source, the reality and the place of ideas." So whenever we have knowledge, we are "seeing things in God."

It is this theory of Ideas that Arnauld attacks with consummate logical skill and acumen in his *Treatise on True and False Ideas*. He first points out there is no sense in asking *why* the mind has perceptions, any more than *why* material bodies have shape, for it is just the nature of mind to be perceptive. Explanation of facts cannot reasonably be required *ad infinitum*. Malebranche, further, has used the term "idea" in varying senses throughout his arguments, to denote indifferently (i.) perception, (ii.) non-representative entities, (iii.) particular existents, numerically distinct from perceptions and thoughts, yet indispensable for our awareness of material things. So Arnauld first undertakes an analysis of the notion of "idea," and the result is an important distinction for epistemology. The Malebranche-Arnauld controversy then centres around the question whether there are "ideas" in the sense of separate mental entities which exist and represent to our minds what is non-mental, or physical in character. The word "idea" is ambiguous. As popularly used it denotes a perceptual or cognitive act of some self; as used by Malebranche, it denotes a representative entity, numerically distinct from cognitive acts and from physical things. In brief, Arnauld decides that the former sense is permissible, but that the latter is a fiction invented simply on account of the fallacious assumption that mind, being mental, cannot be related by way of knowledge, to what is non-mental.

He next examines the grounds Malebranche adduces for demonstrating the indispensability of representative ideas. (1) To the argument that we cannot see an object unless it is present, Arnauld answers that there is a sense in which this is true, and one in which it is false. The "objective presence" and the "physical presence" of an object must be distinguished. To say we perceive, implies that there is *something* perceived; there must be something present to mind if the mind is to perceive it. But this "objective presence" is quite distinct from "local presence," for when I am said to be "thinking of" a person, that person is thereby objectively present to my mind, even though he is "locally" or spatially absent from my vicinity. Whatever I think of or perceive is objectively present by the very fact of my thinking of it, but what is objectively present is often physically or locally absent. Malebranche's error consists in having supposed that a thing could not be objectively present to my mind, without thereby being also locally present to it. And one of the functions of the representative idea was precisely to make good, by its presence, this absence of the physical body. But imagination and memory furnish countless instances to show the independence of objective presence and local presence. Arnauld does not deny "representation" in every sense. He denies representativeness to ideas in the sense in which, *e.g.*, a photograph "represents" the person whose likeness it is, for such representation, if affirmed of ideas, involves the existence of a separate intermediary between the mind and the physical object represented. But he admits explicitly that there is another sense in which all perceptual activity is representative (or better, "presentative"), *viz.*, the sense in which external objects become presented, when locally near, or "represented" when locally absent, to a mind, by means of that mind's cognitive activity.

(2) Arnauld next deals with the argument that material bodies cannot cause our mind to know them, even when locally present, since, being material, they cannot cause (mental) events in a non-material self. This presupposes that our mind can only know what is capable of acting on it. But to be objectively present to a mind is not to be active on it. The relation of presentation must be distinguished from that of causation, which done, the argument falls.

(3) The next argument is that representative ideas are required because, external objects being material, are "too coarse" in nature to admit of being directly perceived. For this, they would have to be "intimately connected" with the mind, but the mind, being spiritual, could not be connected with anything "coarse" like material particles. Hence the supposed necessity of mental intermediaries or ideas which could be "intimately connected" with our minds. Arnauld makes short work of this argument. Even supposing such "imperfection" in bodies, that would only be a ground for denying that a body could be a percipient, not for denying that it could be perceived.

The theory of ideas offends against the principle of logical economy that we should not employ more terms than necessary for an adequate explanation of our problem. Arnauld reiterates, again and again, that the idea, as an intermediate entity between the self and the objects it knows, is completely otiose. There is no good reason for denying that we are directly confronted with physical objects themselves, just as common sense believes. Far from explaining, by means of representative ideas, how we come to know external objects, Malebranche in fact explains just how we *cannot* come to know them. How can we ever know that there do exist independent objects at all, such as our "representative knowledge" is asserted to represent? To call it "representative knowledge" begs the question, for how are we ever to know that any external objects exist? The mind is condemned to a permanent disability from ever knowing material bodies at all. The onus of demonstrating how we come to know of the existence of an external world surely lies with him who denies that we know it by direct perception. And certainly self-inspection does not disclose the presence of any representative or instrumental ideas. Malebranche doubtless foresaw this weighty objection, for he returns the only answer possible, namely, that in point of fact, we do *not* know particular material objects at all. In believing that we do, we fall into illusion and error. What we really know is not this or that particular body, but the geometrical and formal properties of all body. Matter does not really have, but only appears as having, sensible characteristics. Pure thought alone, and not sense-perception, can give us genuine knowledge of bodies, as distinct from their appearances. By a deft stroke of Occam's razor, then, Arnauld effaces these representative intermediaries, and therewith the need for "intelligible ideas in the mind of God." He retains only selves capable of perceptual activity, and external objects. Acts of perception are dually related, viz., to the self, whose states or modifications they are, and to physical bodies, as being directly presented to that self. Before his controversy with Malebranche, Arnauld endorsed his complete Occasionalism, as explaining the occurrence of mental and physical events, but in 1686 (*Réflexions théologiques et philosophiques*), he decided against it, maintaining not only that the self is capable of changes of state independently of divine intervention, but, as against even Descartes, he sees no reason why the self should not cause changes in the physical world. Efficient causation between mental and physical events is thus reinstated.

Now as may be anticipated, Arnauld's view is less explicit and satisfactory where what is in question is our knowledge of universals and not of particular bodies. Here he follows the conceptualists, maintaining that universals have significance and reality only in and for our minds: *universalia tantum in mente*. But he sufficiently answers Malebranche that the conceptual activity by which we represent the notion of infinity, is not itself infinite. Wherever Malebranche departs from Cartesian doctrine, Arnauld is at variance with him, and, proceeding in an empirical way more akin to Reid and the Scottish common-sense school, than to the deductive tendency of Cartesianism, he retains most of Descartes' conclusions, even in respect of the origin of our ideas, until his later period. His specific problems were those of 17th century French philosophy; his conclusions, and the spirit in which he worked to them, are more suggestive of 18th century thought in England. Except for his conceptualism, Arnauld may well be regarded as having established some of the basic theses of present-day Realism.

**CARTHAGE**, one of the most famous cities of antiquity, on the north coast of Africa; it was founded about 814–813 B.C.

by the Phoenicians, destroyed for the first time by the Romans in 146 B.C., rebuilt by the Romans in 122 B.C., and finally destroyed by the Arabs in A.D. 698. It was situated in the heart of the Sinus Uticensis (mod. Gulf of Tunis), which is protected on the west by the promontory of Apollo (mod. Ras Ali el Mekki), and on the east by the promontory of Mercury or Cape Bon (mod. Ras Addar). Its position naturally forms a sort of bastion on the inner curve of the bay between the Lake of Tunis on the south and the marshy plain of Utica (Sukhara) on the north. Cape Gamart, the Arab village of Sidi-bu-Saïd and the small harbour of Goletta (La Goulette, Halk el Wad) form a triangle which represents the area of Carthage at its greatest, including its extramural suburbs. Of this area the highest point is Sidi-bu-Saïd, which stands on a lofty cliff about 490 ft. high. On Cape Gamart (Kamart) was the chief cemetery. The citadel, Byrsa, was on the hill on which to-day stand the convent of Les Pères Blancs and the cathedral of St. Louis, with a very interesting archaeological museum, containing the results of the excavations conducted by Père Delattre, while the objects found in the excavations conducted by the Government are at the Bardo (*see* TUNIS). The harbours lay about three-fifths of a mile south of Byrsa. The tongue of land, from the site of the harbours as far as Goletta, to the mouth of the Catadas which connects the Lake of Tunis with the sea, was known as *taenia* (ribbon, band) or *ligula* (diminutive of *Lingua*, tongue). The isthmus connecting the peninsula of Carthage with the mainland was roughly estimated by Polybius as 25 stades (about 15,000 ft.); the peninsula itself, according to Strabo, had a circumference of 360 stades (41 m.). The distance between Gamart and Goletta is about 6 m.

From Byrsa, which is only 195 ft. above the sea, there is a fine view; thence it is possible to see how Carthage was able at once to dominate the sea and the gently undulating plains which stretch westward as far as Tunis and the line of the river Bagradas (mod. Mejerda). On the horizon, on the other side of the Gulf of Tunis, rise the chief heights of the mountain-chain which was the scene of so many fierce struggles between Carthage and Rome, between Rome and the Vandals—the Bu-Kornaïn ("Two-Horned Mountain"), crowned by the ruins of the temple of Saturn Balcaranensis; Jebel Ressay, behind which lie the ruins of Neferis; Zaghwan, the highest point in Zeugitana; Hammam-Lif, Rades (Ghades, Gades, the ancient Maxula) on the coast and 10 m. to the south-west the "white" Tunis (*λευκὸς Τύννης* of Diodorus) and the fertile hills of Ariana.

**Harbours.**—The ancient harbours were distinguished as the military and the commercial. The remains of the latter are to be seen in a partially ruined artificial lagoon which originally had an area of nearly 60 acres; there were, however, in addition a large quay for unloading freight along the shore, and huge basins or outer harbours protected by jetties, the remains of which are still visible at the water-level. The military harbour, known as Cothon, communicated with the commercial by means of a canal now partially ruined; it was circular in shape, surrounded by large docks 16½ ft. wide, and capable of holding 220 vessels, though its area was only some 22 acres. In the centre was an islet from which the admiral could inspect the whole fleet. The site is traversed by the railway to the north of the village of Douai ech Chott. From this point northward the whole city was laid out in rectangular blocks, each about 130×500 feet and numerous streets have been located. *See* Haverfield, *Ancient Town Planning* (Oxford, 1913, 113–115).

**Byrsa.**—The hill of St. Louis, the ancient citadel of Byrsa, has a circuit of 4,525 ft. It appears to have been surrounded, at least at certain points, by several lines of fortifications which have been found to a height of over 20 metres; a well preserved battery for catapults and munition store was also found, but destroyed. *See* R. Fuchs in *Jahrb. d. Instituts* xxxii. (1917); *Arch. Aux.* 3 sqq. It was, however, dismantled by P. Scipio Africanus the younger, in 146 B.C., and was only refortified by Theodosius II. in A.D. 424; subsequently its walls were again renewed by Belisarius in 553. On the plateau of Byrsa have been found the most ancient of the Punic tombs, huge cisterns in the eastern

The main authority for the topography and the history of the excavations is Audollent's *Carthage romaine* (Paris, 1901). A topographical and archaeological map of the site was published in 1907: but there is no general up-to-date résumé. For a brief bibliography and plan see Pace and Lantier in *Monumenti dei Lincei* xxx. (1926), 129 sqq. (X.)

(1) **Foundation to 550 B.C.**—From an extremely remote period Phoenician sailors had visited the African coast and had had commercial relations with the Libyan tribes who inhabited the district which forms the modern Tunis. In the 16th century B.C. the Sidonians established a trading station called Cambe or Caccabe. Near Bordj-Jedid, unmistakable traces of this early settlement have been found. Carthage was founded about 850 B.C. by Tyrian emigrants led by Elissa or Elissar, the daughter of the Tyrian king Muttou I., fleeing from the tyranny of her brother Pygmalion. Elissa subsequently received the name of Dido, i.e., "the fugitive." The new arrivals bought from the mixed Libyophoenician peoples of the neighbourhood a piece of land on which to build a "new city," *Karthadshat*, whence the Greek and Roman forms of the name. Dido, having obtained "as much land as could be contained by the skin of an ox," proceeded to cut the skin of a slain ox into strips narrow enough to extend round the whole

Mago was succeeded by his elder son Hasdrubal (c. 500) who died in Sardinia about 485 B.C. His brother Hamilcar, having

CARTHAGE

In Sicily, the war lasted for a century. In 406 B.C. Hannibal

and Himilco destroyed Agrigentum and threatened Gela, but the Carthaginians were forced back on their stronghold in the southwest by Dionysius the Elder, Dionysius the Younger, Timoleon and Agathocles successively, whose cause was aided by a terrible plague and civil troubles in Carthage itself. Profiting by these troubles, Timoleon defeated the Carthaginians at Crimissus in 340 B.C. The subsequent peace was not of long duration; Agathocles besieged Carthage, which was then handicapped by the conspiracy of Bomilcar. Bomilcar was crucified, and Agathocles having been obliged to return to Sicily, his general Eumarcus was compelled to carry his army out of Africa, where it had maintained itself for three years (Aug. 310 to Oct. 307 B.C.). After the death of Agathocles, the Carthaginians re-established their supremacy in Sicily, and Mago even offered assistance to Rome against the invasion of Pyrrhus (280 B.C.). Pyrrhus crossed to Sicily in 277 B.C., and was preparing to sail to Africa when he was compelled to return to Italy. Delivered from these dangers, Carthage claimed the monopoly of Mediterranean waters, and seized every foreign ship found between Sardinia and the Pillars of Hercules.

(3) **The Punic Wars.**—(See also *ROME: History*). The first Punic War (268–241 B.C.) (Lat. *Poeni*, Phoenicians) was fought by Carthage for the defence of her Sicilian possessions and her supremacy in the Tyrrhenian Sea. The Romans, victorious at the naval battles of Mylae and Ecnomis (260 and 256 B.C.), sent M. Atilius Regulus with an army to Africa. But the Carthaginians, with the help of the Spartan Xanthippus, captured Regulus. The fighting was then transferred to Sicily, where Hasdrubal was defeated at Panormus (250 B.C.); subsequently the Romans failed before Lilybaeum and were defeated at Drepanum, but their victory at the Aegates Islands ended the war (241 B.C.). Carthage now desired to disband her forces, but the mercenaries claimed their arrears of pay, and, on being refused, revolted under Spendius and Matho, pillaged the suburbs of Carthage and laid siege to the city itself. The genius of Hamilcar Barca raised the siege; the mercenaries were cut down in the defile of the Axe. This war is known as the *bellum inextinguibile*.

Carthage then undertook the conquest of Spain. This operation lasted nine years up to the day of Hamilcar's death, in 228 B.C. His son-in-law, Hasdrubal Pulcher, built Carthago in 227 B.C. and concluded with Rome a treaty by which the Ebro was adopted as the boundary of the Carthaginian sphere. On his death the soldiers chose as leader Hannibal, son of Hamilcar. At this period, Carthage, with a population of perhaps 1,000,000, was in the enjoyment of extraordinary prosperity. The manufacture of woven goods was a flourishing industry. In Sicily, Italy and Greece the Carthaginians sold black slaves, ivory, metals, precious stones and all the products of Central Africa. In Spain, they exploited the modern mines of Huelva, Osca and Carthago. The district round Carthage, with its amazing fertility, was the granary of the city, as it was later that of Rome.

In the midst of this prosperity the Second War with Rome broke out. The campaigns of Hannibal (*q.v.*) in Spain, Italy and Africa have won the admiration of military experts of all ages. In 219 B.C. he captured Saguntum, which was in alliance with Rome. Passing through Spain and Gaul, Hannibal resolved to carry the war into the heart of Italy (218–217 B.C.). The battles of the Ticinus, Trebbia and Trasimene Lake are but stages in the wonderful progress which culminated in the battle of Cannae (*q.v.*, Aug. 2, 216 B.C.). The road to Rome was now open to him, but he did not profit by his advantage, while the Carthaginian senate withheld all further support. His brother Hasdrubal with his relieving army was defeated at the Metaurus in 207 B.C.; the Romans recovered their hold in Spain, and seeing that Hannibal was unable to move in Italy, carried the war back to Africa. Hearing that Scipio (*q.v.*) had taken Utica (203 B.C.) and defeated Hasdrubal and Syphax, king of Numidia, Hannibal returned from Italy, but with a hastily levied army was defeated at Zama (Oct. 19, 202 B.C.). The subsequent peace was disastrous to Carthage, which lost its fleet and all save its African possessions.

After the Second War, Carthage soon revived. The population

is said to have numbered 700,000, and the city never ceased to inspire alarm at Rome. The Numidian, Prince Massinissa, rival of Syphax and a Roman *protégé*, took advantage of a clause in the treaty of 202 B.C., which forbade Carthage to make war without the consent of the Roman senate, to extend his possessions at the expense of Carthage. In response to a protest from Carthage an embassy including Porcius Cato the Elder (*q.v.*) was sent to inquire into the matter, and Cato was so impressed with the city that on returning to Rome he never made a speech without concluding with the warning *Delenda est Carthago* ("Carthage must be destroyed").

At this time, the popular faction, which was turbulent and exasperated by the bad faith of the Romans, expelled the Numidian party and declared war in 149 B.C. on Massinissa who was victorious at Oroscope. Rome then intervened. The third Punic War lasted three years, and after a heroic resistance the city fell in 146 B.C. The last champions of liberty entrenched themselves under Hasdrubal in the temple of Eshmun, the site of which is now occupied by the chapel of St. Louis. The Roman troops were let loose to plunder and burn. The site was dedicated to the infernal gods, and all human habitation throughout the ruined area was forbidden.

**Constitution and Religion.**—The narrative may here be interrupted by an account of the political and religious development of Phoenician Carthage. Carthage was an aristocratic republic based on wealth rather than on birth. So Aristotle, writing about 330 B.C., emphasizes the importance of great wealth in Carthaginian politics. The government was in fact a plutocracy. The aristocratic party was represented by the two suffetes and the senate; the democratic by the popular assembly. The suffetes (*Sofetim*), two in number, presided in the senate and controlled the civil administration. The office was annual, but there was no limit to re-election. Hannibal was elected for 22 years. The senate, composed of 300 members, exercised ultimate control over all public affairs, decided on peace and war, and nominated the Commission of Ten, which was entrusted with the duty of aiding and controlling the suffetes. The commission was subsequently replaced by a council of one hundred (*Gr. gerousia*). This tribunal, which gradually became tyrannical, met frequently at night in the Temple of Eshmun, on Byrsa, in secret sessions.

The popular assembly was composed of those who possessed a certain property-qualification (translated into *Gr. as timouchoi*). The election of the suffetes had to be ratified by this assembly. The two bodies were almost always in opposition. The army was recruited externally by senators who were sent to the great emporia or trade-centres, even to the most remote, to contract with local princes for men and officers. Payments were frequently in arrears; hence the terrible revolts such as that of the *bellum inextinguibile*. It was not till the 3rd century B.C. that Carthage, in imitation of the kings of Syria and Egypt, began to make use of elephants in war. In addition to the mercenaries, the army contained a legion composed of young men belonging to the best families in the state; this force was an important nursery of officers.

The religion of Carthage was that of the Phoenicians. Over an army of minor deities (*alonim* and *baalim*) towered the trinity of Baal-Ammon, or Moloch; Tanit, the virgin goddess of the heavens and the moon, the Phoenician Astarte; and Eshmun, identified with Asklepios, protector of the acropolis. There were also special cults of Iolaus or Tammuz-Adonis, of Patechus or Pygmaeus, a repulsive monster like the Egyptian Pthah, whose images were placed on the prows of ships to frighten the enemy, and the Tyrian Melkhart (Hercules). The statue of this god was carried to Rome after the siege of 146 B.C.

From the close of the 4th century B.C. the intimate relations between the Carthaginians and the Sicilian Greeks began to introduce Hellenic elements into this religion. In the forum of Carthage was a temple to Apollo containing a colossal statue, which was transported to Rome. The Carthaginians sent offerings to Delphi, and Tanit approximated to some extent to Demeter; hence on the coins we find the head of Tanit or the Punic Astarte crowned with ears of corn, in imitation of the coins of the Greek

Sicilian colonies. The symbol of Tanit is the crescent moon; in her temple at Carthage was preserved a famous veil which was venerated as the city's palladium. On the votive stelae which have been unearthed, we find invocations to Tanit and Baal-Ammon (associate gods). Baal-Ammon or Moloch is represented as an old man with ram's horns on his forehead; the ram is frequently found with his statues. He appears also with a scythe in his hand. At Carthage children were sacrificed to him, and in his temple there was a colossal bronze statue in the arms of which were placed the victims. The children slipped one by one from the arms into a furnace amid the plaudits of fanatical worshippers.

(4) **Roman Period.**—In 122 B.C., the Roman senate, on the proposal of Rubrius, decided to plant a colony on the site of Carthage. C. Gracchus and Fulvius Flaccus were entrusted with the foundation of the new city, *Colonia Iunonia*, placed under the protection of Juno Caelestis. But its prosperity was obstructed both by unpropitious omens and by the very recollection of the ancient feud, and about 30 years later Marius, proscribed by Sulla, found the ruins practically deserted (see *MARIUS*). In the neighbourhood were the scattered remnants of the old Punic population. They sent ambassadors to Mithridates, the king of Pontus, assuring him of their support against Rome. Ultimately M. Minucius Rufus passed a law abrogating that of 122 B.C. and suppressing the *Colonia Iunonia*.

Julius Caesar, pursuing the last supporters of Pompey, encamped on the ruins of the city. Returning to Rome, he despatched thither the poor citizens who were demanding land from him. Later Augustus sent new colonists, and, henceforward, the machinery of administration was regularly centred there. The proconsuls of the African province had hitherto lived at Utica. In 14 to 13 B.C., C. Sestius Saturninus transferred his headquarters to Carthage, which was henceforth known as *Colonia Iulia Carthago*.

Pomponius Mela and Strabo already describe Carthage as among the greatest and most wealthy cities of the empire. Herodian puts it second to Rome. Virgil, in the *Aeneid*, celebrated the misfortunes of Dido, whom the colonists ultimately identified with Tanit-Astarte; a public Dido-cult grew up. The religious character of these legends reawakened the old distrust, and even up to the invasions of the Vandals, Rome forbade the reconstruction of the city walls. The revolt of Clodius Macer, legate of Numidia, in A.D. 68, was warmly supported by Carthage. At the moment of the accession of Vitellius, Piso, governor of the province of Africa, was in his turn proclaimed emperor at Carthage. Under Hadrian and Antoninus, there was built the famous Zaghwan aqueduct, which poured more than seven million gallons of water a day into the reservoirs of the Mapalia (La Malga). Under Antoninus Pius, a fire devastated the quarter of the forum.

In the early history of Christianity Carthage played an auspicious part (see *CARTHAGE*, *SYNODS OF*). The labours of Delattre have filled the St. Louis Museum at Carthage with memorials of the early Church. From the end of the 2nd century there was a bishop of Carthage; the first was Agrippinus, the second Optatus. At the head of the apologists, whom the persecutions inspired, stands Tertullian. In A.D. 202 or 203, in the amphitheatre, where Cardinal Lavigerie erected a cross in commemoration, occurred the martyrdom of Perpetua and Felicitas. Tertullian was succeeded (A.D. 248) by a no less famous bishop, Cyprian. About this time the proconsul Gordian had himself proclaimed (A.D. 239) emperor at Thysdrus (El Jem). Shortly afterwards Sabinianus, aspiring to the same dignity, was besieged by the procurator of Mauretania; the inhabitants gave him up and thus obtained a disgraceful pardon. Peace being restored, the persecution of the Christians was renewed by an edict of Decius (A.D. 250). Cyprian escaped, and subsequently caused the heresy of Novatian to be condemned in the council of A.D. 251. In A.D. 257, in a new persecution under Valerian, Cyprian was beheaded by the proconsul Galerius Maximus.

About A.D. 264 or 265 a certain Celsus proclaimed himself emperor at Carthage, but was quickly slain. Probus, like Hadrian and Severus, visited the city, and Maximian had new baths constructed. Under Constantius Chlorus, Maxentius proclaimed him-

self emperor in Africa, but the garrison of Carthage, which was hostile to the pretender, compelled L. Domitius Alexander to assume the purple. Domitius was however captured by Maxentius and strangled. About A.D. 311 there arose the Donatist heresy, supported by 270 African bishops. At the synod of Carthage in A.D. 411 this heresy was condemned owing to the eloquence of Augustine. Two years later the Carthaginian sectaries even ventured upon a political rebellion under the leadership of Heraclianus, who proclaimed himself emperor and actually dared to make a descent on Italy itself, leaving his son-in-law Sabinus in command at Carthage. Being defeated he fled to Carthage where he was put to death (A.D. 413). Donatism was followed by Pelagianism also of Carthaginian origin, and these religious troubles were not settled when in May A.D. 429 the Vandals, on the appeal of Count Boniface, governor of Africa, crossed the Straits of Gibraltar and invaded Mauretania. Genseric appeared in A.D. 439 before the walls of Carthage, which had been hastily rebuilt by the order of Theodosius. Genseric entered almost without a blow and gave over the city to plunder before departing for his attack on Italy. From this time Carthage became, in the hands of the Vandals, a mere pirate stronghold. Once, in A.D. 470, the fleet of the Eastern empire under the orders of Basiliscus appeared in the Bay of Carthage, but Genseric succeeded in setting fire to the attacking ships and from Byrsa watched their entire annihilation.

(5) **Byzantine Rule.**—Under Genseric's successors Carthage was still the scene of many displays of savage brutality, though Thrasamund built new baths and a basilica. Gelimer, the last Vandal king, was defeated at Decimum by the Byzantine army under Belisarius, who entered Carthage unopposed (A.D. 533). The restored city now received the name of *Colonia Iustiniana Carthago*; Belisarius rebuilt the walls and entrusted the government to Solomon.

At length the Arabs, having conquered Cyrenaica and Tripolitana (A.D. 647), and founded Kairawan (A.D. 670), arrived before Carthage. In A.D. 697 Hasan ibn en-Noman, the Gassanid governor of Egypt, captured the city almost without resistance. But the patrician Ioannes retook the city and put it in a state of defence. Hasan returned, defeated the Byzantines again, and decreed the entire destruction of the city. In A.D. 698 Carthage finally disappears from history. Once again only does the name appear, in the middle ages, when the French king Louis IX., at the head of the 8th crusade, disembarked there on July 17, 1270.

**CARTHAGE**, a city in the Ozark region of south-west Missouri, U.S.A., on Spring river, at an altitude of 950 ft.; the county seat of Jasper county. It is on Federal highways 66 and 71, and is served by the Frisco, the Missouri Pacific and the Southwestern Missouri (electric) railways. The population in 1920 was 10,068; 1930 it was 9,736. The city has much natural and architectural beauty. There are famous marble and white limestone quarries in the vicinity; also lead, zinc and coal mines. The city has marble and stone-cutting works, a large overall factory, and various

other manufacturing industries, with an output valued in 1925 at \$3,566,620. Besides marble and stone, it ships flour, strawberries and other fruits, live stock, hides and furs. Carthage was founded in 1833; became the county seat in 1842; and was chartered as a city in 1873. On July 5, 1861, an indecisive skirmish took place between 3,500 Confederates and 1,500 Federal troops about 7m. N. of the city.

**CARTHAGE**, a village of Jefferson county, (N.Y.), U.S.A., 75m. N. by W. of Utica, on the Black river, 742ft. above sea-level, and served by the New York Central railroad. The population in 1930 Federal census 4,460. It is in a dairying and cheese-manufacturing region, and is within easy reach of the Thousand Islands and the western Adirondacks. Its industries include several paper-mills and foundries, and plants making paper-mill machinery, paper sizing, sash and blinds and lumber specialties. The village was incorporated in 1841.

**CARTHAGE, SYNODS OF.** During the 3rd, 4th and 5th centuries the town of Carthage (*q.v.*) in Africa served as the meeting-place of a large number of church synods, of which, however, only the most important can be mentioned here.

1. In May 251 a synod assembled under the presidency of Cyprian to consider the treatment of the *lapsi* (those who had fallen away from the faith during persecution), and declared that the *lapsi* should be dealt with, not with indiscriminate severity, but according to the degree of individual guilt. These decisions were confirmed by a synod of Rome in the autumn of the same year.

2. Two synods, in 255 and 256, held under Cyprian, pronounced against the validity of heretical baptism, thus taking direct issue with Stephen, bishop of Rome, who promptly repudiated them, and separated himself from the African Church. A third synod, September 256, unanimously reaffirmed the position of the other two. Stephen's pretensions to authority as "bishop of bishops" were sharply resented, and for some time the relations of the Roman and African Churches were severely strained.

3. The "Conference of Carthage" (*see* DONATISTS), held by imperial command in 411 with a view to terminating the Donatist schism, while not strictly a synod, was nevertheless one of the most important assemblies in the history of the African church, and, indeed of the whole Christian church.

4. On the 1st of May 418 a great synod ("A Council of Africa," St. Augustine calls it), which assembled under the presidency of Aurelius, bishop of Carthage, to take action concerning the errors of Caelestius, a disciple of Pelagius (*q.v.*), denounced the Pelagian doctrines of human nature, original sin, grace and perfectibility, and fully approved the contrary views of Augustine. Prompted by the reinstatement by the bishop of Rome of a deposed African priest, the synod enacted that "whoever appeals to a court on the other side of the sea (meaning Rome) may not again be received into communion by any one in Africa" (canon 17).

5. The question of appeals to Rome occasioned two synods, one in 419, the other in 424. The latter addressed a letter to the bishop of Rome, Celestine, protesting against his claim to appellate jurisdiction, and urgently requesting the immediate recall of his legate, and advising him to send no more judges to Africa.

**CARTHUSIANS**, an order of monks founded by St. Bruno (*q.v.*). In 1084 Bruno and his six companions presented themselves before the bishop of Grenoble and explained to him their desire to lead an ascetic life in a solitary place. He pointed out to them a desolate spot named Chartreuse, on the mountains near Grenoble, rocky and precipitous, and snow-covered during a great portion of the year, and told them they might there carry out their design. They built themselves three huts and an oratory, and gave themselves up to a life of prayer, silence and extreme austerity. After a few years Bruno was summoned to Rome by Urban II., as an adviser in the government of the Church, *c.* 1090; but after a year or so he obtained permission to withdraw from Rome, and was able to found in the forests of Calabria near Squillace a second, and later on a third and a fourth monastery, on the same lines as the Chartreuse. At one of these south Italian foundations

Bruno died in 1101. On leaving the Chartreuse he had appointed a successor as superior, and the institute steadily became more settled and developed.

There was no written rule before 1130, when Guigo, the fifth prior of the Grande Chartreuse, reduced to writing the body of customs that had been the basis of Carthusian life (Migne, *Patrol. Lat.* cliii. 631); enlargements and modifications of this code were made in 1259, 1367, 1509 and 1681: this last form of the statutes is the present Carthusian rule.

The life is very nearly eremitical: except on Sundays and feasts, the Carthusians meet only three times a day in the church—for the Midnight Office, for Mass and for Vespers; once a week, on Sundays (and feasts) they have their meal in the refectory, and once a week they have recreation together and a walk outside enclosure; the rest of their time is passed in solitude in their hermitages, which are built quite separate from one another. Each hermitage is a house, containing living-room, bedroom and oratory, workshop and store-room, and has a small garden attached; the monks are supplied with such tools as they wish, and with such books as they need from the library.

The manner of life has been kept up almost without variation for eight centuries: among the Carthusians there have never been any of those revivals and reforms that are so striking a feature in the history of other orders—"never reformed, because never deformed." The Carthusians have always lived thus wholly cut off from the outer world, each one in almost entire isolation. They introduced and have kept up in western Europe a life resembling that of the early Egyptian monks, as under St. Anthony's guidance monasticism passed from the utter individualism of the first hermits to the half eremitical, half cenobitical life of the Lauras (*see* MONASTICISM).

The first English Charterhouse was established in 1178 at Witham by Selwood Forest, and at the Dissolution there were nine, the most celebrated being those at Sheen in Surrey and at Smithfield in London. The Carthusians were the only order that made any corporate resistance to the ecclesiastical policy of Henry VIII. The community of the London Charterhouse stood firm, and the prior and several of the monks were put to death in 1535 under circumstances of barbarous cruelty. In Mary's reign a community was reassembled at Sheen, and on her death it emigrated, fifteen in number, to Flanders, and finally settled in Nieuport; it maintained itself as a British community for a considerable time, but gradually dwindled, and the last of the old British Carthusian stock died in 1831. There is now a Charterhouse in Britain established at Parkminster in Sussex in 1833; the community for the most part is made up of foreigners.

At the French Revolution the monks were driven from the Grande Chartreuse, but they returned in 1816; they were again driven out under the Association Laws of 1901, and the community of the Grand Chartreuse is now settled in an old Certosa near Lucca. Of late years the community of the Grande Chartreuse has consisted of some 40 choir-monks and 20 lay brothers. Before the expulsions of 1901 there were in all some 20 Charterhouses in France.

A word may be added as to the famous liqueur, known as Chartreuse, made by the monks. At the Revolution the property of the Carthusians was confiscated, and on their restoration they recovered only the barren desert in which the monastery stood, and for it they had to pay rent. Thus they were for some years in want even of the needful means of subsistence. Then the liqueur was invented as a means of supplying the wants of the community; it became a great commercial success and produces a large yearly income. This income the monks have not spent on themselves, nor does it accumulate. The first charge is the maintenance of the Grande Chartreuse and the other Charterhouses, and out of it have been built and established the new monasteries of the order, as at Düsseldorf, Parkminster and elsewhere; but by far the largest portion has been spent on religious and charitable purposes in France and all over the world.

**AUTHORITIES.**—Reference to histories, old and new, will be found in Max Heimbucher, *Orden u. Kongregationen* (1896), i. § 36; Wetzler und Welte, *Kirchenlexicon* (ed. 2), art. "Karthäuserorden"; Herzog-

Hauck, *Realencyklopädie* (ed. 3), art. "Karthäuser" and the *Catholic Encyclopaedia*, vol. iii., art. "Carthusians." For the English Carthusians, see E. Margaret Thompson, *Somerset Carthusians* (1895), and Dom L. Hendriks, *London Charterhouse* (1889). The best account of the actual life is by Algar Thorold (*Dublin Review*, April 1892), who spent some months in the noviciate at the Grande Chartreuse.

**CARTIER, SIR GEORGES ÉTIENNE, BART.** (1814-1873), Canadian statesman, was born in the province of Quebec on Sept. 6, 1814. Called to the bar in 1835 he gained a large practice. He took part in the rebellion of 1837, and spent some time in exile. In 1848 he was elected to the Canadian parliament. In 1855 he was appointed provincial secretary and in 1857 attorney-general for Lower Canada. From 1858-62 he and Sir John Macdonald were joint prime ministers of Canada, and their alliance lasted till the death of Cartier. He promoted many useful measures, such as the abolition of seigneurial tenure in Lower Canada and the codification of the civil law of that province (1857-64). To his energy and fearless optimism are largely due the eventual success of the Grand Trunk railway and the resolve to construct the Canadian Pacific. In the face of great opposition he carried his native province into federation (1864-67), which would have been impossible without his aid. In the first cabinet of Sir John Macdonald he sat as minister of militia and defence, and carried in 1868 an important act establishing the land forces of Canada on a sound basis. Though a devout Catholic, he became involved in a political quarrel with his Church, and was defeated by clerical influence at the general election of 1872. Another seat was found for him, but his health failed and he died on May 20, 1873.

The *Life*, by Alfred O. De Celles (Toronto, 1904), may be supplemented by the sketch in Dent's *Canadian Portrait Gallery* (Toronto, 1880).

**CARTIER, JACQUES** (1491-1557), French navigator, discoverer of the Canadian river St. Lawrence, was born at St. Malo in Brittany. Of his early life nothing is known. On the suppression by Admiral Chabot of the trade to Brazil, an expedition consisting of two ships and 61 men was despatched from St. Malo under Cartier on April 20, 1534, to look for a north-west passage to the East. Cartier reached Newfoundland on May 10 and entered the strait of Belle Isle. On June 15 Cartier set sail for the south side of the strait, by following which he was led down almost the whole west coast of Newfoundland. Off St. George's bay a storm drove the ships out into the gulf, but on resuming his course Cartier fell in with the Bird Rocks. The island south of these he named Brion island, after Chabot (*q.v.*). Cartier mistook Magdalen and Prince Edward islands for the main shore on the south side of this inland sea. Following the coast of New Brunswick northward he was greatly disappointed to discover Chaleur bay was not a strait. During a ten days' stay in Gaspé harbour Cartier made friends with a tribe of Huron-Iroquois Indians from Quebec, two of whom he carried off with him. On discovering the passage between the island of Acosti and the Quebec shore it was decided to postpone the exploration of this strait until the following year. Heading eastward along the Quebec shore, Cartier soon regained the strait of Belle Isle and reached St. Malo on Sept. 5.

Cartier set sail again from St. Malo with three vessels on May 16, 1536, and passing through the strait of Belle Isle anchored on Aug. 9 in Pillage Bay, opposite Anticosti, which he named the bay of St. Lawrence, a name which spread to the gulf and finally to the river. Proceeding through the passage north of Anticosti, Cartier anchored on Sept. 1 at the mouth of the Saguenay, which the two Indians informed him was the name of a kingdom "rich and wealthy in precious stones." Again on reaching the island of Orleans they told Cartier he was now in the kingdom of Canada, in reality the Huron-Iroquois word for village. Leaving his two larger vessels in the St. Charles which there enters the St. Lawrence, Cartier set off westward with the bark and the long-boats. The former grounded in lake St. Peter, but in the latter he reached on Oct. 2 the Huron-Iroquois village of Hochelaga on the site of the city of Montréal. Further progress was checked by the Lachine rapid. On his return to the St. Charles, where during the winter 25 men died of scurvy, Cartier sought further information

about the rich country called Saguenay, which he was informed could be reached more easily by way of the Ottawa. In order to give Francis I. authentic information of this northern Mexico, Cartier seized the chief and 11 of the headmen of the village and carried them off to France. This time he passed south of Anticosti and, entering the Atlantic through Cabot strait, reached St. Malo on July 16, 1537.

In the spring of 1541 Cartier set sail with five vessels and took up his quarters at Cap Rouge, 9m. above Quebec. The seigneur de Roberval had been chosen to command; but when he did not arrive, Cartier made a fresh examination of the rapid of Lachine, preparatory to sending the men up the river Ottawa. Roberval at length set sail in April 1542, but on reaching St. John's, Newfoundland, met Cartier on his way back to France. In the summer of 1543 Cartier was sent out to bring home Roberval, whose attempt to make his way up the Ottawa to this mythical Saguenay had proved futile. From 1544 until his death at St. Malo, on Sept. 1, 1557, Cartier appears to have done little else than give technical advice in nautical matters and act as Portuguese interpreter.

**BIBLIOGRAPHY.**—Cartier's *Brief récit et succincte narration de la navigation faite es ysls de Canada* . . . was first printed in 1545; an English translation was made by Richard Hakluyt in his *The Principal Navigations*, vol. iii. (1600). J. P. Baxter's *Memoir of Jacques Cartier* (New York, 1906), contains an English translation and a detailed bibliography. See also *The Voyages of Jacques Cartier*, edited by H. P. Biggar (Publications of the Public Archives of Canada, No. ii.; Ottawa, 1924).

**CARTILAGE**, the firm elastic and gristly connective tissue in vertebrates. (See CONNECTIVE TISSUES and JOINTS.)

**CARTON, R. C.** (1853-1928), English playwright, whose real name was RICHARD CLAUDE CRITCHETT, was born in London, the son of a well-known ophthalmic surgeon. He began to play in the provinces at the age of 22, making his first real hit in 1888 at St. James's hall in a play called *Such is the Law*, and from that time had considerable success as an actor. He presently entered into partnership with Cecil Raleigh in writing plays, the first of their joint productions being the *Great Pink Pearl* (1885) with Mrs. Carton (Katherine Mackenzie Compton) as the Russian princess. In 1891 Carton began to write regularly for Sir George Alexander. Many of his later pieces were written for Miss Compton, a good example of these being *Lady Huntworth's Experiment*. The Carton plays were a clever mixture of comedy and farce. One of the best of these light pieces was *Lord and Lady Algy* (1898). Carton died at Acton, London, on April 1, 1928.

Miss Compton's most successful parts were those portraying the imperturbable great lady, although she also played a number of parts in classic comedy. She made her name in the pieces written for her by her husband. Miss Compton, always known under her maiden name, died on May 16, 1925, at Acton.

**CARTON.** A light cardboard box, used for packing small articles of many kinds, including foods, confectionery, tobacco, stationery, medicines, dentifrices, soaps, household pastes, light hardware, etc. The careful packing of such goods is one of the remarkable changes in industrial and commercial methods which marked the opening of the 20th century. In the old days, teas, soaps, tobacco, and other such things were weighed at the counter and packed loosely in paper and string, if packed at all. The growth of proprietary articles and special brands, in addition to a desire for cleaner handling, has changed all that, and carton-making has consequently become a very big industry, employing many people in every great industrial nation throughout the world. (See BOX MAKING.)

**CARTOON**, originally a preliminary drawing, executed to full scale and often in colour, of the design to be carried out in tapestry, mosaic, mural painting, or other work of art, and usually upon a heavy or durable paper. The cartoon when used for tapestry is usually placed in the loom so that the weaver can see it clearly just below his work, for which it acts as a guide.

In the more common parlance of to-day, the word means a drawing, distributed publicly by the press or by means of handbills or posters, which crystallizes some current trend of thought into pictorial form often humorous and derisive. (W. E. Cx.)

## UNITED STATES

The political cartoon has come into greater general use in the United States than in any other country. Almost every daily paper uses either a syndicated cartoon or one drawn by a staff artist. The cartoon's worth is based on its instantaneous exposition of an idea. The very specific character of the drawn picture precludes anything except a direct attack. There is no qualification in it—it says but one thing and that at a glance. Herein lies its virtue and its limitation. The cartoon of approbation is rarely successful. To say a man is a good man in a cartoon carries little force; but if the artist can say that he is corrupt or unworthy, then he is wielding a weighty club. All cartoons, however, need not be bitter to be effective. Humour plays an important part in their appeal. Ridicule is one of the most potent weapons in the world when turned into social and political channels.

The cartoon in America roughly divides itself into two schools. In one, the homely, quasi-rural setting and characters are presented somewhat in the manner of the comic "strip." John McCutcheon of the *Chicago Tribune* is the chief exponent of this, by far the more numerous, group. The chief characteristics of these artists are usually a cheerful humour, a multitude of little figures engaged in violent action, comic animals and a generous labelling of persons and objects. In these pictures the sudden impact of the idea is diffused through the multiplicity of incident. "Balloons," those bits of conversation surrounded with a wire line, must be read as well as the labels attached to the figures in order that the artist's idea may be comprehended. The other school deals in a starker form of pictorial representation. Here the meaning explodes at first glance. Everything exterior to the single idea is eliminated. This method is derived from the French of which Forain is the leading exponent. Also, it may be noted that the execution of this second group is of higher artistic merit or at least aspiration. There is a greater sophistication, both in conception and execution in these cartoons, and they imply an audience of more mature thought than do those of the cheery, bucolic nature which abound in the country's press.

Through syndication, cartoons reach even the smallest papers so that the country is thoroughly supplied with its daily picture. The syndicate, however, having to serve all sorts of papers in all sorts of communities, has softened the "attack" quality in most of this product so that the result has been a more or less negative, qualified picture which is guaranteed to offend no one and therefore has lost most of its pungency. Lacking that virility, it has come to be simply a thing of entertainment wherein the annals of the great middle class are set forth in terms of simplicity.

There is growing up in the daily press a social cartoon which is based upon a close observation of urban life—a sort of picture which has no relation to politics or public affairs, but sets forth some phase of life with either sympathy or satire. Dennis Wortman of the *New York World* is the best representative of this interesting form.

One of the handicaps which confront the cartoonist is the paucity of symbols through which he must express himself. Through repetition the various devices become worn and threadbare; yet there is no escape from them for they have become established in the public's mind and any variant or change would obscure the meaning of the message the cartoonist wishes to convey. The G.O.P. elephant; the Democratic donkey (both originated by Thos. Nast in the days when he fought the Tweed ring); the weedy individual labelled "Prohibition"; the round Nihilist bomb with the sputtering fuse; the apoplectic, silk-hatted individual who becomes "Wall Street" or "The Interests" or "The Trusts"; the meek, side-whiskered, spectacled creature who receives the brick Labour hurls at Capital and who is labelled "The Common People"—all these and more form the standardized little group of puppets with which the cartoonist must work. The figure of Uncle Sam is the most overworked of all. Each day he looks sternly out at the world from his place on the editorial page and views with alarm, warns, dictates, with pontifical fervour. Rarely does he laugh, for he is the Federal voice, and as such, deals only in weighty matters. He tells kings, potentates, labour unions, corrupt office-holders, swindling trusts (depending on whether he is a Re-

publican or Democratic Uncle Sam) where they "get off." In his gayer moments he welcomes transatlantic flyers and channel swimmers and, in his sadder moments, stands with bowed head at the death of a public man of importance. He is ubiquitous, untiring and a good deal of a bore. Yet the management of a daily cartoon would be difficult without his valuable services.

The influence of the cartoon is doubtless a very considerable one in the formation of public opinion; for the public at large can comprehend the simple message of the drawn picture, whereas the reading of long editorials entails a much greater sustained effort on their part. A few of the weekly magazines use a political cartoon; but here we find the methods of the comic "strip" used rather than the sterner forms of satire. It would appear that, on the whole, the editors of the United States feel that a cheerful, simple, innocuous appeal is preferable to a more mordant presentation of pictorial ideas. Many of the cartoons of the extreme left wing of the Socialist party are of great force, full of bitterness and class antagonism. Because of the restricted circulation of the papers in which they appear, they are little known to the public. On the whole, the cartoons of the daily press fairly well represent the mind of the American public in its tolerant, non-critical, excessively partisan point of view. (R. K.)

## THEORY OF DESIGN, TECHNIQUE AND MATERIALS

The word cartoon will no doubt be associated mainly and lastingly with such drawings as have a political or social significance and which, unlike the ordinary run of picture comicalities, stimulate thought on public affairs.

**Materials and Methods of Reproduction.**—To account for the material that cartoonists have used to get the best results one's field for investigation dates from the first Philipon publications (Paris 1830) to the present time. The instruments used for drawing cartoons determine to a large extent the technique. The pencil and the pen have been the favourite tools of the cartoonist all along, the pencil holding first place in order of practicability. The pencil is used in learning to draw, and thus pencil drawings have a more intimate appearance than those done with a pen. Pen drawing is more of an acquired art, and is preferred by some masters of the cartoon because of its directness. In a sense, it is shorthand. A line must suggest more than is there; moreover, it must convey the feeling of substance—not merely the edge of something. Take for example the pen drawings of Gulbransson of *Simplicissimus* and "Phil May" of *Punch*, the former extremely grotesque, the latter but mildly exaggerated. Both cartoonists give the impression of knowing all about their subject, though they express it with the minimum of linear simplicity.

Forain in his early work was another master of brevity, though he used a fine brush much as one would use a pen (*see ART, FAR EASTERN METHODS*). Some cartoonists play sketchily with the pen, while others prefer a rigid outline. Caran d'Ache drew pen and ink outline cartoons that strongly resembled the lines made by an etching needle on copper plate. On the other hand Heinrich Kley of *Jugend* tossed his pen lines like a juggler, making gestures as if about to miss, but always impressing one with his facility in creating amazing fantasies of nudes and animals. Charles Dana Gibson uses the pen as if cutting his way through his composition, the lines falling casually all about; many go part of the way only, leaving the rest to the imagination of the observer.

Two political cartoonists, Tenniel of *Punch* and Nast of *Harper's Weekly*, produced much of their work on wood-blocks. When it was later discovered, however, that a cartoon drawn on paper could be photographed on the wood, paper was used almost exclusively. Wood-cut cartoons were line drawings executed with a pen or sharp pencil, the latter quite similar to a pen point. Both Nast and Tenniel, who were contemporary, put a good deal of shading on their drawings. Nast used the cross-hatch abundantly, a method of shading produced by drawing a lot of more or less parallel lines and then going over them with other lines at right angles. Tenniel cross-hatched sparingly and shaded faces less than Nast. Tenniel had more knowledge of accurate draughtsmanship, whereas Nast had a clumsy way of drawing all his own. Much of his work was comedy, but he had a biting satire and

## TWO POLITICAL CARTOONS OF THE LATE 19TH CENTURY FROM PUCK

1. "Why they dislike him—He will not prove himself a cat's-paw in the enterprise" by Bernhard Gillam. This cartoon, printed in September 1884, shows Cleveland defying corruption during his campaign against James G. Blaine for the presidency
2. "They Hate the Light but they can't escape it" by J. Keppler, published March 26, 1890. The Press is represented as throwing the light of publicity on the secret executive sessions of the U. S. Senate

2. "They Hate the Light but they can't escape it" by J. Keppler, published March 26, 1890. The Press is represented as throwing the light of publicity on the secret executive sessions of the U. S. Senate

BY COURTESY OF (1, 2, 5) "THE NEW MASSES," (3) H. KLEY, "SAMMELALBUM," (A. LANGEN), (4) "SIMPLICISSIMUS"

### SOCIAL AND POLITICAL CARTOONS

1. "Why don't they go to the country?" a cartoon by George Bellows, which appeared in *The Masses*, Aug. 1913; an example of the starker form of cartooning which was used widely in this magazine. The meaning is evident at a glance and all details contribute to the impression. Cartoons of this type are usually propagandist, intended to sway popular feeling and bring about reforms.
2. "Discrimination" from a drawing by Alice Beach Winter, published in *The Masses*, Feb. 1913.
3. "Betriebsstörung" (the Strike) by Heinrich Kley, a contemporary German cartoonist, showing the use of symbolism which is characteristic of the cartoons of that country. A giant satanic figure is stopping production completely by crushing the mill and blocking the smokestacks with his hand.
4. "Fiume," drawing by O. Gulbransson which appeared in *Simplicissimus*, a Munich weekly, following D'Annunzio's occupation of Fiume in 1919. D'Annunzio, the figure on the horse, is brandishing his sword and defying President Wilson, who protested that the Italian had no right in Fiume. The picture when published carried the legend, "How easily even the smallest Europeans manage to ride over the greatest American ideas."
5. "The Bachelor Girl," by John Sloan. *The Masses*, Feb. 1915.

naturally the Democratic press sometimes referred to his work as "those nasty cartoons."

What cartoonists draw with or what they draw on is of course not so important as what is drawn and how well it is done. A real artist can produce very good results with an old piece of charcoal on a barn door, but to have his work widely circulated, and that after all is what a cartoonist desires, he has been led to many experiments in reproduction. Daumier was doing his political cartoons and caricaturing life all about him, on stone; Cruikshank, at the same time, was producing his pictorial satires on copper and steel plates, ploughing through the lines of his drawing with an etching needle, making him both designer and engraver. William Blake at an earlier date did most of his work in the same way. Both processes have long since fallen into disuse except for exclusive reproduction. A remarkable facility was acquired by these artists on wood, steel and stone, in spite of the fact that mistakes made on these surfaces were hard to correct. However, the wood could be dug out and another piece glued in, the metal could be burnished and the stone could be scratched, but obviously with tedious effort and loss of time.

Most cartoons seen in the publications of the 20th century are drawn with a black crayon pencil or pen. Some cartoonists use both instruments on the same drawing. A brush is sometimes used for ready distribution of blacks. When the crayon pencil is employed the paper used has a surface similar to the lithograph stone, to all appearances quite smooth, but with a slightly rough surface (in the technical term, a "tooth" to it). Both pen drawings and those drawn with a crayon lend themselves to that most widely used process of engraving called zinc-etching (*q.v.*). This is also called the direct process as distinguished from the half-tone process, which is the popular way of reproducing drawings having soft gradations of light and shade, executed with a brush and water colour or rubbed in with the thumb or cloth. Zinc-etching is the universal process for making plates ready for printing cartoons done with a black crayon or pen and ink (*see* PRINTING).

**Theory of Design and Technique.**—In the handling of pen and ink there are no rules, except those born of the artist's own feeling. The trite remark, "It is merely a matter of taste," describes the various degrees that artists go in modelling, shading and the other requirements within the main outline of their pen and ink composition. Materials and methods of reproduction are merely incidental in the world of successful cartooning; the main factors lie in the ability to invent ideas, to compose pictures and to understand the value of emphasis. Creating ideas can become habitual. As the cartoonist looks about him he sees in the every-day walks of life scenes that he thinks might apply to political situations. These ideas he notes and stores away in his subconscious mind, some day to develop and release as cartoons. Like the poet and the dramatist, he gets suggestions from the natural scene, from wide and purposeful reading, or from cartoons that have been produced in another era, endeavouring to improve them. We might say that the cartoonist is like the dramatist and, carrying the simile further, that the surface on which he draws is at once his stage-floor and proscenium arch. Within this area he creates a scene.

Doré was one of the most dramatic draughtsmen of any period of art. Had he succeeded Daumier as a cartoonist instead of becoming the illustrator of literary classics there can be no doubt he would have been an extraordinary propagandist, a great portrayer of affairs, for in the realm of both tragedy and comedy and in composing pictures that get "over the footlights," his work was always "cartoony."

The public will not admit that an actor can be both a tragedian and a comedian, but they expect this duality in a cartoonist. Keppler, Tenniel, Nast, Daumier, Doré, Steinlen, Felicien Rops, John Leech and many other draughtsmen of the past were skilful in depicting both humorous and serious ideas. The ideas of these early notables in black and white drawing, with few exceptions, also reveal minds with cultural backgrounds. Most of the political cartoonists of the 19th century, especially Tenniel, Leech, Nast and C. G. Bush of the *New York World*, often illustrated ideas that were suggested by their reading of Shakespeare, Greek

mythology, Aesop's Fables and other classics, which were made analogous to situations in the English parliament, the U.S. Congress, or other seats of legislation.

Later the ideas, especially in America, became less "high brow." Ideas that were supposed not to be "above the heads of the people" were thought by editors to be more popular. As if the common man had to know all about Macbeth before the cartoonist could dress up a politician in a Macbeth costume and put a Macbeth quotation underneath his picture! Once the cartoonist has decided on his idea, then comes the composition of the cartoon. Good composing also is something one must feel, as there are no set rules. But just as in literature and all of the arts, to compose well is to feel a balanced harmony or completeness, which means that the cartoonist has relegated to second place the less essential features of the scene and stressed the most important, that he is alive to the value of contrasts and above all knows when it is time to leave off, having said enough. How much caricature or exaggeration to put into one's cartoon is also a matter of individual preference. What might be called the excessive grotesque appeals to some cartoonists. Others incline more toward a slightly emphasized naturalism, for example Braakensiek of *De Amsterdammer*.

If a public man is fat and his nose is long, good caricature in the opinion of some caricaturists is to magnify these characteristics very much—to pile Pelion on Ossa. To others the natural is almost funny enough and needs but a subtle emphasis.

**Cartoon Publications.**—From about 1870 to 1890 the political cartoon printed in colours was popular in Europe and became so in the United States during the late '70s, when Joseph Keppler started *Puck*. Keppler first experimented with *Puck* in St. Louis, at that time printing it from the stone in black and white only. When the St. Louis *Puck* was abandoned Keppler came to New York and drew cartoons on wood for *Leslie's Weekly*. In a few years, Adolph Schwarzman, a foreman printer of Leslie's, joined Keppler in organizing the Keppler and Schwarzman Company, and revived the name *Puck* for the humorous weekly that later became famous, popular and a financial success. The new *Puck* resembled the general format of the coloured cartoon papers of Europe, especially *La Flaca* in Madrid and *Barcelona* and *Humoristische Blätter* in Vienna.

In Australia, where Phil May started his career and that droll caricaturist Hopkins, "Hop," was a pioneer, the production of cartoons has been mostly in black-and-white. However, the tendency of these later years on the weekly humorous magazines is the use of one or two colours over pen and ink or crayon cartoons—the result of which is posterized attractiveness. Steinlen was one of the first draftsmen to use red as an accompaniment to black crayon drawings. Wilke, Heine, Thöny and others of *Simplicissimus* use flat colours, as do other cartoonists of Europe, especially in Russia. In Mexico also much of the cartooning is simply coloured.

The coloured cartoons of Keppler, like Gillam's and others on the staff of *Puck*, were drawn on and printed directly from the stone. The first printing, in black ink, was called the key-plate. Then followed the printing on this key-plate impression from other stones to register reds, blues and other colours in facsimile to the cartoonist's water-colour design. The decline of the coloured political cartoons and weekly cartoon magazines in general was due, no doubt, to the fact that daily newspapers had begun to employ cartoonists (this was about 1890) and to print coloured comic supplements. These supplements were "thrown in" for the price of the newspaper. This innovation in newspaper publishing was made possible by the invention of the fast multi-coloured printing press. In the beginning, these supplements sometimes printed coloured political cartoons in imitations of those in *Puck* and *Judge*.

As a result of all this the principal humorous weeklies of that day were not so much in public demand. But just as interest in the wood-cut and the lithograph is being revived, so the political cartoon in colours may have another day. The cartoon magazine *Life* was born a decade later than *Puck* and *Judge*. It opened a somewhat different field for artists. This magazine never had a

staff in the sense that *Punch* and *Puck* were produced by a staff of artists regularly employed. John Ames Mitchell, the founder and first editor, was an artist himself, and in the first numbers of the magazine can be seen his pen and ink drawings. However, he is better known as an author. *Life* was not as political as its older contemporaries and was printed for many years without the use of colour. It indulged mostly in ridicule of social foibles and surveyed the American scene from the editor's amiable viewpoint, but not without occasional thrusts at the evils of commercialism, the law, the medical profession and other institutions.

While the Latin Quarter artists of Paris issued protesting magazines in the beginning of the present 20th century, it is generally conceded that one of the most artistic and at the same time shocking magazines was published in America. The magazine was called *The Masses*, the first number appearing in 1910 and the last in 1918. Its existence was due largely to one fact: an artist is an individualist; he wants to express himself in his own way. Many artists who believed that the sordid and the vulgar, the cruelties and hypocrisies that manifest themselves in this age of the industrial machine, should be ridiculed and caricatured without stint, joined the staff of *The Masses*. Then, too, the conventional magazine with its trite and formal make-up and its many taboos, was sooner or later doomed to become a target for the iconoclast artists. The pretty girl cover was the vogue when *The Masses* was started. One of its earliest cover designs was a picture of two poor, homely girls. One of them is saying: "Gee, Mag, think of us being on a magazine cover." On the art staff of *The Masses* were John Sloan, George Bellows, Charles A. Winter, Cornelia Barns, Maurice Becker, Glenn O. Coleman, H. J. Glintenkamp, K. R. Chamberlain, Boardman Robinson and Art Young.

With a natural aptitude for pictorial expression, with patience and hard work, the cartoonist creates ideas, composes pictures and puts exaggeration or mere emphasis where he thinks they belong. But a cartoonist cannot produce convincing cartoons that will live, more than an author can produce good books, unless he feels the truth of his work. (See also CARICATURE; COMIC STRIP; PEN DRAWING; PENCIL DRAWING; ILLUSTRATION.) (AR. Y.)

**CARTOUCHE.** The term is applied in architecture to ornamentation in scroll form, especially to the elaborate, scrolled frames around tablets or coats of arms; by extension, the word is applied to any oval shape, or even to a decorative shield, whether scrolled or not. The word is also used for the oval frame enclosing the hieroglyphs of the name of an Egyptian royal personage, and also for the amulet of similar shape, commonly worn by men and women in ancient Egypt, as a protection against the loss of their names, *i.e.* personalities.

**CARTRIDGE** (corruption of Fr. *cartouche*), a case, of brass or other metal, cardboard, silk, flannel, etc., containing an explosive charge, and usually the projectile also, for small arms and ordnance. (See AMMUNITION.)

**CARTWRIGHT, EDMUND** (1743-1823), English inventor, younger brother of Maj. John Cartwright, was born at Marnham, Nottinghamshire, on April 24, 1743, and educated at Wakefield grammar school and at Oxford university. In 1779 he became rector of Goadby Marwood, Leicestershire, and in 1786 a prebend in the cathedral of Lincoln. He would probably have passed an obscure life as a country clergyman had not his attention been accidentally turned in 1784 to the possibility of applying machinery to weaving. He invented a power-loom, for which he took out a patent in 1785; it was a rude contrivance, though it was improved by subsequent patents in 1786 and 1787, and gradually developed into the modern power-loom. Removing to Doncaster in 1785, he started a weaving and spinning factory, but in 1793 he had to surrender it to his creditors. A mill at Manchester, in which a number of his machines were installed, was wilfully destroyed by fire in 1791. In 1789 he patented a wool-combing machine, for which he took out further patents in 1790 and 1792; it effected large economies in the cost of manufacture, but its financial results were not more satisfactory to its inventor than those of the power-loom, even though in 1801 parliament extended the patent for 14 years. In 1807 a memorial was pre-

sented to the Government urging the benefits that had been conferred on the country by the power-loom, and the House of Commons voted him £10,000 in 1809. He then purchased a small farm at Hollander, near Sevenoaks, Kent, where he spent many years of his life. He died at Hastings, on Oct. 30, 1823. Other inventions of Cartwright's included a corderlier or machine for making rope (1792), and an engine working with alcohol (1797), together with various agricultural implements.

**CARTWRIGHT, JOHN** (1740-1824), English parliamentary reformer, was born at Marnham in Nottinghamshire on Sept. 17, 1740, the elder brother of Edmund Cartwright, inventor of the power-loom. He was educated at Newark grammar school and Heath academy in Yorkshire, and entering the navy served at the capture of Cherbourg, and in the action between Sir Edward Hawke and Admiral Conflans. Engaged afterwards on the Newfoundland station, he was appointed to act as chief magistrate of the settlement (1765-1770). Ill-health necessitated his retirement from active service for a time in 1771. When the disputes with the American colonies began, he was a warm supporter of their cause, and declined to fight against the cause which he felt to be just. "In 1774 he published his first plea on behalf of the colonists, entitled *American Independence the Glory and Interest of Great Britain*. In the following year, when the Nottinghamshire Militia was first raised, he was appointed major and in this capacity he served for 17 years. He was at last illegally superseded, because of his political opinions. In 1776 appeared his first work on reform in parliament, entitled, *Take your Choice*—a second edition appearing in 1777 under the new title of *The Legislative Rights of the Commonalty vindicated*. The task of his life was thenceforth chiefly the attainment of universal suffrage and annual parliaments. In 1778 he conceived the project of a political association, which took shape in 1780 as the "Society for Constitutional Information." From this society sprang the more famous "Corresponding Society." Major Cartwright was one of the witnesses on the trial of his friends, Horne Tooke, John Thelwall and Thomas Hardy, in 1794 and was himself indicted for conspiracy in 1810, and condemned to pay a fine of £100. He died in London on Sept. 23, 1824. He had married in 1780, but had no children.

*The Life and Correspondence of Major Cartwright*, ed. by his niece F. D. Cartwright, was published in 1826.

**CARTWRIGHT, PETER** (1785-1872), Methodist Episcopal preacher of the United States, was born on Sept. 1, 1785, in Amherst county, Virginia. His father, a veteran of the War of Independence, in 1790 took his family to Kentucky. Here Peter Cartwright grew up amid the rude surroundings of the frontier, received little education, and was a gambler at cards and horse-racing until 1801, when he heard John Page preach. In June he was received into the church; in May, 1802 was licensed as a regular exhorter, becoming known as the "Kentucky boy"; in the autumn of 1802 was licensed to form the Livingston circuit around the mouth of the Cumberland river; in 1806 was ordained deacon by Bishop Asbury, and in 1808 presiding elder by Bishop McKendree, under whose direction he had studied theology. He was presiding elder of the Wabash district in 1812, and of Green river district in 1813-16, and, after four years on circuit in Kentucky and two as presiding elder of the Cumberland district, was transferred in 1823 to the Illinois conference, in which he was presiding elder of different districts until 1869. Until 1856 he preached about 14,600 times, received about 10,000 persons into the church, and baptized about 12,000 persons. He died near Pleasant Plains, Sangamon county, Ill., Sept. 25, 1872. He was a typical backwoods preacher, an able, vigorous speaker, a racy writer and a powerful exponent of "muscular Christianity."

See the *Autobiography of Peter Cartwright, the Backwoods Preacher*, edited by W. P. Strickland (1856); also D. C. Seitz, *Uncommon Americans* (1925).

**CARTWRIGHT, SIR RICHARD JOHN** (1835-1912), Canadian statesman, was born in Kingston, Canada, on Dec. 4, 1835, son of an army chaplain. In 1863 he entered the Canadian parliament as a Conservative, but soon after federation in 1867 quarrelled with his party on the question of their financial policy.

(1) BY COURTESY OF "THE NEW MASSES"

### THREE CARTOONS BY ART YOUNG

1. Cartoon first printed in *The Masses* in May 1913 and since reprinted widely. The picture carried this dialogue, "I Gorry, I'm tired." "There you go! You're tired. Here I be a-standin' over a hot stove all day and you workin in a nice cool sewer." 2. "Beast and Man" and 3. "The Price of Prominence" illustrate the satirical manner of cartoon drawing, as distinguished from the cruder method of the "comic strip"

By 1870 the breach was complete, and in 1873 he became finance minister of the Liberal ministry of Alexander Mackenzie. From 1878 to 1896 he was the chief financial critic on the side of the Liberal opposition, and on the accession of Sir Wilfrid Laurier to power in 1896 he became minister of trade and commerce. In 1898-99 he represented Canada on the Anglo-American joint high commission at Quebec. In 1904 failing health led to his retirement to the senate. In Sir Wilfrid Laurier's absence at the Imperial Conference 1907 he was acting premier. Cartwright died on Sept. 24, 1912, at Kingston, Ont.

**CARTWRIGHT, THOMAS** (c. 1535-1603), English Puritan divine, studied divinity at St. John's college, Cambridge; but on Mary's accession he had to leave the university, and found occupation as clerk to a counsellor-at-law. On the accession of Elizabeth he returned to Cambridge, and in 1569 he was appointed Lady Margaret professor of divinity at Cambridge; but John Whitgift, on becoming vice-chancellor, deprived him of the post in Dec. 1570, and—as master of Trinity—of his fellowship in Sept. 1571. After his deprivation by Whitgift, Cartwright visited Beza at Geneva. He returned to England in 1572, and might have become professor of Hebrew at Cambridge but for his expressed sympathy with the notorious "admonition to the Parliament" by John Field and Thomas Wilcox. To escape arrest he again went abroad, and acted as clergyman to the English residents at Antwerp and then at Middelburg. In 1585 he returned without permission to London and was twice imprisoned. He died at Warwick, on Dec. 27, 1603. Cartwright's views were distinctly Presbyterian and he opposed the Brownists or Independents.

**CARTWRIGHT, WILLIAM** (1611-1643), English dramatist and divine, was born at Northway, Gloucestershire. He was educated at the free school of Cirencester, at Westminster school, and at Christ Church, Oxford, where he took his M.A. degree in 1635. He became, says Anthony à Wood, "the most florid and seraphical preacher in the university," and appears to have been no less admired as a reader in metaphysics. In 1642 he was made succentor of Salisbury cathedral, and in 1643 he was chosen junior proctor of the university. He died Nov. 29 of the same year.

Cartwright was a "son" of Ben Jonson and an especial favourite with his contemporaries. His plays are, with the exception of *The Ordinary* (?1635), fantastic in plot, and stilted and artificial in treatment. They are: *The Royal Slave* (1636), produced by the students of Christ Church before the King and Queen, with music by Henry Lawes; *The Lady Errant* (acted, 1635-36); *The Siege, or Love's Convert*.

*Comedies, Tragi-Comedies, with other Poems*, by Mr. William Cartwright . . . (1651) included the plays mentioned above.

**CARUCATE** or **CARRUCATE** (from the Med. Lat. *carrucata*, from *carruca*, a wheeled plough), a measure of land, based probably on the area that could be ploughed by a team of oxen in a year; hence "carucage" means a tax levied on each "carucate" of land (see *HIDE*).

**CARÚPANO**, a town and port of the State of Bermúdez, Venezuela, 65m. N.E. of the city of Cumaná. Pop. (1920), about 11,000. Carúpano is situated on the Caribbean coast on an open roadstead and is a port of call for several regular steamship lines. The country immediately behind the town is rough, but there is a considerable export of cacao, coffee, sugar, cotton, timber and rum.

**CARUS, CARL GUSTAV** (1789-1869), German physiologist and psychologist, distinguished also as an art critic and a landscape painter, was born in Leipzig on Jan. 3, 1789, and in 1811 became a *Privatdocent* in the university there. On the subject which he selected (comparative anatomy) no lectures had previously been given at Leipzig. In 1814 he became professor to the new medical college at Dresden, where he spent the remainder of his life. He died on July 28, 1869. In philosophy Carus belonged to the school of Schelling, and his works are thoroughly impregnated with the spirit of that system. He regarded inherited tendency as a proof that the cell has a certain psychic life; and pointed out that individual differences are less marked in the lower than in the higher organisms. Among his

works may be mentioned: *Grundzüge der vergleichenden Anatomie und Physiologie* (Dresden, 1828); *Psyche: zur Entwicklungsgeschichte der Seele* (3rd ed. Stuttgart, 1860); *Physis, zur Geschichte des leiblichen Lebens* (Stuttgart, 1851).

See his autobiography, *Lebenserinnerungen und Denkwürdigkeiten* (1865-66); C. Bernoulli, *Die Psychologie von C. G. Carus* (1925).

**CARUS, MARCUS AURELIUS**, Roman emperor A.D. 282-283, born probably at Narbona (more correctly, Narona) in Illyria, was a senator and had been appointed prefect of the praetorian guard by the Emperor Probus (q.v.), after whose murder he was proclaimed emperor by the soldiers. Although Carus punished the assassins he was suspected of having been an accessory to the deed. He left his elder son Carinus in charge of the western portion of the empire and took the younger, Numerianus, with him on the expedition against the Persians. Having defeated the Quadi and Sarmatians on the Danube, Carus proceeded through Thrace and Asia Minor, conquered Mesopotamia, pressed on to Seleucia and Ctesiphon, and carried his arms beyond the Tigris. But he died suddenly, probably murdered by the soldiers, who were weary of the war, at the instigation of Arrius Aper, prefect of the praetorian guard.

See Gibbon, *Decline and Fall of the Roman Empire*, Chap. XII.

**CARUSO, ENRICO** (1873-1921), the most famous Italian operatic tenor of his day, was born in Naples on Feb. 25, 1873. He was early apprenticed to a mechanical engineer. He began to sing in the choirs at Naples when he was 11 years old, and later studied under Guglielmo Vergine. He made his début in 1894 in *L'Amico Francesco* at the Teatro Nuovo, Naples, and first won marked success as Marcello in *La Bohème*, at Milan, in 1898. From 1899 to 1903 he was at St. Petersburg (Leningrad) in the winter, and in the summer at Buenos Aires. He appeared also in Moscow, Warsaw, Rome, Paris, London and elsewhere. In America he first appeared in 1903 at the Metropolitan Opera House, New York, where for 18 years he was the leading tenor. Caruso had a very extensive repertory, which was however confined to works of the French and Italian schools; he never appeared in Wagnerian opera, being content with the unrivalled supremacy which he enjoyed in works of the kind best adapted to display his particular powers and with which he was most in sympathy. Among these may be named *Aïda*, *Carmen*, *Les Huguenots*, *L'Elisir d'Amore*, *Pagliacci*, *Rigoletto*, *Samson and Delilah*, and last but not least, Puccini's *La Bohème* in which, to the no less incomparable Mimi of Dame Melba, he celebrated some of his greatest triumphs as Rodolfo. Caruso's voice was of the purest Italian type, being especially distinguished by the warmth and richness of its quality while in all technical respects his singing was of the highest order. He died of pleurisy on Aug. 2, 1921, at Naples.

See D. B. Caruso and T. Goddard, *Wings of Song* (1928).

**CARUTHERSVILLE**, a city in the south-east corner of Missouri, U.S.A., on the Mississippi river; served by the Deering Southwestern and the Frisco railways; the county seat of Pemiscot county. The population in 1920 was 4,750; 1930, 4,781. It is in a cotton-growing and lumbering region, and has cotton gins and compresses, cotton-seed oil mills, planing mills, various wood-working factories, a tomato cannery and a shoe factory.

**CARVAJAL, ANTONIO FERNANDEZ** (c. 1590-1659), a Portuguese Marano (q.v.) or Crypto-Jew, who came to England in the reign of Charles I. He was the first "endenized" Jew in England (1655), and by his extensive trade with the West Indies rendered considerable services to the Commonwealth. Besides his commercial value to Cromwell, Carvajal was politically useful also, for he acted as "intelligencer." When Manasseh ben Israel in 1655 petitioned for the return of the Jews who had been expelled by Edward I., Carvajal took part in the agitation and boldly avowed his Judaism. Carvajal may be termed the founder of the Anglo-Jewish community. He died in 1659.

See Lucien Wolf, "The First English Jew," *Trans. Jewish Historical Society*, ii. 14.

**CARVAJAL, LUISA DE** (1568-1614), Spanish missionary in England, was born at Jaraicejo in Estremadura on Jan. 3, 1568. Moved by the execution of the Jesuit, Henry Walpole, in

1596, she decided to devote herself to the cause of the faith in England. With her share of the family fortune, she founded a college for English Jesuits at Louvain which was transferred to Watten near Saint Omer in 1612 and lasted till the suppression of the Order. In 1605, she arrived in England and established herself under the protection of the Spanish ambassador, whose house was in the Barbican. From there she carried on an active and successful propaganda. She made herself conspicuous by her attentions to the Gunpowder Plot prisoners, and won converts, partly by persuasion, partly by assisting the poor. She was arrested in 1608. But the protection of the Spanish ambassador, and the desire of King James I. to stand well with Spain, secured her release. In 1613, while staying at a house in Spitalfields, where she had set up a disguised nunnery, she was arrested with all the inmates by the pursuivants of Abbot, archbishop of Canterbury. Her release was again secured by the new Spanish ambassador Gondomar. The Spanish authorities thinking her a political danger, recalled her, but before she could be forced to obey she died without her desired martyrdom on Jan. 2, 1614.

See L. Muñoz *La Vida y Virtudes de la Venerable Virgen Doña Luisa de Carvajal y Mendoza* (1632). It is summarized by Southey in his *Letters from Spain and Portugal* (1808). See also *Quatre Portraits de femmes*, by La Comtesse R. de Courson (1895), and refs. in *Records of the English Province of the Society of Jesus*, by Henry Foley (1877-83).

**CARVER, JONATHAN** (1710-1780), American traveller, was born in Weymouth (Mass.), a son of David and Hannah (Dyer) Carver. When he was eight years old his family moved to Canterbury (Conn.), where he gained what seems to have been a fair education, including something of surveying. Here in 1746 he married Abigail Robbins, and a few years later they moved to Montague (Mass.). At the beginning of the French and Indian War Carver joined the Massachusetts provincial troops, serving efficiently until peace was declared and holding the rank of captain the last two years. Part of this period he served in Quebec as a surveyor, and here in the wilderness he may have first dreamed of exploring the great north-western territories, and of finding an overland route to the western sea. Carver's opportunity came through Major Robert Rogers, newly appointed commandant of the north-western fort and trading post of Mackinac, who entertained similar designs. Rogers sent a number of agents among the more distant Indian tribes to win their allegiance and trade and to learn more of the country. Carver travelled, as one of these, by the Fox-Wisconsin route to the Mississippi and up that river to the Falls of St. Anthony to visit the Sioux tribes. He spent the winter of 1766-67 at one of their villages on the Minnesota river and gained an elementary knowledge of their language and customs. In the spring he started to return to Mackinac, but at the mouth of the Wisconsin river he met Captain James Tute, in command of a party sent out by Rogers to explore a route to the Pacific ocean. Tute brought orders for Carver to join the party as draughtsman and third in command. They proceeded up the Mississippi and crossed to and skirted the shores of Lake Superior to the Grand Portage. There they waited for supplies from Rogers, but his failure to send them caused Tute to abandon his expedition and return by the north shore of Lake Superior to the fort, where he arrived in Aug. 1768. Rogers had exceeded his powers in employing these agents, and Carver was never paid. After nine years of misfortune and poverty his book, *Travels through the Interior Parts of North America in the years 1766, 1767, 1768*, was printed in London (1778). Its success was immediate, but this came too late to bring the author any material benefit. He died in London in 1780, a broken old man, 70 years of age, and was buried in the potter's field. No narrative of early adventure and travel in America has ever approached the popularity of this work. At least 32 editions in English, French, German and Dutch were printed. The second part, dealing with the life and customs of the Indians, is largely plagiarized from earlier French writers, but this does not warrant discrediting the whole as some historians have done. Carver's original journals, including a day-by-day log of his journey, are in the British Museum and substantiate the main facts of the first part of his book. Careful comparison leads to the conclusion that the book was written

from memory, with these journals not at hand. Besides the minor inaccuracies, the book is guilty of deliberate falsification when it denies Rogers credit for initiating the expedition and conceals the fact that Tute commanded it. Just how far Carver is responsible for these deceptions and the plagiarism cannot be determined.

See J. T. Lee, *A Bibliography of Carver's Travels* (Wis. Hist. Soc., Proceedings, 1909, pp. 143-183), and *Captain Jonathan Carver: Additional Data* (Ibid., 1912, pp. 87-123); W. Browning, "The Early History of Jonathan Carver" (*Wisconsin Magazine of History*, iii, 291-306); and T. C. Elliott, "Jonathan Carver's Source of the Name Oregon" (*Oregon Hist. Soc., Quarterly*, xxiii, 53-59).

(O. W. H.)

**CARVING.** In carving a long sharp knife and a two-pronged fork are essential, and a steel should also be provided.

*Sirloin.*—Place the joint with the chine bone to the left and the fillet underneath. Release the meat from the chine bone and also from the blade bone for about three-quarters to one inch, according to the number of persons to be served. Then carve in thin slices the entire length of the joint. To carve the fillet or undercut, reverse the joint, loosen the meat from the bone, and cut in slices at right angles to the blade bone.

An alternate method when a large number of portions have to be served, is to turn the dish so that one end faces the carver and the chine bone is at the opposite end. Release the meat from the chine bone with the pointed end of the knife, and cut the meat, slicing vertically the whole length of the joint, commencing at the left hand outside.

*Leg of Mutton.*—Place the knuckle end to the left of the dish and turn the joint on the dish in such a way that the part with the most meat is away from the carver. Commence slicing about two or three inches from the knuckle, holding the knife in a slanting position and working from left to right. Continue until the meat on the upper side of the joint is removed. Turn the joint, and with the knife in a horizontal position and parallel with the dish slice off the remaining meat.

*Shoulder of Mutton.*—Place the joint with the knuckle towards the left hand of the carver. Put the fork securely into the knuckle, raising the joint from the dish. Commence slicing to the left hand side near the fork, carving across the grain in neat slices of about one-quarter to one-eighth of an inch thick. Towards the end of the joint it will be necessary to turn the knife slightly to release the meat from the bone. When as much of the meat as possible has been removed, turn the joint over, keeping the knuckle to the left and the knife in a horizontal position and parallel to the dish, carving thin slices, working from the right to the left.

**Poultry and Game.**—In the case of large birds, it is well to remove the wish-bone or merry thought before carving; birds should be placed with the legs turned away from the carver.

*Turkey.*—Remove the legs by cutting through the thin skin which connects the top of the leg and breast. Then gently pull the joint from the carcass and separate it with the pointed end of the knife; the meat should be cut in vertical slices from the upper joint of the leg. Remove the wing with a portion of the breast, then carve the latter in long, thin slices. An alternative method is to commence carving the breast after the removal of the leg but before the wings. Capon and large fowl are carved in the same way as a turkey.

*Chicken.*—Remove the legs in the same way as when carving a turkey. Cut the legs in half lengthways, serving the drum-stick half with the wing and the other part with the breast. Then slice the remainder of the breast. An alternative method, suitable for hotel and restaurant use, and when dealing with small birds, is to divide the carcass in half horizontally, cutting the remainder into two by chopping through the breast bone lengthways, rejecting the back or under-carcass. Pheasant, blackcock, capercaillie and duck are carved in the same way.

*Goose.*—Remove the legs and wings with a portion of the breast and slice the latter. Release the flesh from the breast bone and carve the breast in thin slanting slices, starting from where the wings have been removed.

*Pigeons, Partridges and Other Small Game.*—When the birds are small and only enough for two portions divide equally into two, cutting through the breast bone with a sharp knife. If available,

## METHODS OF CARVING JOINTS, POULTRY AND GAME

1. Carving a leg of mutton (first position)
2. Second position in carving a leg of mutton
3. Carving a goose. After one leg and the wings have been removed, slices are taken from the breast
4. Carving a roast hare. The first cuts are taken from the back

### METHODS OF CARVING VARIOUS MEATS

1. Carving a sirloin of beef, showing the correct position of the knife and fork with relation to each other and to the grain of the meat
2. Carving a chicken, showing method of cutting slices from the breast after the removal of one wing
3. Carving a turkey, showing, as in Figure 2, the method of removing slices of white meat from the side of the breast
4. Second position in carving a leg of mutton, showing the horizontal position of the knife. (Compare with Plate I, Figures 1 and 2)

use game scissors for they facilitate the severing of the back bone. They are also convenient for removing the base of this bone, which should be done before serving. To serve four portions, cut in half along the breast bone and divide each side of the bird in half with a slanting cut from the point where the wing joins the carcase towards the neck end.

**Wild Duck.**—Remove the wings, dissect the entire breast away from the carcase and carve in horizontal slices across the grain.

**Roast Hare.**—Remove a rectangular portion of flesh from the back forming the saddle, and cut in thin slices. Then slice the flesh from the hind legs. (D. D. C. T.)

**Carving in Sculpture.**—To carve is to cut, whatever the material; but more particularly as appertains to the art of sculpture. The name of sculpture (*see* SCULPTURE) is commonly reserved for the great masters of the art, especially in stone and marble, while that of carver is given to the artists or workmen who execute the subordinate decorations of architecture. The word is also specially applied to sculpture in ivory (*q.v.*) and its substitutes, and in wood (*see* WOOD-CARVING) and other soft materials (*see also* GEM).

**CARVING TOOLS**, the various instruments used in the art of cutting wood, stone, ivory, etc., for ornamental purposes. Primitive peoples employed sharpened fish-bones, flint and shells in carving wood and ivory articles, accomplishing results that to-day would seem impossible. After the discovery of steel the tools for carving were developed considerably; however, the principles of many of the oldest tools are still being used, differing only in the quality of steel. The names and uses of the tools employed in the carving of the most important materials, viz., wood, stone and ivory, are given below.

**Wood-carving Tools.**—The history and development of wood-carving tools may be said to follow the history of iron and steel tools. Except for certain refinements in the steel itself, working methods, etc., and the better and lighter design of the tools, the wood-carving tools of to-day are practically the same as those used several centuries ago. A professional wood-carver may have well over a hundred tools, most of these varying only slightly in size, width and sweep, using them according to the requirements of his work. Japanese and Chinese wood-carvers do very fine work with but few tools, a single knife often being employed for many different purposes.

Beginners are usually advised to start with a set of tools varying from 12 to 24, as the other tools are largely only variations of these in size and sweep, and may be acquired as experience dictates. The wood-carver's tools consist largely of chisels, knives and gouges of various shapes and sizes. These are generally lighter in weight and of a design more suitable for wood-carving than the chisels and gouges used by the carpenter or joiner. Many of the carving tools vary only in the size and sweep of the cutting edge. When a wood-carver speaks of the "sweep" of a gouge, he means the actual curve at the cutting edge, as made when the tool is pressed perpendicularly into a piece of wood.

Chisels and gouges for wood-carving vary from  $\frac{1}{4}$  in. to 1 in. in width at the cutting edge, the curves or "sweeps" of the gouges varying from that of a half circle, called a deep gouge, to a curve that is almost flat, called a flat gouge. The chisels vary in width at the edge, some of them having the edge straight across or at right angles to the blade while others have the edge slanted off at an angle across the tool.

Wood-carving tools are made in two forms: straight-sided (fig. 1, A) and spade-shaped or fish-tailed (B). The latter conceals less of the wood under the tool and also works into corners where a straight-sided tool could not be used.

A straight tool (A) is more generally used than any other. A "long bend" tool and a "short bend" are shown also (C and D). These two tools are used in places where the straight tool would not cut, as in deep hollows. Straight-, long- and short-bend tools may be obtained in the straight-sided or fish-tailed types. Wood-carvers also use especially shaped knives for their work, three types being shown (E). Stamps made of steel are sometimes used by the carver to stamp portions of carved backgrounds into more or less regular patterns, two of which are illustrated (G). Some

wood-carvers make them from iron or steel nails, sawing off the nails and filing the ends into various shapes. Special files, called carver's rasps (H), are sometimes used for roughing out or smoothing off parts of the work.

For the lighter cuts the wood-carver uses the tool with his hands, one hand pushing the tool and the other hand resting on the blade, controlling it. For heavy cuts, usually in preliminary work,

FIG. 1.—VARIOUS TOOLS USED IN WOOD CARVING. SEE TEXT FOR DETAILS

he uses a carver's mallet or maul to drive the tool (F). When clearing away large quantities of wood, as in the preliminary stages of large work, many carvers use the heavier carpenter's or wood-worker's chisels and gouges, and at times parts of the wood are bored away or entirely through, with a brace and bit, the work being of course finished up with the regular carving-tools.

Generally the work that is being carved is held firmly to the bench by clamps, or it is clamped in a vice. A wood-carver's bench is provided with holes in the top, and the top of the vice, which is level with the bench, is also provided with a hole. Pegs fit in these holes. Flat work is rested on the bench top in such a manner as to come between a peg in the vice and one or more pegs in the bench top, the vice being squeezed up to hold the work firmly between the pegs. The top of a wood-carver's bench is here illustrated (J).

Wood-carving tools are made of the best grades of fine tool steel, forged into the various chisel, gouge and knife shapes by a skilled tool-smith, using a charcoal, coal or gas fire in the forge to heat the steel, usually to a dull red colour. When the tool is forged into shape, it is again heated to a dull red and hardened by plunging it into an oil or water bath, after which it is tempered by a slight reheating, the temper being drawn to a lemon yellow or a dull straw colour. Authorities differ as to the proper amount of hardness to be left in the edge of a carving-tool and many wood-carvers reharden and temper their tools to their own liking. After the tempering process the edge of the tool is ground down on a grindstone, the tool being well moistened with water to keep it from so heating as to destroy the temper. The rough edge thus formed is smoothed down by rubbing it back and forth on a fine-grained oil stone, well moistened with oil, until a very keen edge is obtained. Specially shaped stones called "slips," which are oil stones shaped to fit inside gouges and other tools, are used at this stage for the inside sharpening of the tools, the slip being held in one hand and rubbed against the tool held in the other hand. During the sharpening the edge of the tool is frequently driven into soft wood to remove the "feather edge," or fringe of steel which forms on the edge of the tool. Slips and small stones are frequently used as above by the carver to obtain very

fine and accurate edges, particularly on small tools of all shapes. Many wood-carvers sharpen both sides of the edge, the under side at the usual angle and the top side at a very slight angle, though experts differ as to this. The final edge is given to wood-carving tools by stropping them on a piece of oily leather which is charged with some fine abrasive, such as crocus or rouge, to obtain the very sharp cutting edge necessary for all wood-carving tools.

Tools that are used in hard wood are frequently ground and sharpened at a lesser angle than those used in soft wood by professional carvers, who sharpen their tools frequently as they work, never allowing them to become dull. Sharpening is a very difficult art and requires much practice before a satisfactory edge may be had. Instead of a grind-stone many carvers now use a quick-cutting, flat, carborundum stone, well charged with oil, on which the tool is rubbed to a rough edge, before finishing up with the finer stones and the strop.

**Stone-carving Tools.**—The stone-cutter's instruments, as distinguished from those of the wood-cutter, are largely as follow: (1) Chisels, with various shapes, widths, and tempers; (2) tooth chisels, for the first or rougher cutting; (3) splitters; (4) hand-drills; (5) bow-drills; (6) points; (7) pointing machine; (8) pneumatic tools; (9) rasps; (10) hand hammers, including wooden mallets; (11) dummies, which may be of copper, soft iron or lead.

**Ivory-carving Tools.**—The tools for ivory-carving seem to have remained much the same within historic record. The material requires very hard and sharp tools for cutting; however, it is easily sawed or filed. The average ivory-carver's tools include the following: (1) bow-saw, or a small-toothed circular saw for the preliminary cutting; (2) float, a tapering tool in a wooden handle; (3) gouge and mallet; (4) rasp and file; (5) chisels; (6) scraper, a distinctive tool of ivory-carving, resembling a wood-carving chisel, and used for removing the substance in shavings, for engraving the most delicate lines or for finishing; (7) miscellaneous tools, such as drills, compasses, groovers and a large selection of knives for paring and finishing. (See also SCULPTURE TECHNIQUE; IVORY-CARVING.) (E. TH.)

**CARY, ALICE** (1820–1871), and **PHOEBE** (1824–1871), American poets, were born at Mount Healthy, near Cincinnati (Ohio), respectively on April 26, 1820, and Sept. 4, 1824. Their education was largely self-acquired, and their work in literature was always done in unbroken companionship. Their poems were first collected in a volume entitled *Poems of Alice and Phoebe Carey* (1850). Alice, who was much the more voluminous writer of the two, wrote prose sketches, novels and poems, the best of which treat the surroundings and friends of her girlhood. Her lyrical poem, "Pictures of Memory," was praised by Edgar Allan Poe. Phoebe published two volumes of poems (1854 and 1868), but is best known as the author of the hymn "Nearer Home," beginning "One sweetly solemn thought." Alice died in New York city, Feb. 12, 1871, and Phoebe in Newport (R.I.), July 31 of the same year.

The collected *Poetical Works of Alice and Phoebe Cary* were published in Boston in 1886.

**CARY, ANNIE LOUISE** (1842–1921), American singer, was born in Wayne (Me.), on Oct. 22, 1842. She studied in Milan, and made her début as an operatic contralto in Copenhagen in 1868. She had a successful European career for several years, singing in Stockholm, Paris and London, and made her New York first appearance in 1870. Until she retired in 1882, on her marriage to Charles M. Raymond, she was the most popular singer in America. She died on April 3, 1921, at Norwalk (Conn.).

**CARY, HENRY FRANCIS** (1772–1844), translator of the *Divina Commedia*, was born at Gibraltar, the son of an army captain, and educated at Christ Church, Oxford, where he devoted much time to the study of French and Italian literature. On leaving Oxford he took holy orders. For about 11 years he was assistant-librarian in the British Museum, and in 1841 he received a Crown pension. His translation of the whole of the *Divine Comedy* appeared in 1814, was praised by Coleridge, and passed through four editions during its author's lifetime. Though Cary's blank verse hardly reproduces the strength and terseness of Dante's *terza rima*, the translation has great merits.

**CARYATID**, a draped female figure used as a support, especially in Greek, Roman and Renaissance architecture.

**CARYOPHYLLACEAE**, a family of dicotyledonous plants, containing about 80 genera with 1,300 species, and widely distributed, especially in temperate, alpine and arctic regions. The plants are herbs, sometimes becoming shrubby at the base, with opposite, simple, generally uncut leaves and swollen nodes. The main axis ends in a flower (definite inflorescence), and flower-

FIG. 1.—PINK (DIANTHUS), A SWEET SCENTED FLOWER OF RED OR PINK AND WHITE BLOSSOMS

bearing branches are borne one on each side by which the branching is often continued. The flowers are regular, with four or five sepals which are free or joined to form a tube in their lower portion, the same number of petals, free and springing from below

FIG. 2.—PINK (DIANTHUS), SHOWING DETAILS OF STRUCTURE  
A. Flowering shoot  
B. Flower in vertical section  
C. Floral diagram

the ovary, twice as many stamens, inserted with the petals, and a pistil of two to five carpels joined to form an ovary containing a large number of ovules on a central placenta and bearing two to five styles; the ovary is one-celled or incompletely partitioned at the base into three to five cells; honey is secreted at the base of the stamens. The fruit is a capsule containing a large number of small seeds and opening by apical teeth; the seed contains a floury endosperm and a curved embryo.

The family is divided into two well-defined tribes which are distinguished by the character of the flower and the arrangements for ensuring pollination.

I. *Alsinoideae*: the sepals are free and the flowers are open, with spreading petals, and the honey which is secreted at the base of the stamens is exposed to the visits of short-tongued insects, such as flies and small bees; the petals are white in colour. It includes several British genera, *Cerastium* (mouse-ear chickweed), *Stellaria* (stitchwort and chickweed), *Arenaria* (sandwort), *Sagina* (pearlwort), *Spergula* (spurrey) and *Spergularia* (sandwort spurrey).

II. *Silenoideae*: the sepals are joined below to form a narrow tube, in which stand the long claws of the petals and the stamens, partly closing the tube and rendering the honey inaccessible to all but long-tongued insects such as the larger bees and Lepidoptera. The flowers are often red. It includes several British genera:—*Dianthus* (pink), *Silene* (catchfly, bladder campion), *Lychnis*

(campion, *L. Flos-Cuculi* is ragged robin), and *Githago* or *Agrostemma* (corn cockle). Several, such as *Lychnis vespertina*, *Silene nutans* and others, open their flowers and become scented in the evening or at night, when they are visited by night-flying moths.

In North America the family is represented by about 300 species, most numerous in mountain regions and belonging chiefly to *Silene*, *Arenaria*, *Alsine* and *Cerastium*.

The plants of this family are of little or no economic value. *Dianthus* (carnation and pink), *Gypsophila*, *Lychnis* and others, are garden plants.

**CASABIANCA, RAPHAEL**, COMTE DE (1738–1825), French general, was descended from a noble Corsican family, and in 1793 was appointed lieutenant-general in Corsica in place of Pascale Paoli, who was outlawed for intrigues with England. After the 18th Brumaire he entered the senate and was made count of the empire in 1806.

His nephew, **LOUIS DE CASABIANCA** (1762–1798), entered the French navy, and in 1792 was in command of the "Orient," which at the battle of the Nile bore the flag of Admiral Brueys. When the latter was killed, Casabianca, though badly wounded, fought the burning ship to the end, and perished with most of the crew. His son, Giacomo Jocante, a boy of ten years of age, refused to leave the ship and died in trying to save his father. This heroic act was the subject of several poems, including the well-known ballad by Mrs. Hemans.

**CASABLANCA**, a seaport on the Atlantic coast of Morocco, in 33° 27' N., 7° 46' W. The town is built on the site of the ancient city of the same name, is rectangular in shape, with its base toward the sea. The central point of the city is the Place de France, from which all the main routes of the city radiate. In recent years Casablanca has become a considerable port, and harbour developments have made it one of the busiest towns of northern Africa, while ships of the greatest tonnage can be accommodated at the quay.

Casablanca is now the second town of Morocco, with a population of 106,608 (71,624 natives—52,134 Muslims and 19,490 Jews—and 34,984 Europeans, of whom 20,183 are French). The town was originally founded by the Portuguese, on the site of the ancient Anfâ, which they destroyed in 1465. It was occupied by the French in Aug. 1907, in consequence of the murder of a number of French and Spanish workmen engaged on the harbour works. In 1924 large electric power works, erected in connection with the electrification of the railways, were completed, and further extensions of the harbour works undertaken in 1925 are now completed.

**CASA GRANDE**, a national reserve, technically known as a national monument, in Pinal county, Ariz., which has within its bounds some of the most noteworthy relics of a prehistoric age and people within the limits of the United States. The ruins are situated near the left bank of the Gila river about 12m. from Florence, Ariz., and 15m. north-east of the station, Casa Grande, on the Southern Pacific railway. It resembles the Casa Grande ruin of Chihuahua, Mexico, with its walls of sundried caliche (a composition of lime, earth and pebbles), and its area of rooms, courts, plazas and pyramids, surrounded by a wall. The first known white man to visit Casa Grande was the Jesuit missionary Kino, in 1694. The house was already a ruin but he described it as large and ancient and certainly four stories high. In the immediate vicinity were the ruins of other houses, and in the country towards the north, east and west were ruins of similar structures. The identity of its builders has been a subject of speculation from the discovery of the ruins to the present day. The age of Casa Grande is unknown but there is reason to believe that settlements on its site antedate most of the present cliff dwellings of the south-west. An agricultural economy is indicated by a network of irrigation canals. John Russell Bartlett described the ruins in 1854, and in 1889 Congress voted that it be protected as a government reservation; in 1892 it was set apart by the government. Subsequent excavations have disclosed many facts pertaining to the life and customs of this ancient race.

See General Information regarding Casa Grande Ruins, Arizona, a bulletin of the U.S. department of the interior.

FIG. 3.—DETAIL OF THE MOUSE-EAR CHICKWEED (*CERASTIUM HIRSUM*)

A. Pistil out vertically  
B. Pistil out horizontally, and the halves separated so as to show the interior of the cavity of the ovary

**CASALE MONFERRATO**, a town and episcopal see of Piedmont, Italy, in the province of Alessandria, 21m. N.N.W. by rail from the town of Alessandria. Pop. (1921) 20,453 (town); 34,253 (commune). It lies in the plain on the right bank of the Po, 377ft. above sea-level, and is a junction for Mortara, Vercelli, Chivasso and Asti; it is also connected by steam tramways with Alessandria, Vercelli and Montemagno. The fine Lombard Romanesque cathedral, originally founded in 742, was rebuilt 1100-06. The church of S. Domenico is a good Renaissance edifice, and there are some fine palaces. About 10m. distant is the Sacro Monte di Crea, with 18 chapels on its slopes containing terracotta groups of statues, resembling those at Varallo. Casale Monferrato was given by Charlemagne to the church of Vercelli, but obtained its liberty from Frederick I. (Barbarossa). It was sacked by the troops of Vercelli, Alessandria and Milan in 1215, but rebuilt and fortified in 1220. It fell under the power of its marquises in 1299, and became the chief town of a small state. In 1536 it passed to the Gonzagas of Mantua, who fortified it very strongly. It has since been of considerable importance as a fortress; it successfully resisted the Austrians in 1849, and was strengthened in 1852. There are large cement factories here.

**CASALS, PABLO** (1876- ), eminent violoncellist, composer and conductor, was born at Vendrell, near Barcelona, Dec. 30, 1876. He received his first musical instruction from his father, an organist, later becoming a pupil of José García at the Barcelona conservatoire and then studying at Madrid. He made his first public appearance in Barcelona in 1889 but had to wait some years before he obtained general recognition. Thus it was not till 1898 that he was heard in Paris (Lamoureux concerts) and in London (Crystal palace); but thenceforward his fame rapidly extended. His first visit to the United States he paid in 1901. Casals is also a distinguished conductor, whose orchestral concerts in Spain are of the first importance; a fine pianist, and a composer, his works include symphonies and symphonic poems. He married first Guilhermina Suggia, and subsequently Susan Metcalfe. See Lillian Littlehales, *Pablo Casals* (1930).

**CASAMARI**, a Cistercian abbey in the province of Rome, 6m. E.S.E. of Veroli. It marks the site of Cereatae, the birthplace of Marius, afterwards known as Cereatae Marianae. The abbey is a fine example of Burgundian early-Gothic (1203-17), paralleled in Italy by Fossanuova alone (which is almost contemporary with it), and is very well preserved.

**CASANOVA DE SEINGALT, GIOVANNI JACOPO** (1725-1798), Italian adventurer and author of the famous *Mémoires*, was born at Venice in 1725. His parents, taking a journey to London, left him, when he was a year old, in charge of his grandmother, who sent him at 16 to the seminary of St. Cyprian in Venice, from which he was expelled for scandalous and immoral conduct, which would have cost him his liberty, had not his mother procured him a situation in the household of the Cardinal Acquaviva where he remained for a short time before he began that career of adventure and intrigue which only ended with his death. He visited Rome, Naples, Corfu and Constantinople. By turns journalist, preacher, abbé, diplomatist, he was nothing very long, except *homme à bonnes fortunes*. In 1755, having returned to Venice, he was denounced as a spy and imprisoned. On Nov. 1, 1756 he escaped, and made his way to Paris. Here he was made director of the state lotteries, gained much financial reputation and a considerable fortune, and made a figure in high society. In 1759 he set out again on his travels. He visited in turn the Netherlands, South Germany, Switzerland—where he made the acquaintance of Voltaire,—Savoy, southern France, Florence—whence he was expelled,—and Rome, where the pope gave him the order of the Golden Spur. In 1761 he returned to Paris, and for the next four or five years lived partly here, partly in England, South Germany and Italy. In 1764 he was in Berlin, where he refused the offer of a post made him by Frederick II. He then travelled by way of Riga and St. Petersburg to Warsaw, where he was favourably received by King Stanislaus Poniatowski. A scandal, followed by a duel, forced him to flee, and he returned by a devious route to Paris, only to find a *lettre de cachet* awaiting him, which drove him to seek refuge in Spain. Expelled from

Madrid in 1769, he went by way of Aix—where he met Cagliostro—to Italy once more. From 1774, with which year his memoirs close, he was a police spy in the service of the Venetian inquisitors of state; but in 1782, in consequence of a satirical libel on one of his patrician patrons, he had once more to go into exile. In 1785 he was appointed by Count Waldstein, an old Paris acquaintance, his librarian at the château of Dux in Bohemia. Here he lived until his death, which probably occurred on June 4, 1798.

The main authority for Casanova's life is his *Mémoires* (12 vols., Leipzig, 1826-1838; many later editions and translations), which were written at Dux. They are clever, well written and, above all, cynical, and interesting as a trustworthy picture of the morals and manners of the times. Among Casanova's other works are *Confutazione della storia del governo Veneto d'Amelot de la Housaye* (Amsterdam, 1769); and the *Histoire* (Leipzig, 1788; reprinted Bordeaux, 1884; Eng. trans. by P. Villars, 1892). See Arthur Machen, trans., *Memoirs of Casanova*; S. G. Endore, *Casanova: His Known and Unknown Life* (1929); M. Rostand, *Private Life of Casanova* (1929).

**CASAS GRANDES** ("Great Houses"), a small village of Mexico, in the State of Chihuahua, on the Casas Grandes or San Miguel river, about 35m. S. of Llanos and 150m. N.W. of the city of Chihuahua. The railway from Ciudad Juárez to Terrazas passes through the town. It is celebrated for the ruins of early aboriginal buildings still extant, about half a mile from its present site. They are built of "sun-dried blocks of mud and gravel about 22in. thick, and of irregular length, generally about 3ft., probably formed and dried *in situ*." The walls are in some places about 5ft. thick, and they seem to have been plastered both inside and outside. The principal edifice extends 800ft. from north to south, and 250ft. east to west; its general outline is rectangular, and it appears to have consisted of three separate piles united by galleries or lines of lower buildings. The exact plan of the whole is obscure, but the apartments evidently varied in size from mere closets to extensive courts. The walls still stand at many of the angles with a height of from 40 to 50ft., and indicate an original elevation of several storeys, perhaps six or seven. At a distance of about 450ft. from the main building are the substructions of a smaller edifice, consisting of a series of rooms ranged round a square court, so that there are seven to each side besides a larger apartment at each corner. The age of these buildings is unknown, as they were already in ruins at the time of the Spanish conquest. The whole region of Casas Grandes is studded with artificial mounds, from which are excavated from time to time numbers of stone axes, metates or corn-grinders, and earthen vessels of various kinds. The earthen vessels have a white or reddish ground, with ornamentation in blue, red, brown, or black, and are of much better manufacture than the modern pottery of the country. Similar ruins to those of Casas Grandes exist near Gila, the Salinas and the Colorado, and it is probable that they are all the erections of one people. Bancroft is disposed to assign them to the Moquis.

See H. H. Bancroft, *The Native Races of the Pacific States of North America*, of which the principal authorities are the *Noticias del Estado de Chihuahua* of Escudero, who visited the ruins in 1819; an article in the first volume of the *Album Mexicano*, the author of which was at Casas Grandes in 1842; *Personal Narrative of Explorations and Incidents in Texas, New Mexico, California, Sonora and Chihuahua* (1854), by John Russell Bartlett, who explored the locality in 1851.

**CASATI, GAETANO** (1838-1902), Italian geographer and traveller in Africa. Born at Lesmo, he entered the corps of Bersaglieri in 1859 and took part in the wars of independence against Austria. Subsequently he was employed in the making of the ordnance survey maps of Italy. In 1879 Casati resigned his commission to devote himself wholly to geographical work. In the same year he started for the Bahr el Ghazal province of the Sudan to join Gessi Pasha (see *SUDAN: History*). He travelled widely in that region and visited the upper Welle basin of the Congo. He also carried on operations against slave raiders and on the rise of the Mahdi made his way south to Lado, where in 1883 he joined Emin Pasha, under whom he served. He was for some time Emin's agent in Unyoro. There he was made prisoner and tied naked to a tree. Left to his fate he managed to escape and re-joined Emin. In 1889 he accompanied H. M. Stanley and Emin to Bagamoyo and returned to Italy. Later he published an

account of his travels (Eng. trans. *Ten Years in Equatoria*), which had added a good deal to the knowledge of the headwaters of the Nile.

**CASAUBON, FLORENCE ESTIENNE MÉRIC** (1599-1671), English classical scholar, son of Isaac Casaubon, was born at Geneva Aug. 14 1599, and completed his education at Eton and Oxford. For his defence of his father against the attacks of certain Catholics (*Pietas contra maledicos patrii Nominis et Religionis Hostes*, 1621) and against imposters who had published, under his name, a work on *The Origin of Idolatry (Vindictio Patris adversus Impostores*, 1624), James I. conferred on him a prebendal stall at Canterbury. During the Civil War he lived a retired life, and after its conclusion refused to acknowledge the authority of Cromwell, who, notwithstanding, requested him to write an "impartial" history of the events of the period, an offer which he declined. After the Restoration he was reinstated in his benefice. He died at Canterbury July 14 1671. His editions of numerous classical authors, and especially of the *Meditations* of Marcus Aurelius (also English translation, new ed. by W. H. D. Rouse, 1900), were highly valued. Among his other works may be mentioned: *De Quatuor Linguis Commentatio* (1650), *Of the Necessity of Reformation* (1664), *On Credulity and Incredulity in Things natural, civil, and divine* (1668).

**CASAUBON, ISAAC** (1559-1614), French (naturalized English) classical scholar, was born in Geneva on Feb. 18, 1559, of French refugee parents. On the publication of the edict of Jan. 1562, the family returned to France and settled at Crest in Dauphiné. Till he was 19, Isaac had no other instruction than could be given him by his father, Arnaud Casaubon, during the years of civil war. His father was away from home whole years together in the Calvinist camp, or the family were flying to the hills to hide from the fanatical bands of armed Catholics who patrolled the country. Thus it was in a cave in the mountains of Dauphiné, after the massacre of St. Bartholomew, that Isaac received his first lesson in Greek, the text-book being Isocrates's *ad Demonicum*.

At 19 Isaac was sent to the Academy of Geneva, and in 1581 became professor of Greek. At Geneva he remained as professor of Greek till 1596. Here he married twice, his second wife being Florence, daughter of the scholar-printer, Henri Estienne. With few books and no assistance, in a city peopled with religious refugees, and struggling for life against the troops of the Catholic dukes of Savoy, Casaubon made himself a consummate Greek scholar and master of ancient learning. His great wants at Geneva were books and the sympathy of learned associates. He spent all he could save out of his small salary in buying books and in having copies made of such classics as were not then in print. The sympathy and help which Casaubon's native city could not afford him, he endeavoured to supply by cultivating the acquaintance of the learned of other countries. Geneva, as the metropolis of Calvinism, received a constant succession of visitors. It was there that Casaubon made the acquaintance of young Henry Wotton, the poet and diplomatist, and of Richard Thomson ("Dutch" Thomson), fellow of Clare college, Cambridge, through whom the attention of Joseph Scaliger, settled in 1593 at Leyden, was directed to Casaubon. Scaliger and Casaubon began in 1594 a correspondence which culminates in a tone of the tenderest affection and mutual confidence. Influential French men of letters, the Protestant Jacques Bongars, the Catholic Jacques de Thou, and the Catholic convert Philippe Canaye, sieur du Fresne, aided him by presents of books and encouragement and endeavoured to get him invited, in some capacity, to France.

In 1596 Casaubon accepted an invitation to the university of Montpellier, with the titles of *conseiller du roi* and *professeur stipendié aux langues et bonnes lettres*. He held the professorship there only three years as he was badly treated by the authorities. But the love of knowledge was gradually growing upon him and he began to perceive that editing Greek books was an employment more congenial to his peculiar powers than teaching. At Geneva he had first tried his hand on some notes on Diogenes Laërtius, on Theocritus, and the New Testament, the

last undertaken at his father's request. His début as an editor had been a complete Strabo (1587), of which he was so ashamed afterwards that he apologized for its crudity to Scaliger, calling it "a miscarriage." This was followed by the text of Polyænus, an *editio princeps*, 1589; a text of Aristotle, 1590; and a few notes contributed to Estienne's editions of Dionysius of Halicarnassus and Pliny's *Epistolæ*. It is not till we come to his edition of Theophrastus's *Characteres* (1592) that we have a specimen of that peculiar style of illustrative commentary, at once apposite and profuse, which distinguishes Casaubon among annotators. At the time of his removal to Montpellier he was engaged upon the capital work of his life, his edition of, and commentary on, Athenæus.

In 1598 Casaubon was in Lyons, superintending the passage of his Athenæus through the press. There he lived in the house of Méric de Vicq, *surintendant de la justice*, a Catholic but a man of acquirements whose connections were with the circle of liberal Catholics in Paris. In the suite of de Vicq, Casaubon was presented to Henry IV., who said something about employing his services in the "restoration" of the university of Paris. In 1599 Casaubon was summoned by de Vicq, who was then in Paris, to go to him in all haste on an affair of importance. The business proved to be the Fontainebleau Conference. Casaubon allowed himself to be persuaded to sit as one of the referees who were to adjudicate on the challenge sent to du Plessis Mornay by Cardinal Duperron. By so doing he placed himself in a false position. The issue was so contrived that the Protestant Party could not but be pronounced in the wrong. By concurring in the decision, which was unfavourable to du Plessis Mornay, Casaubon lent the prestige of his name to a court whose verdict, without him, would have been worthless, and confirmed the suspicions already current among the Reformed churches that he was meditating abjuration. From this time onward he became the object of the hopes and fears of the two religious parties; the Catholics lavishing promises and plying him with arguments; the Reformed ministers insinuating that he was preparing to forsake a losing cause and only higgling about his price. At the time it was not possible for the immediate parties to the bitter controversy to understand the intermediate position between Genevan Calvinism and Ultramontaniam, to which Casaubon's reading of the Fathers had conducted him.

Meantime the efforts of de Thou and the liberal Catholics to retain him in Paris were successful. The king repeated his invitation to Casaubon to settle in the capital and assigned him a pension. No more was said about the university. The reform of the University of Paris had already closed its doors to all but Catholics. In Nov. 1604 Casaubon succeeded to the post of sub-librarian of the royal library, with a salary of 400 livres in addition to his pension.

Casaubon remained in Paris till 1610. Those ten years constituted the brightest period of his life. He had attained the reputation of being, after Scaliger, the most learned man of the age. He was placed above penury. He had such facilities for religious worship as a Huguenot could have. He enjoyed the society of men of learning. Above all, he had ample facilities for using Greek books, both printed and in ms., which no other place but Paris could at that period have supplied.

In spite of all these advantages Casaubon grew restless, and offers came to him from various quarters, from Nîmes, from Heidelberg, from Sedan. His friends Lect and Giovanni Diodati wished, rather than hoped, to get him back to Geneva, but the principal source of Casaubon's uneasiness lay in his religion. The life of any Huguenot in Paris was hardly secure at that time, but Casaubon was exposed to persecution of another sort. Ever since the Fontainebleau Conference an impression prevailed that he was wavering. It was known that he rejected the *outré* antipapery opinions current in the Reformed Churches; that he read the Fathers and wished for a Church after the pattern of the primitive ages. He was given to understand that he could have a professorship only by recantation. When it was found that he could not be bought he was plied by controversy. By the king's orders Duperron was untiring in his efforts to convert him. On

the other hand, the Huguenot theologians, and especially Pierre du Moulin, chief pastor of the church of Paris, accused him of conceding too much, and of having departed already from the lines of strict Calvinistic orthodoxy.

When the assassination of Henry IV. gave full rein to the Ultramontane Party at court Casaubon began to listen to overtures, which had been faintly made before, from the bishops and the Court of England. In Oct. 1610 he came to England at the invitation of Richard Bancroft, archbishop of Canterbury. He had the most flattering reception from James I., who was perpetually sending for him to discuss theological matters. The English bishops were equally delighted to find that the great French scholar was an Anglican ready made, who had arrived, by independent study of the Fathers, at the very *via media* between Puritanism and Romanism, which was becoming the fashion in the English Church. Casaubon, though a layman, was collated to a prebendal stall in Canterbury and a pension of £300 a year was assigned him from the exchequer. He still retained his appointments in France, and his office as librarian. In order to retain their hold upon him, the Government of the queen regent refused to allow his library to be sent over. It required a special request from James himself to get leave for Mme. Casaubon to bring him a part of his most necessary books. Casaubon continued to speak of himself as the servant of the regent and to declare his readiness to return when summoned to do so.

Meanwhile his situation in London gradually developed unforeseen sources of discomfort. Not that he had any reason to complain of his patrons, the king and the bishops, but he had to share in their rising unpopularity. The courtiers looked with a jealous eye on a pensioner who enjoyed frequent opportunities of taking James I. on his weak side—his love of book talk. His windows were broken by the roughs at night, his children pelted in the streets by day. On one occasion he himself appeared at Theobalds with a black eye, having received a blow from some ruffian's fist in the street. The historian Hallam thinks that he had "become personally unpopular"; but these outrages from the vulgar seem to have arisen solely from the cockney's antipathy to the Frenchman. Casaubon could not speak English. This deficiency excluded him altogether from the circle of the "wits"; either this or some other cause prevented him from being acceptable in the circle of the lay learned—the "antiquaries." Besides the jealousy of the natives, Casaubon had to suffer the open attacks of the Jesuit pamphleteers. They had spared him as long as there were hopes of getting him over. The prohibition was then taken off, as he was committed to Anglicanism. Not only Joannes Eudaemon, Heribert Rosweyd, and Scioppius (Gaspar Schoppe),<sup>1</sup> but a respectable writer, friendly to Casaubon, Andreas Schott of Antwerp, gave currency to the insinuation that Casaubon had sold his conscience for English gold.

But the most serious cause of discomfort in his English residence was that his time was no longer his own. He was perpetually being summoned to one or other of James's hunting residences that the king might enjoy his talk. The king and the bishops wanted to employ his pen in their literary warfare against Rome. They compelled him to write first one, then a second pamphlet on the subject of the day—the royal supremacy. At last, ashamed of thus misappropriating Casaubon's stores of learning, they set him upon a refutation of the *Annals* of Baronius, then in the full tide of its credit and success. Upon this task Casaubon spent his remaining strength and life. He died July 1, 1614. His end was hastened by an unhealthy life of overstudy, and latterly by his anxiety to acquit himself creditably in his criticism on Baronius. He was buried in Westminster abbey. The monument by which his name is there commemorated was erected in 1632 by his friend Thomas Morton when bishop of Durham.

Besides the editions of ancient authors which have been mentioned, Casaubon published with commentaries Persius, Suetonius, the *Scriptores Historiae Augustae*. The edition of Polybius, on which he had spent vast labour, he left unfinished. His most ambitious work was his revision of the text of the *Deipnosophistae*

<sup>1</sup>Eudaemon was a Cretan, Rosweyd a Dutch Jesuit; Schoppe, a German philologist and critic.

of Athenaeus, with commentary. The Theophrastus perhaps exhibits his most characteristic excellences as a commentator. The *Exercitationes in Baronium* are but a fragment of the massive criticism which he contemplated. His correspondence (in Latin) was finally collected by Van Almeloveen (Rotterdam, 1709), who prefixed to the letters a careful life of Isaac Casaubon. But the learned Dutch editor was acquainted with Casaubon's diary only in extract. This diary, *Ephemerides*, of which the ms. is preserved in the chapter library of Canterbury, was printed in 1850 by the Clarendon Press. It forms the most valuable record we possess of the daily life of a scholar, or man of letters, of the 16th century.

**BIBLIOGRAPHY.**—The most complete account of Casaubon is the full biography by Mark Pattison (1875), of which a second and revised ed., by H. Nettleship, was published in 1892; the most recent work on the subject is *Isaac Casaubon, sa vie et son temps*, by L. J. Nazelle (1897); there is a monograph on the Fontainebleau conference by J. A. Lalot (1889). Casaubon is the subject of one of Sainte-Beuve's *Causeries*, July 30 1860 (a notice of the Oxford edition of the *Ephemerides*). See also the article in E. Haag's *La France Protestante* (1882), and J. E. Sandys, *Hist. of Class. Schol.* (vol. ii. (ed. 1908), p. 204, et seq.).

**CASCADE MOUNTAINS**, a continuation northward of the Sierra Nevada, about 500m. across the States of Oregon and Washington, U.S.A., into British Columbia. In U.S. territory the range lies from 100 to 150m. from the coast. The Cascades are separated on the south from the Sierras by deep valleys near Mt. Shasta in California, while on the north somewhat below the international boundary of 49° N. they approach the northern Rockies, mingling with these in inextricable confusion. The Cascades are in general a comparatively low, broad mass surmounted by a number of imposing peaks in Oregon and Washington. Evidences of volcanic activity in comparatively recent geologic time are abundant throughout the length of the range, and all the highest summits are volcanic cones, covered with snow fields and, in a number of instances, with glaciers. The grandest peaks are Shasta (14,161ft.) at the south, and Rainier (or Tacoma, 14,408ft.) in Washington, two of the most magnificent mountains of America. Other notable summits are Mt. McLoughlin (9,493) formerly Pitt, Mt. Scott (8,938), Diamond Peak (8,807), Mt. Thielsen (9,178), Mt. Jefferson (10,495) and Mt. Hood (11,225), in Oregon; and Stuart (9,470), St. Helens (9,671), Baker (10,750), and Adams (12,307), in Washington. The Klamath river in the far north, the Columbia at the middle, and the Klamath in the south cut athwart the range to the Pacific. The Columbia has cut almost to the sea level through the great mountain mass, the Dalles being only about 100ft. above the sea. It is to the cascades of the tremendous rapids at this point that the mountains owe their name. The slopes of the Cascades are clothed with magnificent forests, chiefly of coniferous evergreens: firs, pine, tamarack, and cedar. The Douglas fir, the "Oregon pine" of commerce, often attaining a height of 250ft., is one of the most beautiful trees in the world. In 1926 the mountain forests were largely included in 13 national forest reserves, with a total area of nearly 13,500,000 acres, extending from the northern boundary of Washington to the southern boundary of Oregon.

See OREGON and WASHINGTON; also G. O. Smith and F. C. Calkins, *A Geological Reconnaissance across the Cascade Range near the Forty-Ninth Parallel* (1904), being U.S. Geological Survey Bulletin 253; W. D. Smith, *A Summary of the Salient Features of the Geology of the Oregon Cascades*, being University of Oregon Bulletin, new series, xiv., No. 16.

**CASCARA SAGRADA**, the bark of the California buckthorn (*Rhamnus Purshiana*) used in medicine. An active principle anthra-gluco-sagradin has been isolated by Tschirch. Cascara sagrada is one of the most useful laxatives, since not only does it empty the bowel, but acts as a tonic to the intestine and tends to prevent future constipation. A single full dose of the liquid extract may be taken at bedtime, or divided doses, 10 to 15 minims, three times a day before meals. When a strong purgative is required some drug other than cascara sagrada should be employed, but its use in gradually decreasing doses is indicated after evacuation has been effected by podophyllin or rhubarb. Cascara sagrada is the principal constituent of most of the proprietary laxatives on the market.

**CASE, JOHN** (d. 1600), English Aristotelian scholar and physician, was born at Woodstock. He was educated at Oxford, but had to resign his fellowship at St. John's owing to his Roman Catholic sympathies. He subsequently opened a philosophical school in Oxford, which was largely attended. He was in addition an authority on music and a distinguished physician. Most of his works were commentaries on various treatises of Aristotle (*Organon*, *Ethics*, *Politics*, *Oeconomics*, *Physics*) under curious titles; they enjoyed a large circulation during his time, and were frequently reprinted. He was also the author of *The Praise of Musicke* (1586), dedicated to Sir Walter Raleigh.

**CASE**, in law, the common term for a cause or suit brought before a court of justice. *Action on the case* means an action for the recovery of damages for an injury to the person or property, where the act done was not immediately injurious (see *CONTRACT*; *TORT*). A *case stated* is a statement of facts drawn up by one court for the opinion of a higher on a point of law. A *special case* is a statement of facts agreed to on behalf of two or more litigant parties, and submitted for the opinion of a court of justice as to the law bearing upon the facts so stated. In the legal systems of the United Kingdom and of the United States decided cases are considered authoritative for courts of at least equal jurisdiction with those in which the judgments were given, but on the continent of Europe the rule is, following that of the Roman law, that they are instructive but not authoritative.

A box, sheath, or covering. In building, a "case" is the facing where the backing may be of inferior material; the framework in which a window or door is hung; or the wall surrounding a stair, "staircase" properly signifying the whole structure of walls and stairs. In bookbinding, a "case" means the boards and back in which the books are bound; and in typography, the tray, divided into partitions, containing the type ready for the compositor's use.

**CASE HARDENING.** The process of imparting to steel or wrought iron an extremely hard surface. It is of great importance in cases, and they are many, in which it is necessary to combine, in an article manufactured of iron or steel, tensile strength with resistance to surface attrition. Case hardening secures this by carburizing the outer surface of the steel employed. The article to be case hardened is cast, and the casting heated in a suitable furnace in which it is exposed to contact with charcoal at a temperature of 800° to 900° C. for from a few hours to a few days. The result of this process is very literally to give a "hard case" or skin to the metal; the body of the article being left unchanged in character. For empirical reasons, the charcoal employed is derived from horn, leather, etc. After carburizing, the articles are usually quenched in cold water. The process amounts to a partial application of the principle of cementation. Warships are cased in steel which has undergone various surface hardening processes of this kind; armour plate of the Harvey type is made of ductile steel to which a casing of great hardness is given by the surface being converted into high-carbon steel suddenly cooled. (See *IRON AND STEEL*; *CEMENTATION*.)

**CASEIN.** The milk of all mammals contains casein. Cheese is a modified form of casein. It is a complex product akin to white of egg, belonging to the class of chemical compounds known as albumins. In milk, casein occurs in combination with lime (calcium oxide) as a calcium salt, and in order to isolate it the milk must be broken up by treatment with acid. A white curd is precipitated which is washed and dried, the product thus obtained being sufficiently pure for most technical purposes. From skim milk of average composition, between 3 and 3.25% of casein can be obtained.

**Processes of Manufacture.**—Various acids are used commercially for precipitation, the three main processes are: (1) the rennet process; (2) the process in which an acid, e.g., dilute sulphuric or hydrochloric acid, is added to the milk; and (3) the self-curdling process, in which the milk is allowed to rest until it is curdled by the action of lactic acid formed from lactose or milk sugar of the milk by the activities of a bacillus (*B. acidilactici*). Chemically the substance precipitated by the action of rennet is

termed paracasein, as distinct from that precipitated by acids. In all these processes the precipitated curd is separated from the whey, washed with cold water, passed through a press or centrifugal separator, broken up, and dried by currents of dry air or other means. The dry casein is ground and packed for sale.

**Properties.**—Pure casein is a white powder without taste or smell. Chemically it is composed of carbon, hydrogen, nitrogen, sulphur and phosphorus. The food value of casein is comparable with that of the proteins in meat; its content of amino-acids, some 15 of which have been isolated, contributes to its nutritive qualities, these latter being enhanced also by the presence of vitamins. It is a weak acid, readily soluble in solutions of caustic alkalis and of the carbonates, borates and other salts of the alkali metals. Water dissolves casein only to a very small extent, but causes it to swell. Casein is converted by the action of formaldehyde, or formalin, into a hard material quite insoluble in water. Casein is non-inflammable. Its specific gravity is about 1.26. Commercial casein of good quality is a dry, friable white, or slightly brown powder; casein of inferior quality has an unpleasant smell and is usually moist and dark coloured.

**Uses.**—In many countries casein is produced on a commercial scale, and a large amount is used in the making of confectionery and special foods. Preparations are also used as media for the medicinal administration of quinine, lithium salts, iodides and other drugs. Casein forms the basis of many cosmetics, creams and ointments. It is used to some extent for printing on calico, sizing yarns, and sizing, waterproofing and coating in the paper industry. It is also used largely in the production of cold-water paints and distempers, of cements for porcelain and glass, and of glues for use in bookbinding, wood-working and aircraft construction.

**Moulded Products.**—The production of casein moulded products or plastics intended to imitate ivory, tortoise-shell, amber, horn, ebony, agate, malachite and other decorative materials is an important industry all over the world. Some thousands of tons are made annually in many of the leading countries.

Two methods of manufacture are in use, known as the wet and dry processes. In the wet process, casein prepared by acid precipitation is dissolved in an alkaline solution and the necessary dyes and filling ingredients are added; it is then re-precipitated by acid, washed, and the curd roughly pressed to remove water. The product is then ready for pressing in moulds of any desired shape. The moulded objects thus prepared must be "hardened" and rendered as waterproof as possible by long soaking in a solution of formaldehyde. After prolonged drying and seasoning the article is ready for use.

Rennet casein is used in the dry process; it is first ground to a fine powder, and about one-third of its weight of water added and efficiently mixed. The apparently still dry powder is then well kneaded or pressed through a heated screw-press extruding machine from which it emerges as a soft plastic dough. This dough is then ready for moulding under pressure to the various shapes required. Moulded objects require "hardening" and seasoning, as described for the wet process.

Casein plastics are readily machined and polished and can be produced in a variety of colours, either opaque or transparent; they are difficult to ignite, of good mechanical strength, and when dry can be used for electrical insulation. A disadvantage, particularly for electrical purposes, is the readiness with which the material absorbs water. Combs, beads, buttons, manicure sets, cigarette holders and umbrella handles are among the objects which are made extensively of this material.

The production of dried casein (skim-milk product) in the United States in 1924 was 20,683,000 lb., according to the Statistical Abstract of the United States, 1925.

**BIBLIOGRAPHY.**—E. Sutermeister, *Casein and its Industrial Applications*, Chemical Catalogue Co., New York (1927), a comprehensive symposium by various specialists; E. L. Taque, *Casein, Its Preparation, Chemistry and Technical Utilization* (New York, 1926).

(A. A. D.)

**CASEMATE** (Ital. *casa*, a house, and *matta*, dull or dim), an armoured vault or chamber or, in field fortification, a bomb-proof shelter; in architecture, a hollow moulding, chiefly

employed in cornices.

**CASEMENT, ROGER DAVID** (1864-1916), British consular agent and rebel, was born at Kingstown, Co. Dublin, on Sept. 1, 1864. After serving in the Niger Coast Protectorate he entered the British consular service, and was appointed consul at Lourenço Marques, then at Loanda and then at Boma. He carried out the investigation ordered by the British Government into the conditions under which the rubber trade in the upper Congo was conducted, and his report, published in 1903, led to the official Belgian commission which resulted in the change in the Government of the Congo. In 1910 the British Government commissioned Casement to investigate certain charges brought against the Anglo-Peruvian Amazon Company, and for this service he was knighted (1911). He retired from the service in 1912 and returned to Ireland in 1913. Always a strong Irish nationalist he joined the opposition to Redmond and to the participation of Irishmen in the World War. He thought the circumstances of the war might be used to win Irish independence, and with this in view visited the United States and then in Nov. 1914 Berlin. During 1915 he published various anti-British pamphlets and attempted without success to form a brigade, for service against England, of Irish soldiers who were prisoners of war. He found that the Germans were not prepared to attempt an expedition to Ireland, and conveyed verbal messages to his friends in Ireland to that effect, hoping thus to prevent an abortive rising, although to no purpose. But when he learned of the proposed rising in Easter week 1916 he sailed (April 12) for Ireland in a German submarine, which was accompanied by a vessel laden with arms and ammunition. The latter was captured by a patrol boat. Casement landed in a collapsible boat, was captured on April 24 and brought to London. Tried for treason before the lord chief justice, he was convicted and sentenced to death on June 29, being deprived of his knighthood on the following day. His appeal against conviction was dismissed on July 18, and on Aug. 3 he was hanged at Pentonville, London.

**CASEMENT**, in architecture, a frame in wood or metal, which holds the glass of a window, and is hung by hinges either at the top, bottom or sides. The term is also used for any hinged window, and for a wide hollow or *cavetto* employed in late Gothic architecture.

**CASERNE**, a barrack or lodging for troops in a town (from French *caserne* and Spanish *caserna*, *casa*, a house).

**CASERTA**, a town and episcopal see of Campania, Italy, in the province of Naples, situated 21m. N.E. of Naples by rail via Acerra, and 23m. via Aversa. Pop. (1921) town, 21,637; commune, 35,172. The modern town was a mere village belonging to the Caetani family of Sermoneta, who were counts of Caserta, until its purchase from them by Charles IV. of Naples, and the erection of the royal palace, begun by Luigi Vanvitelli (van Wittel) in 1752, but not completed until 1774 for Charles's son Ferdinand IV. It forms a rectangle, the south front being 830ft. long and 134ft. high, with 37 windows in each storey. The interior is richly decorated with marbles, almost all of which, except the white Carrara marble, are Neapolitan or Sicilian. The staircase, the chapel and the theatre are especially sumptuous. Parts of it are now used for an air force officers' academy and for a commercial school. The extensive gardens which occupy the hillside behind the palace are adorned with fountains and cascades, the water being brought by an aqueduct more than 27m. long with three lofty bridges over valleys, the largest being the Ponti della Valle near Maddaloni; the botanical garden contains many trees from northern climates. Two miles north is St. Leucio, a village founded by Ferdinand IV. in 1789, with large silk factories which are still engaged in production. The old town (Caserta Vecchia) lies high (1,300ft.) about 3m. to the north-east. It was founded in the 9th century by the Lombards of Capua. The cathedral was completed in 1153. It is a copy of that of Sessa Aurunca, and preserves the type of the Latin basilica. The campanile, Sicilian in style, was completed in 1234, while the dome, which betrays similar motives, is even later. Its pulpit is decorated with the richest polychrome mosaic that can be found anywhere in Sicily or south Italy, and is quite Muslim in its brilliance.

See S. di Giacomo, *Da Capua a Caserta* (Bergamo, Arti Grafiche, n.d.) well illustrated.

**CASE-SHOT**, a projectile used in ordnance for fighting at close quarters, now practically obsolete. It consists of a thin metal case containing a large number of bullets or other small projectiles (see **AMMUNITION**). Case-shot was formerly called "canister," though the present term occurs as early as 1625.

**CASH**. Originally meaning a box, the word cash, derived from the O. Fr. *casse*, a box or chest, is now commonly applied to ready money or coin. In commercial and banking usage, "cash" is sometimes confined to specie; it is also, in opposition to bills, drafts or securities, applied to bank-notes. Hence "to cash" means to convert cheques and other negotiable instruments into coin. In bookkeeping, in such expressions as "petty cash," "cash-book," and the like, it has the same significance, and so also in "cash-payment" or ready-money payment as opposed to "credit," however the payment may be made, by coin, notes or cheque.

Cash is also the name given by English residents in the East to native coins of small value, and particularly to the copper coinage of China, the native name for which is *tsien*. This, the only coin minted by the government, should bear a fixed ratio of 1000 cash to one *tael* of silver, but in practice there is no such fixed value. It is the universal medium of exchange throughout China for all retail transactions. The *tsien* is a round disc of copper alloy, with a square hole punched through the centre for stringing. A "string of cash" amounts to 500 or 1000 cash, strung in divisions of 50 or 100. The English term is apparently from the Sinhalese *Kasi* and Tamil *Kasū*, a small coin.

**CASH BOOK**: see **BOOK-KEEPING**.

**CASH CREDIT**. The Scottish banks long ago established a cash credit system which has worked admirably and had much to do with the wide, popular use of banks in Scotland. The system was begun in 1727 by the Royal Bank of Scotland, which was founded in that year.

A cash credit is an advance made to a trustworthy person whose faith is guaranteed personally by two or more competent sureties, who are jointly bound in respect of the advance. Thus a credit is created upon purely personal security. In this way a bank customer is established with a credit account, into which he pays his receipts, and upon which he can draw to the extent of the advance agreed upon, interest being charged to him upon his daily overdraft. Thus a very large number of small businesses have been encouraged, and the foundations of big business securely laid. To the banks also the cash credit system has proved profitable, enabling them to use their resources to great advantage.

**CASHEL**, city and urban district of Co. Tipperary, Ireland, 96 m. S.W. of Dublin on the Great Southern railway. Pop. (1926) 2,945. The town lies at the base of the Rock of Cashel (300 ft.), the summit of which is occupied by remains of St. Patrick's cathedral, a round tower, Cormac's chapel and an ancient cross, on the pedestal of which the kings of Munster were crowned. Of the defences of the rock, a guard-tower and portions of the wall remain. At the base of the rock is Hore Abbey, a Cistercian foundation of 1272, and within the town is a Dominican priory (1243).

Legend states that the vision of an angel blessing the rock, seen by two swineherds in the 5th century, led Corc Mac Luighdeach, king of Munster, to establish a stronghold here. It became one of the chief seats of the kings of Munster, but in 1101 was given over to the church. Here Henry II. received the homage of O'Brien, king of Limerick, and, later, Edward Bruce held his Irish parliament. The cathedral was burnt in 1495 by the earl of Kildare. Cashel was captured during the wars of 1647. It was reduced from an archbishopric to a bishopric in 1839 and was disfranchised in 1870.

**CASHEW NUT**, the fruit of the cashew, *cadju* or *acajou* tree, *Anacardium occidentale* (family Anacardiaceae), a native of the West Indian Islands. The fruit is kidney-shaped, about an inch in length, and the kernel is enclosed in two coverings, the outer of which is smooth, grey and leathery. Inside this external rind is a dark-coloured layer, containing an acid juice. The kernels have a bland, oily, pleasant taste. They are much eaten, both raw

and roasted, in the tropical regions in which the tree is cultivated, and yield a light-coloured, sweet-tasted oil, said to be equal to olive oil for culinary purposes. The fruit-stalk, immediately under the fruit, is swollen and fleshy, and assumes a pear-like shape. This swollen portion of the stalk has a pleasant acid taste, and is eaten as cashew apple. By fermentation it yields an alcoholic beverage, from which a spirit for drinking is distilled in the

BRANCH OF THE CASHW NUT TREE, SHOWING FLOWERS AND NUTS

West Indies and Brazil. The stem of the tree yields a gum similar to gum arabic.

**CASHIBO** or CARAPACHE ("bat"), a tribe of South American Indians of Pannoo stock, living in scanty numbers on the west side of the Ucayali, Peru.

**CASHIER.** (1) (Adapted from the Fr. *caissier*, one in charge of the *caisse*, or money-box), one who has charge of the payment or receiving of money in a business house. The "cashier" may be a high executive official of a banking or mercantile house—thus the name of the chief cashier of the Bank of England appears on all notes issued during his occupation of the post—or he may be merely a clerk, who receives payment for goods sold, and has the right to give receipts for the same.

(2) (In origin ultimately the same as "quash," to annul, from Lat. *quassare*, to dash or break to pieces, a frequentative of *quater*, to shake, but also connected in form and meaning with *cassare*, to make *cassus*, empty or void), a military term, meaning originally to disband, and probably adopted from the Dutch in the 16th century. The word in various forms is used in the same sense in most European languages. It is now used in English for the dismissal of a commissioned officer from the army and navy for particularly serious offences, in the words of the Army Act for "behaving in a scandalous manner unbecoming an officer and a gentleman." "Cashiering" involves not merely the loss of the commission, but also a permanent disqualification from serving the State in any capacity.

**CASHIER'S CHECK** is used in the United States for a check drawn by a bank upon itself and signed by its cashier. It is a direct obligation of the issuing bank and is payable when presented to that institution. It is frequently used as a form of remittance by persons who have no bank accounts or who wish to give assurance that the check will be paid. In such cases the cashier's checks are bought from the bank by paying the face value, sometimes with a small fee for the service. Cashier's checks are also used by the bank to pay its own obligations, such as payment for securities, bills of exchange, discounting notes, purchase of supplies and often, though not always, for payment

of dividends to stockholders. These checks when drawn become a credit to the cashier's account and when returned through the clearing house or other channels become a debit to the same account.

**CASHIN, SIR MICHAEL PATRICK** (1864–1927), Newfoundland politician, was born at Cape Broyle, Newfoundland, on Sept. 29, 1864. He was educated at St. Bonaventure's College, St. John's, and afterwards adopted a business career, becoming a fishery merchant at Cape Broyle in 1885. In 1893 he entered politics as Independent member for Ferryland, but in 1895 joined the Liberals, becoming a prominent member of the party. In 1905, however, he broke away again from the Liberals, joining first the Independent Liberal party, and later (1908) the People's Party, led by Sir Edward (afterwards Lord) Morris. He was chosen to represent Newfoundland on the Commission on West Indian Trade held at Jamaica in 1910. From 1909 to 1919 he was Minister of Finance and Customs, and in this position was largely instrumental in raising the Victory loan (1917–18). In 1918 he was successively acting Prime Minister during the absence of Lord Morris, acting Minister of Militia, and acting Minister of Shipping, becoming Prime Minister in 1919. During the World War he was a member of the War Finance Committee, and for his services on this and other committees was created K.B.E. in 1918. From 1920 he led the Opposition in the House of Assembly until he retired from public life in 1923, after the longest membership recorded in the House. In 1888 he married Gertrude, daughter of Captain Pierre Muldowney, and had four sons and one daughter. He died on August 30, 1927.

**CASH INSURANCE:** see INSURANCE, MISCELLANEOUS.

**CASHMERE.** A textile trade term applied originally to a type of soft woollen dress fabric of very light texture, woven from yarn spun from the fine and long fleece of the Cashmere goat. The modern Paisley shawls, manufactured in the Scottish town of that name, are beautiful reproductions of the shawls woven by the natives of Cashmere on primitive handlooms. The term "Cashmere," however, has lost its original significance and is now applied without discrimination to a variety of dress fabrics whether composed of wool, cotton, or a combination of both types of fibres.

Until the year 1857 the word "Cashmere" does not appear to have been applied to any kind of cloth manufactured in England; though cotton dress goods described as "Mousseline-de-laine" (Muslin-de-laine) were woven in the Colne valley (Lancs.) as early as 1837, and the term Cashmere was probably first used in the dress-goods trade to describe the fine twilled dress fabrics produced from the true fleece wool of the native Cashmere goat. From this date, however, the popularity of the original Cashmere fabric led to the production of inferior and cheaper fabrics first by substituting the fine Merino wool of the Spanish breed of sheep in place of Cashmere wool, and then by weaving fabrics of similar texture by employing weft either of Cashmere or else Merino wool in combination with warps produced from cotton yarn of fine counts; and, finally, by employing cotton yarn entirely both for warp and weft, though still retaining the original description of "Cashmere."

In the Bradford trade the term Cashmere is applied to several distinct varieties and qualities of dress fabrics of light-weight texture, of which one example is a special type of twilled dress goods woven with a cotton warp in combination with Merino (Botany) worsted weft. If a similar style of fabric were woven with both warp and weft of Botany worsted it would be described as "French" or "all-wool" Cashmere; and if woven with a silk warp and Botany worsted weft it would then be termed "Henrietta," or "silk-warp" Cashmere, and of which a good quality contains 72 warp threads per inch of 70/2 spun silk, and 168 picks per inch of 82's Botany worsted weft. The usual variety of Cashmere is a light dress fabric produced either with warp of fine cotton or worsted yarn with weft of fine Botany wool, and woven with the three-end weft-face ( $\frac{1}{2}$ —) regular twill weave. This weave develops a distinct twill effect of diagonal lines on the face of the cloth, owing to the preponderance of the weft yarn on that side, though the reverse side of the fabric, which displays a preponderance of warp yarn, has the appearance of the plain

calico weave, without any resemblance whatever of a twill effect.

"French Cashmere" differs from the usual variety in that it is based on the four-end two-and-two ( $\frac{2}{2}$ ) "Cassimere" or "Harvard" twill weave structure, as distinct from the usual three-end weft face ( $\frac{2}{2}$ ) twill weave, and of which one quality is woven with 60 warp threads per inch of 40's Botany worsted yarn, and 140 picks per inch of 52's Botany worsted weft, approximately. Some varieties of Cashmere dress fabrics are produced entirely from cotton both for warp and weft, woven in the "grey" state and afterwards dyed; whilst others are printed to imitate a mixture or "union" texture woven from warp and weft yarn spun from a blending of wool and cotton staple fibres. One quality of cotton Cashmere contains 72 warp threads per inch of 36's T., and 140 picks per inch of 28's weft. (H. N.)

**CASH ON DELIVERY.** The cash on delivery service, popularly known as C.O.D., is designed principally to provide a means of ordering goods and securing delivery through an agent against payment in cash instead of on credit or prepayment. In most countries the system is a feature of the postal organization, but the facility may also be provided by private agencies or even by joint arrangement between a post office and a private agency. To the trader the system offers a ready means of supplying distant customers without risk of loss. To the customer the system offers equal attractions, not merely by providing with the minimum of trouble for the prompt delivery of, and the payment for, goods that may be ordered by post or otherwise, but by eliminating any risk involved in payment before receipt of the goods. Its essential merit is that it gives to both seller and buyer access to wider markets at a minimum cost: in conjunction with advertising it becomes a distinctive method of retail trade.

It might be thought that the system would offer particular advantages to residents in rural and sparsely populated areas and would therefore prove most popular in countries of wide territory, but experience has shown that the service is no less attractive in town and urban districts. The most striking development of the service has taken place in the United States where more than 51 million domestic cash on delivery parcels were dealt with by the post office in 1926. This, however, is not so much due to the extent of the territory as to the growth in the U.S.A. of the mail-order business and the establishment in 1913 of the postal cash on delivery service.

In nearly every European country, and in many countries outside Europe, a cash on delivery service has been in operation for many years. As long ago as 1849 the Swiss post office instituted an internal service and three years later it was made the subject of a postal arrangement with Austria and with certain German Principalities. But it was not until the Postal Congress held at Lisbon in 1885 that regulations were laid down for the exchange between postal administrations of cash on delivery parcels and regulations for a similar exchange by letter post were added at the Postal Congress of Vienna in 1891. The extension of the system to the letter post, first in internal services and later in international postal relations, has enormously widened the scope of the scheme by providing for the collection and remittance of the value of articles that may be sent by letter post or for the collection and remittance of charges on goods consigned by rail or otherwise.

The service, under the name of "Value payable," was introduced by the post office of India in 1877 and over 12 million articles of the total value of 28 crore of rupees were dealt with in 1926. In Australia the system was established also in 1877 and in 1922 and 1925 the arrangement was introduced by the post offices of Canada and South Africa, respectively, although a system of postal drafts presenting some features of the cash on delivery scheme was in operation in South Africa considerably earlier.

The delay in the adoption of the cash on delivery service in the United Kingdom was due, not to the opposition of the British post office, but rather to the hostility of retail trading interests. Owing to this hostility a proposal in 1904 to introduce a cash on delivery service as part of the inland parcel post had to be abandoned, but negotiations subsequently opened resulted in the estab-

lishment of the system between the post office of the United Kingdom and Cyprus, Egypt, Malta and certain British postal agencies abroad. A wide extension of the arrangement soon followed and the post offices of India, New Zealand and most British colonies and protectorates entered the scheme. In the relations between the British and various foreign post offices the arrangement was introduced generally in 1919 and 1920 and the service is now in operation between the United Kingdom and many European countries as well as with China.

Owing to the striking development of the service abroad and to the fact that experience had shown that the apprehensions of small retail traders were groundless it was eventually decided to introduce the scheme in the United Kingdom. An inland cash on delivery service, limited as in the case of the numerous external services to the parcel post, was accordingly instituted in March 1926. It proved an instant success and the continuous increase of the traffic, which at the end of 1927 was at the rate of nearly two million parcels a year, is evidence of its growing popularity. The scheme has proved particularly attractive to motor and general engineers for the transmission of motor and machine parts, and drapers and outfitters also make considerable use of it.

The maximum amount that may be collected under the arrangement is fixed in the United Kingdom and generally by the post offices of other countries at the limit for money orders, settlement with the sender being effected by means of a special order. For the services of collection and remittance a fee is charged on an *ad valorem* scale, in addition to the postage. As against this, the vendor saves the cost of collection and the purchaser that of remittance. The British service has been found to pay its way on the existing scale of fees.

In April 1928 the British inland cash on delivery service was extended to packets sent by registered letter post as well as to consignments sent by rail to any part of Great Britain. In each case the limit of value is the same as that applicable to inland cash on delivery parcels, *viz.*, £40, and payment is effected by means of a special order.

The service by rail is conducted jointly by the British post office and the four main British railway groups, the latter undertaking conveyance and the former being responsible for the collection from the consignee of the amount due and for the transfer of this sum to the sender. The essential feature of the scheme is that the sender, having consigned his goods by rail, forwards to the consignee in a cash on delivery letter which is handed to him on payment of the amount due, a document enabling him to obtain delivery of the goods from the railway company.

The cash on delivery registered letter post is intended to provide facilities for the despatch of small articles which are more appropriate to the letter than to the parcel post. In the case of the railway service there is practically no weight restriction. The scheme is particularly suitable for consignments too heavy or too bulky for the parcel post as well as for garden and dairy produce for which the parcel limit of 11 lb. may be inadequate.

BY COURTESY OF NATIONAL CASH REGISTER CO.  
THE FIRST CASH REGISTER, INVENTED BY JAMES RITTY OF OHIO IN 1879. THE RECORD WAS SHOWN BY THE HANDS ON THE DIAL

**CASH REGISTER,** a recording, calculating and checking machine used to assist the retail salesman and for other purposes. In various forms it has come into very wide use in Great Britain, the United States and elsewhere. The machines make records, facilitate the giving of change in small transactions, and prevent mistakes and dishonesty.

Sometimes the records are made by holes punched in a roll of paper; in other cases they are shown on dials by the aid of adding mechanism. A common form has a number of keys, each representing a particular sum and each attached to a counting mechanism which records how many times it has been used. By pressing

appropriate combinations of these keys the amount of any purchase can be registered, and the combined records of all the counting mechanism give the total that has been passed through the machine in any selected period. Each key when pressed also raises an indicator which informs the customer how much he has to pay.

In the accompanying illustration, one of the latest forms of the machine is shown. It can be fitted with as many as nine separate

BY COURTESY OF NATIONAL CASH REGISTER CO.

DIAGRAM SHOWING THE MECHANISM OF THE MODERN CASH REGISTER. This machine will register 9 separate adding totals and 1 general total, so that 9 assistants, in a shop or store, can record their individual sales

adding totals and one main adding total, which would receive any or all of the records made on the nine totals. These totals or counters can be used for nine assistants' takings, or, say, six assistants and separate records of credit sales, money received on a/c., and money paid out.

The keyboard will register from a farthing to £9.19.11½, or from one penny to £99.19.11d. The amount is added to the appropriate counter, both in the grand total and on the separate adding counter; "1" is added to the assistant's industry counter showing the number of customers the assistant has served, and opens the assistant's individual cash drawer. Each drawer is fitted with a different tone gong, and ensures that all the money in the drawer has been handled by that one particular assistant.

Locks are provided, so that in the event of the assistant leaving the register, he can prevent the use of his counter and his drawer. No cash drawer can be opened without leaving a definite record inside the machine.

**CASILINUM**, an ancient city of Campania, Italy, 3m. N.W. of the ancient Capua. Its position at the point of junction of the Via Appia and Via Latina, and at their crossing of the river Volturnus, gave it considerable importance under the Roman republic. In the Second Punic War it was occupied by Fabius Cunctator in 217 B.C., taken by Hannibal after a gallant defence by troops from Praeneste and Perugia in the winter of 216-215, but recaptured in the following year, serving the Romans as their base of operations against Capua, and losing its independence. It seems to have been united with Capua before the time of Vespasian. Pliny speaks of the *morientis Casilini reliquiae*, "the remains of dying Casilinum," and only its position at the junction of the roads redeemed it from utter insignificance.

**CASIMIR III.**, called "THE GREAT," king of Poland (1310-1370), son of Wladislaus Lokietek, king of Poland, and Jadwiga, princess of Kalisch, was born at Kowal in Kujavia. He was educated at the court of his brother-in-law, Charles Robert of Hungary, where he had a reputation for frivolity and lack of personal courage. When he became king of Poland in 1333 his kingdom, consisting of the lately reunited provinces of Great and Little Poland, was at war with the Teutonic Order and with John of Luxembourg, king of Bohemia, who claimed the Polish crown. But Casimir was a man of genius, who trusted in a wise diplomacy and not in bloodshed which had brought so much trouble to Poland. He began by tying the hands of the Teutonic Order by the truce of Thorn, and he induced the king of Bohemia to relinquish his claims to the Polish throne by leaving him a free hand in Silesia (conference of Trencsén, early in 1335). At the congress of Visegrád, where both princes were entertained by the king of Hungary, the differences between them were finally

adjusted, and peace was made between the king of Poland and the Teutonic Order on the basis of the cession of Pomerania, Kulm and Michalow to the knights, who retroceded Kujavia and Dobrzyn; the kings of Hungary and Poland agreed to help each other in acquiring Halicz or Red Russia (nearly corresponding to the modern Galicia), Casimir also paid over much money and renounced Polish claims to sovereignty over Masovia, a central province. The pope, jealous of the house of Luxembourg, tried unsuccessfully to set aside the decrees of Visegrád by urging Casimir to fight the knights again. Casimir, who had no male issue, recognized Louis, Charles Robert's son, as the successor to the Polish crown, Louis contracting to confirm the privileges of the Polish gentry and clergy, and to rule Poland through natives only.

In 1340 the death of George II. of Halicz, and the ravaging of that fruitful border principality by the Tatars, induced Casimir and Charles Robert to establish their joint influence there, and in 1344 the Red Russian *boyar*, Demetrius Detko, was appointed *starosta*, or governor, in the names of the two kings. In 1353 Lubart of Lithuania disputed the sway of Poland in that principality. Hungary coming to the assistance of Poland, Lubart was defeated and taken prisoner; but Casimir, to avoid a bloody war with Lithuania's Tatar allies, came to a compromise with Lubart whereby Poland retained Halicz with Lemberg (Lwow), while Vladimir, Belz and Brzesc fell to Lithuania. With the Teutonic knights, Poland's worst foe, Casimir always preserved peace. He used the Luxembourgers against them at Rome; but the disputes between Poland and the order were settled by the peace of Kalisz (July 23, 1343), when the knights engaged for the first time to pay tribute to the Polish crown. Casimir had trouble with John of Bohemia over Silesia, now split up into 17 principalities, and when he invaded that country, took Wschowa, and captured Prince Charles of Bohemia, war broke out and he was besieged in Cracow by the Czechs. But Hungary hastened to his assistance, and the Holy See restored peace in 1346. The death of the adventurous John at Crécy, and the election of his son the peaceful Charles IV. as emperor, improved the situation.

Casimir, aided by Jaroslaw Skotowicki, archbishop of Gnesen, formerly a professor at Bologna, codified the laws of Great and Little Poland in 1347 and in 1356 a supreme court of appeal was established. Casimir, the "Peasants' king," relentlessly put down, often by death, aristocratic oppression and promulgated the severe statute of Great Poland to this end. He also did much for education. Stimulated by the example of Charles IV., who had founded the university of Prague in 1348, Casimir on May 12, 1364, established and richly endowed the first university of Cracow, which has five professors of Roman law, three of Canon law, two of physics, and one master of arts. Casimir reorganized the State finances. He introduced the conscription of landowners for national defence. He founded towns, and protected home industries with tariffs, which led to a tariff war with Bohemia. Ardent Polish patriots complained of his Germanizing policy, but the "German right" which he introduced was the foundation of Polish prosperity; he also encouraged the Jews. He developed architecture, and gave Poland "brick for wood." He unified Poland, making "one law, one king, one currency."

In the course of his reign he subdued Volhynia, Podolia, the palatinates of Brescia and Beltz, beat the Russians as well as the Lithuanians and Tatars, and finally acquired control over Masovia. He set up a cordon of fortresses on his north-east borders. Casimir's last political act was the conclusion of a fresh alliance with Louis of Hungary against Charles IV. at Buda in 1369. He died on Nov. 5, 1370, from a hunting accident. He was the only Polish king called "Great."

**BIBLIOGRAPHY.**—See Jan Leniek, *The Congress of Visegrád* (Lemberg, 1884); J. K. Kochanowski, *Casimir the Great* (1900); Kazimierz J. Gorzycki, *The Annexation of Red Russia by Casimir the Great* (Lemberg, 1889); Stanislaw Kryzanowski, *The Embassy of Casimir the Great to Avignon* (Cracow, 1900). The above are all in Polish. See also R. Dybowski, *Outlines of Polish History* (1925).

**CASIMIR IV.**, king of Poland (1427-1492), second son of Wladislaus II. Jagiello, was appointed as a lad grand-duke of Lithuania by his father, and crowned king of Poland at Cracow

in June 1447, three years after the death of his elder brother, Wladislaus III. Throughout life Casimir aimed at the preservation of the union between Poland and Lithuania, and the recovery of the lost lands of old Poland. Owing to his steadfast adherence to these principles Poland in the 15th century became a great power, but his essential unwarlikeness, and his impartiality between the two countries over which he ruled made him unpopular with both; while his anti-German policy, on which the future safety of the dual state depended, could only be carried through by the most humiliating concessions to patrician pride and greed. By confirming, under threat of deposition, the privileges of the nobles, he established the disastrous principle of elective monarchy in Poland. He also acquiesced when the senate decreed that the king was not to make war without their permission.

He finally subjugated the Teutonic Order after a 13 years' war, during which his subjects troubled him more than his enemies. In Oct. 1453 the Prussian cities and gentry, in dispute with the Order, which had been excommunicated by the Pope and banned by the Empire, placed themselves beneath the overlordship of Casimir; on Feb. 4, 1454, they renounced their allegiance to the Order, and captured 57 towns and castles. On March 6, 1454, Casimir incorporated the Prussian provinces with Poland, with a guarantee of autonomy and of freedom from taxation. This aroused little enthusiasm in Poland, and the Order gradually recovered ground from the incompetent Polish gentry. The king, irritated by the suicidal parsimony of the estates, threatened to retire to Lithuania, but after the bloody victory of Puck (Sept. 17, 1462) fortune favoured Poland. Finally the Holy See intervened, and by the second peace of Thorn (Oct. 14, 1466) all West Prussia was ceded to Poland, while East Prussia was held by the knights as a fief of the Polish crown.

Casimir had previously profited by the rivalry of two popes to acquire the right of appointment of bishops by the Crown; and his resistance to papal claims had naturally caused hostility at Rome. The Curia changed sides in order to enlist Casimir against the Turks. Casimir took advantage of this to get his son Wladislaus made king of Bohemia instead of the Hussite Poděbrad. But his ambitions were frustrated by Matthias Corvinus, king of Hungary, who roused the Order against him. Casimir died in June 1492.

Casimir founded the Polish diet in 1467, and his reign was a Golden Age of culture for Poland. Public schools were established for citizens, serfs and nobles. There was liberty of opinion and of the press, and the many printing presses published books banned elsewhere. Poland was a refuge of scholars, and Copernicus came to Cracow in 1492.

See Jan Dlugosz, *Opera* (Cracow, 1887); August Sokolowski, *Illustrated History of Poland* (Pol.) vol. ii. (Vienna, 1904); R. Dyboski, *Outline of Polish History* (1920).

**CASIMIR-PÉRIER, JEAN PAUL PIERRE** (1847-1907), 5th president of the French Republic, was born in Paris on Nov. 8, 1847, and was the grandson of Casimir Périer, the famous premier under Louis Philippe. He represented Aube in the Chamber of Deputies until he became president, and he joined the Republicans of the Left. He abstained from voting on the question of the expulsion of the princes in 1883 owing to personal connections with the House of Orléans. From Aug. 1883 to Jan. 1885 he was under-secretary for war, vice-president of the chamber from 1890 to 1892, president of the chamber in 1893, and prime minister in the same year. His ministry only lasted six months, and after his resignation in May 1894, he was re-elected president of the chamber. On June 24 he was elected president of the Republic but on the fall of the Dupuy ministry, six months later he resigned, complaining that he had been improperly treated by the ministers. Abandoning politics, he devoted himself to business until his death on March 11, 1907.

**CASINO** or **CASSINO**, a card game for two, three or four (in partnership) players. A full pack is used. Players cut for deal; low deals; king is the highest and ace is the lowest card. *Senior* (eldest hand or elder) sits at the dealer's left; *junior* (youngest hand, younger, pone or pony) sits at the dealer's right. The dealer shuffles and *junior* cuts. Commencing with *senior*,

four cards are dealt to each player in rotation, two at a time. Before taking his own cards, on each round the dealer places two cards face upwards on the table. The remainder of the pack goes face downwards at the dealer's left. After four cards have been played from each hand, four more cards are dealt to each player, two at a time, but none are dealt to the table. These intermittent deals continue until the pack becomes exhausted or until some player counts game. The deal passes to the left. An exposed card or an incorrect number dealt to any player is corrected by taking cards needed from the top of the pack or by returning to the middle of the pack surplus or exposed cards. A card exposed on the final round of deals must be taken by the dealer; in exchange, the owner of the exposed card draws one from the dealer's hand.

*Senior* makes the opening play. (1) He may *match cards*; i.e., lay down a king from his own hand on an exposed king and place both face downwards before him, or he may match two or three fives on the table with a card of that denomination from his hand. (2) He may *total a combination*; i.e., lay down a 6, for example, taking with it any cards of which the combined pips amount to 6, as 5 and ace, 4 and 2, two 3s, or several of these combinations; should the player's card win all those exposed, the *sweep* gives him one point, which is noted for final scoring by *facing* one card taken in. (3) He may *call a combination*; i.e., having two 5s he may lay one of them on top of an exposed 5, or on an ace and 4, or 2 and 3, or place one 5 on more than one combination of 5s, by calling "fives," after which none of these stacked cards can be won by anything except a card of the denomination "called." On the next round a *caller* must *take up his call*: unless he can add to it another card of the same denomination; add to it one card from his own hand and one or more cards from the table whereof the sum equals the *call* (to 5s may be added an exposed ace and trey with an ace from the *caller's* hand); or *match* some exposed card (the *caller* may allow his 5s to stand by matching an exposed queen). Failure to exercise one of the preceding four options forfeits the *caller's* rights, causing his stacked cards to become exposed and liable to any play. Any holder of a card of the denomination *called* may *take up a call*. (4) *Senior* may *build*, by stacking one or more exposed cards with one from his hand, to equal the denomination of another card held; i.e., holding an 8, an exposed 3 and 4 may be stacked with an ace from the player's hand, calling "building 8s." On the next round the *builder* has four options; he may *take up his build*; he may *add to his build* (either by stacking thereon another 8 from his hand or by adding an exposed 5 with a 3 from his hand); he may *build higher*; i.e., holding a 10, he may add a deuce from his hand, or an ace from his hand with an exposed ace, announcing "building 10s"; he may *match* an exposed card with one from his hand. Failure to exercise one of his options forfeits the *builder's* rights to maintain the cards stacked; they become exposed and subject to the same treatment as other cards on the table. Any holder of a card of the denomination *built* may *take up the build* of another player.

A *combination called* cannot be *built higher* (a stack of two 4s or a stack consisting of one 4 and two 2s, called "4s," cannot be built into 9s by adding an ace). Any player may *build higher* a single combination, provided he holds the card needed to raise the combination to the denomination of another card held in his hand (one player's build of a single 8 may be raised to 9 by another player holding both an ace and a 9; after that another player with an ace and a 10 might add his ace to the pile and call "building 10s"). Failure to call aloud the purpose of cards stacked forfeits the *stacker's* rights to those cards, which may be separated by another player for such play as he chooses. A card played out of turn becomes *dead*; it must be laid aside until the turn of its owner to play arrives, when he must expose it on the table instead of making any other play. An attempt to win with a card of incorrect denomination may be corrected, if the player holds a card of correct denomination; otherwise he must expose upon the table the card he attempted to play instead of making any more desirable play. If a player *calls a combination* or *builds*, without holding the proper card to do so, his error must be

corrected; his stacked cards must be broken up and each card played since the error must be restored to its original position; after which the player in error must expose a card on the table in lieu of any more desirable play, and the game proceeds. If *senior* can neither *match cards*, *total a combination*, *call a combination*, nor *build*, he must *trail*, by exposing a card upon the table. Each player after *senior* may exercise the same five options in play.

*Game* is ordinarily 21 points won by a single player or by partners; sometimes *game* is the highest score made on each hand played. Nothing is scored until the end of a hand. Players may keep mental score and the first to reach 21 points may claim and prove game. At the end of each hand, cards taken in are reviewed by each player; points are scored as follows: *cards* (the greatest number) 3, spades (the greatest number) 1, *Big Casino* (ten of diamonds) 2, *Little Casino* (two of spades) 1, *aces* 1 each, *sweeps* 1 each. In *counting out* a 21 point game or in settling a *tie*, precedence follows the order given above.

Strategy requires the holders of important cards to retain them as long as possible, so that these cards may be utilized to *match*, *total a combination* or capture stacked cards, utilizing less valuable cards for *trailing* or *building*. When both the pack and players' cards are exhausted, any cards still exposed on the table go to the player who made the last winning play.

*Draw Casino* requires the balance of the pack to be placed face downwards, after the first four cards have been dealt, and each player of a card at once replaces it by taking the top card from the pack, until that is exhausted. Failure to draw in turn is corrected by drawing two cards at the next turn.

*Royal Casino* differs from *Casino* only in valuing jacks at 11, queens at 12, kings at 13, and aces as either 1 or 14 points. These higher numbers increase combinations and allow higher building.

*Spade Casino* adds to the ordinary scoring of 11 points, one point for each spade taken in (13 added points). Points are scored as made, except *cards*, which are scored at the end of the hand. Game is 61 points (once around a cribbage-board and into the game-hole, permitting handy scoring on a board, unless players prefer a score-sheet). (E. V. S.)

**CASINUM**, an ancient town of Italy, probably of Volscian origin. When it came under Roman supremacy is not known, but it probably received the citizenship in 188 B.C. It is situated on the Via Latina about 40m. N.W. of Capua. Varro possessed a villa near it, in which later Mark Antony held his orgies. Strabo speaks of it as an important town; Varro mentions the olive-oil of its district as especially good. The older Volscian Casinum must have stood on the hill (1,715ft.) above the Roman town (148ft.), where considerable remains of fortifications in Cyclopean masonry, of finely cut blocks of limestone, still exist. The site is now occupied by the Benedictine monastery of Monte Cassino (q.v.), founded by St. Benedict himself in 529. The wall runs south-west and west, starting from the west side of the monastery, for a total length of about 300 yards. The Roman town lay at the foot of the mountain, close to the Via Latina. The amphitheatre, erected by Ummidia Quadratilla (mentioned by Pliny), is still existing and is approximately circular in plan. The external walls are 59ft. high. Above it on the hillside is a theatre less well preserved. Close by is a building converted into the Cappella del Crocefisso, originally perhaps a tomb on the Via Latina; it is a chamber in the form of a Greek cross, constructed of large masses of travertine, with a domed roof of the same material. On the opposite bank of the river Rapido are the ruins attributed to the villa of Varro. The mediaeval town of S. Germano, which resumed the name Cassino in 1871, lies a little to the north. The cathedral was founded in the 8th century, but the present building was constructed in the 17th century. Above the town is a picturesque mediaeval castle.

**CASIRI, MIGUEL** (1710-1791), a learned Maronite, was born at Tripoli (Syria). He studied at Rome, where he lectured on Arabic, Syriac and Chaldee. In 1748 he went to Spain, and in 1763 he became principal librarian at the Escorial, a post which he appears to have held until his death. Casiri published a work entitled *Bibliotheca Arabico-Hispana Escorialensis* (1760-70). It is a catalogue of above 1,800 Arabic mss., which he found in

the library of the Escorial; it also contains a number of quotations from Arabic works on history. The second volume gives an account of many geographical and historical mss., which contain valuable information regarding the wars between the Moors and the Christians in Spain. Casiri's work is not yet obsolete, but a more scientific system is adopted in Hartwig Derenbourg's incomplete treatise, *Les Manuscrits arabes de l'Escorial* (1884).

**CASK**: see COOPERAGE.

**CASKET**, a small box or chest, commonly used for jewels, money, papers or other objects of value. History and literature are full of references to the often disconcerting contents of these famous receptacles. The "Casket Letters" (q.v.) are one of the mysteries of history. Harpagon's casket plays an important part in Molière's *L'Avare*; Bluebeard gives his too-curious wife the keys of his caskets filled with precious stones; the contents of Sainte-Croix's casket brought about the trial and condemnation of the marquise de Brinvilliers, the poisoner. This very ancient piece of furniture was no doubt derived from the chest, which was the original wardrobe. It was an object of great value, covered with ivory, enamel or stamped leather, enriched with precious metals, or encrusted with jewels. One which belonged to St. Louis and is preserved in the Louvre is covered with enamelled shields of arms and other decorations. In the 16th and 17th centuries secret hiding-places were sometimes concealed in the thickness of the lid or in a false bottom. (See also Box.)

**CASKET LETTERS**, the name given to eight letters and a series of irregular sonnets asserted by James, 4th earl of Morton, to have been found by his servants in a silver casket in the possession of a retainer of James, 4th earl of Bothwell, on June 20, 1567, six days after the surrender of Mary, queen of Scots, to her rebels at Carberry Hill. If they are genuine they prove Mary's full complicity with Bothwell in the murder of her husband, Henry, Lord Darnley, in the preceding February. The contents of the casket were produced at Westminster, on Dec. 14, 1568, before a body of English Commissioners appointed by Queen Elizabeth to investigate the charges brought by Mary, then a prisoner in England, against the rebel Scottish lords and by them against her. The originals were in French, but translations had already been made into Scots, and further translations were made into English. After the Conference, the casket and its contents were brought back to Scotland and entrusted to Morton's care; after his execution in 1581, they passed into the possession of William, 1st earl of Gowrie, who refused to comply with Elizabeth's request that they should be sent to England. Gowrie was executed for treason in 1584, and there is no further trace of the originals.

Elizabeth's Commissioners gave no decision about the authenticity of the documents, and, until comparatively recent years, controversy as to their genuineness has been complicated by doubts as to the text actually produced at Westminster in 1568. Translations into Scots, English, Latin and French were published within a few years of the close of the Conference, and it was assumed that these French translations represented the text shown to the English Commissioners. Walter Goodall proved in 1754 that the printed French text was derived from the Scots or the Latin, and this unquestionably strong argument for forgery remained a main factor in the case of Mary's defenders for over a century until the discovery of contemporary French copies of the letters in the Record Office and at Hatfield. This discovery undermined the position taken up by John Hosack in his *Mary, Queen of Scots, and her Accusers* (2nd ed. 1870-74). Hosack also made a very telling attack upon the most incriminating of the letters (Letter II.), on the ground of collusion with a declaration made by Thomas Crawford, a servant of Darnley, which was also produced at Westminster, and his argument for forgery was widely accepted until the publication of an article by Harry Bresslau in the *Historisches Taschenbuch* (1882) and of T. F. Henderson's *Casket Letters and Mary, Queen of Scots* (2nd ed. 1890), the latter of which traversed Hosack's theory of collusion between Crawford's deposition and Letter II., of which no contemporary French copy has been found. A further development of the controversy followed the discovery of a number of documents, notes

of information, and indictments of Mary, which had originally been written for, or by, Darnley's father, Matthew, 12th earl of Lennox, and are preserved in the University library at Cambridge. Transcripts of the Lennox documents were lent by Father Pollen, S.J., to the late Mr. Andrew Lang, who used them in his *Mystery of Mary Stuart* (1900-04). Portions of these documents have since been printed by Maj.-Gen. R. H. Mahon in his *Indictment of Mary, Queen of Scots* (1923) and his *Mary, Queen of Scots: a Study of the Lennox Narrative* (1924). In the light of the new evidence, Lang came to the conclusion that "the least difficult theory is that Letter II. is in part authentic, in part garbled." This conclusion was controverted by Henderson in his *Mary, Queen of Scots* (1904), and in the *Scottish Historical Review* (Oct. 1907), Lang, on different grounds from those of his critic, retracted his own earlier view, and admitted that his hypothesis, that Letter II. was partly based on Crawford's deposition, was impossible. Mary, he was convinced, "wrote the whole letter." This conclusion he elaborated in the 11th ed. of the *Encyclopædia Britannica* (Art. Casket Letters). The authenticity of Letter II. is the central point of the controversy, and the question is not seriously affected by exposures of false statements made in other connections by Mary's accusers. To the arguments of Henderson and Lang no systematic reply has yet been made, and the controversy remains where they left it, though General Mahon in his two books has advanced some arguments against the genuineness of Letter II. (R. S. R.)

**CASLON**, the name of a famous family of English typefounders. WILLIAM CASLON (1692-1766), the first of the name, was born at Cradley, Worcestershire, and in 1716 began in London as an engraver of gun locks and barrels, and as a bookbinder's tool-cutter. Being thus brought into contact with printers, he was induced to fit up a type foundry, largely through the encouragement of William Bowyer. The distinction and legibility of his type secured him the patronage of the leading printers of the day in England and on the Continent. The use of Caslon types, discontinued about the beginning of the 19th century, was revived about 1845 at the suggestion of Sir Henry Cole, and used for printing the *Diary of Lady Willoughby* (a pseudo-17th-century story) by the Chiswick Press. He died on Jan. 23, 1766. His son, WILLIAM CASLON (1720-1778), who had been partner with his father for some years, continued the business.

**CASPER**, the second city of Wyoming, U.S.A., on the North Platte river, in the central part of the State; the county seat of Natrona county. It is on Federal highways 20 and 87E, and is served by the Burlington and the Chicago and North Western railways. In 1900 the population was 883; in 1920, 11,447; and in 1930 Federal census 16,619. It is the industrial, financial and trading centre for a large part of the State, and one of the largest oil-refining centres in the country. Great quantities of petroleum products, wool, sheep and cattle are shipped. Teapot Dome and Salt Creek (20,000ac.) oil-fields lie about 40m. N.; Big Muddy field, 20m. east. The city has four refineries, which use an average of over 50,000 bbl. of crude petroleum daily. The assessed valuation of property (exclusive of the refineries) was \$22,394,240 in 1927; bank debits in 1926 amounted to \$153,855,000.

The city owns a park of 400ac. on top of Casper Mountain, 8m. to the south, and Old Fort Caspar, which guarded the principal crossing of the river in the days of the covered wagon, now belongs to the city. Goose Egg Ranch, a social centre in the early days of the cattle kings, is 14m. S.W.; Hell's Half Acre, a county park of scenic marvels, 45m. W.; and 51m. S.W. is Independence Rock, a great mass of black granite, a landmark on the old Oregon Trail, on which many of the pioneers cut their names, with dates as far back as 1832. Until 1847 the site of Casper was known as The Upper Crossing of the Platte; from 1847 to 1858 as The Mormon Crossing and Ferry; from 1858, when a bridge was built, to 1865, as Platte Bridge Crossing. In 1865 the fort was renamed in honour of Lieut. Caspar Collins, who was killed in an attack on the Indians on July 26, 1865. The town was founded on June 16, 1888, when the first railway train arrived, and was incorporated in 1889. The spelling of the city's name is due to a mistake on the part of a railway clerk.

**CASPIAN LANGUAGES**, the designation of one division of the Iranian group of Indo-European languages, a division comprising (a) Mazandarani, (b) Gilaki, (c) Talishi, (d) Tāt and (e) Samnani. Mazandarani has been a literary tongue since the middle ages and is used in poetry.

**General View.**—The phonology of the Caspian tongues is, in general, that of the north Iranian group. Maz. *aš* (a bear) may be traced from Avesta *areša* (cf. modern Persian *khirs*); *kana* (might, power), Avesta *Kāran* and modern Persian *kun-ad*.

**Morphology.**—The grammatical structure of the languages again follows that of the north Iranian group. Sex is indicated by prefixing or affixing, for masc., *nar*, and for fem. *mada*. The adjective precedes the noun, e.g., Maz.,—*pira mard* (an old man), *surxa gul* (a red rose); Talishi, *serxe sevi* (a red apple); *droza mu* (a long hair). The plural (in modern Persian indicated by the suffix *-ān*) is in Maz. *-ūn*, e.g., *birarūn*, the brothers (modern Persian, *biradar*, a brother, *biradarān*, *biradān*, brothers).

There is an oblique case having many duties. It is marked in the different languages thus:

|      |                                   |
|------|-----------------------------------|
| Maz. | -a-, -e-, -i; Plural -ūni, -hāi   |
| Gil. | -a, -e, -i, -a; Plural -āne, -āni |
| Tal. | -i, -o — — —                      |
| Sam. | -i                                |

In Mazandarani this case usually marks the accusative, sometimes the genitive case. In Gilaki and Talishi it usually marks the dative and in the former it is also occasionally used as a locative mark.

The comparison of adjectives is similar to that of modern Persian. The suffix *-tar* or *-ter* is used. (Cf. Persian *bihhtar*, better.)

**Numerals.**—These in most of the Caspian languages, follow the Persian forms fairly closely. In Talishi they are (1) *i*, (2) *dō*, (3) *sa*, (4) *chō*, (5) *penj*, (6) *shash*, (7) *haft*, (8) *hesht*, (9) *nav*, (10) *da*.

**Pronouns.**—The pronouns are very similar to those of modern Persian, as will be seen from the following:

|               |       | Mazandarani     | Gilaki              | Talishi      | Tāt              | Samnani          |
|---------------|-------|-----------------|---------------------|--------------|------------------|------------------|
| First Person  | Sing. | <i>Man, mun</i> | <i>Man, mū</i>      | <i>az</i>    | <i>mū, mya</i>   | <i>ā, u, mun</i> |
|               | Plur. | <i>amā</i>      | <i>amā (hā), mā</i> | <i>amā</i>   | <i>māyā, imū</i> | <i>hamā</i>      |
| Second Person | Sing. | <i>tu, ta</i>   | <i>tu</i>           | <i>tu</i>    | <i>tū</i>        | <i>tū</i>        |
|               | Plur. | <i>shamā</i>    | <i>sumā</i>         | <i>shimā</i> | <i>shumu</i>     | <i>shama</i>     |
| Third Person  | Sing. | <i>vē, vi</i>   | <i>ūn, u</i>        | <i>av</i>    | <i>ū</i>         | <i>yu, ū</i>     |
|               | Plur. | <i>vashun</i>   | <i>usan</i>         | <i>avūn</i>  | <i>ūshūn</i>     | <i>yun, ūi</i>   |

The languages also make use of suffixed pronouns.

The interrogative pronouns are *ki* (who), in all five languages and *cha* (what, Maz. Tāt and Samnani), *chi* (Talishi and Gilaki).

**Verbs, Adverbs, etc.**—The conjugation of verbs follows the Iranian group very closely. The auxiliary, root *bū-* (to be), cf. Persian *budan*, etc., is used as in the cognate languages.

Adverbs, conjugations, prepositions and postpositions are not declined. Many of them are almost identical in form with Iranian and modern Persian forms and betray extensive borrowings.

See Geiger and Kuhn, *Grundriss der Iranischen Philologie*, 1 Band, 2 Abt. (Strasbourg, 1898-1901). (A. N. J. W.)

**CASPIAN SEA**, an inland sea between Europe and Asia, extending from 37° to 47° N., and from 47° to 55° E. Its length is 1,280 km. from north to south, and its breadth 160 to 440 km., and its area reaches 438,690 sq.km. (a little more than the area of the Baltic), of which 2,340 sq.km. belong to its islands. It fills the deepest part of a vast depression, sometimes known as the Aralo-Caspian depression, once an inland sea, the Eurasian Mediterranean or Sarmatian Ocean. At the present time its surface lies 26 metres below the level of the ocean and 76 metres below the level of the Aral.

**Hydrography and Shores.**—The hydrography of the Caspian Sea has been studied by von Baer, by N. Ivashintsev in 1862-

1870, by O. Grimm, N. I. Andrusov (1895), and by J. B. Spindler (1897), N. von Seidlitz and N. Knipowich (1904 and 1912-15). It has three sections—(1) A northern, forming in the east the very shallow Gulf of Mortvyi Kultuk which is being gradually silted up by the sedimentary deposits brought down by the rivers Volga, Ural and Terek. The Caspian steamers, for example, must lighten their loads nearly 40 miles away from the Volga mouth. The western shore, from the delta of the Volga to the mouth of the Kuma is gashed by thousands of narrow channels or lagoons, termed *limans*, from 20 to 50 km. in length, and separated in some cases by chains of hillocks, called *bugors*, in others by sandbanks. These channels are filled, sometimes with sea-water, sometimes with overflow water from the Volga and the Kuma. The coast-line of the Gulf of Mortvyi Kultuk on the north-east is, on the other hand, formed by a range of low calcareous hills, constituting the rampart of the Ust-Urt plateau, which intervenes between the Caspian and the Sea of Aral. (2) South of the line joining the Bay of Kuma with the Manghishlak peninsula in the East, in 44° 10' N. lat., the western shore is higher and the water deepens considerably, over one-half of the area 100 metres is reached while the maximum depth (between 41° and 42° N.) reaches 768 metres. This, the middle section of the Caspian, which extends as far as the Apsheron peninsula, receives the Terek and several smaller streams that drain the northern slopes of the Caucasus. At Derbent, just north of 42° N., a spur of the Caucasus approaches so close to the sea as to leave room for only a narrow passage, the *Caspiae Pylae* or *Albanae Portae*, which has been fortified for centuries. The eastern shore of this section of the sea is also formed by the Ust-Urt plateau, which rises 150 to 250 metres above the level of the Caspian; but in 42° N. the Ust-Urt recedes from the Caspian and circles round the Gulf of Kara-boghaz or Kara-bugaz. This subsidiary basin is separated from the Caspian by a narrow sandbar, pierced by a strait only 100 to 150 metres wide, through which a current flows continuously into the gulf at the rate of 2.5 to 8 km. an hour. To this there exists no compensating out-flow current at a greater depth, as is usually the case in similar situations. The area of this lateral basin being about 18,400 sq. km., and its depth but comparatively slight (1 to 12 metres), the evaporation is very appreciable (amounting to 1 metre per annum), and sufficient to account for the perpetual inflow from the Caspian. South of a line joining Baku with Krasnovodsk begins (3), the southern and deepest section of the Caspian separated from the middle section by a submarine ridge (66 metres of water), which links the main range of the Caucasus on the west with the Kopet-dagh in the Transcasian region on the east. This section of the sea washes on the south the base of the Elburz range in Persia, sweeping round from the mouth of the Kura to Astarabad at an average distance of 60 km. from the foot of the mountains. A little east of the Gulf of Enzeli, which resembles the Kara-boghaz, though on a much smaller scale, the Sefid-rud and several smaller streams pour into the Caspian the drainage of the Elburz range. Near its south-east corner the Caspian is entered by the Atrek, which drains the mountain ranges of the Turkoman (north-east) frontier of Persia. In 1894 a subterranean volcano was observed in this basin of the Caspian in 38° 10' N. and 52° 37' E. The depth in this section ranges from 25 to 700 metres, with a maximum of 946 metres. The mean depth of the whole Caspian is according to Knipowich (1922) 182 metres. The volume is 79,320 cubic km., rather more than those of the North Sea and Baltic combined.

**Drainage Area and Former Extent.**—The catchment area from which this greatest inland sea is fed is 3,733,000 sq. km. and extends to a very much greater distance on the west and north than it does on the south and east. From the former it is entered by the Volga, which is estimated to provide  $\frac{2}{3}$  of the river supply, i.e., about 301 cubic km. per annum, the Ural, the Terek, the Sulak, the Samur; as compared with these, there comes from the south and east the Kura and Aras, draining the south side of the Caucasus, and the Sefid-rud and the Atrek, both relatively short. Knipowich showed (1922) that without evaporation the level would rise 1.3 metres annually; evaporation counteracts this, but

the level has undergone great non-periodical oscillations, as well as seasonal ones. It is lowest in December and highest in June. If 285 cm. is the normal figure at Baku at present it was in

|      |           |      |         |
|------|-----------|------|---------|
| 1306 | 1,395 cm. | 1845 | 216 cm. |
| 1638 | 763 "     | 1847 | 297 "   |
| 1715 | 305 "     | 1853 | 254 "   |
| 1815 | 515 "     | 1900 | 296 "   |

Thus in 1306 the level was more than 11 metres higher than it is now and the variations are large and irregular. The sea was so low in 1915 as to cause difficulties of navigation in the north.

The level of the Caspian, however, was formerly, in pre-historic times, about the same as the existing level of the Black Sea, although now some 26 metres below it. This is shown by the evidences of erosion on the face of the rocks which formed the original shore-line of its southern basin, those evidences existing at the height of 20 to 25 metres above the present level. Large portions of the vast region comprised between the lower Volga, the Aral-Irtys water-divide, the Dzungarian Ala-tau, and the outliers of the Tian-shan and Hindu-kush systems are actually covered with Aralo-Caspian deposits, nearly always a yellowish-grey clay, though occasionally they assume the character of a more or less compact sandstone of the same colour. These deposits attain their maximum thickness of 30 metres east of the Caspian, and have in many parts been excavated and washed away by the rivers (which have frequently changed their beds) or been transported by the winds, which sweep with unmitigated violence across those wide unsheltered expanses. The typical fossils unearthed in these deposits are shells of species now living in both the Caspian and the Aral, though in the shallow parts of both seas only, namely (according to Ivan V. Mushketov 1850-1902) *Cardium edule*, *Dreissena polymorpha*, *Neritina liturata*, *Adacna vitrea*, *Hydrobia stagnalis*, in the Kara-kum desert, and *Lithoglyphus caspius*, *Hydrobia stagnalis*, *Anodonta ponderosa* and the sponge *Metchnikovia tuberculata*, in the Kizil-kum desert. The exact limits of the ancient Aralo-Caspian sea are not yet settled, except in the north-west, where the Ergeni Hills of Astrakhan constitute an unmistakable barrier. Northwards these marine deposits are known to exist 128 km. away from Lake Aral. The eastern limits of these deposits lie about 160 km. from Lake Aral. Southwards they have been observed without a break for 250 km. from Lake Aral, namely in the Sary-kamysh depression. Hence in late Tertiary, and probably also in Post-Tertiary, times the Aralo-Caspian Sea covered a vast expanse of territory and embraced very large islands (e.g., Ust-Urt), which divided it into an eastern and a western portion. More than this, the Caspian was also, it is pretty certain, at the same epoch, and later, in direct communication with the Sea of Azov, no doubt by way of the Manych depression; for the *limans* or lagoons of the Black Sea share with the Caspian:—*Archaeobdella*, *Clessinia variabilis*, *Neritina liturata*, *Gmelina*, *Gammarus moeoticus*, *Pseudocuma pectinata*, *Paramysis Baeri*, *Mesomysis Kowalevskyi* and *M. intermedia*, *Limnomysis Benedeni* and *L. Brandti*, *Gobius*, *Clupea* and *Acipenser*.

In early Tertiary times the Caspian belonged to the Sarmatian Ocean, which reached from the middle Danube eastwards through Rumania, South Russia, and along both flanks of the Caucasus to the Aralo-Caspian region, and westwards had open communication with the great ocean. Before Pliocene times the Sarmatian Ocean was divided into sections, one of which was the Aralo-Caspian sea. During the Pleistocene Ice Age the Caspian flowed over the steppes that stretch away to the north, and was probably still connected with the Black Sea (itself as yet unconnected with the Mediterranean). After the great ice cap had thawed and a period of general desiccation set in, the Caspian began to shrink in area, and simultaneously its connections with the Black Sea and the Sea of Aral were severed.

**Fauna.**—The fauna of this sea has been studied by Eichwald, Grimm, Kessler, Sars and Wukotitsch. Marine elements include the herring (*Clupea*), and freshwater elements, species of *Cyprinus*, *Perca* and *Silurus*, also a lobster. Rhizopoda (*Rotalia* and *Textillaria*), the sponge *Amorphina*, the *Amphicteis* worm.

the molluscs *Cardium edule* and other *Cardidae*, and some Amphipods (*Cumacea* and *Mysidae*), are marine forms which either tolerate variations in salinity or are especially characteristic of brackish waters. Species not found elsewhere include Protozoa, three sponges, Vermes, twenty-five Molluscs, numerous Amphipods, fishes of the genera *Gobius*, *Benthophilus* and *Cobitis*, and one mammal (*Phoca caspia*). This last, together with some of the *Mysidae* and the species *Glyptonotus entomon*, exhibits Arctic characteristics, which has suggested the idea of a geologically recent connection between the Caspian and the Arctic, an idea of which no real proofs have been as yet discovered. The Knipowich expeditions found no traces of organic life below the depth of 400 metres except micro-organisms (zooplankton) and a single Oligochaete, but above that level the phytoplankton is rich. Fisheries off the mouths of Volga, Ural, Terek and Kura yielded in 1925 about 22 million tons, *i.e.*, much less than in 1913. The catch included *vobla* (a kind of roach) (44.5%), herring (42.2%), sturgeon (four varieties) and salmon (1.2%), carp, bream, perch, tench and pike. The marked drop in the sturgeon and salmon catch is due to destructive exploitation. Cold storage is provided in Astrakhan, Makach-Kala and Derbent, but the export of fresh fish is hampered by lack of refrigerator transport, and salted, smoked or dried fish, with caviare and isinglass from the sturgeon are the chief exports. Seals are hunted in Krasnovodsk bay. The northern section with great rivers has a salinity 10% or less and the water in the north-west corner is drinkable. In Mortvyi Kultuk gulf, on the east, salinity rises above 30%. In the open Caspian it averages 12.8%, less than that of the Black sea. Of the salts present common salt (NaCl) forms only 62% against 78% in the ocean, magnesium sulphate ( $MgSO_4$ ) 24% against 5%. In the Kara-bugaz gulf into which the Caspian water streams continuously to be evaporated, salinity rises to 200% and large quantities of Mirabilite ( $Na_2SO_4 + 10H_2O$ ) are deposited, to be dissolved afresh in summer. Below a level of 300 metres Caspian water contains practically no oxygen, but some  $H_2S$ , as is the case in the Black Sea. This accounts for the absence of life in the depths of both.

**Currents and Climate.**—Currents (Knipowich, 1922) follow the coasts in counter-clockwise direction, the east-west section crossing the sea near the boundary between shallow and deeper water. Through these currents the Volga water spreads southwards on the west and lowers the general temperature. Average temperature of the air in winter is about 16° in the north and 46° in the south, for the summer the average figures are 73° and 82° respectively. At a depth of 300 metres the temperature remains at about 41°–43°. Near the Volga mouth the Caspian is frozen for 112 days on an average, and winter in the northern basin is very severe with frequent falls of temperature to –13°, and to –22°, and lower still, on the Ust-Urt plateau. The north and east wind contribute to winter's severity; summer winds are variable, often westerly, with frequent alternation of land and sea breezes during the day.

**Navigation.**—Transport is hindered by antiquated vessels for dry cargo freightage of timber, salt, sugar, fish and dried fruit, and by the silting of the Volga. There were in 1925 81 motor-driven vessels, freightage 112,049 tons, 162 oil barges, freightage 246,000 tons, 75 dry cargo steamers, 38,400 tons and 63 line steamers and tugs with 18,300 horse power. The total freightage carried 1925–26 was in dekatonas 402,552 as against 632,214 in 1913. It consisted of—

**BIBLIOGRAPHY.**—See works quoted under ARAL; also von Baer, "Kaspische Studien," in *Bull. Sci. St. Pétersbourg* (1855–59); Radde, *Fauna und Flora des südwestlichen Kaspigebietes* (1886); J. V. Mushketov, *Turkestan* (St. Petersburg, 1886), with bibliographical

references; Ivashintsev, *Hydrographic Exploration of the Caspian Sea* (in Russian), with atlas (2 vols., 1866); Philippov, *Marine Geography of the Caspian Basin* (in Russian, 1877); *Memoirs of the Aral-Caspian Expedition of 1876–1877* (2 vols., in Russian), edited by the St. Petersburg Society of Naturalists; Eichwald, *Fauna Caspio-Caucasica* (1841); Seidlitz, "Der Karabugas Meerbusen," in *Globus*, with map, vol. lxxvi. (1899); Knipowich, "Hydrobiologische Untersuchungen des Kaspischen Meeres," *Internat. Revue der Hydrobiologie*, Bd. 10 (1922); W. Halbfass, *die Seen der Erde* (1922).

**CASQUE**, a covering for the head, a helmet; mediaeval protective armour for the head. The ancient Greeks and Romans wore helmets of brass and sometimes of skins. Casques were either open or closed; the open usually had a bar descending from the forehead to protect the face against transverse sword cuts. Close casques were fitted with visors hinged above the ears; a beaver was fitted which covered the mouth and chin only. Slits or perforations were also provided for ventilation and vision.

There have been several patterns of casques, *e.g.*, *chapelle-de-fer*, or iron hat, worn by light horsemen under Edward I.; *bourguignote* or *burgonet*, made to the shape of the head; *bacinet*, a light helmet resembling a basin; *salade*, *salet* or *celate*, a light casque; *hufken*, headpiece for archers; *castle*, protecting the whole of the head; *morion*, open, resembling a hat, worn by musqueteers and harquebussiers; *pot*, iron hat with a broad brim. (See HELMET.)

**CASS, LEWIS** (1782–1866), American general and statesman, was born at Exeter, N.H., on Oct. 9, 1782. He was educated at Phillips Exeter academy, joined his father at Marietta, Ohio, about 1799, studied law there in the office of Return Jonathan Meigs (1765–1825), and was admitted to the bar at the age of twenty. Four years later he became a member of the Ohio legislature. During the War of 1812 he served under Gen. William Hull, whose surrender at Detroit he strongly condemned, and under Gen. W. H. Harrison, and rose from the rank of colonel of volunteers to be major-general of Ohio militia and finally to be brigadier-general in the regular United States army. In 1813 he was appointed governor of the territory of Michigan, the area of which was much larger than that of the present State. This position gave him the chief control of Indian affairs for the territory, which was then occupied almost entirely by natives, there being only 6,000 white settlers. During the 18 years in which he held this post he rendered valuable services to the territory and to the nation. His relations with the British authorities in Canada after the War of 1812 were at times very trying, as these officials persisted in searching American vessels on the Great Lakes and in arousing the hostility of the Indians of the territory against the American Government. To those experiences was largely due the antipathy for Great Britain manifested by him in his later career. He was secretary of war in President Jackson's cabinet in 1831–36, and it fell to him, therefore, to direct the conduct of the Black Hawk and Seminole wars.

In 1836 Gen. Cass was appointed minister to France, and became very popular with the French government and people. In 1842, when the Quintuple Treaty was negotiated by representatives of England, France, Prussia, Russia and Austria for the suppression of the slave trade by the exercise of the right of search, Cass attacked it in a pamphlet which was probably instrumental in preventing the ratification of the treaty by France. In this same year the Webster-Ashburton treaty between Great Britain and the United States was concluded, and, as England did not thereby relinquish her claim of the right to search American vessels, Cass felt himself in an awkward position, and resigned his post. His attitude on this question made him very popular in America. From 1845 to 1848 and from 1849 to 1857 he was a member of the U.S. Senate, and in 1846 was a leader of those demanding the "re-annexation" of all the Oregon country south of 54° 40' or "war with England," and was one of the 14 who voted against the ratification of the compromise with England at the 49th parallel. He loyally supported Polk's administration during the Mexican War, opposed the Wilmot Proviso, and advocated the Compromise Measures of 1850 and the Kansas-Nebraska Bill of 1854.

In 1848 he received the Democratic nomination for the presidency, but owing to the defection of the so-called "Barnburners"

(see FREE-SOIL PARTY) he did not receive the united support of his party, and was defeated by the Whig candidate, Zachary Taylor. On account of his eminently conservative attitude on all questions concerning slavery, General Cass has been accused of pandering to the southern Democrats in order to further his political aspirations. His ideas of popular sovereignty, however, were not inconsistent with the vigorous Democratic spirit of the west, of which he was a typical representative, and it is not clear that he believed that the application of this principle would result in the extension of slavery. As the west became more radically opposed to slavery after the troubles in Kansas, Cass was soon out of sympathy with his section, and when the Republicans secured control of the legislature in 1857 they refused to return him to the Senate. President Buchanan soon afterward made him secretary of state, and in this position he at last had the satisfaction of obtaining from the British government an acknowledgment of the correctness of the American attitude with regard to the right of search. In Dec. 1860 he retired from the cabinet when the president refused to take a firmer attitude against secession and he remained in retirement until his death at Detroit, Mich., on June 17, 1866. He wrote for the *North American* and the *American Quarterly Reviews*, and published *Inquiries Concerning the History, Traditions and Languages of Indians Living Within the United States* (1823), and *France: Its King, Court and Government* (1840).

See W. T. Young, *Life and Public Services of General Lewis Cass* (Detroit, 1852); W. L. G. Smith, *Life and Times of Lewis Cass* (1856). The best biography is by A. G. McLaughlin, *Lewis Cass* (revised edition, Boston, 1899) in the "American Statesmen" series.

See also *General Lewis Cass, 1782-1866*, Cass Canfield, compiler (1916); Benjamin Freeman Comfort, *Lewis Cass and the Indian Treaties* (1923); and John Spencer Bassett, "Lewis Cass on Nomination of Andrew Jackson," *American Antiquarian Society Proceedings*, n.s. vol. xxxiii, pp. 12-33 (1924).

**CASSABA** or **TORGUTLU**, a town of Asia Minor in the vilayet of Sarukhan, 63 m. E. of Smyrna, with which it is connected by rail. Pop. (1927) 31,105. It has considerable local trade, and exports the products of the surrounding district. Cotton is the most important article, and there are ginning factories in the town; the silkworm is largely raised and exported; and the "melons of Cassaba" are sent not only to Smyrna but to Constantinople.

**CASSANA, NICCOLÒ** (1659-1714), often called NICOLETTO, Italian painter, was born at Venice, and became a disciple of his father, Giovanni Francesco Cassana, a Genoese, who had been a pupil of Bernardino Strozzi ("il Prete Genovese"). Having painted portraits of the Florentine court and of some of the English nobility, Nicoletto was invited to England and introduced to Queen Anne, who sat to him for her portrait. He died in London in 1714. One of his principal works is the "Conspiracy of Catiline," now in Florence.

**CASSANDER** (c. 350-297 B.C.), king of Macedonia, eldest son of Antipater, first appears at the court of Alexander at Babylon, where he defended his father against the accusations of his enemies. On the death of Antipater, who had passed over his son and appointed Polyperchon regent of Macedonia, Cassander allied himself with Ptolemy Soter and Antigonus, and declared war against the new regent. Most of the Greek states went over to him, and Athens also surrendered. He further effected an alliance with Eurydice, the ambitious wife of King Philip Arrhidaeus of Macedon. Both she and her husband, however, were soon after slain by Olympias, mother of Alexander the Great. Cassander at once marched against Olympias, and, having forced her to surrender in Pydna, put her to death (316). Left master of Macedonia, Cassander joined in a coalition with Lysimachus, Ptolemy, and Seleucus, against Antigonus; in 311 a peace was concluded by which Cassander was recognized as general of Europe during the minority of Alexander IV. In 310, therefore, he murdered the young king and his mother. In 303, Cassander, alarmed at the liberation of Greece by Demetrius Poliorchetes, renewed the coalition, and, when Antigonus was defeated and killed in 301, was recognized as king of Macedonia. He died of dropsy in 297. Cassander was a man of literary taste, but violent and ambitious. He restored Thebes after its destruction

by Alexander the Great, transformed Therma into Thessalonica, and built the new city of Cassandrea upon the ruins of Potidaea. See Diod. Sic. xviii., xix., xx.; Plutarch, *Demetrius*, 18. 31, *Phocion*, 31; also MACEDONIAN EMPIRE.

**CASSANDER** or **CASSANT, GEORGE** (1513-1566), Flemish theologian, born at Bruges, studied at Louvain, and taught theology and literature at Bruges. He studied the differences between the Catholic and Protestant bodies with a view to facilitating reunion, and in 1561 published anonymously *De Officiis pii ac publicae tranquillitatis vere amantis viri in hoc dissidio religionis* (Basle), in which, while holding that no one, on account of abuses, has a right utterly to subvert the Church, he disapproves of exaggerated papal claims. He appeals to Scripture explained by tradition and the fathers of the first six centuries. Such a book pleased neither party; but the German emperor Ferdinand asked him to publish his *Consultatio de Articulis Fidei inter Catholicos et Protestantis Controversis* (1565), in which, like Newman at a later date, he tried to put a Catholic interpretation upon Protestant formularies. While never attacking dogma, he criticizes the papal power and makes reflections on practices. The work, attacked both by the Louvain theologians and by Calvin and Beza was put on the Index in 1617. He died at Cologne on Feb. 3, 1566. His works were published at Paris in 1616.

**CASSANDRA**, in Greek tradition, daughter of Priam and Hecuba. In legend she was beloved of Apollo, who promised to bestow on her the spirit of prophecy if she would comply with his desires. Cassandra accepted the proposal, and then refused her favours. Apollo revenged himself by ordaining that her prophecies should never be believed. On the capture of Troy she was ravished by Ajax, the son of Oileus, in the temple of Athena. In the distribution of the booty, Cassandra fell to the lot of Agamemnon (q.v.) and was murdered with him. It is to be noticed that there is no mention in Homer of her prophetic gifts. Together with Apollo, she was worshipped under the name of Alexandra.

**CASSANO ALL'IONIO**, a town of Calabria, Italy, in the province of Cosenza; its railway station (6m. S. of the town) is 37m. N. by E. from the town of Cosenza, while it is 6m. W. of Sibari, on the line between Metaponto and Reggio. Pop. (1921) 7,002 (town), 9,221 (commune). It is very finely situated 820ft. above sea-level; the rock above it is crowned by a mediaeval castle. See also COMPESA.

**CASSATION**, in music, the name of a type of orchestral work, consisting of several short movements of a light character, popular in the 18th century, serenade and divertimento being other names for much the same kind of composition. Mozart wrote three works so named.

In law, cassation signifies quashing, annulling or reversing, hence Court of Cassation as the name for a court of appeal.

**CASSATT, MARY** (1855-1926), American artist, was born at Pittsburgh, (Pa.), a sister of A. J. Cassatt, president of the Pennsylvania railroad. In 1875 she went to Europe to study art, spending some time in Spain, afterwards proceeding to Paris, where she was greatly influenced by Manet, Renoir, Degas and the Impressionist school. Her first exhibition in Paris was in 1893 at the gallery of M. Durand-Ruel, where in later years her works were frequently exhibited. She also contributed to the various exhibitions of the Impressionist school, but never to the salons. Her work was warmly appreciated in French artistic circles. Mothers and babies or children were to her the chief subjects of inspiration, and her pictures are distinguished by great firmness in drawing and boldness of tone and colour. As a pastellist she attained high rank. Exhibitions of her works have been held in New York and Pittsburgh, and she is represented in the public art galleries of the United States and in private collections. She died in June, 1926.

See Achille Legard, *Un Peintre des Enfants et les Mères: Mary Cassatt, illustrated* (1913); Mary Cassatt, *Painting; Bulletin of the Rhode Island School of Design*, vol. v.; L. W. Hanemeyer, *The Cassatt Exhibition; Pennsylvania Museum Bulletin*, 1927, vol. xxii.

**CASSAVA**, the farinaceous root of two plants of the spurge family (Euphorbiaceae, q.v.), the bitter cassava, *Manihot*

*utilissima*, and the sweet cassava, *M. Aipi*, both important sources of food starches. They are herbaceous or semi-shrubby perennials with very large fleshy, cylindrical, tapering roots as much as 3 ft. long and 6 to 9 in. in diameter, and filled with milky juice. The slender stems, 5 to 9 ft. high, bear large spreading long-stalked leaves, with the blade divided nearly to the base into three to seven long narrow segments. The plants are probably natives of South America, but the bitter cassava, which is the more important of the two in an economic sense, has been introduced into most tropical regions, and is extensively cultivated in west tropical Africa and the Malay Archipelago, from which, as well as from Brazil and other South American States, its starch in the form of tapioca is a staple article of export. The sap of the bitter cassava root contains hydrocyanic acid, and the root, being therefore highly poisonous, cannot be eaten in a fresh condition; while on the other hand the sweet cassava is perfectly innocuous, and is employed as a table vegetable. Exposure to heat dissipates the poisonous principle, and the concentrated juice is in that state used as a basis of cassareep and other sauces. From the bitter cassava roots many different food preparations are made in Brazil. The roots are preserved for use by being cleaned, sliced and dried; from such dried slices manioc or cassava meal, used for cassava cakes, etc., is prepared by rasping. The starch also is separated and used for food under the name of Brazilian arrowroot; and this, when agglomerated into pellets on hot plates, forms the tapioca (*q.v.*) of commerce.

CASSAVA, A TROPICAL PLANT, SHOWING THE SWOLLEN ROOTS WHICH STORE STARCH

This starch forms the Brazilian arrowroot, and, when dried, is known as tapioca

**CASSEL, SIR ERNEST JOSEPH** (1852–1921), Anglo-German financier, was born at Cologne, on March 3, 1852, the son of a small banker in that city, and at the age of 16 became a clerk in the banking firm of Elspacher. In 1870 he went to London and entered the foreign banking house of Bischoffsheim and Goldsmid. There he attracted notice by his skilful disentanglement of the accounts of the Khedival loans. In 1884 he set up for himself and became interested in South-American finance. He re-organized the finances of Uruguay and issued three Mexican loans, as well as acquiring the Royal Swedish railway and financing enterprises such as Vickers' absorption of the Maxim-Nordenfellt Co. and the building of the Central London railway. He also raised a Chinese loan after the war with Japan. His principal achievement was, however, the financing of the Nile irrigation work, and in connection with that the founding of the National Bank of Egypt. During the World War, though he had long been a naturalized British subject, an unsuccessful attempt was made to have his name removed from the privy council. Sir Ernest retired in 1910 and died in London on Sept. 21, 1921. His daughter married Col. W. W. Ashley, M.P., Minister of Transport, and their daughter, who inherited much of her grandfather's great wealth, married Lord Louis Mountbatten. Cassel's public benefactions to hospitals and for educational purposes have been estimated at two millions sterling. He helped to found the King Edward VII. sanatorium for consumptives at Midhurst, Kent, the Radium Institute, and created an educational trust for specified purposes, among these being facilities for workers' education.

**CASSEL, GUSTAV** (1866– ), Swedish economist, was born at Stockholm on Oct. 20, 1866. He became in 1904 professor of economics in the *Högskola* at Stockholm. His memorandum on "The World's Monetary Problem" at the Brussels Conference in 1920 attracted great attention. In another memorandum to

the League of Nations Finance Committee in Sept. 1921 (printed together with the first under the title of *The World's Monetary Problems. Two Memoranda*, 1921), he discussed the questions connected with the financial crisis of 1920. By this time he had come to be regarded as one of the world's leading authorities on foreign exchanges. Cassel was attached to the Swedish delegation as a financial expert at the 1922 Genoa Conference and was a delegate at the meeting of International Chambers of Commerce in London in 1921 and 1922. He was again a delegate at the International Economic Conference held at Geneva under the auspices of the League of Nations in 1927.

Among Cassel's published works are: *The Nature and Necessity of Interest* (1903); *Theoretische Sozialökonomie* (1918); *Money and Foreign Exchanges after 1914* (1922); *Weltwirtschaft und Geldverkehr unter besonderer Berücksichtigung des Valutaproblems* (1920); *Fundamental Thoughts on Economics* (1925).

**CASSEL**, a town of northern France in the department of Nord, on an isolated hill, about 12 m. E.N.E. of St. Omer. Pop. (1926) 2,158. It was a Roman station *Castellum Menapiorum*, as numerous remains of the Gallo-Roman period attest, and an important centre of roads. It was the scene of important battles in 1071, when Robert, count of Flanders, vanquished his rival Arnulf; 1328, when Philip of Valois defeated the Flemish; and 1677, when William of Orange was defeated by Philip, duke of Orleans, brother of Louis XIV. It was the headquarters of Gen. Foch in 1914–15 and of Gen. Plumer in 1916–18, and was bombarded, though not seriously damaged, in 1918.

The former *hôtel de ville* (1634), the *hôtel de la Noble Cour*, once the seat of the jurisdiction of maritime Flanders, now the town-hall, and the *hôtel des ducs d'Halluin* are the historic buildings of the town. Its industrial establishments include tanneries and oil-mills, and there is trade in cattle and butter.

**CASSEL** (also **KASSEL**), a city of Germany, capital of the former electorate of Hesse-Cassel, and, since its annexation by Prussia in 1866, capital of the province of Hesse-Nassau. Pop. (1925) 171,486. The earliest mention of Kassel is in 913, when it is referred to as Cassala. The town passed from the landgraves of Thuringia to the landgraves of Hesse in the 13th century, becoming one of the principal residences of the latter house in the 15th century. The burghers accepted the reformed doctrines in 1527. The fortifications of the town were restored by the landgrave Philip the Magnanimous and his son William IV. during the 16th century, and it was greatly improved by the landgrave Charles (1654–1730), who welcomed many Huguenots. The latter founded the upper new town. In 1762 Kassel was captured by the Germans from the French; after this the fortifications were dismantled and New Kassel was laid out by the landgrave Frederick II. After changing hands several times in the nineteenth century, it was made in 1867 the capital of the newly formed Prussian province of Hesse-Nassau.

It is situated on both sides of the river Fulda, a tributary of the Weser, over which a stone bridge leads to the lower new town. The river is navigable for barges, and railways connect the town with all parts of Germany. The streets of the old town are narrow and crooked, and contain many gabled houses, generally of the 17th century. The principal modern streets are the *Königsstrasse*, the *Schöne Aussicht* and the *Stände-platz*. The *Friedrichs-platz* is 1,000 by 450 ft. in area. In it stands a marble statue of the landgrave Frederick II. The former residence of the electors (*Residenzschloss*) fronts this square, as well as the *Museum Fridericianum*. The museum contains a collection of clocks and watches. Among other public places and buildings are the Roman Catholic church, the *Königs-platz*, the *Karls-platz*, with the statue of the landgrave Charles, and the *Martins-platz*, with a large church—St. Martin's—containing the burial-vaults of the Hessian princes. The gallery of paintings contains one of the finest small collections in Europe, especially rich in the works of Rembrandt, Frans Hals and Van Dyck.

The descendants of the French refugees who founded the upper new town have a church and hospital of their own. A new *Rathaus* (town-hall) has been erected. The town has museums of natural history and ethnography, an industrial exhibition hall and and industrial art school. The town's command of routes

explains its importance in mediaeval times, its fluctuating political fortunes in the nineteenth century and its modern development as a railway centre. It has connections with the manufacturing centres of the Ruhr, with Koblenz, with Frankfurt, with München, with Leipzig and Dresden, and with Berlin. The industries embrace engine-building, the manufacture of railway carriages and plant, scientific instruments, porcelain, tobacco and cigars, iron-founding, jute-spinning and other textiles.

**CASSELL, JOHN** (1817–1865), British publisher, was born in Manchester on Jan. 23, 1817. His father was the landlord of a public-house, and John was apprenticed to a joiner. He was self-educated, gaining by his own efforts a considerable acquaintance with English literature and a knowledge of French. He came to London in 1836 to work at his trade; in 1847 he established himself as a tea and coffee merchant, and about 1850 started a publishing business with the object of supplying good literature to the working classes. From the offices of the firm, which became in 1859 Cassell, Petter, Galpin and Co., were issued the *Popular Educator* (1852–55), the *Technical Educator* (1870–72), the *Magazine of Art* (1878–1903), *Cassell's Magazine* (from 1852) and numerous editions of standard works. A special feature of Cassell's popular books was the illustration. At the time of the Crimean War he procured from Paris the cuts used in *L'Illustration*, and by printing them in his *Family Paper* (begun in 1853) secured a large circulation for it. The firm was converted in 1883 into a limited liability company, under the name of Cassell and Company, Limited. John Cassell died in London on April 2, 1865.

**CASSEROLE**, a covered earthenware dish in which meat and vegetables are cooked in the oven. The heat penetrates the porous dish thereby insuring an even temperature for all its contents. The cover prevents any of the flavour from escaping as steam so that food cooked in casseroles retains all its juices and savour. Glass casseroles which withstand oven heat, and are attractive to the eye, are also obtainable.

**CASSIA, VIA**, an ancient high-road of Italy, leading from Rome through Etruria to Florentia (Florence). At the 11th mile the *Via Clodia* (see *CLODIA, VIA*) diverged north-north-west, while the *Via Cassia* ran to the east of the *Lacus Sabatinus* and then through the place now called Sette Vene, where a road, probably the *Via Annia*, branched off to Falerii (q.v.) through Sutrium (where the *Via Ciminia*, running along the east edge of the *Lacus Ciminius*, diverged from it, to rejoin it at Aquae Passeris, north of the modern Viterbo), Forum Cassii, Volsinii (novi), Clusium and Arretium, its line being closely followed by the modern high-road from Rome to Florence. The date of its construction is, at earliest, 187 B.C., when the consul C. Flaminius constructed a road from Bononia to Arretium (which must have coincided with a portion of the later *Via Cassia*). Cicero speaks of the existence of three roads from Rome to Mutina (Modena), the Flaminia, the Aurelia and the Cassia. As milestones show, it was repaired partly by Trajan, partly by Hadrian. One stretch was called the *Via Nova Traiana*, but it was not a distinct road (*Year's work in Classical Studies*, 1925–26, 121).

**CASSIA**, the aromatic bark derived from *Cinnamomum Cassia* (family Lauraceae). The greater part of the supply coming from China, it is sometimes termed Chinese cinnamon. The bark is much thicker than that of true cinnamon; the taste is more pungent and the flavour less delicate, though somewhat similar to that of cinnamon. The properties of cassia bark depend on the presence of a volatile oil—the oil of cassia, which is imported in a fairly pure state as an article of commerce from Canton. Cassia bark is in much more extensive demand on the Continent of Europe than in Great Britain, being preferred to cinnamon by southern nations. The chief use is for flavouring liqueurs and chocolate, and in cooking generally. When ground as a spice it is difficult to distinguish cassia from cinnamon (q.v.), and it is a common practice to substitute the cheap common spice for the more valuable article. *Cassia Buds*, which have a pleasing cinnamon flavour, are believed to be the immature fruits of the tree which yields Chinese cinnamon. They are brought in considerable quantities from Canton, and used as a spice and in confectionery.

*Cassia pulp*, used as a laxative, is obtained from the pods of *Cassia Fistula*, or pudding pipe tree, a native of Africa which is cultivated in both the East and West Indies. Some confusion occasionally arises from the fact that *Cassia* is the generic name of an extensive genus of leguminous plants, which, in addition to various other medicinal products, is the source of the senna leaves which form an important article of *materia medica*.

**CASSIANUS, JOANNES EREMITA or JOANNES MASSILIENSIS** (360–435), a celebrated recluse, and one of the founders of monasticism in the west. His early life was spent in the monastery of Bethlehem and after dwelling for several years among the ascetics of the Nile desert, in 403 he repaired to Constantinople where he was ordained deacon by Chrysostom. Becoming a priest at Rome, he journeyed to Marseille (after 410), where he founded a convent for nuns and the abbey of St. Victor. Cassianus was one of the first Semi-Pelagians, maintaining that while man is by nature sinful, some good remains in him, and that, while the immediate gift of grace is necessary to salvation, conversion may begin by the exercise of man's will. He further asserted that God gives grace to all who seek it, though He sometimes bestows it without its being sought. At the request of Castor, bishop of Apt, he wrote two treatises on the monastic life. The *De Institutione Coenobiorum* describes the daily life, the discipline and the special spiritual dangers of monasticism. The *Collationes Patrum*, a series of dialogues with the pious fathers of Egypt, deal with the avoidance of these dangers. At the desire of Leo (then archdeacon of Rome) he wrote against Nestorius his *De Incarnatione Domini*.

EDITIONS.—Douay (1616) by Alardus Gazäus, with excellent notes; Migne's *Patrol. Lat.* vols. xlix. and l.; M. Petschenig in the *Vienna Corpus Script. Eccles. Lat.* (2 vols. 1886–88; Eng. trans. in the *Library of Nicene Fathers*, vol. xi.). See A. Harnack, *History of Dogma*, v. 246 ff., 253 ff.; A. Hoch, *Die Lehre d. Joh. Cassian von Natur und Gnade* (Freiburg, 1895).

**CASSINI**, the name of an Italian family of astronomers, four generations of whom succeeded each other in official charge of the observatory at Paris.

GIOVANNI DOMENICO CASSINI (1625–1712) was born at Perinaldo near Nice on June 8, 1625. Educated by the Jesuits at Genoa, he was nominated in 1650 professor of astronomy in the University of Bologna. In 1671 he became director of the Paris observatory, and became a French subject in 1673. Between 1671–84 he discovered four Saturnian satellites, and in 1675 the division in Saturn's ring (see SATURN); made the earliest sustained observations of the zodiacal light, and published, in *Les Éléments de l'astronomie vérifiés* (1684), an account of Jean Richer's (1630–96) geodetical operations in Cayenne. Certain oval curves which he proposed to substitute for Kepler's ellipses as the paths of the planets were named after him "Cassinians." He died at the Paris observatory on Sept. 11, 1712.

A partial autobiography left by Giovanni Domenico Cassini was published by his great-grandson, Count Cassini, in his *Mémoires pour servir à l'histoire des sciences* (1810).

JACQUES CASSINI (1677–1756), son of Domenico Cassini, was born at the Paris observatory on Feb. 8, 1677. Having succeeded to his father's position at the observatory in 1712, he measured in 1713 the arc of the meridian from Dunkirk to Perpignan, and published the results in a volume entitled *De la grandeur et de la figure de la terre* (1720) (see GEODESY). He wrote besides *Éléments d'astronomie* (1740), and died on April 18, 1756, at Thury, near Clermont. The first tables of the satellites of Saturn were supplied by him in 1716.

CÉSAR FRANÇOIS CASSINI or CASSINI DE THURY (1714–1784), son of Jacques Cassini, was born at the observatory of Paris on June 17, 1714. He succeeded to his father's official employments, continued the hereditary surveying operations, and began in 1744 the construction of a great topographical map of France. The post of director of the Paris observatory was created for his benefit in 1771, when the establishment ceased to be a dependency of the Academy of Sciences. Cassini de Thury died at Thury on Sept. 4, 1784. His chief works are: *Méridienne de l'observatoire de Paris* (1744), *Description géométrique de la terre* (1775), and *Description géométrique de la France* (1784).

JACQUES DOMINIQUE CASSINI, Count (1748–1845), son of César François Cassini, was born at the observatory of Paris on June 30, 1748. He succeeded in 1784 to the directorate of the observatory; but his plans for its restoration and re-equipment were wrecked in 1793 by the French Revolution. He spent some months in prison in 1794, and then withdrew to Thury, where he died on Oct. 18, 1845. He completed his father's map of France, which was published by the Academy of Sciences in 1793. It served as the basis for the *Atlas National* (1791), showing France in departments. Count Cassini's *Mémoires pour servir à l'histoire de l'observatoire de Paris* (1810) included the autobiography of his great-grandfather, the first Cassini.

See J. F. S. Devic, *Histoire de la vie et des travaux de J. D. Cassini* (1851); J. Delambre, *Histoire de l'astronomie au XVIII<sup>e</sup> siècle*; C. Wolf, *Histoire de l'observatoire de Paris* (1902).

**CASSIODORUS** (not CASSIODORIUS), the name of a Syrian family settled at Scyllacium (Squillace) in Bruttium, where it held an influential position in the 5th century A.D. Its most important member was FLAVIUS MAGNUS AURELIUS CASSIODORUS SENATOR (c. 490–585), historian, statesman, and monk. "Senator" (not a title) is the name used by himself in his official correspondence. His father attached himself to Theodoric, who appointed him *corrector* (governor) of Bruttium and Lucania, and *praefectus praetorio*. The son at an early age became *consiliarius* (legal assessor) to his father, and (in 507) *quaestor*, his chief duties being to act as the mouthpiece of the ruler and draft his despatches. In 514 he was ordinary consul, and later *corrector* of his native province. At the death of Theodoric (526) he held the office of *magister officiorum* (chief of the civil service). Under Athalaric he was *praefectus praetorio*, a post which he retained till about 540, after the entry of Belisarius into Ravenna, when he retired. He founded two monasteries—Vivarium and Castellum—in his ancestral domains at Squillace (others identify the two monasteries). The special duty which he enjoined upon the inmates was the acquisition of knowledge, both sacred and profane. He also collected and emended valuable mss., which his monks were instructed to copy, and superintended the translation of various Greek works into Latin. As he is stated to have written one of his treatises at the age of 93, he must have lived till after 580. His works are (1) historical and political; (2) theological and grammatical.

1. (a) *Variae*, his most important work, published in 537, contains the decrees of Theodoric and his successors Amalasuntha, Theodahad, and Witigis; the regulations of the chief offices of State; the edicts published by Cassiodorus himself when *praefectus praetorio*. It is the best source of our knowledge of the Ostrogothic kingdom in Italy (ed. T. Mommsen in *Monumenta Germaniae Historica: Auctores Antiquissimi*, xii, 1894; condensed English translation by T. Hodgkin, 1886).

(b) *Chronica*, written at the request of Theodoric's son-in-law Eutharic, published in 519. It is an inaccurate compilation, unduly partial to the Goths (ed. T. Mommsen in *Mon. Germ. Hist.: Auct. Ant.*, xi, pt. i, 1893).

(c) Panegyrics on Gothic kings and queens (fragments ed. L. Traube in *Mon. Germ. Hist.: Auct. Ant.*, xii).

2. (a) *De Anima*, a discussion on the nature of the soul, in which the author deplores the quarrel between Goths and Romans. It seems to have been published with the last part of the *Variae*.

(b) *Institutiones divinarum et humanarum litterarum*, an encyclopaedia of literature and the arts for the monks.

(c) A commentary on the Psalms and short notes (*complexiones*) on the Pauline epistles, the Acts, and the Apocalypse.

(d) *De Orthographia*, a compilation made by the author in his 93rd year from the works of 12 grammarians, ending with his contemporary Priscian (ed. H. Kell, *Grammatici Latini*, vii.).

The Latin translations of the *Antiquities* of Josephus and of the ecclesiastical histories of Theodoret, Sozomen, and Socrates, under the title of *Historia Tripartita* (embracing the years 306–439), were carried out under his supervision.

Of his lost works the most important was the *Historia Gothorum*, which appears to have brought the history down to the death of Theodoric. His chief authority for Gothic history and legend was Ablavius (Ablabius). The work is only known to us in the meagre abridgment of Jordanes (ed. T. Mommsen, 1882).

**BIBLIOGRAPHY.**—*Editio princeps*, by G. Fornerius (1579); J. Gare (Rouen, 1679; Venice, 1729), reprinted in J. P. Migne, *Patrologia Latina*, lxx, lxx. On Cassiodorus generally, see *Anecdota Holderi*, excerpts from a treatise of Cassiodorus, edited by H. Usener (Bonn, 1877), which throws light on questions connected with his biography; T. Mommsen, preface to his edition of the *Variae*; monographs by

A. Thorbecke (Heidelberg, 1867) and A. Franz (Breslau, 1872); T. Hodgkin, *Italy and her Invaders*, iii, p. 280, iv, p. 348; A. Ebert, *Allgemeine Geschichte der Literatur des Mittelalters*, i; Teuffel-Schwabe, *Hist. of Roman Literature* (Eng. trans.), Section 483; G. A. Simcox, *Hist. of Latin Literature* (1884); W. Ramsay in Smith's *Dictionary of Greek and Roman Biography*; J. B. Bury's edition of Gibbon's *Decline and Fall*, iv, 180, 522; R. W. Church in the *Church Quarterly Review*, x, (1880); J. E. Sandys in *Hist. of Classical Scholarship* (2nd ed. 1906); A. Olleris, *Cassiodore, conservateur des livres de l'antiquité latine* (1891); G. Minasi, *M. A. Cassiodoro . . . ricerche storico-critiche* (1895); and C. Cipolla in *Memorie della r. Accademia delle scienze di Torino* (2nd ser. xliii, pt. 2, 1893); L. M. Hartmann in Pauly-Wissowa's *Realencyklopädie*, iii, pt. 2 (1899), with note on the musical section of Cassiodorus' *Institutiones* by C. von Jan.

**CASSIOPEIA**, in Greek mythology, the wife of Cepheus and mother of Andromeda; in astronomy, a constellation of the northern hemisphere, easily recognized by the group of five stars forming a slightly irregular W. The most brilliant Nova (temporary star) on record broke out in this constellation in 1572 when it was observed by Tycho Brahe.

**CASSIRER, ERNST** (1874– ), German philosopher, was born at Breslau, and educated at the universities of Berlin, Leipzig, Munich, Heidelberg and Marburg. In 1919 he became a professor at Hamburg. Cassirer's chief interests lie in the history of transcendental philosophy, in the theory of scientific knowledge and in the formation of concepts. His most important works are *Descartes Kritik der math. u. naturwissenschaftlichen Erkenntnis* (1899); *Leibniz' System* (1902); *Das Erkenntnisproblem in der Phil. u. Wissenschaft der neueren Zeit*, 3 vols. (1906–20); *Kants Leben u. Lehre* (1921); *Zur Einstein'schen Relativitätstheorie* (1921); *Idee u. Gestalt. Goethe, Schiller, etc.* (1921); *Philosophie der symbolischen Formen* (1923); and *Substanzbegriff u. Funktionsbegriff* (1910, Eng. trans. 1923).

**CASSITERIDES**, in ancient geography the name of islands regarded as being situated somewhere near the west coasts of Europe (from the Gr. *κασσίτερος*, tin, i.e., "Tin-islands"). Herodotus (430 B.C.) had dimly heard of them. Later writers, Posidonius, Diodorus, Strabo and others, call them smallish islands off (Strabo says, some way off) the north-west coast of Spain, which contained tin mines, or, as Strabo says, tin and lead mines. A passage in Diodorus derives the name rather from their nearness to the tin districts of north-west Spain. While geographical knowledge of the west was still scanty and the secrets of the tin-trade were successfully guarded the idea of tin-producing islands easily arose. Later, when the west was better explored, it was found that tin actually came from two regions, north-west Spain and Cornwall. Neither of these could be called "small islands" or described as off the north-west coast of Spain, and so the Cassiterides were not identified with either by the Greek and Roman geographers. Instead, they became a third, ill-understood source of tin, conceived of as distinct from Spain or Britain. Recent archaeological research has enlarged our knowledge of early sources of tin, apparently obtained by "streaming," and islands off the coast of Brittany which have tin-bearing sands have been suggested as the original Cassiterides. It may well be however that the name represents merely early and vague knowledge of the Greeks that tin was found overseas somewhere in or off western Europe.

**BIBLIOGRAPHY.**—Herodotus iii, 115; Diodorus v, 21, 22, 38; Strabo ii, 5, iii, 2, 5, v, 11; Pliny, *Nat. Hist.*, iv, 119, vii, 197, xxxiv, 156–158, are the chief references in ancient literature. T. R. Holmes, *Ancient Britain* (1907), appendix, identifies the Cassiterides with the British Isles.

**CASSITERITE**, the mineralogical name of tin-stone, SnO<sub>2</sub>, the common ore of tin (from the Gr. *κασσίτερος*, tin). It crystallizes in the tetragonal system, usually in prisms with four or eight sides, terminated by pyramids. Twinning is common, as shown by re-entrant angles on the crystals, certain slender prismatic crystals are called "sparable tin" and "needle tin" in Cornwall, where the usual name for the ordinary mineral is "black tin." The banded and fibrous mineral of the same composition known as "wood tin" is probably formed by precipitation from the colloidal state. It is common in Cornwall and Bolivia. Cassiterite varies from colourless to dark brown or black, the darker shades being commonest. It has a brilliant adamantine lustre; hardness about 6.5 and density 7. It is also very stable and therefore

readily concentrated in residual and alluvial deposits, from which in fact most of the ore is obtained. Primary cassiterite occurs in disseminations, segregations, lodes and veins in and around granites, in association with tourmaline, topaz, lithia-mica, fluorspar, beryl, and other minerals of pneumatolysis (*q.v.*), and is often accompanied by wolframite. It is believed to be formed at a late stage in the cooling of the granite by a reaction between tin-fluoride and water.

Cassiterite is found in all parts of the world.

**CASSIUS**, the name of a distinguished ancient Roman family, originally patrician. Its most important members are the following:

1. **SPURIUS CASSIUS**, surnamed *Vecellinus* (*Vicellinus*, *Viscellinus*), three times consul, and author of the first agrarian law. In his first consulate (502 B.C.) he defeated the Sabines; in his second (493) he renewed the league with the Latins, and dedicated the temple of Ceres in the Circus; in his third (486) he made a treaty with the conquered Hernici. His agrarian law was clearly intended to benefit the needy plebeians (*see* AGRARIAN LAWS), and was violently opposed both by the patricians and by the wealthy plebeians. Cassius was condemned and executed. According to Livy, his proposal to bestow a share of the land upon the Latins was regarded with great suspicion. According to Mommsen (*Römische Forschungen*, ii), the whole story is an invention of a later age, founded upon the proposals of the Gracchi and M. Livius Drusus, to which period belongs the idea of sharing public land with the Latins.

*See* Livy ii. 33, 41; Dion Halic. v. 49, viii. 69–80; Cicero, *Pro Balbo*, 23 (53), *De Republica*, ii. 27 (49), 35 (60); Val. Max. v. 8.2.

The following Cassii are all plebeians. It is suggested that the sons of Spurius Cassius either were expelled from, or voluntarily left, the patrician order, in consequence of their father's execution.

2. **GAIVS CASSIUS LONGINUS**, consul 73 B.C. With his colleague, Terentius Varro Lucullus, he passed a law (*lex Terentia Cassia*), the object of which was to give authority for the purchase of corn at the public expense, to be retailed at a fixed price at Rome.

*See* Cicero, *In Verrem*, iii. 70, v. 21; Livy, *Epit.* 96; Appian, *Bell. Civ.* iv. 28; Orosius v. 24.

3. **GAIVS CASSIUS LONGINUS**, prime mover in the conspiracy against Julius Caesar. In 53 B.C. he served in the Parthian campaign under M. Licinius Crassus, saved the remnants of the army after the defeat at Carrhae, and for two years successfully repelled the enemy. In 49 B.C. he became tribune of the plebs. The outbreak of the civil war saved him from being brought to trial for extortion in Syria. He at first commanded part of Pompey's fleet. After Pharsalus he became reconciled to Caesar, who made him one of his legates. In 44 B.C. he became *praetor peregrinus* with the promise of the Syrian province for the ensuing year; yet he was one of the leading conspirators against Caesar, taking an active part in the actual assassination. In September he left Italy for Syria, where he raised a considerable army, and defeated P. Cornelius Dolabella, to whom the province had been assigned by the senate. On the formation of the triumvirate, Brutus and he, with their combined armies, crossed the Hellespont, marched through Thrace, and encamped near Philippi in Macedonia. Their intention was to starve out the enemy, but they were forced into an engagement. Brutus was successful against Octavian, but Cassius, defeated by M. Antonius (Mark Antony), gave up all for lost, and ordered his freedman to slay him.

*See* Plutarch, *Brutus*, *passim*, *Crassus*, 27, 29, *Caesar*, 62, 69; Dio Cassius xl. 28, xlii. 13, xlii. 14, xlvii. 20; Vell. Pat. ii. 46, 56, 58, 69, 70, 87; Cicero, *Philippics*, xi. 13, 14, *ad Att.* v. 21, xiv. 21, *ad Fam.* xi. 3, 15, 16; Appian, *Bell. Civ.* ii. iii., 113, iii. 2, 8, iv. 60–62, 87, 90, iii. 13, 132; Caesar, *Bell. Civ.* iii. 101.

4. **QUINTUS CASSIUS LONGINUS**, the brother or cousin of the murderer of Caesar, quaestor of Pompey in Further Spain in 54 B.C. In 49, as tribune of the people, he supported the cause of Caesar, by whom he was made governor of Further Spain. His oppression of the provincials led to an unsuccessful insurrection at Corduba. Cassius punished the leaders with merciless severity, and made the lot of the provincials harder than ever. At last some of his troops revolted and proclaimed the quaestor M. Marcellus, governor of the province. The king of Mauretania and the pro-

consul of Hither Spain, to whom Cassius had applied for assistance, arranged with Marcellus that Cassius should go free with the legions that remained loyal to him. Cassius sent his troops into winter quarters and took ship at Malaca, but was wrecked at the mouth of the Ebro. His tyrannical government of Spain had greatly injured the cause of Caesar.

*See* Dio Cassius xli. 15, 24, xlii. 15, 16, xliii. 29; Livy, *Epit.* III.; Appian, B.C. ii. 33, 43; *Bellum Alexandrinum*, 48–64.

5. **GAIVS CASSIUS LONGINUS** (1st century A.D.), Roman jurist, consul in 30, proconsul of Asia 40–41, and governor of Syria under Claudius 45–50. He was banished by Nero (65) to Sardinia. He was recalled by Vespasian, and died at an advanced age. Cassius was a pupil of Masurius Sabinus, with whom he founded a legal school, the followers of which were called Cassiani. His chief work was the *Libri Iuris Civilis* in ten books, which was used by the compilers of Justinian's *Digest*.

*See* Tacitus, *Annals*, xvi. 7–9; Suetonius, *Nero*, 37; Dio Cassius lix. 29; Teuffel-Schwabe, *Hist. of Roman Literature*, § 298, 3.

**CASSIUS, AVIDIUS** (d. A.D. 175), Roman general, a Syrian by birth, lived during the reign of Marcus Aurelius. He distinguished himself during the Parthian War (A.D. 162–165), and was apparently appointed military governor of Asia, though the actual extent of his jurisdiction is doubtful. In 172 he was sent to Egypt, where he put down a rising of the Bucolici, the robber herdsmen of the delta, after which he returned to Syria. In 175 Aurelius fell ill, and his wife Faustina, to secure her position in case of his death, offered her hand and the throne to Cassius. A rumour of Aurelius's death having reached Syria, Cassius proclaimed himself emperor. The senate declared him a public enemy, and Aurelius set out for the east. While in Illyria, he received the news that Cassius had been slain by his own officers.

*See* Dio Cassius lxxi. 2–4, 17, 22–28, 30, 31; Fronto, *Letters*, i. 6; Lives of Marcus Aurelius, Verus, and Commodus in the *Scriptores Historiae Augustae*, and the special biography of Avidius Cassius in the same by Vulcacius Gallicanus. The various letters and documents in the last-named are very probably spurious. *See* also article in Pauly-Wissowa's *Realencyklopädie*, ii. pt. 2.

**CASSIUS, GAIVS**, called Parmensis from his birthplace Parma, was one of the murderers of Julius Caesar, and after his death joined the party of Brutus and his namesake Cassius. In 43 B.C. he was in command of the fleet on the coast of Asia, but after the battle of Philippi he joined Sextus Pompeius in Sicily. When Pompeius was defeated at Naulochus by Agrippa and fled to Asia, Cassius went over to Antony, and was present at Actium (31). He afterwards fled to Athens, where he was put to death by Octavian (Suetonius, *Augustus*, 4). Cassius is credited with satires, elegies, epigrams and tragedies. Some hexameters with the title *Cassii Orpheus* are by Antonius Thyestes, an Italian of the 17th century. Horace seems to have thought well of Cassius as a poet. (*Epistles*, i. 4.3.). The story in the Horace scholia, that L. Varius Rufus took his tragedy *Thyestes* from a ms. found amongst the papers of Cassius, is due to a confusion.

*See* Appian, B.C. v. 2, 139; Cicero, *ad Fam.* xii. 13; Vell. Pat. ii. 87; Orosius, vi. 19; *see* also the diffuse treatise of A. Weichert, *De L. Varii et Cassii Parmensis Vita et Carminibus* (1836).

**CASSIVELAUNUS** or **CASSIVELLAUNUS**, a British chieftain, the ruler of the country north of the Thames, who led Caturellauni against Julius Caesar on his second expedition (54 B.C.) (*see* BRITAIN). After several indecisive engagements, Caesar took the camp of Cassivelaunus, who was obliged to make peace on condition of paying tribute and giving hostages.

*See* Caesar, *B.G.* v. 11–22; Dio Cassius xl. 2, 3; Orosius vi. 9.6; for the etymology of the name *see* J. Rhys, *Celtic Britain*, pp. 289–290 (1904); C. I. Elton, *Origins of English History* (1890).

**CASSOCK**, a long-sleeved, close-fitting robe worn by the clergy and others engaged in ecclesiastical functions. Originally applied to the dress of soldiers and horsemen, and later to the long garment worn in civil life, the name came into ecclesiastical use somewhat late (as a translation of *subtaneum*, *vestis talaris*, *toga talaris*, or *tunica talaris*); and it now survives in this sense alone. The word is derived through the French from Ital. *casacca*, "a frock, a horseman's cote, a long cote; also a habitation or dwelling" (Florio, *Q. Anna's New World of Words*, 1611), and

this in turn is perhaps derived from *casa*, a house (*cf.* chasuble). A Slav origin has also been suggested, and the Cossack horseman may have given to the West both garment and name. Or it may be derived from *casequin* (Ital. *casecchino*), rather than vice versa, and this in turn from Arabic *kazāyand* (Pers. *kashāyand*), a padded jerkin (Lagarde in *Gött. gelehrte Anzeiger*, April 15, 1887, p. 238).

The cassock, though part of the canonical costume of the clergy, is not a liturgical vestment. Originally the ordinary dress of lay-people as well as clergy, it has survived only among the latter. In mild weather it was the outer garment; in cold weather it was worn under the tabard or chimere (*q.v.*); the latter name was sometimes given to it as well as to the sleeveless upper robe. In the Roman Catholic Church the cassock (Fr. *soutane*, Ital. *sottana*) must be worn by the clergy both in ordinary life (except in Protestant countries) and under their vestments in church. It varies in colour with the wearer's rank: white for the pope, red for cardinals, purple for bishops, black for the lesser ranks. In the Church of England the cassock, prescribed in 1604 as the canonical dress of the clergy, has been continuously, though not universally, worn by the clergy since the Reformation. It is now, however, usually only worn in church, at home, or within the precincts of the parish.

See the *Report of the sub-committee of Convocation on the Ornaments of the Church and its Ministers* (London, 1908), and authorities there cited.

**CASSONE**, in furniture, the Italian name for a marriage coffer. The ancient and once almost universal European custom of providing a bride with a chest or coffer to contain the household linen, which often formed the major part of her dowry, produced in Italy a special type of chest of monumental size and artistic magnificence. The cassoni of the people, although always large in size, were simple as regards ornament; but those of the nobles and the well-to-do mercantile classes were usually imposing as regards size, and adorned with extreme richness. The cassone was almost invariably much longer than the English chest, and even at a relatively early period it assumed an artistic finish such as was never reached by the chests of northern Europe, except in the case of a few of the royal *corbeilles de mariage* made by such artists as Boulle for members of the house of France. Many of the earlier examples were carved in panels of geometrical tracery, but their characteristic ornament was either *intarsia* or *gesso*, or a mixture of the two. Bold and massive feet, usually shaped as claws, lions, or other animals, are also exceedingly characteristic of cassoni, most of which are of massive and sarcophagus-like proportions with moulded lids, while many of them are adorned at their corners with figures sculptured in high relief. The scroll-work inlay is commonly simple and graceful, consisting of floral or geometrical motives, or arabesques. The examples coated with gilded *gesso* or blazoned with paintings are, however, the most magnificent. They were often made of chestnut, and decorated with flowers and foliage in a relief which, low at first, became after the Renaissance very high and sharp. The panels of the painted cassoni frequently bore representations of scriptural and mythological subjects, or incidents derived from the legends of chivalry. The arms of the family for which the chest was made might also be emblazoned upon the front. These chests rarely bear dates or initials, but it is often possible to determine their history from their armorial bearings.

**CASSOWARY** (*Casuarus*), a genus of ostrich-like birds, only inferior in size to the emu and ostrich, and approximating to the extinct moas of New Zealand. The species is characterized by rudimentary wings, bearing four or five barless shafts, a few inches long, and apparently useless; and by loosely webbed feathers, short on the neck, but of great length on the rump and back, whence they descend over the body, forming a thick hair-like covering. They possess stout limbs, with which they kick, and have the inner toe armed with a long, powerful claw. The common cassowary (*Casuarus galeatus*) stands 5ft. high, and has a horny, helmet-like protuberance on the crown of its head; the front of the neck is naked, with two brightly-coloured wattles. It is a native of the island of Ceram, where it lives in pairs, feeding

on fruits and herbs, and occasionally on small animals. The mooruk, or Bennett's cassowary (*Casuarus bennetti*), is a shorter and more robust bird. It differs further in having its head crowned with a horny plate. It has only been found in New Britain. When captured shortly after being hatched, and reared by hand, it soon becomes tame. The adult bird is exceedingly shy and, owing to its great fleetness and strength, is rarely caught. It eats voraciously, and, like the ostrich, will swallow whatever comes in its way. (See EMU.)

COMMON CASSOWARY. A RUNNING BIRD ALLIED TO THE OSTRICH

**CAST**, a throw, or something thrown (a word of Scandinavian origin, *cf.* Dan. *kaste*, throw), *e.g.*, a throw of dice, with the figurative sense of a chance; the spreading out of hounds in search of a lost scent; with the meaning of a twisted throw or turn, a slight squint in the eye. A "cast" is a measure of fish, being the amount taken in two hands to be thrown into a vessel, and similarly a potter's measure for a certain quantity of clay. It is also a term for the coils of earth thrown up by earthworms, and in fly-fishing for the casting line of gut. The phrase "to cast up an account" is probably derived from the old method of calculation by counters which were thus thrown into a heap. The word is also used of a mould for casting metals, or of the copy of an original statue or relief, taken from a mould, and similarly of fossils for the mineral filling of the empty mould left by the organism. The casting of a play is the assignment of particular parts to the actors and actresses.

**CASTAGNO, ANDREA DEL** (1390–1457), Italian painter of the Florentine school, was born in 1390, probably at Castagno, in the district of Mugello, and died in Aug. 1457. He imitated Masaccio and the naturalists of his time in boldness of attitude. The charge that he treacherously assassinated his colleague, Domenico Veneziano, in order to monopolize the then recent secret of oil painting as practised in Flanders by the Van Eycks, has been proved to be untrue. Domenico died four years after Andrea. The latter is commonly called "Andrea (or Andreino) degli Impiccati" (of the hanged men), in consequence of his being commissioned in 1435 to paint, in the Palazzo del Podestà in Florence, the fallen leaders of the Peruzzi and Albizzi. One of his principal works now extant (most of them have perished) is the equestrian figure of Nicola di Tolentino, in the cathedral of Florence.

**CASTALIA** or **FONS CASTALIUS**, a celebrated fountain in Greece, now called the Fountain of St. John, which rises in a chasm of Mount Parnassus near Delphi. It was sacred to Apollo and the Muses, and its water was used in the religious purifications of pilgrims. From its connection with the Muses it is mentioned by late Greek writers (*e.g.*, Lucian, *Jup. Trag.* 30) and Latin poets (*e.g.*, Ovid, *Am.* i. 15. 36) as a source of inspiration, and this has passed into a commonplace of modern literature.

**CASTANETS**, instruments of percussion, introduced through the Moors by way of Spain into Europe from the East. Castanets, always used in pairs, one in each hand, consist of two pear- or mussel-shaped bowls of hard wood, hinged together by a cord, the loop being passed over the thumb and first finger. The two halves are struck against each other by the other fingers giving out a series of hollow clicks of indefinite musical pitch. Castanets were used by the ancient Greeks, and also by the Romans to accompany the dances in the Dionysiac and Bacchanalian rites.

**CASTE (INDIAN)**. The term caste is in English hardly older than 1800, before which year it was spelt "cast." Borrowed from the French "caste," itself an adaptation of the Portuguese "casta" (also Spanish) meaning "breed" or "clan," it was used by the earlier Portuguese travellers in the sense of tribe or even race, being often applied to the lowest Indian classes in contradistinction to their overlords. The word is probably derived ultimately from the Latin *castus*, "pure." It has no general equivalent in modern India.

A caste is in India fairly definable as an endogamous group or even as a collection of endogamous groups, bearing a common name, whose members follow traditionally a single occupation or certain cognate occupations, have by fact or fiction a common origin and are generally deemed to form a homogeneous unit, whose constituent parts are more closely allied to one another than to any other section of society. This definition is, however, only applicable to modern India, and even so may be subject to qualifications. In ancient India caste in this sense probably did not exist, but we have no real knowledge of pre-Aryan India, and it is not until we reach the Vedic Arya period (c. 1200 B.C.) that any records are as yet available. The social system of these Aryas resembled that of their kindred in Iran. It is fairly certain that the penetration was a long drawn out process, possibly at times peaceful, though in the main effected by tribes or military confederacies under adventurous leaders perhaps of different race, who succeeded from time to time in welding larger forces together, though none founded any lasting dynasty or permanent kingdom.

The invaders, it may be inferred from the earliest hymns of the *Rig-Veda*, were a pastoral folk, loosely organized into groups of related families or clans which, aggregated, formed tribes. Authority over these vested in chieftains and a nobility, the mass of the tribes being designated the "clans" or "peoples" always in the plural—foreshadowing the use of "caste" by Portuguese writers—while priests mostly conducted the public sacrifices of the tribe, leaving family worship entirely in the hands of its head and his consort.

But as yet there was no restriction of even the privilege of tribal sacrifice to a sacerdotal class, since it could be solemnized by a scion of a ruling family and occasionally others disputed the priestly claims. Hence we can at most distinguish three nascent orders, the noble, the priest and the mass of the clansmen; all three excluding the aborigines or *Dasyus*.

In the latest Vedic literature, the Brahman is represented as the incontestable head of society with the noble next and below him the "clans" or third estate; while the lower classes form the lowest or fourth order in which it would seem are merged the *Dasyus*, or such of them as survived. This organization was confined to quite a small area of Northern India, Kurukshetra and the adjoining lands, roughly in Moghul days the province of Sirhind. Within it lay Brahmanarta, the peculiarly holy land between the Sarasvati and the Drishbachvati; the Bicharshidisha was quite a small part of the extensive Aryalands, *Aryāvarta*.

After the Vedic period the principal document is the *Laws of Manu*, compiled soon after the Christian era but most probably going back to a much earlier epoch. This specifies the four cardinal *varnas*, "complexions," of Indian society, viz., the Brahmins, Kshatriyas, Vaisyas (the twice born) and the Sūdras, and appears to deny or forbid the existence of a fifth one. To reconcile fact with this classification, however, Manu apparently resorted to a strange device, assigning to the fruit of mixed marriages certain lowly avocations and tribes of impure descent. In so doing he recognized two main principles: (i.) that while the ideal spouse for a man is a bride of his own caste (endogamy *q.v.*), marriage to a woman of a caste below his (hypergamy *q.v.*) is by comparison a venial offence against the endogamous rule, the chief penalty for it being a diminution of the son's shares in the inheritance; (ii.) that the union of a woman with a man of higher status was, in some circumstances, an unpardonable sin, disinheriting their children and relegating them to a degraded caste. Manu allotted a name to almost all castes in this scheme. In it, for instance, the son of a Kshatriya lady by a Brahman husband seems to be a Brahman but forfeits a fourth of his heritage. But a Brahman's son by a Vaisya wife would be an Ambashthan (mod. Ambattan), an unpretentious barber-surgeon, while his son by a Sūdra became a Nishada, normally a fisherman but in the text a Parasava, a living corpse. Since the fisherman's trade must have existed before Manu, he is regarded as defining the status of *pratiloma* sons in terms of existing occupational groups. Similarly he defines a Vaisya's son by a Kshatriya wife as a Magadha, or man of Magadha, i.e., S. Behar, while his son by a Brahman wife is to be a Vaideha, or man of Videha, otherwise

Mithila, mod. Tirhut in Behar. For the Abhira, a generic name for tribes of the north-west, he finds a status as sons of a Brahman by an Ambashtha's daughter, and so for the Sairandhras, apparently the people of Sirhind in the E. Punjab, a much lowlier origin, nearly, if not as degraded as that of an Andhra, a man of Telingana which lay far to the south.

But while disparaging tribes of non-Aryan or not purely Aryan blood as mixed castes, Manu also branded a number of quite cleanly avocations, such as carpentry, as disreputable. The post-Vedic caste system had some merits. The Brahman was the priest and scholar who was to teach the other castes, and if he awarded himself great privileges including benefit of clergy for criminalous clerks, he had renounced by a self-denying ordinance all pretensions to temporal authority. The function of the Kshatriya was defence of the realm, and if to it was added all administrative power under the king, himself a Kshatriya, that power was to be exercised under Brahman counsels, even the king's conscience being kept in a manner by Brahman advisers. The Vaisyas were the graziers, yeomen and burgesses of the community, while the Sūdras were to serve all the other castes. To which of the four Manu assigned the mixed castes is not clear but few of them can have ranked above the Sūdras, though he recognized the principle that the children of an *amuloma* union could by marrying in the paternal caste regain their father's status in six generations. For the fruit of *pratiloma* unions there was no hope of promotion in the social scale. In all Manu recognizes more than a score of mixed castes as already existing, and it is self-evident that two new mixed castes could on his principles be formed by old ones if sufficiently remote in status. If, in the event, mixed castes were not multiplied Manu had paved the way for the creation of new castes on an extended scale by creating degrees of legitimacy based on disparities of status, by bastardizing the issue of *pratiloma* unions, and recognizing function as a factor in caste-formation. From the midland the influence of his laws spread all over India, and in the south acquired new vigour by being grafted on Dravidian institutions. After Manu's time the history of caste in India enters on a period of obscurity except in the north-east, where we get light from the Buddhist writings. This part of India had rejected the Brahmanism of the midland. Thus in Buddha's time and after it we find in N.E. India a social stratification which is astonishingly western and almost modern in essentials. The Kshatriya forms the highest class, and Buddha himself claimed Kshatriya birth, being a scion of the princely Sakyas of Kapilavasthu, Kapilavastu in the Buddhist *Madhyadesa* or "Midland" which lay to the east of the Aryan midland. But a legend tells us that Buddha in a previous incarnation had in his mind debated whether he should be reborn as a Kshatriya or a Brahman, and he decided to be re-incarnated as a Kshatriya as the then higher of the two. We find the term Kshatriya of Magadha and its adjacent principalities applied to the ruling classes in general and thus corresponding to the Vedic title of Rajanya. The Kshatriya was a warrior, a civil functionary and a teacher. His education was fully equal to that of a Brahman and youths of princely families trudged on foot from the north-east to distant Taxila, in the north-west, then the great university where all sciences were imparted to princes and Brahmins by famous teachers—one of them a former incarnation of Buddha himself. Thus equipped, the Kshatriya held his own against the Brahman's pretensions and even acted as his instructor. The Kshatriya had played a similar part in the profound teachings of the *Upanishad*, wherein he had been the Brahman's teacher, and was again to assume that rôle, after the lapse of centuries in the remote Punjab, as the founder of Sikhism. The Buddhists, carrying on keen propaganda in their witty Birth Stories (*the Jatakas*), invented a dialogue between Buddha and Ambattha, a Brahman with a surely plebeian name, in which the latter admits that a Kshatriya's son by a Brahman wife would be recognized as a full Brahman by his caste fellows but not by the Kshatriyas, among whom purity of blood, nay more, purity of Kshatriya descent, was of cardinal importance.

The Brahmins occupied in the Buddhist society of the north-east a curiously anomalous position. They were in fact or in Buddhist theory divided into two groups, the true Brahman and

the worldling. The Brahman who adopted the life and practices of a homeless ascetic, who sought no worldly wealth and attained to the ideals of his own scriptures was revered, whereas he who prided himself on birth, erudition in the Vedas and sacrifices performed, was contemned. But the Brahmans regarded themselves as almost a caste in the modern sense. Birth, not calling, was the prime condition of its membership. A Brahman might change his vocation and pursue the lowest without loss of "caste," which could, however, be forfeited by a *mésalliance* or by eating defiled food. Yet we read of nothing like an organization of the "caste." It had as yet no head and no council. Exclusion from it was apparently enforced solely by general sentiment—which was, indeed, strong enough to drive a Brahman, who when starving had devoured a Chandāla's leavings, to suicide.

In the Buddhist writings, however, the Brahman's distinctive calling was his function as officiant in sacrificial rites, in exorcism and the interpretation of dreams and omens. Buddhism condemned animal sacrifices, and when a king, terrified by a fancied portent, orders a fourfold sacrifice of that type completed with its four human victims, a Birth Story explains away the evil omen and discomfits the Brahmans, whereupon the king destroys the place of sacrifice. Yet we find all classes from the king downwards invoking a Brahman's aid when menaced by evil signs or in domestic events. The Brahmans as a body played an influential part in social life; they were well educated and many acquired wealth, often owning villages, bestowed on them by grateful kings as fees for their ministrations. Above all was the Brahman of the north-west held in respect.

In Buddhist times we find no Vaisya caste in the Vedic sense. Originally in the oldest Vedic days a term applied to the Aryan settlers engaged in cattle raising and cultivation, the Vaisya was made to fit into the Brahmanical scheme of caste, but comprised in fact an almost indefinite number of social groups. The principal of these included the householders, *grihapati*, the lower landed gentry and the wealthier and more prominent burgesses of the cities. In this class the foremost rank was taken by the Masters of the Guilds, the *sreshtins*, mod. *seth*, whose wealth and office brought them into close touch with the court, where they represented the commercial interests of the kingdom and often wielded great influence as personal friends of a king, while their sons were playmates of his sons and sharing in their education. The *sreshtin*, indeed, often appears as a country gentleman having doubtless made money and purchased an estate. But his wealth was based on commerce, and we find him financing businesses, e.g., a tailor's and a spirit-seller's, without any apparent loss of repute. Yet the *sreshtins* as a group are careful to marry their sons in their own class and their office was hereditary.

Neither the *sreshtin* nor the *grihapati* formed a caste in any real sense. Almost a synonym for the latter term is *kutumbika*. They too formed a class of capitalists lending money to rural clients and carrying on such trades as grain dealing. They were found both in the towns and in the villages whence their daughters were sought in wedlock by leading townsmen of presumably their own class.

Of Sūdras in Buddhist literature we read little but the name. That the "caste" exists is tacitly assumed. Buddha did not seek to abolish classes. He stressed their spiritual equality, their ability to attain *nirvāna*, "emancipation," by righteous conduct. In his teaching even the outcasts, the Chandāla and the Pukkusa, could be virtuous and self-controlled since none among those who had won peace of soul was higher or lower than his fellows. But what avocations were included in the term Sūdra does not appear, an indication that it was quite vaguely used in practice of all the lower orders, excluding those which stood below the social scheme.

The depressed classes were undoubtedly remnants of the conquered races of Eastern India, speaking their own dialect or dialects, and relegated to hamlets outside the villages, and confined to uncleanly functions. To them generally the term Chandāla was applied until it became a term of abuse. Yet lower than the Chandāla ranked the Pulkasa or Pukkusa, trappers who lived by snaring animals which dwelt in holes. The hunter was also degraded probably because he destroyed life, but he did not constitute a

class and could, seemingly, rise in social esteem by taking up the higher pursuits. On the other hand the Nishāda, fisher as well as hunter, could not. He, too, dwelt apart, but in a hamlet of his own, not with the Chandāla and Pulkasa. The origin of the name is unknown but they are assuredly not occupational terms.

In N. E. India the Buddhist times held certain crafts in disrepute. The basket maker and wheel-wright, the weaver, tanner, potter and barber were all despised. The Vena who wove articles of willow and cane ranked on a level with the builder of carts, and the joiner, whose abode was outside the town by the gates, graded between the Chandāla and the Pulkusa, or at least no higher than those "out-castes," though one imagines that even if the basket-making Vena was a gipsy he was less impure than an aboriginal out-caste, even though his mode of life set him below the carpenter to whose craft a needy Brahman could occasionally resort. All these groups bore occupational names and the Buddhist writers speak of the *sippas* or "arts" without disparagement (the word is applied to all the 18 "sciences" taught at Taxila), while seeming to draw some distinction between the *jāti* or tribes of the aborigines and those who were so designated.

In a very similar scheme, to the carpenter (*Ayogava*) Manu assigns a semi-servile status, emphasizing his duty to serve the twice-born castes, his inability to own property (at least when in a Brahman's service) and his obligation to serve.

The king's service was then as now a highly important numerous body. The royal ministers formed a class apart, being neither Brahmans nor Kshatriyas, but holding heritable offices. At their head stood the *senapati*, in war commander-in-chief, in peace the chief judiciary. His relations with the other ministers of justice and magistrates are vaguely defined; but the principal of them could on occasion intervene to rectify a decision wrongly given by the king in person. The judicial council as a body could be asked to give legal advice. These functionaries might be Brahmans by birth but are quite clearly distinguished as a class apart, having precedence over the Brahmans as well as the other classes. A salaried cadre of officials, surveyors, tax-collectors, treasurers, executioners and watchmen is also mentioned. But for all these officers we find no general term. Each seems to have formed a separate hereditary body, in which the king could appoint or dismiss at will, without regard to birth or standing.

Finally, outside the pale of class, were the homeless ascetics, those who had chosen an anchorite's life and had by so doing abandoned all worldly ties. They were recruited from all classes, from the king down to the barber, even to the Chandāla and the Pukkusa.

**The Kings and Caste.**—In the Vedic period we find few traces of the royal power regulating "caste." The king was doubtless the fountain of honour but he hardly seems to have directly interfered with caste.

In more modern times, the king found ways to influence caste a good deal. Various legends declare that a Rājā was often compelled to create new Brahmans—to increase the number which sacerdotal etiquette demanded should be fed at some great occasion—by issuing invitations to recognized and unrecognized Brahmans alike and thus elevating the latter to Brahmanhood in the lower degrees. But as a rule these new creations were either of suspected descent or of status lowered by function, or, less frequently, tribal priests of local indigenous deities.

Contrariwise a ruler could on occasion lower a caste, if we are to credit legends like that of Rājā Ballāl Sen of Eastern Bengal who deprived the Suvānababikas, "traders in gold," once acknowledged to be Vaisyas of high standing, of the right to wear the sacred thread, and with them degraded their Brahmans too. Occasionally a king would enfranchise a servile caste which had rendered him good service in the field, or restore privileges formerly confiscated. The chief privilege bestowed was the right to wear the sacred thread.

That the king exercised considerable authority over caste affairs is, however, beyond question. The caste assembly or council, or the guild, judged offences against its rules, but it might be unable to enforce its decrees, whereupon the king could either execute its decisions or reverse them. The Brahman could pre-

scribe penances for such breaches or for religious offences but he had to hand the offender over to the secular arm to secure their enforcement. On the whole the king interfered little with caste constitution. His policy was to uphold the existing social order. Any attempt to interfere with caste equilibrium might have dissolved the whole system with results not to be foreseen.

The social organization of Buddha's time displays a keen consciousness of class and position, pride in birth and strong prejudice against the lowest orders as impure. On the other hand we find no line of demarcation between the victorious invaders and their conquered subjects. Occupation is the dominant factor in fixing a man's standing or at least a conventional fashion of defining it. Marriage is limited to one's own class but of the hard and fast demarcation between the castes of modern times in regard to food and touch we find but the faintest symptoms. Above all we fail to discern many premonitions of the individual man's inability to win social promotion. Education was free to any respectable class, and even the depressed classes could attain spiritual prominence. The Brahmans held a position of influence but not of authority. In the spiritual field they met with a counterpoise in the ascetics. In the temporal they had successful rivals in the Kshatriya and the royal officials. While the king's chief minister, his guide in secular and religious matters, should be a Brahman he was by no means invariably of that class. The only royal office which the Brahmans held as of right was that of the king's domestic priest, but if a weak king fell wholly under his influence a ruler with a will of his own kept his *purohita*, his chaplain, in his place. Brahmans who had already taken to worldly pursuits could, naturally, exercise them in the royal service.

Of the transition from the older system to the new but few facts emerge. A noteworthy incident in the process of change is the disappearance of the Kshatriya caste. A myth informs us that Parasurama, an incarnation of Vishnu, literally axed them repeatedly. What historical event is concealed in the myth it is impossible to say, but the fact remains that of this, the most important lay caste of ancient Hinduism, hardly a trace remains to-day. The Kshatriyas never founded a great landed class as far as we know. Though Indra was a divine Kshatriya and the welfare of the Brahmans was regarded as dependent on their maintaining good relations with the Kshatriyas, their social extermination was complete and the only caste which preserves their name is the Khatri, a trading caste localized in upper India.

#### THE MODERN CASTE SYSTEM

It follows from the definition of caste that the homogeneity of a unit and its consciousness of a closer alliance between its members than exists between it and other units, finds expression in definite social rules or even in outward and visible signs. The exclusiveness of caste, then, has led to prohibitions on intermarriage between castes or eating, drinking and smoking with members of castes other than one's own and even to differences in attire. It may be asked how such restrictions and precepts could be enforced. The reply is to be found in the mentality of the people. In India individuality is weak. Indian society admits of no compromise. Its principles are pushed to their extremest conclusions. In such matters as food and drink, material considerations have accentuated and to some extent justified this attitude.

The Indian is by instinct cleanly. He has invented many effective devices to protect himself from personal defilement. If many of his precautions have become ceremonial rather than hygienic he has nevertheless modified them in practice on common-sense lines. Thus a caste will sometimes refuse to inhale smoke from the *huqa* mouth piece of a lower caste, but it makes a funnel of the hand and substitutes it for the infected tube. It will decline to drink from the drinking cup but will take water poured into the hands from the waterskin which has not come into actual contact with the unclean lip. It will not eat soft food from a common dish but it will accept dry biscuit which is obviously less easily contaminated.

But where matrimony is concerned the feeling that the caste must be absolutely isolated is stronger, and it has strengthened

by lapse of time. The Kshatriyas admitted, at least in theory, a maiden to choose her husband in the *swayamvara*, a festive ceremony at which her suitors were assembled and the one who found favour in her eyes was garlanded by her own hand. No doubt this freedom of choice was often replaced by the bride's capture or a contest in wit or warlike skill in which the prize was her hand. But whatever forms the usage took it has fallen into complete abeyance, its last traditional observance being ascribed to Prithiraj of Delhi, late in the 12th century A.D.

Modern usage denies to a girl any say in the choice of a husband by the simple device of betrothing her at a very early age, sometimes, indeed, before birth to a "suitable" bridegroom, who must be selected not merely within the caste but in certain groups inside it. The ancient hypergamous rule which allowed a woman to be married to a man of a higher class has also been modified so that she is now only eligible to wed in a higher group within the caste. On the other hand the Hindus and their offshoots have maintained the old exogamous principles which prevent in-breeding, though in south India cross-cousin marriage is largely practised. Hence Hindu society is endogamous restricting marriage to a group, while it is more rigidly exogamous in that it disallows it within the blood kin. It is only hypergamous to a limited degree. Complex as caste has become, its guiding principles are simple and are only departed from occasionally. It has resulted in the creation of some 3,000 or 4,000 social units, many of which are, however, not altogether homogeneous, so that these figures do not represent all its ramifications. It has accentuated the weakness of Indian individuality. The system of caste has made it virtually impossible for an individual citizen to raise himself in the social scale; but it has made it fairly easy for groups to do so. Its burden, however, lies heaviest on the women. It has made premature marriage a necessity. It has led to an embargo on the remarriage of widows, even virgin widows, because the strictest monogamy being the ideal of the highest castes, the lower have been forced to adopt it as a token of social advance. It has often so narrowed the field of selection that brides command a high and increasing price, and marriages are arranged without regard to the future wife's welfare or that of her offspring but to gratify parental greed. Even after death the individual is all but forgotten. Passing by an Indian hamlet the traveller can readily tell if it is Mohammedan or Hindu. In the former there will be a cemetery, however rude. In the latter the only graves will be those of the very young who died of small-pox and the memorials of holy men who died to the world on entering some religious order. The village fanes contain no tablets to the ashes of the dead. Cremation consigns human personality to oblivion. So faint is the memory of it that the next brother of a soldier killed in action will step into his place, take his wife and name, his regimental number and his land with hardly a formality. And if the widow display any tendency to revolt and a preference for another man, even for a near kinsman of the dead husband, all the influence of the caste will be employed to bring her to acceptance of the age-long custom.

**The Brahman.**—To the definition of caste given above the Brahmans certainly do not conform. In a very limited unreal sense the Brahman stands at the head of modern Hindu society owing to his congenital sanctity. But he does not form a horizontal stratum overlying it. He forms a stratified cone which penetrates it vertically from top to bottom. Divided into great territorial groups, 5 in the north, and 5 in the south, the former are the Gauda, the latter the Dravida.

**Northern Groups.**—Gaur, from Gauda in Oudh, Kanaujia, Central Doab, Saraswata, on the upper Jamna-Maithila, from Tirhut, Utkala in Orissa.

**Southern Groups.**—Mahārāshtri, Deccan, Karnāta, Mysore, Andhra, Telingāna, Dravida, Tamil, Gurjara of the west. The northern groups do not all hold a position of unchallenged superiority over those of the south. The Brahmans of Mahārāshtra, the modern Mahratha country, do not form an organized body and mostly follow such professions as medicine, law, teaching and government service. Even those who are priests are not always well versed in the vedas, and the later Hindu scriptures. Yet the prominent subgroup, the Chitpāwan, "pure-hearted," caste of the

Konkan, which leads Mahratha society, used to feel polluted by the food of a Saraswata Brahman because the latter ate fish, a diet forbidden to the former. They despise the Brahmans of Guzerat, the Gurjara, as water carriers and those of Telingana as cooks, and those of all other parts of India as unable to pronounce Sanskrit correctly.

Of the territorial Brahman groups it is impossible to say which really holds the leading place. The traditional centres are still occupied by the Gaur, the Kanaujia and the Saraswata, yet their supremacy is not acknowledged by the other groups. The Kanaujia and the Gaur are probably the purest in blood, but the former exhibit the acme of subdivision combined with or based on ceremonial exclusiveness. The least divided are those of the Dekkan. Hence it has been justly said that the Brahmans form "the most heterogeneous collection of minute and independent subdivisions that ever bore a common designation." Never organized into a tribe on a territorial basis the Brahman was, from the beginning, parasitic upon other "classes" of the communities which conferred their patronage upon him in return for his varied services. As in Vedic times the Brahman followed the fortunes of his chief, so later a village sending forth a segment of its tribal owners to found a new hamlet would send with it a detachment of its hereditary village servants including Brahmans of the section attached to the tribe; and to every group within a caste is conjoined a specific group of Brahmans whose precedence is fixed by its patrons' standing in the caste. Hence if a group lost ground socially its Brahmans also lost ground, though they had the option of declining to serve it if it dropped out of caste altogether. This new disintegrating force is ever at work. Lastly, just as function fixed or lowered or raised the positions of castes and subcastes, so it altered the status of Brahmans within their own caste. Good samples of such will be found in Bengal where the Agradani Brahmans who conduct funeral rites and accept the offerings of the dead, and the Achārjī, fortune-teller, palmist and maker of horoscopes and the Bhat, a rapacious genealogist and bard living largely on blackmail, are degraded by function to a level nearly as low as the Pirālī whose ancestors were forced some 400 years ago to eat or at least smell beef cooked for a Brahman converted to Islam when he became chief minister to a Mohammedan ruler of Jessore. Degradation may indeed go further for it ranks the Vyasokta so low that even his patrons the Chasa-Kaibartta, fishermen and cultivators, refuse to touch food in his house.

But the Brahman may abandon all Brahmanical functions altogether and take to a secular calling as a lawyer, school-master, engineer or less willingly as a physician. Land-owning is, however, of as good repute in Brahman eyes, and when grants of land were made by grateful rulers or nobles for secular service or spiritual benefits to a Brahman his descendants would often set up as plain country gentlemen farming their estates through serfs of aboriginal or lowly origin. Such Brahman squires are the Nambutiri of the Malabār coast, the Haiga or Havika in Kanara, and the Māsthān of Orissa and Guzerāt, and scattered representatives of this class exist everywhere. If, however, the estate was of poor soil or became too minutely sub-divided among its heirs the Brahman had perforce to turn farmer himself, like the Bābhan or Bhūinhār of Bengal, the Taga of the Punjab.

Further, when economic pressure is severe, the Brahman may descend to agricultural labour, domestic cook or any vocation not involving actual defilement, without loss of caste. Military service is equally open to him, a notable example being the Nuhāl of the Punjab, a group which has entirely given up sacerdotal functions for soldierly careers; while the Panre subdivision of the Kanaujias of the United Provinces prior to the Mutiny of 1857 enlisted freely and with their title anglicized as Pandey acquired a terrible notoriety.

Yet it is as hard for a Brahman as it is for a Mohammedan Saiyid to divest himself of his personal sanctity by turning his hand to any reputable employment. He will lessen or lose it far more readily by other means, by ministering to an unclean caste, or by eating the sins of a dead Raja and taking upon himself the pollutions they have caused. To the latter the term Achāraj has come to be applied though it originally meant only a spiritual

guide or teacher, and he is also styled Mahā-Brahman or "great Brahman," doubtless to avoid the ill effects of calling him by his real and less auspicious title. The Mahā-Brahmans are endogamous, having been excommunicated by all the other Brahmans because they accepted alms made within 13 days of a death. But his functions touch even a lower depth. Occasionally he used to take food from the hand of a corpse on the funeral pyre, but this usage is dying out, and he is now paid merely to eat as much as he can in the belief that the more he consumes the better it will fare with the soul of the dead. Even lower is his own sin-eater, the Par-Achāraj who accepts from the Achāraj those gifts which the latter takes from the Hindus. But sometimes the Achāraj makes these gifts to Saniāsīs who being dead to the world are seemingly beyond the reach of defilement; or they are made to his daughter or son-in-law with what consequences is not known. Naturally the touch of an Achāraj pollutes, since he never visits a house save at or after a death which has defiled it.

But the Brahmans who have taken to crime as a profession are merely degraded, not unclean. Such are the Tāgūs on the upper Jamna. They form a criminal tribe, yet seclude their women, wear the sacred thread, plead "benefit of clergy" on conviction and make vows for success in crime to a Muslim saint. They fell because their forefather married a widow of his own caste. Well above them stand the Tāga in the same locality. Gaur Brahmans by origin, they abandoned sacerdotal functions and took to farming, but they are bad farmers, strictly secluding their women and wearing the sacred thread. A notable tradition says they received a big grant of real estate in lieu of offerings, so other Brahmans refused to marry with them or even to take bread from their hands. They have in fact to employ Brahmans for their own sacerdotal business. Yet their social standing is high and the holy Jamna has spared Tāga hamlets when changing her course, while floods have swept away those of other castes.

**The Modern Khatri.**—Scattered over N. India the Khatri caste derives its name from the Kshatriyas, but holds a very different place in Hindu society, being the leading commercial caste. In religion it is mostly Hindu, but the founders of Sikhism belonged to it and many of its members are Sikhs (*q.v.*). In its modern organization the caste presents features unknown to the Kshatriyas and of obscure origin. It is graded in three main groups, the Bāri or "12," the Bunjāhis or "52" (suggesting some solar basis) and the Sarīn, possibly guildsmen. Not one of these groups is absolutely endogamous, but they tend to become so. Each group comprises in theory certain specified exogamous clans which strive to form yet further subgroups, by refusing to give daughters to clans of lower status, and even families rise and fall as they evolve scruples in this respect. The Sarīn group is not permitted even to smoke with the two higher. No less than 500 clans are named but even folk-etymology has failed to explain many of them; e.g., the Khokharain sub-group of the "52's" claims descent from a son of Manu, but it is possibly named from the Khokhar Rājputs, and several clan-names are traced to military terms in support of the claim to Kshatriya descent. Probably the caste had a Kshatriya nucleus and its lowest group, the Sarīn, was affiliated to it when it took to trade. But the above do not exhaust the Khatri sub-groups.

Territorial groups cross-divide the status groups, so that a Lahoria or Sirhindia Khatri will not bestow his daughter on a man of the eastern group; some of the Sarīn clans have risen high in status because they gave *gurūs* or pontiffs to Sikhism, and these tend to coalesce into a subgroup, intermarrying one with another, or even splitting a clan into two exogamous septs, so as to make it possible to find equal mates for daughters. As a caste the Khatri is singularly heterogeneous in usage, many clans have special social rites at weddings and the like; and several septs possess inherited powers of curing disease, affect particular Sikh saints or even Muslim usages.

The Khatri organization has been adopted more or less imperfectly by other castes. Thus the Brahmans who are clients of Khatri clans for ceremonial purposes are graded *inter se* on the Khatri scheme and their *purohīts* are invariably Saraswati Brahmans. Thus, when Parasurāma axe'd the Kshatriyas, a pregnant

widow of the exterminated caste found a refuge with a Saraswati and gave birth to a boy who espoused 18 Kshatriya wives whose male offspring refounded the caste, assuming the names of as many Hindu saints. Hence the Khatri *gotras* are identical with those of the Brahmans, though they are seemingly ignored in practice.

**Aroras.**—Similarly the Arora, a trading caste which traces its origin to Sindh, is in part organized on the Khatri model and claims a like origin; but its clan names are frequently totemistic and in its ranks Sikhism only counts a substantial minority of Sikhs.

**Bhātias.**—The Bhātias, yet another trading caste which has overspread the Punjab from the south-east displays still further traces of Khatri influence, but it is stricter in its Hinduism, eschews widow remarriage and claims Rajput origin. Though it has no territorial groups the caste tradition is that while brides may be taken from the east, the western clans should avoid the converse concession. The Bhātias comprise 84 septs, 12 at the top and a group of "52" below, with a mixed clan styled *Gond*, "defiled," sprung from widows remarried or Arora mothers. Naturally the latter are only served by Pushkar Brahmans.

**Banias.**—The great trading caste of the Banias or Mahājan, "great folk," spread all over N.W. India and Rājputāna, is obviously organized on a scheme of its own. It is split into three territorial groups, of which the principal are the Aggarwāl from Western, and the Oswāl (who became Jains) from Eastern Rājputāna. But the offspring of Aggarwāls by handmaidens form a kind of "half-score" subcaste whose clans are named after their mothers' clans. The pure Aggarwāls only number 17 clans, descended from as many snake maidens, but to these must be added the Gond, a half clan, due to an unwitting breach of the exogamous law, and another due to a marriage with a low-caste wife, with which last other Banias will not smoke. Finally a subcaste said to be quite distinct, descends from tanners who took to trade. Small wonder then that the Banias in the mass are admitted to be of pure Vaisya descent, eschew widow remarriage, wear the sacred thread and refuse food and drink at the hands of the yeomen who despise them. Sectarian differences have also cross-divided the Banias, since while Vaishnava and Jain families intermarry the Shaiva or Maheshri stand, or are kept, aloof. Yet the disruption is not absolute, for the Jains have made converts from groups other than the Oswāl and these with the Oswāl seem to have assumed in the Punjab the ancient title of Bhābra, now applied to any Bania from Rājputāna whether Jain or not. Jain Bhābras profess strict monogamy. All these trading castes of N. India contain enterprising elements, Khatri and Aroras being found in the Pathān borderland, Afghānistān and even in Turkistān. One Khatri clan, the Merwāhā, claims its origin from Merv. As an owner of land acquired by moneylending, he is a progressive landlord, but the Arora when allowed a chance runs him close. On the Punjab borderland the latter has been for centuries treated as a denizen of the Ghetto, forbidden to wear a turban, and only allowed to stride an ass, to carry on petty trade and lend money. Never permitted to employ his capital in developing commerce or improving agriculture, he has invested it in usury of the harshest type and is equally hated and despised, dubbed a Kirār till that term has come to imply all that is mean and cowardly.

**Kayasth.**—In the plains of Hindustan and Bengal the Kayasth may be called the Khatri's substitute. The term simply means accountant or scrivener and in old days the Kayastha kept up court records, collected taxes and administered finance. These functions brought him into collision with the Brahmans as in Kashmir. The present stronghold of the Kayasth caste is in Lower Bengal where tradition plausibly describes it as an importation of the 9th century into that country; but it was not organized until the 11th when Ballāl Sen forbade the immigrants to intermarry with their indigenous caste-fellows. But he apparently failed to do more than stabilize existing usage which permitted the former to take brides from the latter. However this may be, the Kayasth either imitated the Brahmans' Kulinism or, quite conceivably, founded that system which the Brahmans adopted. Whether the Kayasths were originally all Kshatriyas or comprise elements

affiliated from lower classes akin to them by occupation, it is impossible to decide; but they are minutely subdivided.

**Caste and Occupation.**—In different groups the smiths will be known by different names, but as yet mere community of vocation would not make a smith's daughter of Madras marriageable to a Punjabi smith's son. Indeed the smiths of much smaller territories than a Province would not tolerate equal alliances outside their own territorial subgroups. At best the smiths of a territory esteeming itself superior to those of another might accept daughters from an inferior territory. But the smiths were, it would seem, recruited from many sources. Some were, or asserted a claim to be, originally of a high caste like the Rājput, or respectable middle-class yeomen. The recollection of superior origin would die hard and the clan name would be carefully retained, so that the families so descended would only marry with families of equal descent—or at best accept brides from those not more than a degree lower. Again there are grades of occupational repute among smiths. Some may gain rank by pursuing a higher calling, as armourers. Economic pressure may turn others into nomad smiths or tinkers. The former will assume a new trade name, almost a surname, describing their skilled handicraft and the white-smiths will now intermarry still preserving their old clan exogamy. Popular speech will dub the nomads tinkers or even gipsies and they will have perforce to accept it, but they will be glad to give daughters to settled smiths, people who still form an integral factor in the village community and may even hold land of it as a retaining tenure for keeping up the village smithy. Other smiths may get engineering qualifications or build up big businesses but that will not raise them, at least not at all speedily. But to the outside world they will drop the caste name of smith, and use the one they have ready to hand; *i.e.*, their old clan name which may denote descent from a historic stock. In two or three generations they may succeed in obtaining at a price brides from impoverished families of a similar stock, thus taking the first step towards the recognition of their long-lost and not convincingly authenticated status. But such social progress is tedious as well as costly and may halt halfway, the new subgroup finding it easier to intermarry with its equals until it becomes strictly endogamous and forms a sub-caste. Yet again a number of similar families may be converted to a new sect recognized as Hindu but stressing certain Hindu doctrines on social usages which mark it off from the rest of the caste. It, too, will tend to intermarry but may continue to accept brides from the unregenerate members of the caste. Political parties when they become stabilized may some day produce still further cross-divisions among the smiths. Meanwhile the smiths show little inclination to become Smiths by surname and probably the future history of Indian surnames will not disclose the full extent to which the craft is followed in India. Still less likely is it that it will ever see hyphenated Smiths, since subcastes with social ambitions will discard any surnames reflecting their traditional calling, and metonymics have rarely found favour in India.

The present tendency is to retain or revive the old clan names which makes it quite easy to avoid breaches of the exogamous principles, or adopt titles of offices held, even if they were Mohammedan assumed under the Moghul overlords.

**Bhois.**—A caste of some size (about 60,000 in number) is that of the Bhois in Bombay. The term is also used to denote a litter-bearer and some Mahars style themselves Bhois. In some parts of Khandesh the Bhois are confused with Kahars, an immigrant caste of fishermen from northern India. Elsewhere they are known as Maharia and are very often called Koli on account of similarity of occupation. In the Deccan they differ little from the Mahratha Kunbis in looks, dwellings, etc., and indeed in Nasik they called themselves Kunbis and some of that caste eat with them. One authority says that they sprang from a Brahman father and a Parasar mother, and terms them Paushtikas. Yet they have dark complexions and amongst them totemism survives, chiefly among the Khandesh Bhois, whose totems are leaves of trees. The Bhois are divided broadly into five groups, each again subdivided into endogamous sections. Many of these are again subdivided but are able to eat together though they

cannot intermarry. The exogamous sections are numerous but are merely surnames, many of which are found also among the Mah-rathas. Fairly strict Hindus, they yet have the custom of burying the dead, especially the unmarried.

**Modes of Life.**—An Indian's mode of life varies with his caste and occupation, and the climate of the part to which he belongs. His vocation and his ceremonies may be said to fill his life, and they are of equal importance. The cultivator has to work on the land in due season, but his hours of leisure are taken up by the countless rites which accompany birth, marriage and death, and by fairs and festivals, so that he does not feel the want of much else to instruct or amuse him. A birth, especially a boy's birth, is the occasion for observances which occupy his family for years, and by family here is meant his sept rather than his parents and their closer kindred. A marriage is a quasi-public event and so is a funeral. Hence to abolish or reduce ceremonial would deprive the people in the mass of their employment, for there is as yet little or nothing to replace it. The sequence begins at pregnancy, which is solemnized by a series of observances often obscure in origin, but intended to result in a safe confinement, to revere ancestors, to ensure a lucky life for the child, and so on. They are continued at birth, twins being occasionally unpropitious, and certain sequences, as *e.g.*, a birth of one sex after three of the other being peculiarly so, and requiring special observances to avert their effects. An eighth child is most ill-omened to its parents. Other untoward births affect other near relatives. At birth astrology is called in to determine the child's future, and often it is sought to decide its future calling, a choice already largely made for it by its caste.

Its head may in places be moulded, but otherwise little is done for it physically. Naming is an important rite and so is the first tonsure which may mean a journey to some distant place for certain septs. These and other minor rites lead up to the investiture with the sacred thread for boys of the twice-born castes, a rite of initiation wherein they become pilgrims, at least potentially.

Marriage absorbs more rites and usages than all the rest put together. Betrothal begins with numerous minor rites, even when it is itself a binding ceremony, sometimes known as "little wedding," the *shādi* or a similar expression, the popular term for wedding meaning literally "rejoicing," but older terms are still in use. The wedding is the occasion for usages to ensure its fertility, for games to decide which of the parties is to be the dominant partner and for luck in the new household. Important rôles are assigned to women, and men whose spouses are still alive, to the best man, to the mother's brother and others. The death of a bride-to-be or a newly-wedded wife is peculiarly inauspicious. Many usages are probably survivals of obsolescent customs. At a Hindu wedding, the binding rite is often the seven-fold circumambulation of the sacred fire, as fire, like the other elements, is a witness. In many forms of marriage rite, the wedded pair are treated as a god and goddess, or are crowned like them. There are also degrees of marriage varying among different castes, and equally degrees of legitimacy, relics of ancient usages. In strict practice a bride must be a virgin, can only be ritually married once and should be given by her father without price to the bridegroom. But, as a fact, brides are usually bought or exchanged, unless the hypergamous rules compel the purchase of the groom. Widows are remarried, if custom permits, by observances which are civil rather than religious or merely by co-habitation with the dead man's next of kin. In places her children by the first husband are brought into the new one's family, but this usage is rare and the right of the widow's son to succeed as his heir is now usually contested. It is not unusual for the bride to be formally admitted into her husband's sept. Consummation is sometimes deferred, the bride remaining in her parents' house for one, three, five or even 11 years and then being brought to her new home by a rite known as *mukhlawa* ("disclosing the face"), *gauna* and so on. But this usage is by no means universal and the Legislature has fixed a more advanced age for the legal consummation of marriage. But the difficulties of dealing with such a matter by statute are immense. The community of a married pair is emphasized in the Central Provinces, where they perform the business of their caste or an imitation of it.

Death ritual is not quite as intricate or as costly. Cremation is far and away more prevalent with Hindus than burial, but some castes bury the dead, and infants are almost always buried, though they may be exposed. The lower grades of Brahmans play a fairly extensive part in death rites, taking most of the alms offered by the dying man or his heirs. The popular theory is that as the funeral rites can only be validly performed by a man's next heir, he who fulfils them will inherit and, despite innumerable decisions to the contrary, the idea dies hard. In Bengal the Hindu law of inheritance follows the sacerdotal law which regulates the sacrificial efficiency of the heirs, each in his degree.

**Post death rites** for the dead continue for months or even years, and their non-observance may cause harm not merely to the dead but to the living. The spirit of a sonless man is particularly liable to be malignant. Hindus believe in Put, "Hell," which is reconciled to the doctrine of metempsychosis, making it a temporary place of abode like Svarga, "Heaven." After the term therein decreed to the soul by Yama, it will be reborn, the form of its rebirth depending on its *karma* (*q.v.*), or the accumulated energy of past actions which is not wholly removed by its sojourn in Heaven or Hell. Funeral feasts, usually eaten at the grave and immediately after the funeral, are common among low castes in the Central Provinces and are probably non-Aryan in origin though also practised by Bishnois.

**Seasonal Rites.**—The life of a pastoral tribe is often nomadic. To find pasture, flocks and herds are taken to the hills or to lands beside the rivers in the hot season, and there is no respite for the herdsmen. Their festivals have to be held on such dates as fit in with their movements. For the cultivator things are easier, yet, even in his case, the great festivals are all held at times when manual work is slack. Thus the Holi falls in early spring when the crops are ripening and the Dasehra (*q.v.*) in autumn when the work is again slackening. Among Mohammedans the festivals and fasts, being determined by the lunar year, fall at times in the midst of the busy season and, therefore, seriously affect agricultural efficiency.

**Economic Effects.**—In a country where agriculture more or less supports over 72% of the population, the caste prejudices and habits of the mass of the workers prevent their taking up other occupations to utilize their spare time. A man may have insufficient land to support his family but if he is of good caste he cannot take to weaving or work for hire because that would lower his social status. This difficulty is enhanced by the laws as to tenant-right which have subdivided holdings until they are minute in area. This fact compels the tenant of a fighting caste in the Punjab and Hindustan to seek employment in the army, but in Bengal he is shut out from such a vocation. Nor does he seek work on the tea estates of Assam or the indigo plantations of Bihar. Only in the coal-fields of Bengal do the Rājputs and even Brahmans find employment as skilled coal cutters. In southern India the conditions are apparently much the same. Obviously the lowest castes have a great advantage over the middle, even the lower middle, ones in their capacity for migration. Similar is the case of jute-spinning and weaving, the most important manufacture in Bengal. Only a fourth of the skilled workers in this industry are natives of that province. A province like Bengal where the population is already dense absorbs about 1,200,000 souls from other parts of India. The root cause of the Bengal cultivators' poverty has been attributed to his not having enough work to fill in his time. In spite of the extension of canal-irrigation in the Punjab the same remark applies to the lowest castes of that province.

**Caste Government.**—Caste government may have been imposed from without and not be of spontaneous growth. In N. Arcot (southern India) the eighteen right-hand castes, which include few landed elements, used to obey the Desāis, intendants of a *desh* or circuit-area, who are Chettis (Sethi) of the great Telugu trading caste, the Baliya, and some humbler castes still submit to them. Entitled the "protector of wealth," Dhanapāla, the Chetti deals with moral delinquencies (in both sexes), his badge of office being a brass cup-shaped spoon round which a carved figure represents each caste. The post is saleable and is worth thousands of rupees, but it is kept in the Baliya caste.

The Uriya, "of Orissa," carpenter caste has an official hierarchy in its *mahārāna*, "great prince," *dondopāto mahārāna*, his criminal deputy, *swangso mahārāna*, and others, as the *agopothiria*, whose function it is to eat with a man re-admitted to caste. Here, again, for grave cases, representatives of five castes, equal or superior to the carpenters' own, are called in to sit with the caste officers and act as assessors. The Gaudo of the Uriyas in Ganjam does not call in outside assessors, but it, too, has a series of officials, including the *desia* who re-admits to caste.

**Marriage and Remarriage.**—The age for marriage is largely a matter of social status as well as of caste. Generally it is lowest among the high castes, but even in their case may be almost adult because their girls are more secluded, it may be difficult to arrange betrothals, or the evils of premature unions may be recognized. On the other hand, among the Cherumans, agricultural serfs in Cochin, a girl not married before puberty is regarded as polluted, as a woman "whose age is known," and out-casted. In the old days she was handed over to a headman who could marry her to his own son or sell her into slavery. The prejudice in favour of infant marriage is strongest in Lower Bengal, where a religious compulsion for it has been discovered by the Brahmans in the scripture which consigns to hell the father who lets his daughter attain puberty unwed. But the scripture may have sought a religious explanation of an aboriginal prejudice.

Over the problems of its origin and effects and reform, controversy has raged for over a century without much result. Marriage, indeed, does not necessarily imply co-habitation, which may not take place till one or any odd number of years up to 11 after the wedding, so that often the earlier the latter ceremony the later the actual marriage. It is not, however, likely that the usage will spread much. Too many factors militate against reform. A horde of parasites, the go-between, the bards, priests, artisans, prostitutes, almost every caste gets perquisites at betrothals, weddings, funerals, and the social rites therewith connected. The dullness of village life and the inconceivable *ennui* of the secluded *zenana*, among the classes which regard the emancipation of women with horror, are only brightened by the excitements which attend domestic events. When a bridegroom has to be paid for, he probably costs less if his bride is a child. When a bride has to be bought her price is high and going higher. The father of sons must buy quickly if he would secure daughters-in-law. The peasant youth who finds himself unwed at 20 may have to resort to the thoroughly disreputable matrimonial agents who abduct girls from localities where females are in excess, harbour discontented young wives or buy up low caste damsels, disposing of them at excellent prices to purchasers who are careful not to enquire too closely into antecedents. A single scandal in a family of good standing will undo years of reform propaganda; and nothing but a revolution in female education will alter things.

Closely interwoven with the problem of premature marriage is that of widow remarriage. Like *sati* (*q.v.*) the dislike to it as a social stigma is based on idealism. But the ideal is the enemy of the real.

In southern India, a group of the Mārāns, temple servants, stand higher than other sections of that caste because they forbid a widow to remarry, but permit her to take a Brahman or higher caste paramour. They are in consequence known as Orunul, "one-string." So great is the dislike among the Jāts of upper India to her remarriage even with the husband's younger brother, that they generally avoid espousing the widow, so that she remains tenant-for-life of the dead husband's land, and is kept in concubinage. If, however, she takes advantage of her position to elope with another, she is claimed by her husband's nearest kinsman on the plea that she was informally wed to him. Generally the sacrament of marriage being only once possible for a woman, her remarriage is a purely social rite unsanctified by priestly recognition. Nevertheless the general dislike of widow remarriage and the stigmas attached to it make the acquisition of a child-bride a social necessity, cost what it may. Several of the terms for "widow" connote ill-repute or ill-luck. But when the prejudice has once been overcome the widow remarried may rank higher than the ritual wife. Thus, in the eyes of the Gavara, a respectable cultivating caste in Mad-

ras, a woman who has had seven husbands is much respected: in the Himalayas, a widow's son provided he be born in her husband's house, is regarded as the husband's son even if obviously he is not: and a Jāt will conceive it a duty to put away his wife in order to fulfil the higher obligation to marry a brother's widow.

**Divorce.**—As a general rule, among the higher Hindu castes no divorce is recognized, but where it is recognized it is not dependent on judicial decree but on the husband's will, and no countervailing privilege is accorded to the wife. Yet, in fact, all castes would recognize the expulsion from caste and consequent annulment of a marriage in case of a wife's misconduct or misfortune such as violation. Where divorce is permissible it becomes capricious and often degenerates into sale, but as a rule caste opinion is strong enough to prevent grave abuses and marriage is remarkably permanent. Even among the humbler castes a man who had put away a wife without grave cause would find it difficult to find a new one. Dissolution of a marriage by mutual consent is usual only among inferior castes or backward tribes and is then effected by a simple rite such as the breaking of a stick, the cutting of a melon in two or the like. Even the caste council's intervention is superfluous.

**Polygamy.**—As an institution polygamy (*q.v.*) is the exception. It is almost the privilege of wealth, irrespective of caste and often discountenanced by important sects. Its principal justification is sonlessness in the wife. Very generally the wife first wedded holds a favoured position and the co-wife may suffer various disabilities but much depends on her relative social status, on understandings arrived at when the first bride is acquired and so on. A bride or her parents may stipulate that she shall not be given a rival, but in its zeal to void agreements in restraint of matrimony, the Indian Legislature has also invalidated covenants in restraint of polygyny, so such stipulations have been judicially declared of no avail. Polygyny is sometimes advocated by childless wives anxious to see the birth of an heir and ready, if not eager, to adopt him. A curious rule of inheritance may arise in families where all the wives have sons, the inheritance being by top-knots, each wife's sons getting an equal share collectively, irrespective of their number.

**Adoption.**—The intense desire for a son to inherit and to solemnize his father's funeral rites necessary to the welfare of his soul, has led to adoption in various forms in the regions under Brahmanical influences; and to various species of substituted sons. Manu's laws, which probably drew largely on primitive ideas of paternity, allow that in default of a real son, the wife's son born secretly, her son previously born or begotten, the son of a remarried wife, and a foundling or a son purchased, should inherit in his place. Yet, the principle of legitimation, *per subsequens matrimonium*, is not expressly enunciated and its rare occurrence is confined to tribes little influenced by Brahmanism. Manu accepted the *niyoga* rule whereby a sonless man could appoint his wife or widow to bear him an heir, just as he could designate a daughter to that end. The man chosen, however, must be a near agnate kinsman of the husband and one son only could be begotten by him. The Arya Samāj (*q.v.*) has inculcated a great extension of this practice, removing all Manu's restrictions. In one passage Manu condemns not *niyoga* but the levirate (*q.v.*) whereby the husband's kinsmen could impose the duty of raising an heir to him without appointment, and seems to say that if a son is born under the levirate the deceased husband's property must be absolutely surrendered to him. To the son by *niyoga*, Manu assigns the term *Kshetraja*, "field"-son, in allusion to the question discussed by him and still much debated, whether a crop grown from seed sown on an alien field belongs to the sower or the owner of the land. He decides that the latter owns it, in the absence of a contract to the contrary, although the seed is more important than the soil, but clearly other jurists differed from him. Sociologically the results of Manu's rules have been evil. Their principles have come down into modern custom in countless forms, their complexities have been fostered by advocacy resulting in costly and protracted litigation, culminating in universal debt. The demand for credit being insatiable has had to be met by the capitalist castes, and in the absence of opportunity for financing industry, Indian capital

has followed the line of least resistance, lending at customary rates which it is folly to regard as usurious. An inveterate tendency to procrastinate and evade repayment of a loan has rendered security nugatory. The distinction between an assured debt and one totally unsecured is unknown to the borrower, carefully ignored by the lender and disregarded in legislation, so that a man of substance pays almost as readily for accommodation as a man of straw. Land hunger is not confined to the cultivating classes. It is keenly felt among all. In more than one province the Legislature has been compelled to protect the peasantry *en masse* from economic serfdom and expropriation of its age-long tenures, just as it has had to check the abuses of landlordism and create fixity of tenant-right. The usurer has realized the utmost in kind, and for the still huge balance has been able to extort personal service extending even to *jus primae noctis* and creating an unrest which has found a vent in such jacqueries as occurred in the Punjab in 1914-15. The usage of *niyoga* has been attributed to customs of group marriage (*q.v.*) or to polyandry (*q.v.*), which in India is not common save among primitive groups or in tracts where women and land are scarce, as in the Himalayas, it is a precaution against fragmentation of holdings and is almost invariably fraternal. Elsewhere when custom bids a widow espouse her husband's brother or his agnatic cousin, suspicion of polyandrous practices may be justified, a theory supported by the popular view that adultery within the caste is much more venial than infidelity outside it. Among the Nairs (*q.v.*) of Madras, polyandry in the strict sense does not prevail. The rule is that a woman can have but one lawful spouse. To a man more is allowed. Among the Madu in Madras he may be polygamous in one village and polyandrous in another.

**Matriarchate.**—The matriarchate (*q.v.*) can hardly be traced in India, but in the south polyandrous practices make it inevitable that descent should sometimes be traced by the female line and a man's heir is then his uterine sister's son. Women, however, rarely manage property even when it vests in them and the duty is entrusted to the eldest male of the family. The Bants of S. Kanara furnish a conspicuous instance to the contrary, doubtless because the men were a feudal body like the Nairs incessantly engaged in war, and still great sportsmen, though excluded from the army. Disdain for cultivation may indeed degenerate into sheer idleness, all fieldwork being left to the women while the men knit as a pastime. Yet the purchase of wives as workers is rare.

**Ritual and Caste.**—A fruitful source of caste formation and ramification, especially in the south, is the complexity of ritual. Each grade of priest tends to form a separate subcaste, and every ministrant in a fane belongs to a caste-group. The bent of the barber for music in Malabār has led to his employment as a temple bandsman which function has raised him to semi-sacerdotal status with Ambalavāsi, "temple-resident," rank. The latter may trace descent in the male or female line, are divided into a number of functional castes each actively fissiparous, and employed in many rites outside the temples, leading to further disintegration. The question whether they are Brahmans degraded by function or Sūdras elevated by it is insoluble.

**Criminal Tribes.**—Like any other calling in India, crime tends to become hereditary and as sanctified by custom, almost respectable. This tendency has been strengthened in two ways, the protection of the criminal by territorial magnates and the patronage of a goddess. The notorious Thugs furnish the classic instance in Bhawāni, the goddess who received homage from the fraternity. Similarly in Madras the Donga-Dāsuri take omens for thieving excursions from their goddesses and also from Hanumān.

**Templewomen.**—A feature of South Indian religion is the dedication of women of many castes to a temple where they live immoral lives. Thus, when a Bedar family has no sons or a girl child falls ill, a vow is made that she or the next girl baby shall become a Basawi and she is branded if vowed to a male deity and styled "male Basawis": if vowed to a goddess girls are known as female Basawis. The son of a Basawi is, however, affiliated to her father's family; but a daughter also becomes a Basawi. In some places a Basawi lives in her parents' house and is hand-fast to a man, the sole object in this case being to prevent extinction of the family. The Devidāsīs, a god's handmaidens, are less reputable

and are divided into right and left hand, the former only consorting with men of the former faction while the latter only draw the line at the lowest castes. It is hard to say how these usages arose. Possibly not earlier than the 9th century A.D., the temples seem to have taken over an older state-controlled institution. Basawi is the name also given to a cow dedicated to Shiva, but Devadāsīs also serve in Vishnu's temples. The latter are divided into seven classes including the Vikrita who sells herself, the Bhritya who wishes to enrich her family, and the Bhakta who joins a temple out of devotion, but the Gopika or Rudraganika are simply hired by it. Both Gopika and Bhakta suggest a connection with Krishna. Traces occur in Northern India of girls of low caste being wedded to a god, and in Southern India both Basawis and Devadāsīs are so united to the idol by wedding rites. They are often highly accomplished, learning to read and write as well as sing and dance. Their attainments have in fact given female education a distinct tinge of disrepute. Poor law relief exists in India in embryo. The practice of handing over deformed infants to religious mendicants is widespread. Thus in Madras infirm children are claimed by the Mudavāndi or "lame" Andis, a special sect of professional beggars of the Shaiva persuasion who are subsidised by the Vellālas, a land-holding class, for this service. The children are well-treated and adopted into the Andi families. Generally a deformed child is supposed to be handed over to a god in fulfilment of a vow for male issue, but quite possibly the vow is an apologetic fiction. Microcephalous infants are thus "vowed" to a so-called Muslim saint in the Punjab and are styled "Shāh Daula's rats." They are exhibited by peripatetic beggars, but not maltreated. Owing to the intensity of family and caste solidarity the aged and unfortunate are almost universally given maintenance or found work. In famines, of course, much hardship is endured, especially by secluded women of high castes who cannot "break their *pardah*," i.e., emerge from privacy to find work. Some castes, like the Nuttukottai Chattis, are as noted for charity as for acquisitiveness, and alms-giving is an atonement for every sin including covetousness. That it is indiscriminate and ill-directed is undeniable, religious mendicancy having made begging reputable.

An odour of sanctity attaches to all forms of feeble-mindedness, and cruelty to the insane is rare though demoniacal possession may be deemed curable by flogging.

**Slavery.**—It is only of quite recent years that slavery in India has ceased, and marked traces of it can still be found from the Afghān borderland to the extreme south. It often originated in debt, a freeman selling himself for an advance of money or to pay off a debt, but praedial serfs like the Cheruman of Malabār and the Holeya of Mysore are races enslaved by conquest. Among the latter, local capitalism devised a system of hand-fasting female serfs to serfs lest marriage in a better caste should lead to emancipation. Yet the serf often enjoyed strange privileges. Thus in South Travancore for some time after harvest a Pulaiyar who succeeds in casting a stone at a high-caste woman after sunset, unless escorted by a male over three years old, caused her excommunication and could compel her to accompany him. In 1695 a royal edict abrogated this usage under pain of death. Less extreme privileges of Saturnalia are common.

**Feudalism.**—The chronic warfare of India has played its part in the formation of castes. To defend their frontiers the kings of the great realm of Vijāyanagar employed Mutrāchas, now a caste, with the title of Palaiyukkaram, now Paligar, holder of a *palaiyan* or feudal estate (no connection with modern Greek *palika*). A Telugu caste following various callings from agriculture down to palanquin-bearers, the Mutrāchas are largely watchmen, but some having been petty chiefs claim Kshatriya status. They have a special tutelary goddess but little or no marriage, forming unions often permanent with women of their own caste. Another caste of Pāligars is the Maravar and they stoutly defended Tinnevely against the British up to the beginning of the 19th century. They claim descent from the boatman who ferried Rāma over to Ceylon, and the Rājā of Rāmnād, their head, has the title of Satupati, or "lord of the bridge," but inscriptions indicate that the title originated about A.D. 1400 though coins may antedate it by a couple of centuries. The Maravars are now mainly culti-

vating sub-tenants, but contain a large criminal element which till recently virtually ousted the police at Tinnevely as detectives, acquiring considerable popularity.

Another feudal caste is the Bedar Kanarese-speaking and the Telugu-speaking Boyas who once formed a homogeneous caste, but many of their septs bear names which indicate that once it was a fusion of many elements. Both Bedar and Boya are now cross-divided into Uru or villagers and Myāsa or grass-land men each subdivided into buffalo-men, men of the herd, of the flower and fish-men, with each its own god. Caste government is to a great extent carried on by priests, a Vaishnava Brahman or officiants at shrines of Hanumān and other gods. But they have also such groups as Nāyaka and Pallagar and as infantry were recruited not only by the Pāligars but by Haidar Ali himself who had raised himself from the rank of *nāyaka* in the Mysore service largely by their aid. At one time they seem to have been forced or converted into partial acceptance of Islam, since some of them eat beef, but not pork, and circumcise boys. Yet they are still Hindus, worshipping both Shiva and Vishnu, with many other gods, and observing Hindu rites. The Pāligars proved so lawless that they had to be dispossessed.

In the Central Provinces the castes formed by military service seem to be mainly derived from non-Aryan tribes. With the Mahrāthas the Khandaits received grants of land as a reward for, or a condition of, such service, and rank somewhat above the cultivating castes. The Rautias of Chota Nagpur formed mainly from Kol tribes are in much the same position, while the Paiks, "footmen," and Taonlas, not having received such grants, rank below those castes. The Bangi Dhangars, "spear-shepherds," or Hatkars, enlisted in Marātha armies and still rank slightly higher than other shepherds (Dhangars).

#### THE MODERN LOW CASTES

In the Punjab Himalayas the Hinduism is of a primitive type and presumably caste is so likewise. Here we find the Dāgi, also commonly called Koli, and in the higher mountainous regions Betus, while those who have taken to any specific trade are styled *barhai*, carpenter, *dhogri*, iron-smelters, *pumba*, woolcomber, and *barara*, basket maker, etc., and these names stick to families long after they have abandoned these crafts. These families do not form castes. Probably Chamārs and Lohārs are merely Dāgis who once took to such trades as the tanner's and smith's, though in some parts a Dāgi will not eat with the former or marry with the latter, even though he will eat the flesh of bears and monkeys and all, except the Lohār, that of cattle which have died a natural death. The term Dāgi seems to be derived from *dāg*, a blemish, and a Dāgi is always below the Kanet and the Ghirth, the yeoman or cultivating castes of these hills. But *inter se* his status has varied and is varying. It depends for example on religious influences as round about the temple of Nirmand the Kolis will only marry with a family of Koli tanners who still style themselves Dāgis also but refrain from touching dead cattle.

**Kolis.**—But the Kolis are still more numerous than the Dāgis. The term Koli indeed is used in three distinct senses. The old Rājās of Kulu were known as Koli Rājās, and it appears to be in fact a territorial name; secondly it denotes the Dāgi just described, and, in Chamba, the Sippi. Thirdly it is used of Chamārs in the south-east plains of the Punjab who have taken to weaving. Of the term Koli several explanations are given. It is supposed to be derived from *kulin*, "degraded from a family," *i.e.*, of Sūdra status and so on; just as the Dāgi is said to be a degraded offshoot of the Kolis. In one part of the hills sumptuary rules restrain the Kolis and Dāgis from wearing gold and using certain instruments of music; in the lower hills both castes may use them, though Chamārs may not, and a Dāgi who makes shoes becomes a Chamār. Further the Kolis are divided into two classes, the true (*sacha*) Kolis from whose hands water may be taken by higher castes; and the rest. Another tale divides the Kanets from the Dagoli and Thākur, the latter descended from a Kanet who killed a bullock in a passion, and were degraded a degree further because they eat and drink with Muslims. Further local sub-

divisions exist, distinguished one from another by local customs. At some time or other the Kolis probably obtained caste promotion which took the form of sumptuary privileges granted by the local Rājās or chieftains for services rendered.

**Batwāls.**—Westward, in and near Chamba State, the position of the Dāgis is held by the Batwāls who in the Kāngra hills form a true caste. The term is said to mean "tax collector," and everyone so employed is thus styled, but a true Batwāl is probably a Barwāla, a maker of winnowing fans and mats, who was enlisted as a soldier and in the lower hills the latter term is applied to a man of any low caste employed as a watchman or messenger, another name for him being *satwāg*, "bearer of burdens," or *kirauk* "convener of men for forced labour." But as soon as we reach the plains we find the occupational Barwālas forming a caste though each section of them has its own temple, merely a mound of earth at which sacrifice is offered in the eldest son's honour. Although both the castes are Hindus they do not employ Brahmans but Meghs at weddings. The Batwāl tradition is that they are descended from a Rājā's daughter who went astray and was married by a Chuhra, the lowest caste, and that the name is really Betwāl, "son of a daughter," but in Chamba they claim descent from a deified ascetic.

**Meghs.**—The Meghs are numerous in Siālkot and ramify all along the borders of Jammu (Kashmir) into the submontane. Among them caste feeling is strong and attempts have been made to raise the standing of the fraternity by avoiding the use of dead animals and so on. Employing Brahmans of a low degree the Meghs also have prayer-sayers of their own and being by occupation largely weavers affect the cult of Kabīr; indeed further to the westward *megh* seems to be a synonym for *Julāha*, "weaver"; but they have also a priest of their own and his decision is final in social as well as on religious points and he has local agents. There are also two superior sections which hold aloof from the mass of the caste. It is impossible to say whether the Barwālas and Meghs are by origin occupational. Probably they are so, but their position all along this borderland from the inner high ranges down into the plains at their feet, suggests that they are *débris* of suppressed races or fragments of ancient states which have preserved something of their primitive pride.

**Central Provinces.**—In the Central Provinces we have a more developed system of caste among the lower strata. Occupation is the real basis of the divisions and social precedence of the castes down to the lowest. Thus the Udia Ghasias are not merely grass-cutters, but cure raw hides and do scavengers' work and are looked down on by other Ghasias. The Pardhis or "sportsmen" are divided into Shikaris who use firearms; Phansas, who use snares; Chitewalas, who tame leopards; and Gayakas who employ bullocks to stalk game. The sub-caste of Dhimars, "fishermen," are Singaria who grow waternuts, Tankiwala who sharpen grindstones, Jhingar or prawn catchers, Bansia or Saraia, "anglers," and others. Nowhere is difference of occupation more active, yet other factors also operate. The Gohardhua Chamārs wash out the undigested grain from the droppings of cattle to eat, and the Chungia group of the Satnāmi Chamārs to whom smoking is prohibited, use the chongi or leaf pipe; the Nāgle, or naked, Khonds wear only a negligible amount of clothes and the Makaria Kamārs eat monkeys: and all are despised. The taint of illicit birth is also a frequent cause of a new, more or less temporary, group within the caste. But as a rule a new subcaste subsists and among the Kumhārs the hand-using potters are still separate from those who use the wheel, though hand-made pottery is now unknown. Lastly we find groups adopted into other, even lower, castes, such as the Kor-Chamārs, Koris, "weavers," received into the Chamārs, "tanners"; Khatri Chhīpas, Khatri admitted into the dyers and printers; and similar groups in the Dāngris and tailors, probably owing a similar origin. We do not, however, find caste so much in process of formation as already formed; though the Satnāmi Chamārs of one district are now endogamous, the Kabīr-panthis only tend to be so.

The Naiyadis, or hunters, of Malabar are the dog-eaters and the lowest of the Hindu castes. Miserable specimens of humanity, they used to be excellent shots, but the Arms Act deprived them of

their weapons and they now work at rope-making, slings, mats and so on, with occasional cultivation. Yet they have succession in the male line and adultery is abhorrent to them. Some have been converted to Christianity and others to Islam, the latter maintain themselves by begging from Mohammedans. Their chief priest, Muppon, is hereditary. He enquires into all matters affecting the community and can excommunicate a guilty person.

In the Central Provinces the subdivision of labour is well exemplified. Objection is taken to the growing of hemp and so Kurmis who descend to it form the Santora (from *san*, "hemp") sub-caste, and so on. The Indian madder-dye (*āl*) is likewise offensive on account of its blood-like product, so we have Alia sub-castes of the Kāchhis, who grow vegetables, and of the Bānias. Similarly Barais grow the betel-vine, and various groups of the *Mālis*, "gardeners," specialize in flowers, cumin and turmeric. The arts of weaving also divide castes. Thread is spun by a special caste, the Katias. Cotton is cleaned by the Mohammedan Bahnas, and coarse cloth is woven by groups of the low castes, such as the Mahārs, Gāndas and Koris; while the finer kinds are again the work of separate castes, the Patwas embroidering in silk and braid; Tāntis; Koshtis, the latter having a separate sub-caste of Salewars, "silk-weavers." Metal workers and even bangle-makers are divided on identical lines.

Rose, *Tribes and Castes of the Punjab* (Lahore); R. V. Russell, *Tribes and Castes of the Central Provinces* (London, 1916), and E. Thurston, *Castes and Tribes of Southern India* (1909, Madras). The volumes for the United Provinces of Agra and Oudh, Rajputana, etc., have not yet been published. Sir D. C. J. Ibbetson, *Punjab Castes* (reprint, Lahore, 1916). The Census Reports, Imperial and Provincial, for 1901, 1911, 1921, also contain much valuable information. (H. A. R.)

**CASTELAR Y RIPOLL, EMILIO** (1832–1899), Spanish statesman, was born at Cadiz, on Sept. 8, 1832. He received the doctorate in philosophy and letters at Madrid in 1853, and from the time of the Spanish revolutionary movement of 1854 became active in politics, radical journalism, literary and historical pursuits. After his defeat in the first rising of June 1866, he fled to France to escape death, returning after the successful revolution of 1868 and entering the *cortes* as deputy for Saragossa. At the same time he resumed the professorship of history at Madrid. His demand for a federal republic in the constituent *cortes* of 1869 was realized on the abdication of Amadeus, but it lasted only from Feb. 11, 1873, to Jan. 3, 1874. Disorder was so rife that the president of the executive, Figueras, deserted his post. The doctrinaires, Pi y Margall and Salmeron, in successive attempts to govern, received no support from influential Spaniards. Finally at the beginning of September the federal *cortes* made Castelar chief of the executive and virtual ruler of Spain. He at once reorganized the army and sent forces to cope with the 60,000 Carlists in arms, and the cantonal insurrectionists around Alcoy and Cartagena (those of Cordoba, Seville, Cadiz, and Malaga had been already quelled under Salmeron).

Castelar next turned his attention to the Church. He put a stop to persecutions of the Church and religious orders and enforced respect of Church property. He attempted to restore order in the administration of finance, with a view to covering the expense of the three civil wars, Carlist, cantonal, and Cuban. The Cuban insurgents gave him much trouble, the famous *Virginus* incident nearly leading to a rupture with the United States. Castelar sent out reinforcements to Cuba and a new governor-general, Jovellar, whom he instructed to crush the mutinous spirit of the Cuban militia. At the end of 1873 Castelar had reason to be satisfied with the military operations in the peninsula, with the assistance he was getting from the middle classes and even from the non-republican elements. On the other hand, the extreme republicans openly dissented from his conservative and conciliatory policy. Hence when the federal *cortes* resumed its sittings (Jan. 2, 1874), it passed a vote of censure on Castelar. He resigned, and on the following day Pavia, the captain-general of Madrid, forcibly ejected the deputies, closed and dissolved the *cortes*, and called upon Marshal Serrano to form a provisional government.

A *pronunciamiento* put an end to Serrano's government in Dec., 1874, when Generals Campos at Sagunto, Jovellar at Valencia, Primo de Rivera at Madrid, and Laserna at Logroño, proclaimed Alphonso XII. king of Spain. Castelar then went into voluntary exile for 15 months, at the end of which he was elected deputy for Barcelona. He sat in all subsequent parliaments. During that period he became more estranged from the majority of the republicans, because he elected to seek the realization of the programme of the Spanish revolution of 1868 by evolution, and legal, pacific means. Hence the contrast between his attitude from 1876 to 1886, during the reign of Alphonso XII., when he stood in the front rank of the Opposition to defend the reforms of that revolution against Canovas, and his attitude from 1886 to 1891 when he acted as a sort of independent auxiliary of Sagasta and of the Liberal party. Besides the unfinished history of Europe in the 19th century he left:—*La civilización en los cinco primeros siglos del cristianismo* (1875); *Vida de Byron* (1873); *Cartas sobre política europea* (1875); and other works. Castelar died near Murcia, on May 25, 1899.

See D. Hannay, *Life of Castelar* (1896); Butler Clarke, *Modern Spain* (1906); *Correspondencia de Emilio Castelar 1868–98* (1908); E. Varagnac, *Emilio Castelar, un grand Espagnol* (1920).

**CASTELFRANCO DELL' EMILIA**, a town of Emilia, Italy, in the province of Bologna, 16 m. northwest by rail from the town of Bologna. Pop. (1921) 2,925 (town), 17,115 (commune). The churches contain some pictures by later Bolognese artists. Just outside the town is a massive fort erected by Urban VIII. in 1628, on the frontier of the province of Bologna, now used as a prison. Castelfranco either occupies or lies near the site of the ancient Forum Gallorum, a place on the Via Aemilia between Mutina and Bononia, where in 43 B.C. Octavian and Hirtius defeated Mark Antony.

**CASTELFRANCO VENETO**, a town and episcopal see of Venetia, Italy, in the province of Treviso, 16m. W. by rail from the town of Treviso. Pop. (1921) 4,240 (town), 15,881 (commune). The older part of the town is square, surrounded by mediaeval walls and towers constructed by the people of Treviso in 1199 (see CITTADILLA). The painter Giorgio Barbarelli (Il Giorgione, 1477–1512) was born there. The cathedral contains his Madonna with SS. Francis and Liberalis (1504), one of his finest works, in the background of which it is possible to see the town walls.

**CASTELL, EDMUND** (1606–1685), English orientalist, born at Tadlow, Cambridgeshire, entered Emmanuel college, Cambridge, but removed to St. John's, where he compiled his *Lexicon Heptaglotton Hebraicum, Chaldaicum, Syriacum, Samaritanum, Aethiopicum, Arabicum, et Persicum* (1669), on which he spent 18 years, working (if we may accept his own statement) from 16 to 18 hours a day, and employing 14 assistants. He was in prison in 1667 because he was unable to discharge his brother's debts, for which he had made himself liable. His own fortune had been spent on the *Lexicon*. A volume of poems dedicated to the king brought him preferment. He was made prebendary of Canterbury and professor of Arabic at Cambridge. His mss. he bequeathed to the University of Cambridge. He died in 1685 at Higham Gobion, Bedfordshire, where he was rector.

The Syriac section of the *Lexicon* was issued separately at Göttingen in 1788 by J. D. Michaelis. Trier published the Hebrew section in 1790–92.

**CASTELLAMMARE DI STABIA**, a seaport and episcopal see of Campania, Italy, in the province of Naples, 17m. S.E. by rail from the town of Naples. Pop. (1921) town, 28,340; commune, 39,188. It lies in the south-east angle of the bay of Naples, at the beginning of the peninsula of Sorrento, and owing to the sea and mineral water baths (12 different springs) and its attractive situation, with a splendid view of Vesuvius and fine woods on the hills behind, it is a favourite resort of Neapolitans in summer. The ruined castle from which it takes its name, on the hill to the south of the town, was built by the emperor Frederick II. There is a large royal dockyard (3,000 workmen), and a small-arms factory; there are also ironworks, cotton, flour and macaroni mills. An electric tramway leads along the coast to Sorrento.

**CASTELLES, ADRIANO** (1460?-1521), Italian cardinal and writer, known also as CORNETO from his birthplace, was sent by Innocent VIII. to reconcile James III. of Scotland with his subjects. While in England he was appointed (1503), by Henry VII., to the see of Hereford, and in 1504 to the diocese of Bath and Wells, but he never resided in either. Returning to Rome, he became secretary to Alexander VI. and was made cardinal (May 31, 1503). Soon after the election of Leo X. he was implicated in the conspiracy of Cardinal Petrucci against the pope. He confessed his guilt, fled from Rome and was deposed from the cardinalate. As early as 1504 he had presented his palace (now the Palazzo Giraud-Torlonia) to Henry VII. as a residence for the English ambassador to the Holy See; and on his flight Henry VIII., who had quarrelled with him, gave it to Cardinal Campeggio. Of Adrian's subsequent history nothing is known. As a writer, he was one of the first to restore Latin to its pristine purity; and among his works are *De Vera Philosophia ex quatuor doctoribus ecclesiae* (Bologna, 1507), *De Sermone Latino* (Basle, 1513) and a poem, *De Venatione* (Venice, 1534).

See B. Gebhardt, *Adrian von Corneto* (Breslau, 1886).

**CASTELLI, IGNAZ FRANZ** (1781-1862), Austrian dramatist, was born at Vienna on March 6, 1781. During the Napoleonic invasions his war song, *Kriegslied für die österreichische Armee*, was printed by order of the archduke Charles and distributed in thousands. For this Castelli was proclaimed by Napoleon in the *Moniteur*. In 1815 he went to France as secretary to Count Cavriani, and, after his return to Vienna, resumed his post in the government service. In 1842 he retired to his estate at Lilienfeld, where he devoted himself to literature. Castelli's dramatic talent was characteristically Austrian; his plays were well constructed and effective and satirized unsparingly the foibles of the Viennese. But his wit was local and ephemeral. His excellent *Gedichte in nieder österreichischer Mundart* (1828) are still read. He died at Lilienfeld on Feb. 5, 1862.

Castelli's *Gesammelte Gedichte* appeared in 1835 in 6 vols.; a selection of his *Werke* in 1843 in 15 vols. (2nd ed., 1848), followed by 6 supplementary volumes in 1858. See his autobiography, *Memoiren meines Lebens* (1861-62); new ed. *Aus dem Leben eines Wiener Phäaken* (1912).

**CASTELLO, BERNARDO** (1557-1629), Genoese portrait and historical painter, born at Albaro near Genoa, was the intimate friend of Tasso, and designed the figures of the *Gerusalemme Liberata*, published in 1592; some of these subjects were engraved by Agostino Caracci.

**CASTELLO, GIOVANNI BATTISTA** (1500?-1569?), Italian historical painter, architect and sculptor, was born near Bergamo in 1500 or perhaps 1509, and is hence termed Il Bergamasco. He belongs, however, to the school of Genoa, but does not appear to have been related to the other two painters named Castello, also noticed here. He decorated the Nunziata di Portoria in Genoa, the saloon of the Lanzi palace at Gorlago, and the Pardo palace in Spain. His best-known works are the "Martyrdom of St. Sebastian" and the picture of "Christ as Judge of the World" on one of the vaultings of the Annunziata. In 1567 he was invited to Madrid by Philip II., and there he died, holding the office of architect of the royal palaces. The date of death (as of birth) is differently stated as 1569 or 1579.

**CASTELLO, VALERIO** (1625-1659), Italian painter, was the youngest son of Bernardo Castello (q.v.). He surpassed his father, and particularly excelled in painting battle scenes. He painted the "Rape of the Sabines," now in the Palazzo Brignole, Genoa, and decorated the cupola of the church of the Annunciation in the same city.

**CASTELLO BRANCO, CAMILLO**, VISCONDE DE CORREIA BOTELHO (1825-1890), Portuguese novelist, was born out of wedlock and lost his parents in infancy. He spent his early years in a village in Traz-os-Montes. He learnt to love poetry from Camoens and Bocage, while Mendes Pinto gave him a lust for adventure, but he dreamed more than he read, and grew up undisciplined and proud. He took minor orders, but his restless nature prevented him from following one course for long and he soon returned to the world, and henceforth kept up a feverish literary activity to the end. He was created a viscount in 1885

in recognition of his services to letters, and when his health finally broke down he received a government pension. When, old and blind, he died by his own hand in 1890, it was recognized that Portugal had lost the most national of her modern writers.

Apart from his plays and verse, Castello Branco's works may be divided into three sections. The first comprises his romances of the imagination of which *Os mysterios de Lisboa*, in the style of Victor Hugo, is a fair example. The second includes his novels of manners, a style of which he was the creator and remained the chief exponent until the appearance of *O Crime de Padre Amaro* of Eça de Queiroz. In these he is partly idealist and partly realist, and describes to perfection the domestic and social life of Portugal in the early part of the 19th century. The third division embraces his writings in the domain of history, biography and literary criticism. Among these may be cited *Noites de Lamego*, *Cousas leves e pesadas*, *Cavar em ruínas*, *Memorias do Bispo do Grão Para* and *Bohemia do Espírito*.

Knowing the life of the people by experience and not from books, he was able to fix in his page a succession of strongly marked and national types, such as the *brazileiro*, the old *fidalgos* of the north, and the Minho priest. Among the most notable of his romances are *O Romance de um Homem Rico*, his favourite, *Retrato de Ricardina*, *Amor de Perdição*, and the magnificent series entitled *Novellas do Minho*. Many of his novels are autobiographical, like *Onde está a felicidade*, *Memorias do Carcere* and *Vingança*. No other Portuguese author has shown so profound a knowledge of the popular language as Castello Branco. Though nature had endowered him with the poetic temperament, his verses are mediocre, but his best plays are cast in bold lines and contain really dramatic situations, while his comedies are a triumph of the grotesque, with a mordant vein running through them that recalls Gil Vicente.

**BIBLIOGRAPHY.**—The *Diccionario Bibliographico Portuguez*, vol. ix. p. 7 et seq., contains a lengthy but incomplete list of Castello Branco's publications. See A. Pimentel, *Romance do Romancista* (1890), a badly put together but informing biography; also a study on the novelist by J. Pereira de Sampaio in *A Geração Nova* (Oporto, 1886); Theophilus Braga, *As Modernas Ideias na literatura Portuguesa* (Oporto, 1892); Padre Senna Freitas, *Perfil de Camillo Castello Branco* (S. Paulo, 1887); Paulo Osorio, *Camillo, a sua vida, o seu genio, a sua obra* (Oporto, 1908).

**CASTELLO BRANCO**, a Portuguese episcopal city, 1,560ft. above the sea, on the Abrantes-Guarda railway. Pop. (1925), 10,486. The city has many Roman remains and is dominated by a ruined castle, and partly enclosed by ancient walls; its chief buildings are the cathedral and episcopal palace. Cloth is manufactured, and there is a flourishing local trade in cork, wine and olive oil. The administrative district of Castello Branco coincides with the south-eastern part of Beira; pop. (1920), 239,167; area, 2,582 sq.m.

**CASTELLÓN DE LA PLANA**, a province of eastern Spain, formed in 1833 of districts formerly included in Valencia; bounded on the north by Teruel and Tarragona, east by the Mediterranean sea, south by Valencia, and west by Teruel. Pop. (1920) 306,886; area, 2,495sq.m. The province is mainly occupied by mountains which increase in height westward and culminate in the peak called Peñagolosa (5,945ft.). Lowlands occur only along a narrow coastal belt and up some of the river valleys. The interior is dissected by the valleys of many streams flowing to the Mediterranean. The chief rivers are the Cenia, the Vinaroz and the Mijares with its tributary the Monlleo, separated from the Palancia by the Sierras de Espina and de Espadan. The coast-line is unbroken by any marked inlet and there is no first-class harbour. The climate is cold and variable in the hilly districts, temperate in winter and very warm in summer in the lowlands. Here irrigation supplements the scanty rainfall and cereals, including rice, the vine and olive, vegetables and hemp are cultivated but fruit and, above all, oranges are the chief products. Cork and locust beans are obtained from the mountain regions where marble is quarried, and fishing is important off the coast. Lead, zinc and iron and other ores are known to be present but in 1924 only three mines operated, producing about 100 tons of lead ore. The chief industries are fish-curing and the manufacture of woollen,

linen and silk goods and of porcelain. Oranges, wine, oil and beans are exported. The Barcelona-Valencia railway skirts the coast, passing through Castellón the capital; and the Calatayud-Sagunto line crosses the southern extremity of the province. A light railway from Onda links Castellón with its port of El Grao. Castellón (pop. 1920, 34,457), Villareal (16,770), Burriana (13,895) and Peñíscola (2,975), a town of some historical interest, are described in separate articles. The other chief towns are Vall d'Uxó (8,807), Vinaroz (7,846), Villafamés (7,356), Almazora (7,273), Benicarló (7,012), Onda (6,631), Segorbe (6,555), Nules (5,874), Alcalá de Chisbert (5,855) and Morella (5,498). (See also VALENCIA.)

**CASTELLÓN DE LA PLANA**, a city of eastern Spain, capital of the province described above, on the Barcelona-Valencia railway, 4m. from the Mediterranean sea. Pop. (1920) 34,457. Castellón lies on a fertile plain irrigated from the Mijures estuary, 5m. S.E., by a rock-hewn Moorish aqueduct. The town, partly encircled by ruined walls, is mainly modern, but contains several ancient convents, an old octagonal bell-tower, 130ft. high, and a 14th century church with an interior painting by Francisco Ribalta, who was born here in 1555. Castellón manufactures porcelain, leather, rope, paper and clothing. Its harbour, El Grao de Castellón, 4m. E., and lately improved, is annually entered by some 400 small vessels, mainly engaged in shipping oranges, almonds and locust beans to Britain and hemp to other parts of Spain. The chief imports are coal and chemical manures. A light railway from Onda connects Castellón and its port with the orange groves to the south-west. Under the Moors Castellón occupied a hill to the north of its present site; its removal to the plain by James I. of Aragon (1213-76) gave the town its full name, "Castellón of the Plain."

**CASTELLORIZO**, the ancient Megiste, an island of the Dodecanese. It was included by the Turks in the privileged group known as "the Dodecanese" (q.v.), but did not form part of the Italian "Dodecanese" occupied during the Libyan War of 1912. The outbreak of hostilities against Turkey during the World War gave the Italians an opportunity of adding Castellorizo to their Dodecanesian possessions, after the French had occupied it on Dec. 27, 1915. Articles 122 of the Treaty of Sévres in 1920 and 15 of the second Treaty of Lausanne in 1923 provided that "Turkey renounces in favour of Italy all rights and title . . . over the island of Castellorizo." Its population is entirely Greek.

See *Peace Handbooks*, vol. xi. No. 64; *The Turkish Islands* (1920).

**CASTELNAU, EDOUARD DE CURIERES DE** (1851- ), French soldier, was born at Saint-Affrique, Aveyron, Dec. 24, 1851, third son of the Marquis de Curières de Castelnau. He entered the military school of St. Cyr, near Versailles, in 1869; and during the Franco-German War took part in the Loire campaign. Captain in 1876 and commandant in 1889, he was appointed by Gen. de Miribel in 1893 to a post in the chief department of the general staff; later, as head of the department he built up the vast system of French mobilization. In 1910 he became general of division, and in June 1911 assistant to the chief of the general staff. On the outbreak of the World War he commanded the II. Army in Lorraine. After the French offensive had failed at Morhange in Aug. 1914, General Castelnau in turn successfully repulsed the Germans at the Trouée de Charmes and the heights of the Grand Couronné. On Sept. 18 the II. Army was moved to the west between the Somme and the Oise in the abortive attempt to outflank the German armies—known as the "race to the sea."

On June 13, 1915, Gen. Castelnau took command of the group of four armies which constituted the French centre, and directed the September offensive in Champagne. In the following December he became chief of the general staff under General Joffre. He was next sent to Salonika on a tour of inspection, returning by way of Athens and Rome. Three days after the opening of the German attack at Verdun on Feb. 21, 1916, Castelnau was sent there on an emergency mission, with full powers, and appreciating the danger, gave orders that the right bank of the Meuse should be held at all cost; he returned to Chantilly only when the position

was secure. On the appointment of Nivelle in place of Joffre, Castelnau was sent on a mission to St. Petersburg in Jan. 1917. On his return he was given command of the group of armies in the east with a view to directing the large-scale operations which were anticipated in Nov. 1918, and which the Armistice happily forestalled. After the war General Castelnau entered the Chamber as deputy for Aveyron; he acted as president of the army committee, and allied himself to the group known as the *Entente démocratique et sociale*. See Victor Giraud, *Castelnau* (1921).

**CASTELNAU, MICHEL DE**, SIEUR DE LA MAUVISSIÈRE (c. 1520-1592), French soldier and diplomatist, was born in Touraine. After some service in the French army in Italy he entered the service of the Cardinal of Lorraine. He was employed on a series of important diplomatic missions, and after the death of Francis II. accompanied his widow, Mary Stuart, to Scotland in 1561. During that year he sought in vain to effect a reconciliation between Mary and Elizabeth. During the next ten years he was employed alternately in the army and in diplomacy. In 1572 he was sent to England by Charles IX. to allay the excitement created by the massacre of St. Bartholomew, and the same year he was sent to Germany and Switzerland. Two years later he was reappointed by Henry III. ambassador to Queen Elizabeth, and he remained at her court for ten years. Castelnau used his influence to promote the marriage of the queen with the duke of Alençon, but Elizabeth made so many promises only to break them that at last he refused to accept them or communicate them to his Government. On his return to France he found that his château of La Mauvissière had been destroyed in the civil war; and as he refused to recognize the authority of the league, the duke of Guise deprived him of the governorship of Saint-Dizier. He was thus brought almost to a state of destitution. But on the accession of Henry IV., the king, who knew his worth, and was confident that although he was a Catholic he might rely on his fidelity, gave him a command in the army, and entrusted him with various confidential missions.

Castelnau died at Joinville in 1592. His *Mémoires* rank very high among the original authorities for the period they cover, the 11 years between 1559 and 1570. They were written during his last embassy in England for the benefit of his son; and they possess the merits of clearness, veracity and impartiality. They were first printed in 1621; again, with additions by Le Laboureur, in 1659; and a third time, still further enlarged by Jean Godefroy, in 1731. Castelnau translated into French the Latin work of Ramus, *On the Manners and Customs of the Ancient Gauls*. Various letters of his are preserved in the Cottonian and Harleian collections in the British Museum.

His grandson, JACQUES DE CASTELNAU (1620-1658) distinguished himself in the war against Austria and Spain during the ministries of Richelieu and Mazarin, and died marshal of France.

See G. Hubault, *Ambassade de Castelnau en Angleterre* (1856); *Relations politiques de la France . . . avec l'Écosse au seizième siècle*, edited by J. B. A. T. Teulet (1862); and De la Ferrière, *Les Projets de mariage d'Élisabeth* (1883).

**CASTELNAUDARY**, a town of south-western France, in the department of Aude, 22 m. W.N.W. of Carcassonne, on the railway to Toulouse. Pop. (1926) 6,131. It probably represents the ancient town of *Sostomagus*, taken during the 5th century by the Visigoths, who, it is conjectured, rebuilt the town, calling it *Castrum Novum Arianorum*, whence the present name. Early in the 13th century the town was the scene of several struggles during the war against the Albigenses. It is finely situated on rising ground in the midst of a fertile and well-cultivated plain, on the Canal du Midi, which here widens out into an extensive basin lined with warehouses. The church of St. Michel (14th century) has a street running beneath its tower. There is a number of flour-mills, as well as manufactories of earthenware and tiles; trade is in lime, timber, grain, fruits, wine, cattle and farm implements.

**CASTELSARRASIN**, a town of south-western France, capital of an arrondissement in the department of Tarn-et-Garonne, 12m. W. of Montauban. Pop. (1926), 2,826. The name appears in the 13th century. *Castrum Cerrucium*, *Castel-sur-Azine* (from the neighbouring stream, Azine) and *Castellum Sarracenum* are

suggested derivations. The town is situated on the left bank of the lateral canal of the Garonne about a mile from the right bank of the river. Promenades occupy the site of the old fortifications. Its chief building is the 13th century brick church of St. Sauveur, typical of the Tolosan style.

**CASTI, GIOVANNI BATTISTA** (1721–1803), Italian poet, a native of Montefiascone, entered the Church, but surrendered his chance of preferment to the pleasure of visiting the courts of Europe. From 1782–96 he was poet-laureate at the Austrian court. The rest of his life was spent in Paris, where he died on Feb. 6, 1803. He wrote lyrics, the libretti of many cantatas and operas and a satire in 26 cantos, *Gli Animali parlanti* (1802), which was translated into many languages (Eng. version by W. S. Rose, *Court and Parliament of Beasts*, 1819).

**CASTIGLIONE, BALDASSARE** (1478–1529), Italian diplomatist and author of *Il Cortegiano*, was born at Casanatico near Mantua, and was educated at Milan under the famous professors Merula and Chalcondyles. In 1496 he entered the service of Lodovico Sforza, duke of Milan, returning to Mantua in 1500 when Lodovico was carried prisoner into France. In 1504 he was attached to the court of Guidobaldo Malatesta, duke of Urbino, and in 1506 he was sent by that prince on a mission to Henry VII. of England. He also served Malatesta's successor, Francesco Maria della Rovere, for whom he obtained the command of the papal troops. Charged with the arrangement of the dispute between Clement VII. (Medici) and Charles V., Castiglione crossed, in 1524, into Spain, where he was received with honour, being afterwards naturalized, and made bishop of Avila. In 1527, however, Rome was seized and sacked by the Imperialists under Bourbon, and in July of the same year the surrender of the castle of Sant' Angelo placed Clement in their hands. Castiglione had been tricked by the emperor, but there were not wanting accusations of treachery against himself. He had, however, placed fidelity highest among the virtues of his ideal "courtier," and when he died at Toledo on Feb. 7, 1529 it was said that he had died of grief and shame at the imputation. The emperor mourned him as "one of the world's best cavaliers."

Castiglione wrote little, but that little is of rare merit. His verses, in Latin and Italian, are elegant in the extreme; his letters (Padua, 1769–71) are full of grace and finesse. But the book by which he is best remembered is the famous treatise, *Il Cortegiano*, written in 1514, published at Venice by Aldus in 1528, and translated into English by Thomas Hoby, the *Courtier of Count Baldessar Castilio* as early as 1561. This book, called by the Italians *Il Libro d'oro*, is one of the great books of 16th century European prose literature; it describes the Italian gentleman of the Renaissance under his brightest and fairest aspect, and gives a charming picture of the court of Guidobaldo, duke of Urbino, "confessedly the purest and most elevated court in Italy." In the form of a discussion held in the duchess's drawing-room—with Elizabeth Gonzaga, Pietro Bembo, Bernardo Bibbiena, Giuliano de' Medici, Emilia Pia, and Ceretino the Unique among the speakers—the question, what constitutes a perfect courtier, is debated. With but few differences, the type determined on is the ideal gentleman of the present day.

The best edition of *Il Cortegiano* is that of V. Cian (Florence, 1894). See P. L. Ginguené, *Histoire littéraire de l'Italie*, vi., vii.; J. A. Symonds, *The Renaissance in Italy* (1875); C. Hare, *Courts and Camps of the Italian Renaissance* (1908); Julia Cartwright, *B. Castiglione, the Perfect Courtier* (1908, bibl.); *The Book of the Courtier*, Everyman ed. (1928).

**CASTIGLIONE, CARLO OTTAVIO, COUNT** (1784–1849), Italian philologist, was born at Milan, and died at Genoa on April 10, 1849. He assisted Cardinal Mai in editing the fragments of Ulphilas's Gothic version of the Scriptures discovered by the cardinal in 1817, and himself edited separately between 1829 and 1839 the Gothic texts of various books of the New Testament.

See Biondelli, *Carlo Ottavio Castiglione* (Milan, 1856).

**CASTIGLIONE, GIOVANNI BENEDETTO** (1616–1670), called in Italy Il Grechetto, and in France Le Bénédette, Italian painter of the Genoese school, was born in Genoa, and studied for some time under Vandyck. He painted portraits, historical pieces and landscapes, but chiefly excelled in fairs,

markets and rural scenes with animals. Noah and the animals entering the Ark was a favourite subject. He also executed a number of etchings, which earned for Castiglione the name of "a second Rembrandt." "Diogenes searching for a Man" is one of the principal of these. The *Presepio* (nativity of Jesus) in the church of San Luca, Genoa, ranks among his most celebrated paintings, the Louvre contains eight characteristic examples, and works of his are also to be found in Rome, Venice, Naples, Florence, Genoa and Mantua. In his closing years he lived in Mantua, painting for the court, and died there in 1670. His brother Salvatore and his son Francesco excelled in the same subjects.

**CASTIGLIONE DELLE STIVIERE**, a town in Lombardy, 22 miles N.W. of Mantua, was the scene of a battle on Aug. 5, 1796, between the French Army of Italy under Napoleon Bonaparte and the Austrians under Wurmser. The latter's attempt to relieve the fortress of Mantua, which had been besieged by the French since the middle of July, by an advance in two columns on both sides of Lake Garda, met with such initial success that Bonaparte had been compelled to raise the siege. Having defeated the Austrian right column at Lonato, he then turned eastwards against Wurmser, who with his left column had entered Mantua on Aug. 1, and now deployed his 25,000 men for battle with his right at Solferino and his left at Medole. Bonaparte, who had in all some 31,000 men at his disposal, now made use for the first time of a plan of battle typically his own; it consisted in a series of holding attacks along the whole of the enemy's front, to pin down his forward troops and induce him to engage his reserves; a thrust into the rear of one of his wings by a detached force called up from a distance to the battlefield designed to shake his morale and disorganize him; and a decisive frontal assault on the hostile wing so threatened, which completed his defeat. On this occasion Bonaparte deployed Masséna and Augereau against Wurmser's front, while Serurier's blockading troops, which after the raising of the siege of Mantua had retired to Marcaria, some 15 miles south of Medole, and had been ordered to march all night, struck into his rear at Guidizzolo. Wurmser was taken by surprise by the sudden appearance of this new enemy, and Bonaparte seized his opportunity to throw a picked force of grenadiers under Kilmaine against the Austrian left centre.

The result was the complete defeat of the Austrian army, which having lost 2,000 men and 18 guns, retreated eastward over the Mincio into Tirol. Strategically Wurmser had in part achieved his object in securing an additional lease of life for the fortress he had been sent to relieve; but he had failed to seize the chance offered him of decisively defeating the French, whose brilliant recovery from an apparently desperate situation and tactical victory on the battlefield left the honours of the campaign with them, and greatly enhanced their morale and prestige. (See further FRENCH REVOLUTIONARY WARS.)

**CASTIGLIONE OLONA**, a village of Lombardy, Italy, in the province of Como, 27 m. N.E. of Milan by rail. Pop. (1921) 834 (commune) 2,168. The choir of the collegiate church, erected about 1428 by Cardinal Branda Castiglioni, contains fine frescoes by Masolino of Florence. There are other works by the same master in the baptistery. The tomb of the cardinal (1443) is good. The church of S. Sepolcro is also in the village.

**CASTILE**, an ancient kingdom of Spain, bounded on the north by the Bay of Biscay, north-east by the Basque provinces and Navarre, east by Aragon, south-east by Valencia and Murcia, south by Andalusia, west by Estremadura and Leon, and north-west by Asturias. Pop. (1926) estimated 4,494,872. Area, 53,307 sq.m. The name is said to be derived from the numerous frontier forts (*castillos*), erected as a defence against the Moors. The territorial extent of mediaeval Castile grew with progressive conquests from the Moors. From a mere county in the north (Old Castile) the kingdom extended to include the whole of central Spain. The final successful resistance of Asturias was followed by the liberation of Galicia and Leon and in the time of Ferdinand I. of Castile (1035–1065) the kingdoms of Leon and Castile were united. New territories were annexed on the south and the capture of Toledo in 1085 saw the formation of New Castile.

The centre of Old Castile is the basin of the Upper Douro, that of New Castile the trench-like upper basins of the Tagus and Guadiana. In 1833 Old Castile was divided into the provinces of Avila, Burgos, Logroño, Palencia, Santander, Segovia, Soria and Valladolid; while New Castile was similarly divided into Ciudad Real, Cuenca, Guadalajara, Madrid and Toledo (*q.v.*). The entire area extends for about 300 m. from north to south, and 160 m. from east to west. It is a plateau, with average altitude about 2,500ft. and a natural frontier of high mountains on all sides, except on the borders of Leon, Extremadura and Murcia. On the north-west are the Sierra de Culebra and the high plains of Leon, on the north the Cantabrian mountains, on the east the Sierra del Demanda and its offshoots. The Sierra de Gaudarrama, Sierra de Gredos and Sierra de Gata extend across the centre in a south-westerly direction, forming the southern boundary of Old Castile. The Sierra de Albarracín and Sierra de Cuenca continue the mountain girdle of New Castile on the east, with parts of the Sierra Morena forming its southern boundary. The mountains on the south-west are less definite and include the minor ranges that more or less unite the Sierra de Gredos, Sierra de Guadalupe and Sierra Morena. This highland region, shut off from the sea, is exposed to extremities of heat and cold. Snow falls early and lies late on the mountains of the north and there is a heavy rainfall in the north-west. The southern regions of New Castile are more arid with a rainfall rarely exceeding 10 inches in the year. The country is swept by bitter gales in winter and scorching dust-laden winds in summer. In both the Castiles the plateau-soil is naturally fertile, and after rain a luxuriant vegetation appears; but drought is common. In the neighbourhood of Valladolid, Palencia and in the Mesa de Ocaña, where heavy loam underlies the porous surface, moisture which elsewhere is absorbed remains available. On the mountains surrounding the plateau vast tracts are useless except as pasture for sheep, and the severe winters drive the sheep to migrate yearly into Extremadura (*q.v.*). On the wheat-growing lands arose centrally situated cities, like Valladolid, Palencia and Toledo, while arranged around them at the foot of the mountain passes grew up a ring of smaller centres, mediaeval market towns where the produce of the plains was exchanged for that of the highlands. In Old Castile we have Leon, Burgos, Segovia, Avila and Salamanca; in New Castile, Guadalajara, Cuenca, Albacete and Ciudad Real. Salamanca, linked with the Moorish south, became the historic university of Christian Spain, while Toledo was a link between north and south—Christian and Moor. At Alcalá de Henares was established in 1510 another university.

Castilian is the literary language of Spain, and with certain differences, of Spanish America also. It is spoken in Old and New Castile, Aragon, Extremadura and the greater part of Leon; in Andalusia it is subject to modifications of accent and pronunciation. Cut off on all sides from the sea and full of memories of the bitter struggle with the Moors, this region has preserved many mediaeval features in its life. Madrid (*q.v.*) grew up following the defeat of the Moors, and has little relation to the evolution of Castile.

**CASTILHO, ANTONIO FELICIANO DE** (1800–1875), Portuguese man of letters, was born at Lisbon. He lost his sight at the age of six, but the devotion of his brother Augusto, aided by a retentive memory, enabled him to go through his school and university course with success; and he acquired an almost com-

plete mastery of the Latin language and literature. His first work of importance, the *Cartas de Echo e Narciso* (1821), belongs to the pseudo-classical school, but his romantic leanings became apparent in the *Primavera* (1822) and in *Amor e Melancholia* (1823), two volumes of honeyed and prolix bucolic poetry. In the poetic legends *A noite de Castello* (1836) and *Cuimes do bardo* (1838) Castilho appeared as a full-blown Romanticist. A fulsome epic on the succession of King John VI. brought him an office of profit at Coimbra. Going to Brazil in 1854, he there wrote his famous "Letter to the Empress." Though Castilho's lack of strong individuality and his over-great respect for authority prevented him from achieving original work of real merit, yet his translations of Anacreon, Ovid and Virgil, and the *Chave do Enigma*, explaining the romantic incidents that led to his first marriage with D. Maria de Baena, a niece of the satirical poet, Tolentino, and a descendant of Antonio Ferreira, reveal him as a master of form and a purist in language.

See *Memorias de Castilho*, ed. Julio de Castilho (1881–1903); Innocencio da Silva in *Dicionario bibliographico Portuguez*, i. 130 and viii. 132; Latino Coelho's study in the *Revista contemporanea de Portugal e Brazil* vols. i. and ii.; Theophilo Braga, *Historia do Romantismo* (1880); and F. de Figueiredo, *Historia da litteratura romantica portuguesa 1825–70* (1913).

**CASTILLEJO, CRISTÓBAL DE** (1490–1550), Spanish poet, was born at Ciudad Rodrigo. When quite young he entered a Carthusian monastery, but in 1525 he became secretary to Charles V.'s brother, Ferdinand of Austria, in whose service he spent the rest of his life, mostly outside Spain. He died and was buried at Vienna. Castillejo's poems are interesting, not merely because of their intrinsic excellence, but also as being the most powerful protest against the metrical innovations imported from Italy by Boscán and Garcilaso de la Vega. He adheres to the native metres except when parodying the new school—as in the lines *Contra los que dejan los metros castellanos*. He excels by virtue of his charming simplicity and his ingenious wit, sometimes cynical and sometimes urbane. His plays are lost; the best text of his verses is that printed at Madrid in 1926.

See C. L. Nicolay, *The Life and Works of Cristóbal de Castillejo* (1910).

**CASTILLO SOLÓRZANO, ALONSO DE** (1584?–1647), Spanish novelist and playwright, issued his first work, *Donaires del Parnaso*, two volumes of humorous poems, in 1624–25, but his *Tardes entretenidas* (1625) and *Jornadas alegres* (1626) proved that he was a novelist by vocation. He published in quick succession three clever picaresque novels, two of which, *La Niña de los embustes*, *Teresa de Manzanares* (1634) and *Las Aventuras del Bachiller Trapaza* (1637), were used by Lesage in *Gil Blas*. To these shrewd cynical stories he owes his reputation. He was also popular as a playwright both at home and abroad. His *Marqués del Cigarral* and *El Mayorazgo figurón* are the sources respectively of Scarron's *Don Jophet d'Arménie* and *L'Héritier ridicule*. Among his numerous remaining works may be mentioned *Las Harpías en Madrid* (1633), *Fiestas del Jardín* (1634), *Los Alívios de Casandra* (1640) and the posthumous *Quinta de Laurel* (1649); the witty observation of these books forms a singular contrast to the prim devotion of his *Sagrario de Valencia* (1635).

**CASTING AND FINISHING:** see SCULPTURE.

**CASTING or FOUNDED.** The process of giving shape to or reproducing an object by pouring its material in liquid form into a mould. (See FOUNDED.)
